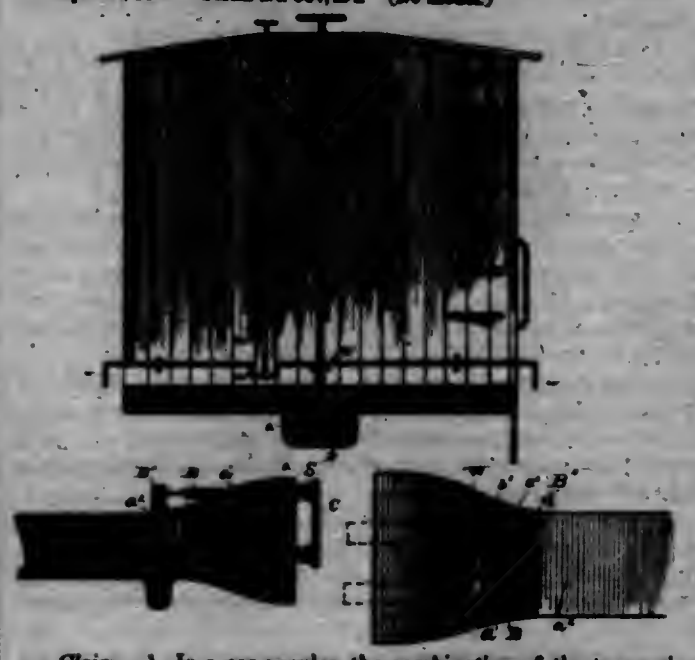
PATENTS

GRANTED SEPTEMBER 3, 1889.

410,140. CHECK-ROW CORN-PLANTER. Gustave L. Rahm, Fall River, Kans., assignor to William R. Case, Darwin S. Remig, and Alonzo F. Dufrees, same place. Filed Mar. 18, 1889. Serial No. 303,714. (No model.)

Claim.—1. The combination, with the beam A, having the slots P, of the vibratory rock-shaft E, journaled on the front side of the beam A and having depending crank-arms, the runners depending from the beam, the valves mounted in the runners, the pitmen extending transversely under the beam and connecting the crank-arms on the rock-shaft with the valves, the seed-disks on the upper side of the beam having ratchet-teeth in their under sides, the pawls pivoted to the pitmen passing through the slots P and engaging the said ratchet-teeth, and the springs secured to the pitmen and bearing on the pawls, as set forth.

2. The combination, with the beam A and the runners, of the bearings on the front side of the beam, one of said bearings having the stops H, the rock-shaft journaled in said bearings and having a radial pin playing between the said stops, the valves mounted in the runners, the pitmen connecting the valves with the rock-shaft, and mechanism for operating said shaft, as set forth.



410,141. SEAT FOR HARROW-TEETH. Clarence E. Bement, Lansing, Mich. Filed Mar. 5, 1889. Serial No. 301,964. (No model.)

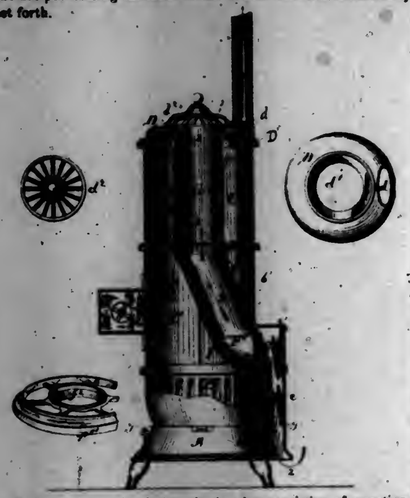
Claim.—1. The combination, with the beam A, having the openings A', of the holder B, having the angular seat B', the elongated opening B^3, arranged at one side thereof and registering with one of the openings A' and having the notches B^4, arranged at the opposite side of the seat and in the edge of the holder, the tooth C, mounted in the seat, and the binding-staple D, passed through the openings A' B^3 and notch B^4 and provided with binding-nuts D^2, substantially as specified.

2. The combination, with the beam A, having the openings A', of the holder B, having the angular seat B', the elongated opening B^3, arranged at one side thereof and registering with one of the openings A' and having the notches B^4, arranged at the opposite side of the seat and in the edge of the holder, the angular tooth C, mounted in the seat, and the binding-staple D, passed through the openings A' B^3 and notch B^4 and provided with the binding-nuts D^2 and the intermediate notch D^3, for receiving the angular edge of the tooth substantially as specified.

410,142. CAR-COUPLING. John C. Rockenstaff, Dahinda, Ill. Filed Apr. 16, 1889. Serial No. 307,434. (No model.)

Claim.—1. In a car-coupler, the combination of the two spring-actuated bolts, one of which has a catch and the other connected thereto, the bar connecting said bolts, the coupling-pin, and the draw-head provided with apertures and a groove, substantially as described.

2. In a car-coupler, the combination of the two spring-actuated bolts, one of which has a catch and the other connected thereto, the bar connecting the front ends of said bolts, the coupling-pin, the draw-head provided with apertures and a groove, and the horizontal crank-bar connected to the pin, provided with a vertical operating-rod, substantially as described.



3. The combination, with the draw-head provided with the link-chamber having corresponding vertical grooves in its side walls, of a horizontally and transversely disposed link-supporting plate provided with end lugs vertically movable in said grooves, and a spring or springs disposed under said plate, substantially as set forth.

4. In a car-coupler, the combination of the two spring-actuated bolts B and B', the bolt B having a catch b and the bolt B' connected to a lever B^5, attached to catch b by a chain b^5, the bar C, the coupling-pin W, and the draw-head, with its apertures and groove, substantially as described.

410,143. STOVE. Alpheus H. Blakesley, Rock Island, Ill. Filed July 20, 1888. Serial No. 280,471. (No model.)

Claim.—1. In a stove, a circulating air-chamber separated from and extending to a point over and above the fire-pot, the outer wall

of the fire-pot forming the inner wall of the air-chamber, substantially as set forth.

2. In a stove, a circulating air-chamber consisting of a section E adjacent to and separated from the fire-pot by the fire-pot wall, which forms the inner wall of said section, a section G within the stove, and an inclined section F, connecting the sections E and G, substantially as described.

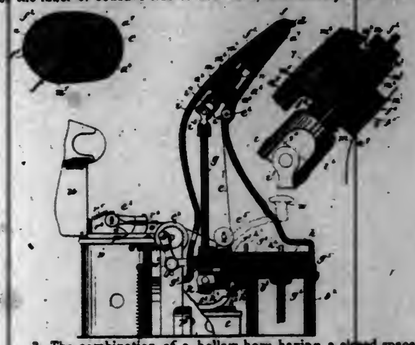
3. In a stove, a circulating air-chamber consisting of a section E exterior to and adjacent to the fire-pot, the wall of which forms the inner wall of said section, a section G within the stove-body, and an inclined section F above the fire-pot communicating with the section E through an opening in the said stove-body, and also connected with the section G, substantially as described.

4. In combination with a stove-body, an air circulating-chamber consisting of a lower section E, an upper section G, and an inclined section F, connecting the other sections, and having a flange *e* on one end and an enlarged part or collar on the other end, said collar and flange being at substantially right angles to each other, and supporting-rings for the sections F and G, substantially as described.

5. In a stove, the combination, with the cylindrical chamber C, of the top plate, the cover, and the ring D', interposed between the top plate and formed with depending flange and upwardly-extending flange d^3, over which the outer edge of the cap fits, substantially as shown and described.

6. In a stove, the combination, with the sectional cylinder C, the top plate D, and ring D', having vertically-extending flanges, of the ring F' and the rod *b b'*, engaging said rings and serving to hold the rings and sections together, substantially as and for the purpose specified.

7. In a stove, the combination, with the cylinder C in sections, the top plate D, having central openings *d'* and depending flange, and the ring D', formed with the inner concentric ring d^3, of the ring F', formed with the inner concentric ring f^3, the upper section G of the circulating-flue held in said inner rings, and the rods *b b'*, connecting the rings F' and D', substantially as and for the purpose specified.

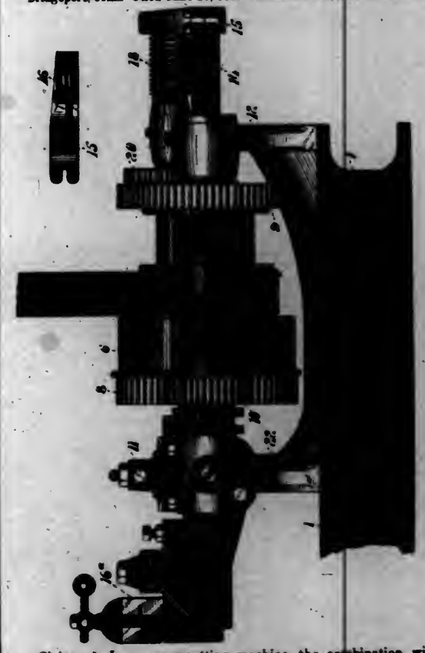


410,144. WOOD-FILLER. GRANVILLE M. BARNES, New Milford Conn. Filed Feb. 27, 1889. Serial No. 301,341. (No specimens.)

Claim.—A compound for wood-filling, containing silex ground in oil in combination with ground meal, in proportions substantially as specified.

410,145. MACHINE FOR SEWING SHOES. HERBERT H. BUTTON, Whitman, Mass. Filed Feb. 25, 1889. Serial No. 301,071. (No model.)

Claim.—1. In a machine for sewing boots and shoes, a pivotally-supported horn having its lower and upper portions inclined with relation to one another, a whirl at the tip of the horn, and actuating shafts therefor in the upper and lower portions of the horn connected by a universal joint at or near the point *x* where the inclination of the horn changes, a shaft extending through the axis of the horn, and gear-wheels g^3 g^4 g^4 g^5, connecting the same with the whirl-operating shafts, substantially as described.

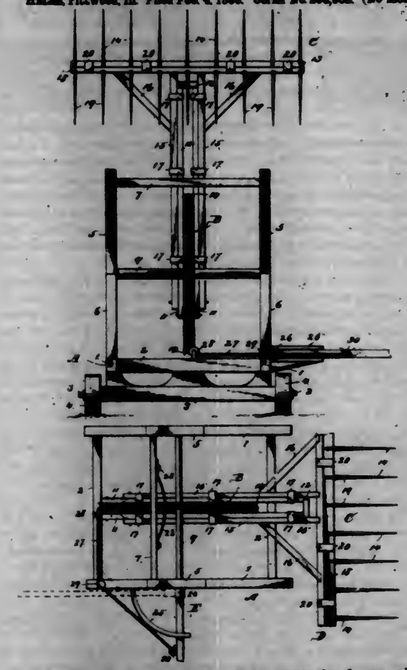


2. In a machine for sewing boots and shoes, a horn to support the sole inside the upper, said horn being inclined downward from its supporting-tip for a portion of its length and turned at an intermediate point at a different angle toward its base, and a movable cover for the inner or concave side of said horn, substantially as described.

3. The combination of a hollow horn having a closed space or chamber extending substantially from its base to its tip, the said horn being provided at its tip with a whirl and at its base with a dry thread and wax receptacle, with a heater having burners below the wax-receptacle and below the base of the horn, and thread-guides contained within the closed space in the horn, whereby the thread passes from the base to the tip of the horn through the interior of said closed space, substantially as described.

4. In a machine for sewing boots and shoes, a horn to support the sole inside the upper, having its upper and lower portions at an angle to one another, combined with a whirl and two actuating-shafts therefor in the upper and lower portions of said horn, respectively, said shafts having their axes inclined to one another and being connected at or near the angle of the horn, the upper one of said shafts being made in two parts, the lower portion of which is restrained from longitudinal movement by a bearing in the horn, and the upper portion of which is provided with a pinion meshing with the whirl and longitudinally adjustable in the lower portion, substantially as described.

410,146. SCREW-CUTTING MACHINE. EDWARD P. BULLARD, Bridgeport, Conn. Filed June 26, 1889. Serial No. 315,469. (No model.)

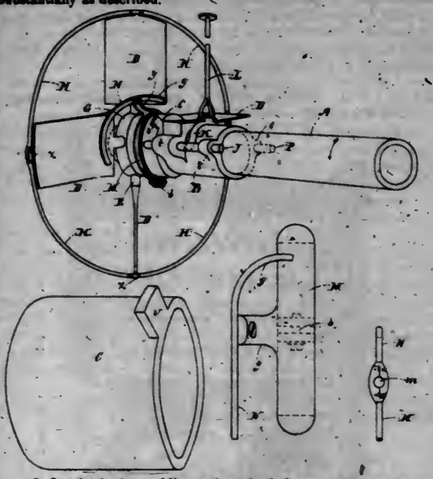


Claim.—1. In a screw-cutting machine, the combination, with the hollow spindle and means for revolving the same, of the back gear quill and the back gears, the leader-screw and means for operating it, the chaser-bar extending through the quill and back-gear standards, and the leader-screw nut and tool-holding devices mounted upon and carried by the chaser-bar, substantially as set forth.

2. In a screw-cutting machine, the combination, with the hollow spindle provided with means, as the chucks, for holding the work therein, of the belt-pulley whereby power is applied to the spindle, the back-gear standards and quill arranged parallel with said spindle, the leader-screw and means for rotating it, the chaser-bar extending through the quill, the leader arm and nut secured upon one end of said bar and adapted to engage the leader-screw, and the tool-post, bracket and carriage secured upon the other end of the chaser-bar, substantially as set forth.

3. In a screw-cutting machine, the combination, with the hollow spindle, the chuck secured thereto, and the belt-pulley whereby said spindle is rotated, of the back-gear standards and the quill carrying the back gears, and the chaser-bar extended through said quill and back-gear standards, said bar carrying the leader-screw nut and the tool-holding device, substantially as specified.

410,147. HORSE HAY-FORK. HARLEY BURGESS and JAMES A. HELMS, Pittwood, Ill. Filed Feb. 4, 1889. Serial No. 298,602. (No model.)



Claim.—1. The combination, with the supporting-frame and the tongue or lever secured to the side of the frame to swing in a horizontal plane, of the grooved pulley mounted on bearings on the side posts of the frame and having rigidly fixed to it the fork-supporting rods, and the fork having rods fixed to its head-rail and passed through sleeves on the rods on the pulley, substantially as described.

2. The combination, with the grooved pulley journaled in uprights on the carriage and provided with fork-supporting rods, of the lifting-fork adjustably supported by rods resting in sleeves on the rods of the grooved pulley, and the dropping-fork journaled on the head-rail of the lifting-fork, substantially as described.

3. The combination, with the grooved pulley journaled in uprights on the carriage and provided with fork-supporting rods, of the lifting-fork adjustably supported by rods resting in sleeves on the rods of the grooved pulley, the dropping-fork journaled to the head-piece of the lifting-fork, and springs adapted to hold the dropping-fork in vertical position, substantially as described.

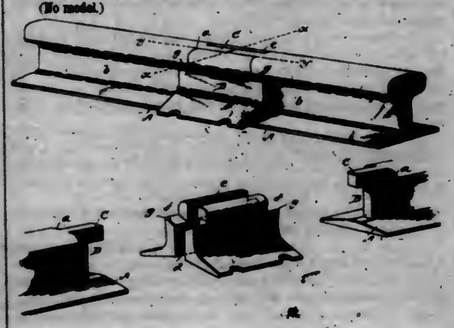
410,148. FEATHERING PADDLE-WHEEL. ANOS H. CARPENTER, Waterford, Vt. Filed Nov. 3, 1887. Serial No. 254,182. (No model.)

Claim.—1. In a feathering paddle or other wheel, the shaft A, provided with the hollow boss G, in combination with the shafts E, carrying the floats D and provided with the curved portions *f*, said float-shafts being journaled in said boss at right angles to each other and their curved portions disposed within said boss, the members of each pair of said floats being arranged at right angles to each other, substantially as described.

2. In a feathering paddle or other wheel, the quadricircular braces H, in combination with the feathering-floats D, provided with the studs *x*, substantially as set forth.

3. The sliding rods J P, in combination with the box B, fork K, rod L, and sleeve C, mounted on the shaft A and provided with the projection *v*, substantially as described.

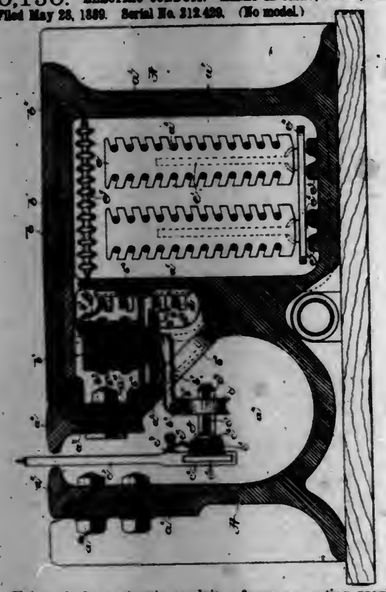
4. The cam-bar N, in combination with the sleeve C, provided with the projection *v*, said bar being adjustable on said sleeve, substantially as set forth.



5. The floats D, mounted at right angles to each other on the shaft E, having the curve *f*, said shafts being journaled in the hollow boss G, in combination with the shaft A, means for feathering said floats, and means for reversing the floats, substantially as described.

6. The clasp M, provided with the arm *y*, and bolt and nut *b*, in combination with the cam-bar N and sleeve C, provided with the projection *v*, substantially as set forth.

7. In a device of the character described, the combination of the following instrumentalities, to wit: a main shaft, a box or bearing for said shaft, a hollow boss connected with said shaft, a sleeve mounted on said shaft and provided with a projection, movable rods adapted to engage said projection at opposite sides of said main shaft and serve as stops for said sleeve, a fork and rod or equivalent means for actuating said rods, two shafts curved at their centers and carrying floats at their outer ends, said float-shafts being journaled at right angles in said boss and having their curved portions disposed therein, and a cam mounted on said sleeve and adapted to engage said floats and feather them as the main shaft revolves, substantially as described.



8. In a feathering paddle or other wheel, the feathering-floats D, pivoted at their outer ends to a connecting brace or braces, substantially as described.

410,149. RAILWAY-RAIL JOINT. JOSEPH S. CRABSCOMBE and LORING C. STOCKET, Rosamond, Cal. Filed May 4, 1889. Serial No. 309,606. (No model.)

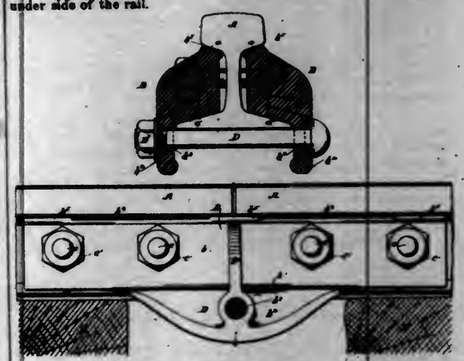
Claim.—The combination, with the adjacent ends of two railway-rails the tread or flanges of which are cut away, as described, to form the shoulders *a* and the vertical portion *b*, of the connecting-block D, beveled upon its lower face to correspond with the inclined base of the rails, provided at its ends with slots *d*, upon its upper face with a longitudinal recess *e* to receive the projections C of the rail, and having its upright portions formed with a beveled recess *f* and shoulder *g*, substantially as and for the purpose specified.

410,150. ELECTRIC CONDUIT. HENRY A. CRASE, Boston, Mass. Filed May 28, 1889. Serial No. 312,429. (No model.)

Claim.—1. In an electric conduit, a frame or casting provided with a slot-chamber and an accessible chamber communicating therewith, and a power-chamber, substantially as described.

2. In an electric conduit, the combination, with the series of castings or frames, each comprising a slot-chamber, an accessible chamber, and a power-chamber, of means to connect the chambers of adjacent castings, substantially as described.

3. The combination, with an electric conduit having a slot-chamber and an accessible chamber communicating therewith, and a conductor located in said slot-chamber, of a trolley-arm adapted to be inserted into said slot-chamber through the said slot and a trolley-carriage and means to positively secure said trolley-carriage to the trolley-arm within the slot-chamber, the said trolley-carriage being readily detachable from the trolley-arm to permit the carriage to be removed through the accessible chamber and to allow the trolley-arm to be withdrawn from the slot-chamber, substantially as described.



4. The combination, with an electric conduit having a slot-chamber and a power-chamber, of an insulating support in said power-chamber and a supporting-guide, substantially as described, located in the said power-chamber above the insulating-support, substantially as and for the purpose specified.

5. The combination, with an electric conduit having a slot-chamber and a main conductor located therein, and an insulating-support for said conductor, of a feed-wire and an insulating-support for said feed-wire consisting of a trough, an oily barrier therein, and an upright or arm extended upward from said trough, substantially as described.

6. In an electric conduit, the combination, with a support or bar 4, of an insulator consisting of a trough, an oily barrier therein, and a back piece provided with a dovetail slot to enable the said insulator to be slipped over the said bar or support, substantially as described.

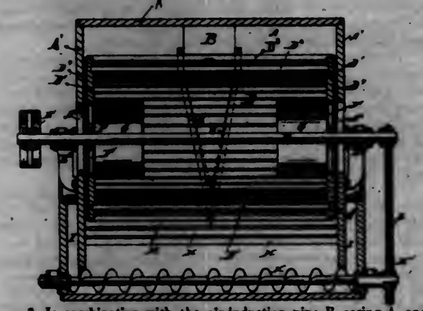
410,151. RAIL-JOINT. JOHN W. CLOUD, Buffalo, N. Y. Filed Jan 2, 1889. Serial No. 295,300. (No model.)

Claim.—1. A rail-joint, consisting of two fish-plates B, having upwardly-extending flanges *b*, adapted to fit under the head of a rail and provided with bolt-holes, outwardly-extending flanges *b'*, adapted to extend along and over the rail-base, and downwardly-extending flanges b^3, adapted to extend below the rail-base without coming in contact with it and provided with one or more bolt-holes b^4 at a point or points below the level of the rail-base, in combination with bolts for securing the flanges *b* to the rail and a bolt or bolts passing through the downwardly-extending flanges, said fish-plate flanges b^3 and the bolt or bolts uniting them beneath the rail-base being so constructed and combined as not to press directly or indirectly upon the under side of the rail.

2. As a new article of manufacture, a railway fish-plate having an upwardly-extending flange *b*, adapted to fit beneath the head of the rail and provided with bolt-holes, an outwardly-extending flange *b'*, adapted to lie along and extend beyond the rail-base, and a downwardly-extending flange b^3, adapted to extend below the rail-base without coming in contact with it or passing beneath its edges, and having one or more bolt-holes at a point below the level of said rail-base, all substantially as described, and so as to form with a similar plate a rail-joint of the kind specified.

3. As a new article of manufacture, a railway fish-plate having an upwardly-extending flange *b*, adapted to fit beneath the head of the rail and provided with bolt-holes, an outwardly-extending flange *b'*, adapted to lie along and extend beyond the rail-base, and a downwardly-extending flange b^3, shorter than the flange *b*, adapted to extend below the rail-base without coming in contact with it or passing beneath its edges, and having one or more bolt-holes at a point below the level of said rail-base, all substantially as described, and so as to form with a similar plate a rail-joint of the kind specified.

4. As a new article of manufacture, a railway fish-plate having an upwardly-extending flange *b*, adapted to fit beneath the head of the rail and provided with bolt-holes, an outwardly-extending flange *b'*, adapted to lie along and extend beyond the rail-base, a downwardly-extending flange b^3, shorter than the flange *b*, adapted to extend below the rail-base without coming in contact with it, and having one or more bolt-holes at a point below the level of said rail-base, and a web b^4, connecting the flanges *b* and *b'*, all substantially as described, and so as to form with a similar plate a rail-joint of the kind specified.



5. As a new article of manufacture, a railway fish-plate having an upwardly-extending flange *b*, having projections b^5, adapted to fit beneath the head of the rail at the center and the ends of the flange, said upwardly-extending flange being provided with bolt-holes, an outwardly-extending flange *b'*, adapted to lie along and extend beyond the rail-base, and a downwardly-extending flange b^3, shorter than the flange *b*, adapted to extend below the rail-base without coming in contact with it, and having one or more bolt-holes at a point below the level of said rail-base, all substantially as described, and so as to form with a similar plate a rail-joint of the kind specified.

6. As a new article of manufacture, a railway fish-plate having an upwardly-extending flange *b*, having projections b^5, adapted to fit beneath the head of the rail at the center and the ends of the flange, said upwardly-extending flange being provided with bolt-holes, an outwardly-extending flange *b'*, adapted to lie along and extend beyond the rail-base, a downwardly-extending flange b^3, shorter than the flange *b*, adapted to extend below the rail-base without coming in contact with it, and having one or more bolt-holes at a point below the level of said rail-base, and a web b^4, connecting the flanges *b* and *b'*, all substantially as described, and so as to form with a similar plate a rail-joint of the kind specified.

410,152. DUST-COLLECTOR. WILLIAM A. COMBELL, Dayton, Ohio. Filed July 2, 1888. Serial No. 278,572. (No model.)

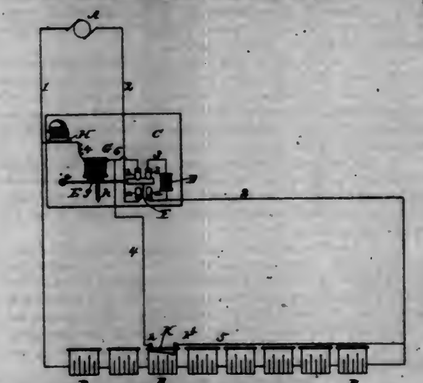
Claim.—1. In a dust-collector, the combination, with the tangential air-induction pipe B and casing A, of a revolving cylinder D, having blades D^2 and independently driven in the direction of the movement of the vertical current, substantially as set forth.

2. In combination with the tangential air-induction pipe B, casing A, provided with openings A^2, and revolving cylinder D, a wedge-formed partition C, interposed between the cylinder and casing, substantially as set forth.

3. In combination with the air-induction pipe B, casing A, and revolving cylinder D, inclined ribs D^2, placed between the heads A' and D' and attached to the latter, substantially as set forth.

4. In combination with the tangential air-induction pipe B, casing A, and revolving cylinder D, the tubular air-escape G, attached to the cylinder and in line with the opening A^2, substantially as set forth.

5. In combination with the tangential air-induction pipe B, casing A, and separation-chamber X, the dead-air chamber I and overlapping gather-boards H, placed between said chambers, substantially as set forth.



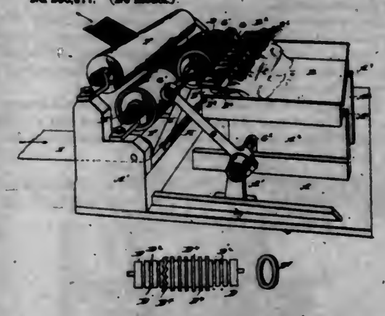
6. In combination with the air-induction pipe B, casing A, revolving cylinder D, and partitions C, holes A^2, formed in the end of the casing, and a dead-air chamber I, substantially as set forth.

7. In combination with the air-induction pipe and the separation-chamber of a dust-collector, the holes A^2, formed in the end A' of the casing, for the escape of the dust, substantially as set forth.

8. In combination with the air-induction pipe and separation-chamber of a dust-collector, the holes A^2, formed in the end A' of the case and cut transversely through the same, substantially as set forth.

9. In combination with the air-induction pipe and separation-chamber of a dust-collector, the revolving cylinder D and openings through the case for the escape of the dust peripherally and at the end, substantially as set forth.

410,153. APPARATUS FOR AUTOMATICALLY CHARGING SECONDARY BATTERIES. STANLEY G. C. CURRIE, Philadelphia, Pa., assignor to the United Electric Improvement Company, Gloucester City, N. J. Filed Nov. 21, 1888. Serial No. 291,442. (No model.)



Claim.—1. In an automatic circuit-changer for secondary batteries, the combination of a generator, a secondary battery, a main circuit connecting the same, a circuit-making device arranged above a coil of said battery, an electro-magnetic switch adapted to make and break said main circuit, an electro-magnetic signal, and a resistance-circuit having contact-points adapted to be connected by said switch, the circuit-making device, switch-magnet, and signal being arranged in a branch of the main circuit, all substantially as described.

2. In an automatic circuit-changer for secondary-battery plants, the combination of the generator, the battery, a pair of terminals arranged in the vicinity of said battery and adapted to be electrically connected by spray arising from said battery, and an electro-magnetic switch having its magnet arranged in a branch including said terminals and in a branch circuit containing a resistance and having a spring-retracted armature adapted to alternately close the main-line circuit and said branch circuit, whereby said switch is adapted to automatically break the main circuit between the generator and the battery when the latter has become charged and to automatically complete the main-line circuit when the battery is discharged, substantially as described.

3. In an automatic circuit-changer for secondary-battery plants, the combination, with the generator, battery, and conductors connecting the same, of a circuit-making device, and an electro-magnetic switch adapted to open and close the main circuit and to open and close a branch circuit extending from the magnet of the switch around the contact-points of said main circuit, substantially as described.

4. In an automatic circuit-changer for secondary-battery plants, the combination of a generator A, batteries B B, connected to said generator by a main line and return-conductor 1 2, an electro-magnet G, having a spring-retracted armature-lever E, adapted to open and close contacts *a a* of return-conductor 2, a circuit-making device K, arranged in the vicinity of the batteries B B and in circuit with the magnet G, and a high-resistance circuit 3, having contact-points *b b*, adapted to be closed by said armature-lever and constituting a branch circuit from the magnet-circuit 4 to the return-conductor 2, all constructed and arranged substantially as described.

410,154. MACHINE FOR ORNAMENTING PAPER. CHARLES A. DEAN and FREDERIC E. ROBIE, Boston, Mass. Filed July 21, 1888. Serial No. 280,677. (No model.)

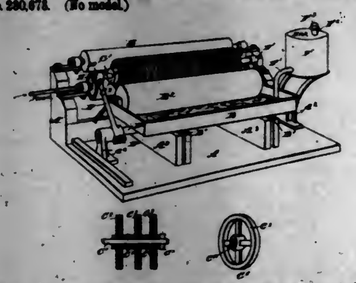
Claim.—1. In a machine for ornamenting paper, a printing-roll comprising a body provided with circumferential grooves, and flexible printing-rings removably fitted in said grooves and projecting beyond the periphery of the body, substantially as described.

2. The combination, with the ink-well and printing-roll, of an ink-conductor of the character described, and compressing means located between the roll and well for compressing said ink-conductor, substantially as and for the purpose specified.

3. The combination, with the printing-roll and ink-well, of the capillary ink-conductor, the transverse bar extending across said conductor between the rolls and well, and means, as the screw-bolt B^4, for pressing said bar downward to compress the conductor, substantially as and for the purpose specified.

4. The combination, with an ink-well, of a conductor of the character described, a slotted clamp, and adjusting-bolts having pins, substantially as specified.

5. The combination of an ink-well, a textile conductor, a printing-roll arranged adjacent to the conductor, and means for adjustably arranging the edge of the conductor at different points along the roll, substantially as specified.



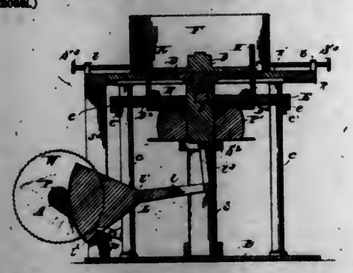
6. The combination of an ink-well, a rotatable printing-roll, and a conductor of the material specified, arranged with one end in the well and the other in contact with the roll, substantially as shown and described.

7. The combination of an ink-well, an impression-roll, a capillary ink-conductor, and a printing-roll mounted in rock-arms, substantially as specified.

8. The combination of an ink-well adapted to contain liquid ink, a conductor arranged therein and projecting therefrom, a printing-roll arranged adjacent to the conductor, and a hollow steam-heated impression-roll, substantially as specified.

9. In a machine of the class described, a movable ink-well, and means, as the spring H, connecting the well with the frame, for maintaining the same in operative contact with the printing-roll thereof, substantially as specified.

410,155. MACHINE FOR ORNAMENTING PAPER. CHARLES A. DEAN and FREDERIC H. ROSER, Boston, Mass. Filed July 21, 1888. Serial No. 280,673. (No model.)



Claim.—1. The combination, with the printing-roll consisting of a shaft and a series of removable wheels and means for holding said wheels to their shaft, of rock-arms carrying bearings for said shaft, substantially as and for the purpose specified.

2. The combination, with the impression-roll and the printing-roll consisting of a shaft and a series of removable wheels on said shaft, of the shaft D^2, parallel with the shaft of the printing-roll, the rock-arms detachably clamped to said shaft D^2, and provided at their ends with bearings in which the shaft of the printing-roll is journaled, and the collar C^x on the shaft of the printing-roll, substantially as and for the purpose specified.

3. In a machine of the class described, the combination of a flexible elastic ink-supplying roll, a printing-roll having its printing-surface variable as to length, and a steam-heated drying and impression roll, said printing-roll revolving in contact with both said ink-supplying and impression rolls, substantially as described.

4. In a machine of the class described, a flexible elastic ink-supplying roll, a steam-heated drying and impression roll, and a rigid printing-roller pivotally mounted between said rolls and in contact with both of them, substantially as specified.

410,156. MACHINE FOR MOLDING WHEELS. ALEXANDER DELANEY, Petersburg, Va. Filed Jan. 24, 1888. Serial No. 297,473. (No model.)

Claim.—1. In a machine for molding pulleys or wheels, the combination, with a molding-table for supporting the flask, in which table is formed an annular slot, of one or more coring-tools revoluble in said slot, substantially as and for the purposes specified.

2. In a machine for molding pulleys or wheels, the combination, with a molding-table for supporting the flask, in which table is formed an annular slot, of one or more vertically-movable coring-tools revoluble in said slot, substantially as and for the purposes specified.

3. In a machine for molding pulleys or wheels, the combination, with a molding-table for supporting the flask, in which table is formed an annular slot, of one or more cutting-tools, and a smoothing and compacting tool revoluble in said slot, substantially as and for the purposes specified.

4. In a machine for molding pulleys or wheels, the combination, with the molding-table for supporting the flask, in which table is formed an annular slot, of one or more cutting-tools, and one or more smoothing and compacting tools of greater thickness than the coring tool or tools, substantially as and for the purposes specified.

5. In a machine for molding pulleys or wheels, the combination, with the molding-table for supporting the flask, in which table is formed an annular slot, of one or more revoluble cutting-tools provided with a vertical cutting-edge, and one or more smoothing and compacting tools tapering from the vertical edges toward the center and of greater thickness at that point than the thickness of the coring tool or tools, substantially as and for the purposes specified.

6. In a machine for molding pulleys or wheels, the combination, with the molding-table for supporting the flask, in which table is formed an annular slot, of a revoluble and vertically-movable tool-carrier, a smoothing and compacting tool, and one or more cutter-tools secured to the carrier, said cutter-tools being adjustable vertically on the carrier relatively to the smoothing and compacting tool, substantially as and for the purposes specified.

7. In a machine for molding pulleys or wheels, a molding-table comprising an outer ring, a disk-pattern having formed thereon one-half of the hub and spokes or radial arms of a wheel or pulley centrally placed in said ring, and an intermediate ring, the inner diameter of which is greater than the diameter of the disk-pattern, whereby an annular slot is formed between the two, in combination with a revoluble coring tool or tools working in said slot, substantially as and for the purposes specified.

8. In a machine for molding pulleys or wheels, a molding-table comprising an outer ring, a disk-pattern centrally placed in said ring and having formed thereon one-half of the hub and spokes or radial arms of a wheel or pulley, and an intermediate ring supported from the outer ring, the inner diameter of which intermediate ring is greater than the diameter of the disk-pattern, to form an annular slot between the two, in combination with one or more revoluble and vertically-movable coring-tools adapted to work in said annular slot, substantially as and for the purposes specified.

9. In a machine for molding pulleys or wheels, a molding-table comprising an outer ring, an axial standard, a disk-pattern detachably connected thereto, and an intermediate ring detachably connected with the outer ring, the inner diameter of which intermediate ring is greater than that of the disk-pattern, in combination with a revoluble tool or tools adapted to move vertically on the axial standard and operate through the annular slot formed between the disk-pattern and the intermediate ring, substantially as and for the purposes specified.

10. In a machine for molding pulleys or wheels, a molding-table comprising an outer ring, centering devices supported from said ring for centering the flask, a standard arranged axially of the ring, a disk-pattern detachably connected with the standard and an intermediate ring detachably connected with the outer ring, the inner diameter of which intermediate ring is greater than that of the disk-pattern, in combination with a tool-carrier adapted to rotate and move vertically on the standard, and coring-tools adjustably connected with said carrier, substantially as and for the purposes specified.

11. In a machine for molding pulleys or wheels, the combination, with the stationary molding-table provided with an annular slot and a revoluble and vertically-movable tool-carrier, the tool or tools of which are adapted to penetrate into and through said slot, of an index for indicating the extent of vertical motion of the tool-carrier, substantially as and for the purposes specified.

12. In a machine for molding pulleys or wheels, the combination, with the stationary molding-table provided with an annular slot and a revoluble and vertically-movable tool-carrier, the tool or tools of which are adapted to penetrate into and through said slot, of a stop or abutment for limiting the upward motion of the tool-carrier, substantially as and for the purposes specified.

13. In a machine for molding pulleys or wheels, the combination, with the stationary molding-table provided with an annular slot and a revoluble and vertically-movable tool-carrier, the tool or tools of which are adapted to penetrate into and through said slot, of a vertically adjustable stop or abutment for limiting the upward motion of the tool-carrier, substantially as and for the purposes specified.

14. The combination, with the slotted molding-table, the standard S, and the revoluble and vertically-movable tool-carrier provided with a segmental cam-face D^2, of the arm E, loosely mounted on the standard, and a coring-tool secured to said arm, substantially as and for the purposes specified.

15. In a molding-machine, a molding-table consisting of an outer fixed ring, a disk-pattern arranged axially of said ring, a support for and with which said pattern is detachably connected, and an intermediate removable ring, the inner diameter of which is greater than the diameter of the disk-pattern, in combination with a revoluble and vertically-movable tool-carrier, and a coring tool or tools detachably connected with and adjustable in radial lines on said tool-carrier, substantially as and for the purposes specified.

410,157. ELEVATING-TRUCK. CLINTON B. DE WITT, Sidney, Ohio. Filed Apr. 20, 1889. Serial No. 308,782. (No model.)

Claim.—1. The combination, in an elevating-truck, of hinge-jointed standards S S S' S', bearing-plates B' B', and tie-rod C, substantially as and for the purpose set forth.

2. In an elevating-truck, the combination of axle A', fixed to lever M L, and to standards S' S', jointed to strut Y Y, and having ratchet R, and a trip-wire s, run from ratchet to a convenient distance from outer end of lever M, substantially as and for the purpose set forth.

3. In an elevating-truck, the combination of strut Y Y, conveying the force from lever-arm L to rear bearing-plate B', and thence through table T to front bearing-plate B', thus securing a perpendicular elevation of the table T, substantially as set forth.

4. The combination, in an elevating-truck, of axles A^x $A^{x'}$, connected by tie-rod e, and joining the standards S S S' S' at their joints J J J J, thereby making the relative distances between said joints constant and firm, substantially as set forth.

5. In an elevating-truck, the combination of axles A A', held to respective positions relative to each other by tie-bars r r, the rear axle carrying rear wheels W W and the rear hinge-jointed standard S S, and the forward one carrying the lever M L and the front hinge-jointed standards S' S', both the lever M L and the hinge-jointed standards S' S' being fixed rigidly to front axle A', all substantially as set forth.

6. In an elevating-truck, the combination of lever-strut Y Y, having assisting-springs S^2 S^2, joining axle A^x to center of strut-arms Y Y, all substantially for the purposes set forth.

410,158. DENTAL INSTRUMENT. ROBERT B. DONALDSON, Washington, D.C. Filed May 24, 1889. Serial No. 311,926. (No model.)

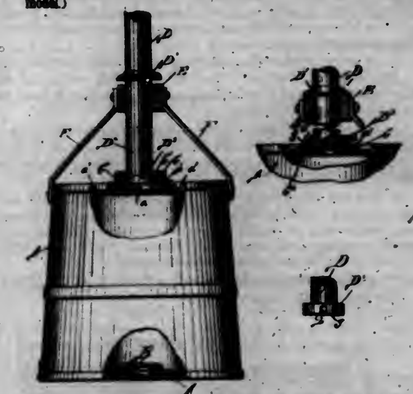
Claim.—1. A dental instrument for removing the pulp and cleaning the canal in the root of a tooth, consisting of a hollow handle, and a shaft held in said handle and adapted to be rotated therein and projected therefrom and carrying at its outer end the cleaning-tool.

2. A dental instrument of the nature described, composed of a handle, and a shaft held in said handle and adapted to be rotated therein and projected therefrom, and having at its outer end the socket for holding the broach or cleaning-tool, which shaft has a flexible section interposed in its length whereby the line of direction of said shaft may be changed from straight to angular.

3. In a dental instrument of the nature described, in combination with the handle, the bracket support or arm secured to said handle and carrying at its outer end the swinging bearing, and shaft held in said handle and swinging bearing, which shaft is adapted to be rotated in said handle and bearing and to be projected from the handle, as and for the purposes described.

4. In a dental instrument of the nature described, in combination, the hollow handle A, bracket support or arm B, with swinging bearing G, and shaft D, having flexible connection H, which shaft is held in said handle and adapted to be rotated therein and projected therefrom, and socket or tool-holder *d*, substantially as described, for the purposes specified.

5. In a dental instrument of the nature described, in combination, the handle, shaft having the socket for the cleaning-tool at its outer end projecting through said handle, and a thumb-screw arranged to project the shaft from the handle.



6. In a dental instrument of the nature described, in combination, the hollow handle with screw-threaded rear end, and shaft extending through said handle, and a screw passing through said screw-threaded end of handle and impinging against the end of shaft, substantially as described, for the purposes specified.

7. In a dental instrument of the nature described, the shaft having the socket for the cleaning-tool at its end, and burrs or thumb-nut for operating the same, and an interposed flexible portion whereby said shaft may be rotated and bent at an angle.

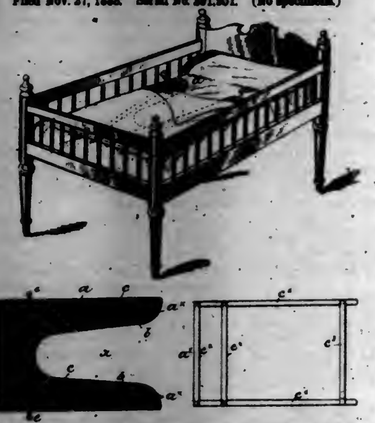
8. In a dental instrument of the nature described, in combination, the hollow handle, the shaft with interposed flexible portion, the bracket with swinging bearing for the shaft, the set-screw for projecting the shaft, and socket or tool-holder at the outer end of the shaft.

9. In a dental instrument of the nature described, in combination, the handle, the flexible shaft carrying the cleaning-tool, the swinging bearing for the shaft, the burrs keyed thereon to operate the same, the screw at the outer end of handle to project the shaft, and the set-nut on said screw, all constructed and arranged to operate substantially as described, for the purposes specified.

410,159. CISTERN-CLEANER. JOHN H. DUNCAN and FRANK A. HALE, Syracuse, N. Y. Filed Nov. 26, 1888. Serial No. 291,902. (No model.)

Claim.—1. The combination, in a cistern-cleaner having a lower valve for the admission of refuse and an upper valve, of a movably mounted handle connected to operate the upper valve when the handle is turned, substantially as and for the purpose set forth.

2. In a cistern-cleaner, the combination of the receptacle having a valve in its base, with an aperture or valve in the upper part of the receptacle, a flange-collar above said aperture, and a handle movably mounted in the collar adjacent to said valve and actuated to operate the same, substantially as described.



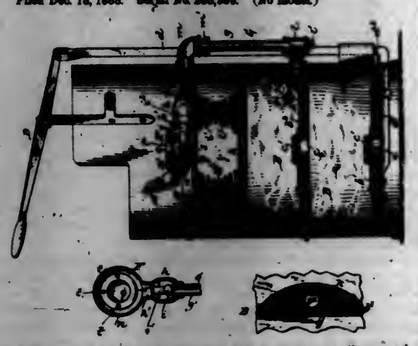
3. In a cistern-cleaner, the combination of the receptacle A, having a valve in its base, with an aperture or opening *a* in the upper part of the receptacle, a collar above said aperture and provided with openings *b*, and the handle movably mounted in the collar adjacent to said aperture and actuated to connect a passage from the opening *a* in the upper part of the receptacle and the opening *b* in the collar, substantially as and for the purpose set forth

4. In a cistern-cleaner, the combination of the receptacle A, having a valve in its base and an aperture or opening *a* in the upper part of the receptacle, a collar G, mounted above said aperture and provided with openings *b*, and a flange G', provided on the collar G, with the handle D, movably mounted in the collar G, the annular shoulder D^x, interposed between the flange G' and the cleaner-receptacle for closing and opening the aperture *a*, substantially as and for the purpose set forth.

5. In a cistern-cleaner, the combination of a receptacle having a valve in its base, and an aperture or valve in its upper part, with the collar G, mounted above said aperture, a handle D, movably mounted in the collar G, adjacent to said aperture, for opening and closing

the same, and a collar E, above the cleaner-receptacle and braced thereto for supporting the movable handle D, substantially as and for the purpose specified.

410,160. RETAINER FOR BED-COVERINGS. DARIUS FARRINGTON, Brooklyn, N. Y., assignor of one-half to Thomas I. Andrews, Rahway, N. J. Filed Nov. 27, 1888. Serial No. 291,951. (No specimens.)



Claim.—1. As a new article of manufacture, a retainer for holding the covering in place on a bed, consisting of a flat thin flexible and elastic U-shaped shield having sufficient stiffness to retain its form, substantially as set forth.

2. As a new article of manufacture, a retainer for the coverings of a bed, consisting of a sheet of flexible but not limp material of the proper dimensions, and longitudinally-extending springs secured to said sheet, substantially as described.

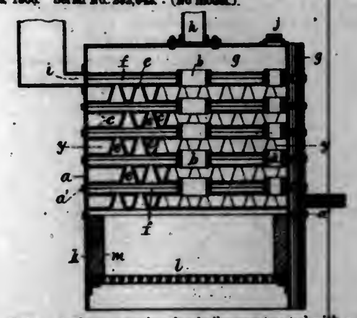
3. As a new article of manufacture, a retaining-shield for the covering of a bed, consisting of a thin flexible sheet of material, as wire-netting, having the U shape described, and springs e e, secured to said sheet and extending longitudinally of the same, as set forth.

4. As a new article of manufacture, a retaining-shield for the covering of a bed, consisting of a sheet of wire-netting of the proper dimensions bound with flexible material and provided with two longitudinally-extending springs arranged in the form of a V, as set forth.

410,161. PORTABLE FORGE. CHARLES HANNEMANN, Buffalo, N. Y. Filed Dec. 16, 1882. Serial No. 208,992. (No model.)

Claim.—1. In a forge, the combination, with a bellows and a tuyere or blast-discharge nozzle, of a blast pipe or passage connecting the bellows with said tuyere or discharge-nozzle, and a check-valve arranged in said passage, substantially as set forth.

2. In a forge, the combination, with a bellows and a tuyere, of a valve-casing connected with said tuyere and provided with an inclined way, a blast pipe or passage connecting said valve-casing with the bellows, and a check-valve arranged in the valve-casing upon said inclined way, substantially as set forth.



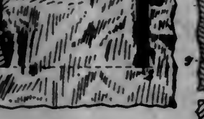
3. In a forge, the combination, with the tuyere and the bellows having a stationary partition b^3, of a blast-pipe connecting the bellows with the tuyere and provided with a horizontal branch or section g^3, entering an opening in the flexible portion of the bellows and secured to the partition b^3, and a block k, fitted over said pipe within the bellows and forming a support to which the flexible portion of the bellows surrounding the pipe is tacked, substantially as set forth.

4. In a forge, the combination, with the bellows and the tuyere, of the valve-casing h and check-valve i, the blast-pipe G, connecting the bellows with said valve-casing and composed of horizontal sections g' g^2, and an upright section g, a T l, connecting the lower horizontal section g^2 with the lower end of the upright section g, an elbow m, attached to the outer end of the upper horizontal section g', and a movable screw thimble or nipple m', attached to the upper end of the upright section g and connecting the latter with the elbow m, substantially as set forth.

5. In a tuyere for forges, the combination, with an annular shell or casing provided in its top with a discharge-opening and in its side with an inlet-opening, of a depending flange or rim surrounding said opening, a cup or receptacle arranged within the annular casing underneath said discharge-opening and depending flange, and a guard or shield arranged on said cup in front of the inlet-opening of the tuyere, substantially as set forth.

6. In a forge, the combination, with the hearth-plate or fire-pan, of a tuyere composed of a lower part n, formed in said hearth-plate and provided with a socket, an upper part n', provided with a discharge-opening o and a depending flange p, and a cup or receptacle q, arranged within the tuyere-casing underneath the discharge-opening o and provided with a stem seated in the socket of the lower part n of the tuyere, substantially as set forth.

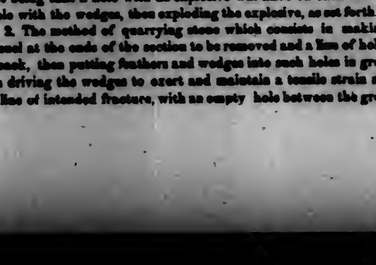
410,162. BOILER. JOHN J. HOGAN, New York, N. Y. Filed Dec. 4, 1888. Serial No. 292,642. (No model.)



Claim.—1. In a water-heating boiler constructed with a series of flat hollow sections provided with marginal flanges a' and arranged horizontally, with intermediate combustion-chambers, and having vertical gas or smoke passages extending through the sections, the combination, with the several sections, of the central thimbles b, forming a continuous central water-channel, and several series of outer thimbles d, arranged one over another and forming continuous water-channels near the periphery of the sections, the whole arranged and operated as and for the purpose set forth.

2. In a water-heating boiler constructed with a series of flat hollow sections provided with marginal flanges a' and arranged horizontally, with intermediate combustion-chambers, and having vertical gas or smoke passages, formed as slits c, extending through the sections, the combination, with the several sections, of the central thimbles b, forming a continuous central water-channel, and several series of outer thimbles d, arranged over one another and forming continuous water-channels near the periphery of the sections, and the radial water-channels c', formed through the walls of the slits c, the whole arranged and operated as set forth.

3. The combination, in a water-heating boiler, of the series of hollow sections formed with cylindrical shell a and horizontal plate c, and provided with the slits having partitions c' within the water-spaces of the sections, and the radial passages c', formed in the water-spaces by interrupting such partitions, the central thimbles b, and the several series of thimbles d, connecting the several boiler-sections with intermediate combustion-chambers f and forming continuous vertical water-channels, the water-chamber g, connected with the upper thimbles b and d, the discharge-pipe h, applied to the top of the chamber g over the thimble b, the smoke-outlet i, extended laterally from the upper chamber f, and a water-inlet near the bottom of the boiler, the whole arranged and operated substantially as set forth.



410,163. MICROMETER-GAGE. FRANKLIN SHELDON, New Britain, Conn. Filed May 18, 1888. Serial No. 311,262. (No model.)

Claim.—1. The combination of a case, an anvil, the sliding arm 16, the cam-wheel for moving said arm, the operating-shaft 10, carrying said cam-wheel, devices for moving said shaft, and the pointer or index secured directly upon said operating-shaft and moving therewith, substantially as described, and for the purpose specified.

2. The combination of a case, the spring-actuated shaft, a pointer, cam-wheel, and pinion secured thereto, the sliding arm 16, moved by said cam-wheel, an anvil, the rack 6, and operating-handle for moving said shaft through said pinion, substantially as described, and for the purpose specified.

410,164. TRUCK. EDWARD W. H. HOSKIN, Chicago, Ill., assignor to the Fox Solid Pressed Steel Company, same place. Filed June 11, 1888. Serial No. 313,912. (No model.)

Claim.—1. A truck-frame for vehicles, having the side frames and end frames integral, substantially as described.

2. A truck-frame for vehicles, having the side frames and end frames integral, the said side frames and end frames being pressed from a single piece of metal into a box shape, substantially as described.

3. The truck for moving vehicles herein shown, consisting of a single piece of pressed steel having side frames, end frames, and pedestals pressed therein, substantially as described.

410,165. METHOD OF QUARRYING STONE. JOHN H. JACOBS, Marquette, Mich. Filed Oct. 1, 1887. Renewed July 20, 1889. Serial No. 318,188. (No model.)

Claim.—1. The method of quarrying stone which consists in making a channel at the ends of the section to be removed and a line of holes at its back, then putting feathers and wedges into some of the holes and driving the wedges to exert a tensile strain along the line of intended fracture and an explosive into the others, the arrangement being that a hole with an explosive will have on each side of it a hole with the wedges, then exploding the explosive, as set forth.

2. The method of quarrying stone which consists in making a channel at the ends of the section to be removed and a line of holes at its back, then putting feathers and wedges into such holes in groups, then driving the wedges to exert and maintain a tensile strain along the line of intended fracture, with an empty hole between the groups, then putting an explosive into such empty holes and firing the explosive, as set forth.

3. The method of quarrying stone which consists in making a channel at the ends of the section to be removed and a line of holes at its back, then putting at the bottoms of the holes a set of feathers and driving wedges between the feathers, then putting a set of feathers and wedges at the top of the holes, these feathers and wedges being placed into the holes in groups, with an empty hole left between, then putting an explosive into the empty holes and firing it, as set forth.

410,166. MINER'S CANDLESTICK. DAVID B. JAMES, San Francisco, Cal. Filed Feb. 2, 1889. Serial No. 298,982. (No model.)

Claim.—1. In a candlestick for use by miners, the spring-metal frame having a slotted shorter arm and the longer arm provided with a knife-edge, in combination with the loop passing through the slotted arm, substantially as described.

2. In a candlestick for miners' use, the spring-metal frame forming the slotted shorter arm, the longer arm having the pointed extremity, a knife-edge, and a circular notch, and the loop connected to the longer arm, passing through the slotted arm, and provided with a hook, substantially as described.

3. In a miner's candlestick, the metal frame bent at A and having the slotted shorter arm, and the longer arm pointed at E, having a knife-edge G and notch H, and the loop C, passing through the slotted arm, together with its hooked end F, substantially as described.

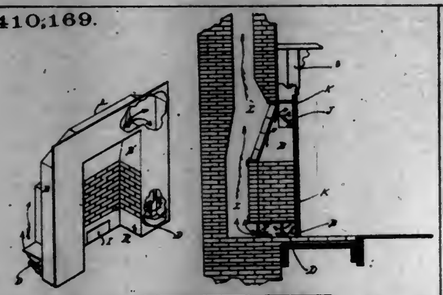
410,167. CURRY-COMB. FREDERICK G. KENT, Wadsworth, Ill. Filed Dec. 13, 1888. Serial No. 293,449. (No model.)

Claim.—1. In a curry-comb, a blade provided with serrated edges and inclined wings, the edges and wings being adapted to act in conjunction with each other, substantially as set forth.

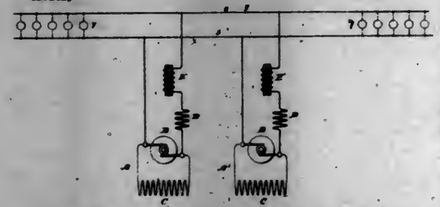
2. In combination with a curry-comb having a blade provided with serrated edges and having a slot or slots, side wings projecting from the edges of the slot or slots and formed integrally with the blade, substantially as set forth.

3. A curry-comb consisting of a blade having serrated edges and provided with longitudinal slot or slots, and wings projecting from the blade at the edges of the slot or slots, substantially as set forth.

410,168. JOINT FOR CARBON FILAMENTS. HERMANN LEMP, Lynn, Mass., assignor to the Thomson-Houston Electric Company, of Connecticut. Filed Sept. 17, 1888. Serial No. 285,044. (No model.)



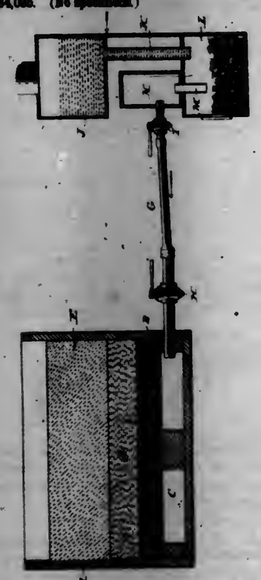
Claim.—The carbon filament and body joined thereto, and a deposit on said filament interposed between the said filament and body, which are out of contact with one another, but connected by the said intervening deposit, substantially as described.



410,169. ATTACHMENT FOR OPEN FIRE-PLACES. DOUGLAS P. LEWIS, Cincinnati, Ohio. Filed Aug. 24, 1888. Serial No. 283,612. (No model.)

Claim.—The heat-radiating attachment for open fire-places described, having openings D and D' at the lower ends and rear side of hollow jambs B and B', which openings are connected directly to the rear with the flue L by means of passages P, formed between the plates that comprise the side walls of the ash-pit R, the jambs of the fire-place, the hearth, and the plates N and N', as hereinbefore described.

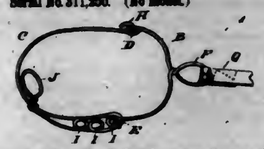
410,169.



410,170. REGULATION OF COUPLED DYNAMOS. OSBORN P. LOOMIS, New York, N. Y., assignor to the Loomis Electric Manufacturing Company, same place. Filed Apr. 23, 1889. Serial No. 308,355. (No model.)

Claim.—The combination, as hereinbefore set forth, of two or more compound-wound dynamo-electric machines connected in multiple arc to a common supply-circuit, and one or more reactive coils placed in the circuit between said dynamos for regulating the action of one dynamo upon the other, for the purpose described.

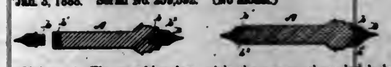
410,171. PROCESS OF PREVENTING THE FLOURING OF MERCURY. FREDERIC A. LOCKINGHAM, New York, N. Y. Filed Aug. 23, 1888. Serial No. 284,086. (No specimens.)



Claim.—1. In the process of amalgamating gold and silver by means of mercury, the application of hydrogen in volume held under pressure and control to a body of mercury and pulp of ores, substantially in the manner and for the purposes set forth.

2. In a process for amalgamating gold and silver by means of mercury, the simultaneous generation of hydrogen in volume by means of acids, water, and metals, and the application of such hydrogen held under pressure and control to a body of mercury and water or the pulp of ores, substantially in the manner and for the purpose described.

3. In the process of amalgamating gold and silver by means of mercury, the application of hydrogen in volume held under pressure and control to a body of mercury and pulp of ores, the hydrogen being distributed upward through the body of mercury and pulp of ores in numerous small streams or particles, substantially as set forth.

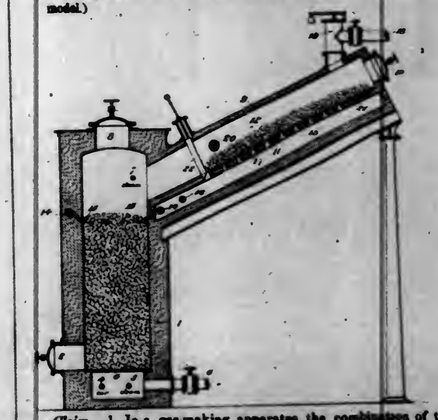


410,172. BAG-TIE. ALBERT MAYFET, Hayesville, Ohio. Filed May 15, 1889. Serial No. 311,250. (No model.)

Claim.—1. In a bag-tie of the character described, the member C, having its free end doubled on itself to form a series of rings I and then extended backward and doubled on itself to form the loop J, in combination with the member B, hinged thereto at one extremity and provided with an engaging hook at its other extremity, substantially as described.

2. The improved bag-tie herein described and shown, consisting of the members B C, constructed of spring-wire, and having engaging eyes forming a hinge, the member B being further provided with a hook E and the loop F, and the member C having the free end of the spring-wire doubled on itself to form a series of rings I, and then extended backward and doubled on itself to form the loop J, adapted to serve as a handle, as set forth.

410,173. WATCH-PIVOT. CHARLES H. MONFORT, Utica, Mich. Filed Jan. 3, 1888. Serial No. 259,592. (No model.)

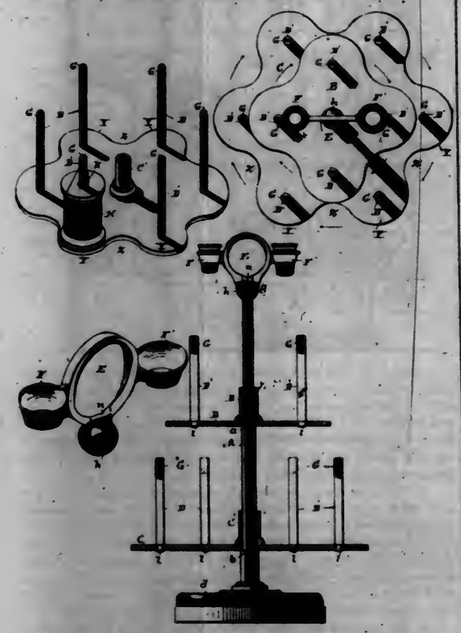


Claim.—1. The combination, with the screw-threaded balance-staff A, of the pivots B, screw-threaded for engagement with the said staff, and having angular heads b^3, substantially as described.

2. The combination, with the staff A, having an orifice, of the pivots B, said staff and pivots being screw-threaded for engagement with each other and together forming a lengthwise-adjustable balance-staff, substantially as described.

3. An extensible balance-staff consisting of a shaft provided at one or both of its ends with a pivot engaged therewith by a screw-thread, substantially as described.

410,174. APPARATUS FOR THE MANUFACTURE OF GAS. FRANK D. MORSE, Zanesville, Ohio. Filed May 15, 1889. Serial No. 310,812. (No model.)

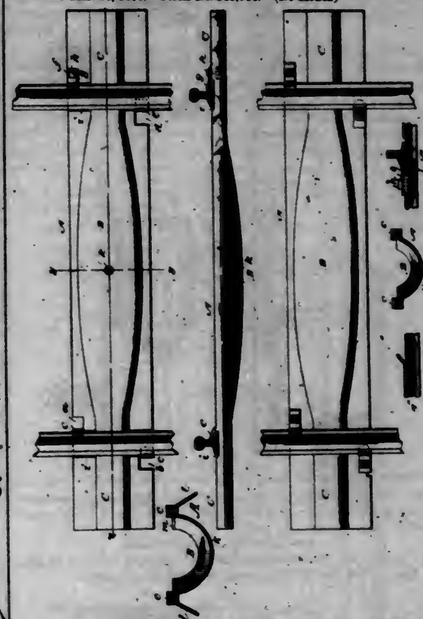


Claim.—1. In a gas-making apparatus, the combination of the generator provided with air and steam pipes, the inclined coking-chamber connected to and communicating with the generator and provided with a perforated diaphragm, a conduit communicating with the generator-chamber and with a space below the said diaphragm and adapted to conduct products of combustion from the generator to the said space, and a cut-off or damper to prevent direct communication from the generator to the upper part of the retort, substantially as set forth.

2. In a gas-making apparatus, the combination of the generator provided with air and steam pipes, the inclined coking-chamber connected to and communicating with the generator and provided with a perforated diaphragm, a conduit communicating with the generator-chamber and with a space below the said diaphragm and adapted to conduct products of combustion from the generator to the said space, a cut-off or damper to prevent direct communication from the generator to the upper part of the retort, and an air-inlet to the retort, substantially as set forth.

3. In a gas-making apparatus, the combination of the generator provided with air and steam pipes, the inclined coking-chamber connected to and communicating with the generator and provided with a perforated diaphragm, a conduit communicating with the generator-chamber and with a space below the retort-diaphragm and adapted to conduct products of combustion from the generator to the said space, a cut-off or damper to prevent direct communication from the generator to the upper part of the retort, an air-inlet to the retort, and a damper or cut-off in the diaphragm, substantially as set forth.

4. In a gas-making apparatus, the combination of the generator provided with air and steam pipes, the inclined coking-chamber connected to and communicating with the generator and provided with a perforated diaphragm, a conduit communicating with the generator-chamber and with a space below the retort-diaphragm and adapted to conduct products of combustion from the generator to the said space, a cut-off or damper to prevent direct communication from the generator to the upper part of the retort, an air-inlet to the retort, a damper or cut-off in the diaphragm, and an outlet for gas from the retort located near the cut-off which excludes direct communication from the generator, substantially as set forth.



410,175. REVOLUBLE SPOOL-STAND. WILSON-BELA P. MCALISTER, Kansas City, Mo. Filed June 15, 1889. Serial No. 314,454. (No model.)

Claim.—1. The spool-holder having the base, the shouldered shaft rising therefrom, the shelves revolving on the shaft, the lower shelf being of greater diameter than the upper shelf, and said shelves having the radial arms Y and indentations Z, and the pins D', rising from the centers of the radial arms, the pins on the lower shelf having their axes beyond the periphery of the upper shelf, substantially as described.

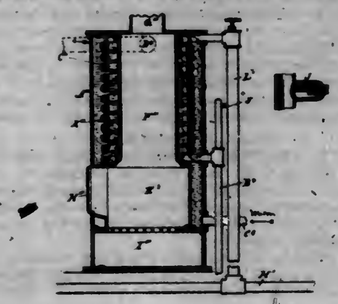
2. The spool-holder comprising the base having the shouldered shaft rising therefrom, the shelves of unequal diameter on the shaft and having the radial arms and the pins D', rising from the centers thereof, the loop E, attached to the upper end of the shaft and forming a handle, said loop having the rings F F', forming thimble-holders, and having the thread-cutter in its lower side, substantially as described.

410,176. RAILWAY-TIE. JOHN R. MCCARTEY, Kendall Creek, Pa. Filed Mar. 20, 1889. Serial No. 303,983. (No model.)

Claim.—1. A railway-tie consisting, essentially, of a metallic plate formed in its upper side with a longitudinal groove the central portion of which is elliptical.

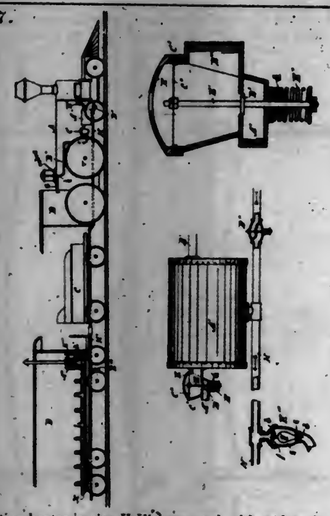
2. A railway-tie formed in its upper side with a longitudinal groove that increases in width toward the center of the tie, substantially as specified.

3. A railway-tie formed in its upper side with a longitudinal concave groove and with retaining-clips, in combination with a retaining-clip *g*, substantially as described.



4. A railway-tie formed with transverse grooves *i* and a longitudinal concave groove which gradually increases in breadth and depth toward the center of the tie from points just within the transverse grooves, substantially as described.

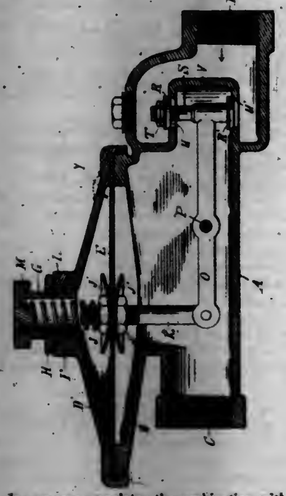
5. A railway-tie formed throughout its length with a longitudinal groove that increases in width toward the center of the tie, and having its longitudinal edges terminating in anchoring-flanges, substantially as specified.



6. A railway-tie formed in its upper side with a longitudinal groove that increases in width toward the center of the tie, and having the rail-seating surface provided with fastening devices and its longitudinal edges turned outwardly and downwardly, substantially as specified.

410,177. SYSTEM FOR HEATING CARS. JAMES F. MCELROY, Lansing, Mich. Filed Mar. 10, 1887. Serial No. 230,340. (No model.)

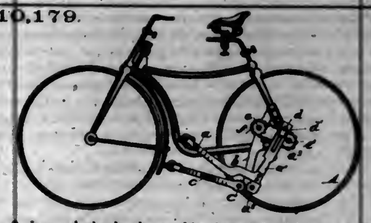
Claim.—The combination, with the locomotive and the tank A', secured thereto and connected at one end with the exhaust and at the other with the live-steam space of the locomotive-boiler, of a hot-



410,177.

water-circulating heater, a pipe H H', connected with said tank and heater, a pressure-regulator in the connection between the tank and the live-steam space, and a safety-valve in the pipe H, substantially as and for the purpose specified.

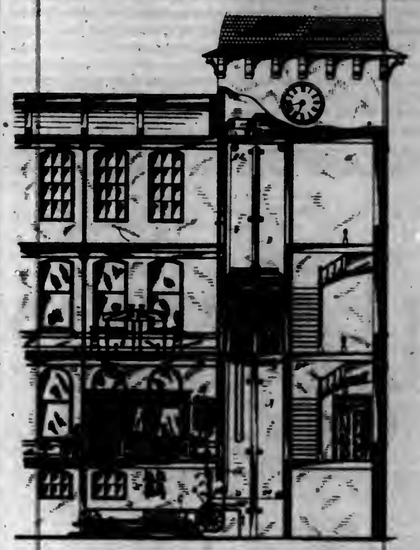
410,178. PRESSURE-REGULATOR. JAMES F. MCELROY, Lansing, Mich. Filed Mar. 1, 1889. Serial No. 301,629. (No model.)



Claim.—In a pressure-regulator, the combination, with the casings A, D, and D', the diaphragm, the pivoted lever O, the valves carried by one end of said lever, and the screw-threaded stem passed through said diaphragm, of the spherical washers on said stem upon opposite sides of the diaphragm, the nuts, the hollow adjusting-bolt, the nut H, and the spring within the hollow nut and bearing on one of the nuts on the stem, substantially as shown and described, and for the purpose specified.

410,179. VELOCIPEDE. OTTO NIEDLANDS, Pforzheim, Baden, Germany. Filed Apr. 4, 1888. Serial No. 306,044. (No model.)

Claim.—1. In a velocipede, the combination of the driving-axle with the sprocket-wheel *d'* rigidly secured thereto, the second sprocket-wheel *c*, driving-levers *a c*, and the backward and forward swinging arm *d'*, substantially as described.



2. In a velocipede, the combination of the lever *d'* with the reciprocating block *d* and chain *f*, which travels over the sprocket-wheels *c d'*, substantially as described.

410,179.

3. In a velocipede, the combination of the driving-axle with the sprocket-wheel *d'* rigidly secured thereto, with the chain *f*, sprocket-wheel *c*, arm *d'*, with reciprocating block *d*, driving-levers *a c*, and ratchet-teeth *c'* and *c²*, substantially as described, and for the purpose set forth.

410,180. ELECTRICALLY-CONTROLLED ELEVATOR. CHARLES R. OSBLEY, New York, N. Y., assignor to the Hydraulic Elevator Company, of Illinois. Filed Nov. 22, 1887. Serial No. 255,257. (No model.)

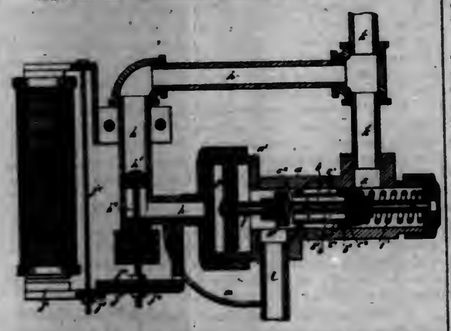
Claim.—1. The combination, with an elevator-car and the mechanism for controlling its movements, of an electro-magnet for actuating said controlling mechanism, a circuit-closer 14 or 15, in circuit with said magnet, and a circuit-closer 19, operated by a moving part of the elevator mechanism to close the circuit through said magnet when the car is in motion and to break the circuit through said magnet when the car is at rest, substantially as described.

2. The combination, with an elevator-car and the mechanism for controlling its movements, of electro-magnets I J, for actuating said controlling mechanism to cause the car to move in opposite directions, a circuit-closer 14 on the car, which is in circuit with both of said magnets, and a circuit-closer 19, operated by a moving part of the elevator mechanism to close the circuit through one of said magnets when the car is in motion and to break the circuits through both of said magnets when the car is at rest, substantially as described.

3. The combination, with an elevator-car and the mechanism for controlling its movements, of electro-magnets I J, for actuating said controlling mechanism to cause the car to move in opposite directions, circuit-closers 15, located at the landings and in circuit with both of said magnets, a circuit-closer 19, operated by a moving part of the elevator mechanism to close the circuit through one of said magnets when the car is in motion and to break the circuits through both of said magnets when the car is at rest, substantially as described.

4. The combination, with an elevator-car and mechanism for controlling its movements, of electro-magnets I J, for actuating said controlling mechanism to cause the car to move in opposite directions, circuit-closers 10 11 upon the car, one of which is in circuit with each magnet, a third circuit-closer 14, which is in circuit with both of said magnets, and a circuit-closer 19, operated by a moving part of the elevator mechanism to close the circuit through one of said magnets when the car is in motion and to break the circuits through both of said magnets when the car is at rest, substantially as described.

5. The combination, with the mechanism for controlling the movements of an elevator, of the cylinder F², and piston F', for actuating said mechanism, an auxiliary-valve apparatus controlling said piston and normally maintained in an open position to allow the water to flow out of the cylinder from either side of the piston, an electro-magnet for actuating said auxiliary-valve apparatus, an electric circuit including said magnet and a circuit-closer upon the car, and a rope or its equivalent connected to operate said controlling mechanism from the elevator-car, substantially as described.



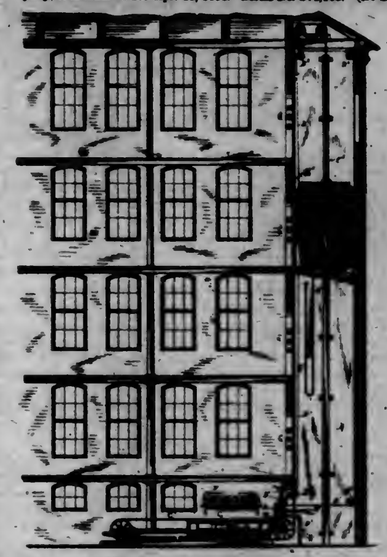
6. The combination, with the mechanism for controlling the movements of an elevator-car, of a cylinder and piston for actuating said mechanism, an auxiliary-valve apparatus controlling said piston and normally maintained in an open position to allow the water to flow out of the cylinder from either side of the piston, two electro-magnets for actuating said auxiliary-valve apparatus to cause the car to move in opposite directions, two electric circuits including said magnets and circuit-closers upon the car, and a rope or its equivalent connected to operate said controlling mechanism from the elevator-car, substantially as described.

7. The combination, with the mechanism for controlling the movements of an elevator-car, of a cylinder and piston for actuating said mechanism, an auxiliary-valve apparatus controlling said piston and normally maintained in an open position to allow the water to flow out of the cylinder from either side of the piston, two electro-magnets for actuating said auxiliary-valve apparatus to cause the car to move in opposite directions, two electric circuits including said magnets and circuit-closers upon the car, a rope connected to operate said controlling mechanism from the elevator-car, and stops 23 upon said rope arranged to be engaged by a moving part of the elevator before the car reaches the limit of its movement in either direction, substantially as described.

8. The combination, with the mechanism for controlling the movements of an elevator, of the cylinder F², and piston F', for actuating said mechanism, an auxiliary-valve apparatus controlling said piston and normally maintained in an open position to allow the water to flow out of said cylinder from both sides of said piston, an electro-magnet for actuating said auxiliary-valve apparatus, and an electric circuit including said magnet and a circuit-closer upon the car, substantially as described.

9. The combination, with the mechanism for controlling the movements of an elevator, of the cylinder F², and piston F', for actuating said mechanism, an auxiliary-valve apparatus for controlling said piston and normally maintained in an open position to allow the water to flow out of said cylinder from both sides of said piston, two electro-magnets for actuating said auxiliary-valve apparatus to cause the car to move in opposite directions, and two electric circuits including said magnets and circuit-closers upon the car, substantially as described.

410,181. ELEVATOR. CHARLES R. OSBLEY, New York, N. Y., assignor to the Hydraulic Elevator Company, of Illinois. Original application filed Nov. 22, 1887, Serial No. 255,257. Divided and this application filed Mar. 9, 1888. Serial No. 266,653. (No model.)



Claim.—1. The combination, with the mechanism for controlling the movements of an elevator, of the cylinder F² and piston F', for operating said mechanism, an auxiliary valve for controlling said piston, which is normally maintained in position to allow the water to flow out of the cylinder, a piston for operating said auxiliary valve, and a primary valve for controlling said last piston, substantially as described.

2. The combination, with the mechanism for controlling the movements of an elevator, of the cylinder F² and piston F', for operating said mechanism, an auxiliary valve for controlling said piston, which is normally maintained in position to allow the water to flow out of the cylinder, a piston for operating said auxiliary valve, a primary valve for controlling said last piston, and a permanently-open exhaust between said last piston and said primary valve, substantially as described.

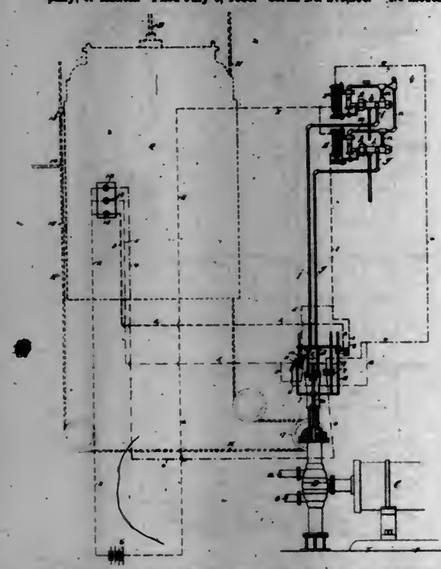
3. The combination, with the mechanism for controlling the movements of an elevator, of the cylinder F² and piston F', for actuating said mechanism, an auxiliary-valve apparatus controlling said piston and normally maintained in an open position to allow the water to flow out of the cylinder from either side of the piston, pistons for operating said auxiliary-valve apparatus, primary valves for controlling said last pistons, and a rope connected to operate said controlling mechanism from the elevator, substantially as described.

410,182. ELECTRICALLY-CONTROLLED ELEVATOR. CHARLES R. OSBLEY, New York, N. Y., assignor to the Hydraulic Elevator Company, of Illinois. Filed Apr. 18, 1888. Serial No. 271,109. (No model.)

Claim.—1. The combination, with an elevator-car and the mechanism for controlling its movements, of an electro-magnet for operating said controlling mechanism, a circuit-closer 15 or 19 in circuit with the magnet, and a circuit-closer operated by the car to close the circuit through the magnet shortly before the car arrives at a landing, substantially as described.

2. The combination, with an elevator-car and the mechanism for controlling its movements, of an electro-magnet for operating said controlling mechanism, a circuit-closer 15 or 19 in circuit with the magnet, and a circuit-closer operated by the car to close the circuit through the magnet shortly before the car arrives at a landing, and to break the circuit as the car arrives at the landing, substantially as described.

3. The combination, with an elevator-car and the mechanism for controlling its movements, of an electro-magnet for operating said controlling mechanism, a circuit-closer 15 or 19 in circuit with said magnet, a circuit-closer R or R', operated by a moving part of the elevator mechanism to close the circuit through the magnet when the car is in motion and to break the circuit when the car is at rest, and a circuit-closer operated by the car to close the circuit through the magnet shortly before the car arrives at a landing, substantially as described.



4. The combination, with an elevator-car and the mechanism for controlling its movements, of electro-magnets for operating said controlling mechanism to cause the car to move in opposite directions, a circuit-closer 15 or 19 in circuit with both the said magnets, and a circuit-closer operated by the car to close the circuit through one of said magnets shortly before the car arrives at a landing going down, and through the other of said magnets shortly before the car arrives at the landing going up, substantially as described.

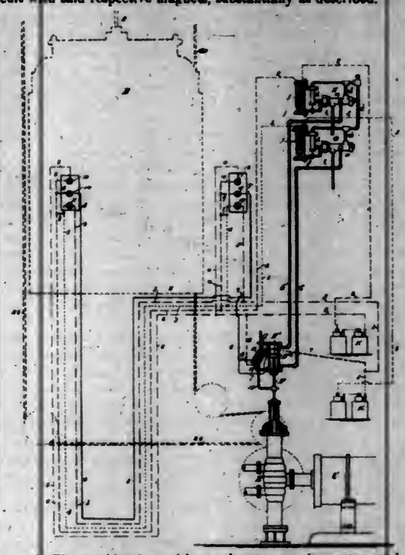
5. The combination, with an elevator-car and the mechanism for controlling its movements, of electro-magnets for operating said controlling mechanism to cause the car to move in opposite directions, a circuit-closer 15 or 19 in circuit with both the said magnets, a circuit-closer operated by the car to close the circuit through one of said

magnets shortly before the car arrives at a landing going down, and through the other of said magnets shortly before the car arrives at the landing going up, and circuit-closers R R', operated by a moving part of the elevator mechanism to close the circuit through one of said magnets when the car is in motion and to break the circuits through both of said magnets when the car is at rest, substantially as described.

6. The combination, with an elevator-car and the mechanism for controlling its movements, of an auxiliary cylinder and piston for operating said controlling mechanism, an electro-magnet for actuating the auxiliary valve, an electric circuit including said magnet and a circuit-closer on the car, and a circulating-passage having a check-valve for permitting the water to circulate from one side to the other of the auxiliary piston, substantially as described.

410,183. ELECTRICALLY-CONTROLLED ELEVATOR. CHARLES R. OGSLEY, New York, N. Y., assignor to the Hydraulic Elevator Company, of Illinois. Filed July 6, 1888. Serial No. 279,206. (No model.)

Claim.—1. The combination, with an elevator-car, its motor, and the main valve for controlling the movements of the motor, of an electro-magnet for controlling the movement of the main valve, an electric circuit for energizing said magnet, and a circuit-closer operated by a moving part of the mechanism to break the circuit through the magnet as the main valve reaches the limit of its working movement, substantially as described.



2. The combination, with an elevator-car, its motor, and the main valve for controlling the movements of the motor, of electro-magnets for controlling the movements of the main valve in opposite directions, electric circuits for energizing said magnets, and circuit-closers operated by a moving part of the mechanism to break the circuits through the respective magnets as the main valve reaches the limit of its working movement in opposite directions, substantially as described.

410,184. ELECTRICALLY-CONTROLLED ELEVATOR. CHARLES R. OGSLEY, Yonkers, N. Y., assignor to the Hydraulic Elevator Company, of Illinois. Original application filed Nov. 22, 1887, Serial No. 255,857. Divided and this application filed Jan. 22, 1889. Serial No. 297,127. (No model.)

Claim.—1. The combination, with an elevator-car, its motor, and main valve, of an electro-magnet for actuating said main valve, a circuit-closer upon the car, which is in circuit with said magnet, and circuit-closers at the landings, also in circuit with said magnet, substantially as described.

2. The combination, with an elevator-car, its motor, and main valve for controlling its movements, of an electro-magnet for actuating said main valve, and circuit-closers located at the landings which are in circuit with said magnet, substantially as described.

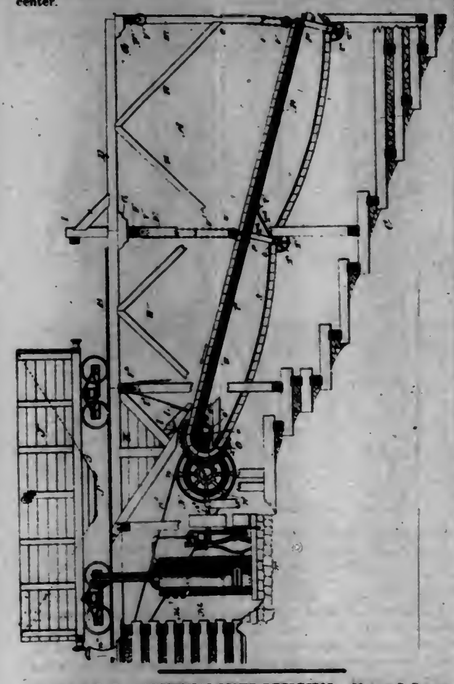
3. The combination, with an elevator-car, its motor, and main valve for controlling its movements, of electro-magnets for actuating said main valve to cause the car to move in opposite directions, circuit-closers upon the car which are in circuit with said respective magnets, and corresponding circuit-closers at the landings, also in circuit with said respective magnets, substantially as described.

4. The combination, with an elevator-car, its motor, and main valve for controlling its movements, of electro-magnets for actuating said main valve to cause the car to move in opposite directions, and circuit-closers at the landings which are in circuit with said respective magnets, substantially as described.

5. The combination, with an elevator-car, its motor, and main valve for controlling its movements, of an auxiliary valve, an electro-magnet for actuating said auxiliary valve, and an electric circuit including circuit-closers at the landings, substantially as described.

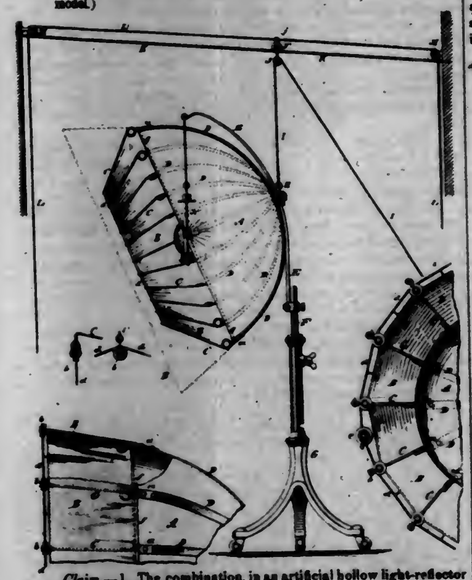
6. The combination, with an elevator-car, its motor, and main valve for controlling its movements, of auxiliary valves for controlling the movements of the main valve in opposite directions, electro-magnets for actuating said auxiliary valves, and circuit-closers at the landings in circuit with said respective magnets, substantially as described.

410,185. COAL-CONVEYER. WILLIAM H. PAGE, Powelton, W. Va. Filed Apr. 15, 1889. Serial No. 307,209. (No model.)



Claim.—1. The combination, substantially as hereinbefore set forth, of the frame-work, the endless apron or conveyer, the end wheels over which it traverses, the girders extending longitudinally beneath the upper side of the apron, the links secured to the girders, the supporting wheels or rollers journaled in the lower ends of the links, and the adjusting devices connected with the upper ends of the links, for the purpose specified.

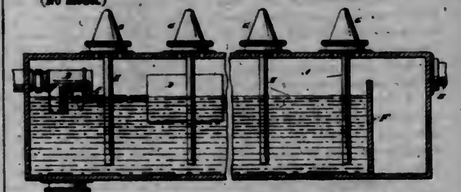
2. The combination, substantially as hereinbefore set forth, of the frame-work, the endless apron or conveyer, the upper end wheels over which it traverses, the lower end wheels, the vertical guide-rails curved in the arc of a circle from the upper end wheel as a center, and the grooved bearing-blocks of the lower end wheel, adjustable vertically on the guide-rails.



3. The herein-described apparatus, comprising the bed-work, the uprights or standards, the top beams carried thereby, the tracks mounted on the top beams, the hopper at the upper end of the frame-work, the adjustable chute at its lower end, the inclined vertically-adjustable conveyer extending under the top beams, from which it is suspended at each end and intermediately.

4. The herein-described apparatus, comprising the frame-work, the endless apron or conveyer, the wheels at each end thereof which it traverses, the longitudinal girders, the shafts R', mounted in bearings on the girders, the rollers carried by the shafts and on which the apron is supported, the links T', secured to the girders and suspended from pulleys on the frame-work, the shafts T, mounted in the lower ends of the links, and wheels T thereon for supporting the endless conveyer or apron on its lower or returning side.

5. The herein-described apparatus, comprising the frame-work, the endless apron or conveyer, the upper end wheels over which it traverses, the girders, the lower end wheels, the vertical guide-rails at the lower end of the frame-work, and means, substantially such as described, for adjusting the lower end of the apron and the girders along the guide-rails and from the axis of the upper end wheels as a center.

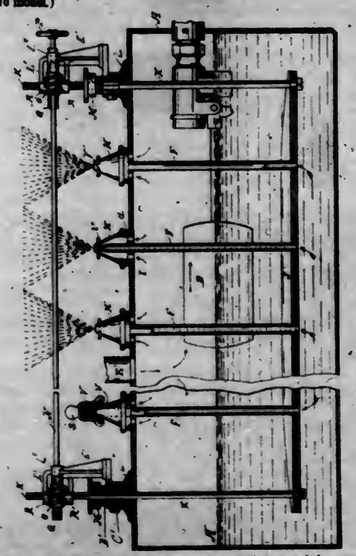


410,186. ARTIFICIAL-LIGHT REFLECTOR. MORRIS R. PARKINSON, New York, N. Y. Filed Mar. 6, 1889. Serial No. 302,173. (No model.)

Claim.—1. The combination, in an artificial hollow light-reflector substantially of the shape of a hemisphere, of an adjustable screen B, attached to and forming part of the reflector A, the curved ribs D D, the band *g* around the periphery of the reflector, and a suitable covering of light material—such as cloth or papier-maché—attached to the outside of the curved ribs D D, and a suitable lining of white material, preferably white cloth or papier-maché, attached to the inside of the curved ribs D D, all as heretofore described.

2. In an artificial-light reflector, the combination of the following parts: the adjustable screen B, attached to and forming a part of a reflector A, the springs C C, the pulleys *b b*, the cord *d*, and the reel *e*, and a suitable covering of light material—such as cloth or papier-maché—attached to the outside of the springs C C, and a suitable lining of white material, preferably white cloth or papier-maché, attached to the inside of the springs C C, all as heretofore described.

410,187. ATOMIZER FOR DAMPENING FABRICS. MICHAEL PARTINGTON, Fall River, Mass. Filed Jan. 18, 1889. Serial No. 296,997. (No model.)



Claim.—1. In a sprinkler, a trough for containing liquid and air under pressure, a sleeve attached to said trough, a tip removably attached to said sleeve, forming a tapering chamber in communication with the air-space in said trough, and a tube, one end of which is to be immersed in said fluid and the other end of which projects outside of said trough, said tube having provision, substantially as described, for enabling it to be raised and lowered through said sleeve while the sleeve remains fixed to regulate the spray.

2. In a sprinkler, a trough for containing liquid and air under pressure, a sleeve attached to said trough, a tip removably attached to said sleeve, provided with a web having a screw-threaded aperture therethrough, said tip forming a tapering chamber in communication with the air-space in said trough, and a tube, one end of which is to be immersed in said fluid and the other end of which projects outside of said trough, said tube being provided with a screw-threaded section taking with the screw-threaded aperture in the said web, whereby it is adjusted, substantially as described.

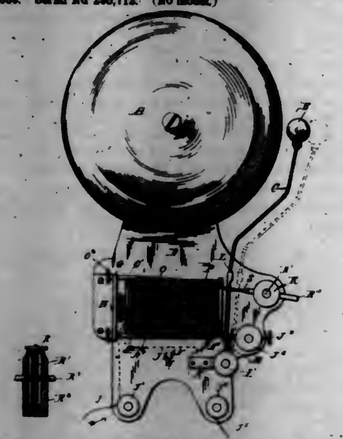
3. In a sprinkler, a trough for containing liquid and air under pressure, an air-chamber formed at one end of said trough, combined with a tube, one end of which is carried outside of said trough, and a casing having a chamber in communication with the air-space in said trough, and having an opening inclined with relation to the opening in the outside end of said tube, substantially as described.

410,188. ATOMIZER FOR DAMPENING FABRICS. MICHAEL PARTINGTON, Fall River, Mass. Filed Apr. 20, 1889. Serial No. 307,953. (No model.)

Claim.—1. The combination of a trough for containing water and

air under pressure, a plurality of spraying nozzles in communication with the air contained in said trough, a plurality of tubes in communication with the water contained in said trough, an adjustable plate connected with all of said tubes for adjusting the relation of all of said nozzles and tubes simultaneously, and means for raising and lowering said plates, substantially as described.

2. The combination of a trough for containing water and air under pressure, a plurality of spraying-nozzles in communication with the air contained in said trough, a plurality of tubes in communication with the water contained in said trough, said nozzles being provided with a smooth-bore web through which said tubes pass, and means, substantially as described, for raising and lowering said tubes.



3. The combination of a trough for containing water and air under pressure, a plurality of spraying nozzles in communication with the air contained in said trough, a plurality of tubes in communication with the water contained in said trough, and caps removably attached to said nozzles provided with a packing—such as rubber—for said nozzles, substantially as described.

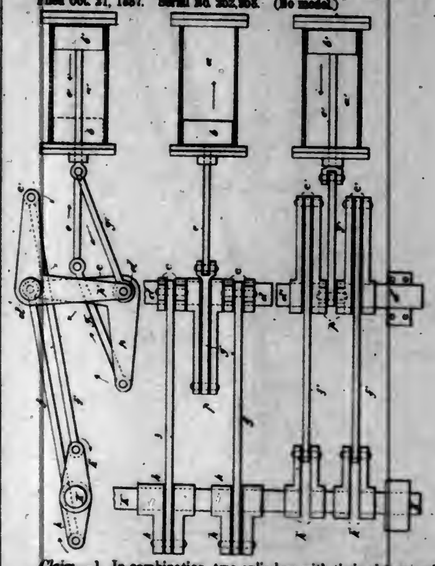
4. In combination with a trough adapted to contain fluid, spraying-nozzles and tubes, a support for said tubes, an adjustable rod provided with a threaded portion attached to said support, a worm-gear engaging with the threaded portion on said rod for adjusting said tubes, and a worm for operating said gear, substantially as described.

5. In combination with a trough adapted to contain fluid, a plurality of spraying-nozzles and tubes, a plate attached to said tubes supported by a plurality of adjustable rods, each provided with threaded portions, worm-gears engaging with said threaded portions for simultaneously raising and lowering said rods, and a rod provided with worms connecting said worm-gears to cause them to operate together, substantially as described.

6. In combination with a trough adapted to contain fluid, a plurality of spraying-nozzles and tubes, a plate attached to said tubes supported by two adjustable rods, and means for raising and lowering the said rods simultaneously, substantially as described.

410,189. ELECTRIC GONG. JAMES H. PHALAN, Ansonia, Conn., assignor to the Electrical Supply Company, same place. Filed Jan. 7, 1889. Serial No. 295,712. (No model.)

Claim.—1. In an electric bell or gong, the combination of a pivoted armature with a bell-hammer shank secured thereto, a contact-spring on one side thereof, and an elastic stop in the path of such armature and which bears against such contact-spring.



2. In an electric bell or gong, the combination of the pivoted armature with the bell-hammer shank secured thereto, a contact-spring on one side thereof, and an elastic stop on the opposite side of said shank and projecting therefrom and bearing against such contact-spring.

3. In an electric bell or gong, the combination of a pivoted armature with a bell-hammer shank secured thereto, an elastic contact on one side and moving therewith, and an elastic stop in the path of such contact and adapted to engage the same, so that during the motion of the bell-hammer shank the contact will not be broken until the elasticity of the contact and stop has been overcome.

4. In an electric bell or gong, the combination of the pivoted armature with the bell-hammer shank secured thereto, and an adjustable elastic stop in the path of such armature.

5. In an electric bell or gong, the combination of the pivoted armature with the bell-hammer shank secured thereto, an elastic contact on one side thereof, and an adjustable elastic stop in the path of and operating against such contact.

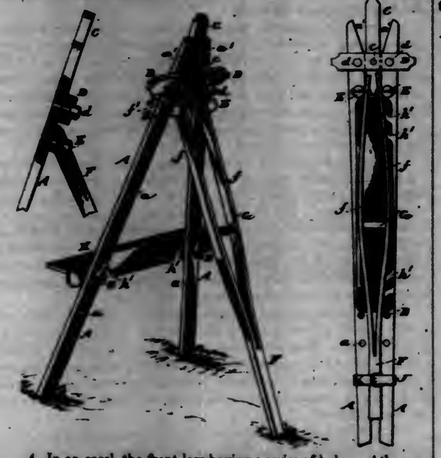
410,190. STEAM-ENGINE. WILLIAM A. PITT, Glastonbury, Conn. Filed Oct. 21, 1887. Serial No. 252,968. (No model.)

Claim.—1. In combination, two cylinders with their pistons and piston-rods, two sets of cranks mounted on independent shafts set in the same vertical plane, each set being placed at right angles to the other, two sets of cranks set on the same plane on the work-shaft and connected therewith, and two intermediate cranks set on the said independent shafts at right angles to each other and to the other cranks and connected with the pistons in the respective cylinders, all arranged in the manner and for the purpose set forth.

2. In an engine, the combination, with two cylinders, their pistons, and piston-rods, of two shafts set in the same vertical plane, two sets of cranks placed at right angles to each other on said shafts and connected with two cranks mounted on a common shaft set on a plane intermediate between the said independent shafts, and two cranks set on the independent shafts and connected with the piston-rods, as set forth.

3. In combination, the cylinders *a a'*, with pistons and piston-rods *b b'* and *c c'*, shafts *d d'*, placed in the same vertical plane, cranks *p p'*, connecting-rods *g g'*, double cranks *e e'*, and double cranks *h h*, with connecting-rods *f f f f*, as set forth.

4. The combination, with two cylinders and their pistons and piston-rods and working-shafts, of two shafts placed one above the other and equidistant from the direct line of motion of the engine, two pairs of cranks set at right angles to each other on said shafts, and intermediate cranks set on the same shafts at right angles to each other and to the aforesaid cranks, and rods connecting the said cranks with the piston-rods and working-shaft, as set forth.



5. In an engine, a leverage consisting of double cranks placed on independent shafts between the piston cross-heads and crank-shaft and connected with double cranks of half-length on the crank-shaft, and cranks interposed between the double cranks and connected with the steam piston-rods, substantially as set forth.

410,191. EASEL. JAMES F. PLUMER, Watertown, N. Y., assignor of one-half to William G. Pierce, same place. Filed Jan. 5, 1889. Serial No. 295,530. (No model.)

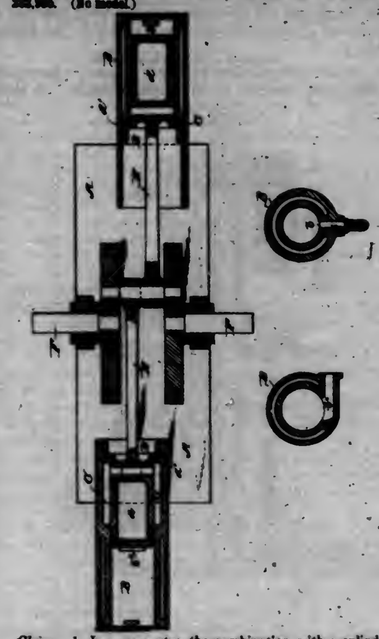
Claim.—1. In an easel, the combination, with the front legs and a short piece interposed between their upper ends, of a cross-piece to which the front legs are pivoted, and the spring rear supporting-leg pivoted to the front legs, substantially as specified.

2. In an easel, the front legs and the rear projections or brackets secured thereto, combined with a cross-piece to which the front legs are pivoted and the rear leg divided longitudinally for nearly its entire length to form two parts, said two parts being pivoted at their upper ends to the rear projections or brackets, substantially as specified.

3. In an easel, a rear supporting-leg divided longitudinally for nearly its entire length to form two parts, and a strut interposed between said two parts about midway of their length, for the purpose specified, combined with the front legs, a cross-piece to which said front legs are pivoted, and rear projections or brackets secured to the front legs, and to which the upper ends of the two parts of the rear leg are pivoted, as set forth.

4. In an easel, the front legs having a series of holes and the pegs inserted therein, combined with the rear spring-leg and a shelf having recesses to fit over said pegs, substantially as specified.

410,192. NOZZLE FOR STEEL-LADLES. CHARLES S. PRICE, Johnstown, Pa. Filed May 2, 1888. Serial No. 309,949. (No model.)



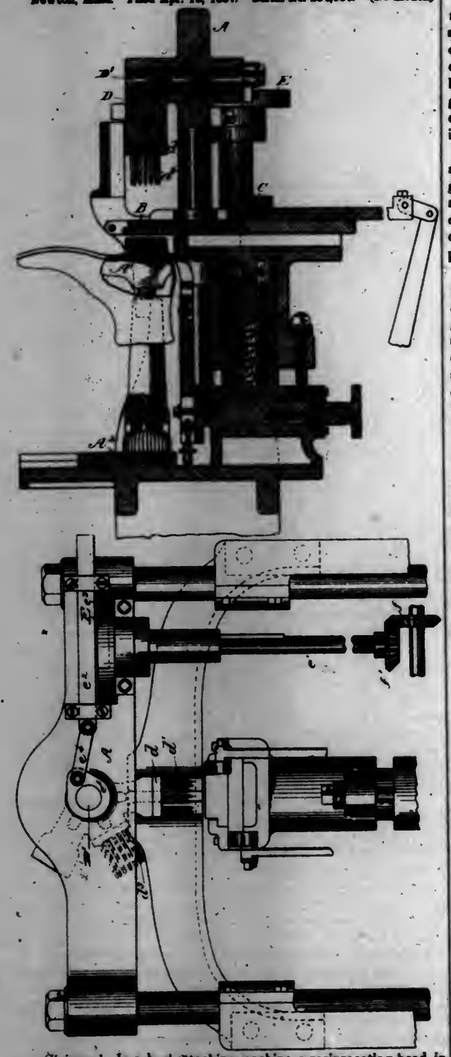
Claim.—1. In a ladle for receiving and pouring hot steel, a refractory nozzle composed of two parts, an outer and an inner part, the inner part being detachably fitted to the outer part by conically-fitting surfaces for the purpose of allowing the inner part to be readily replaced, in combination with a stopper contained within the ladle and operated by means of a rod extending through the molten metal, the said stopper having its bearing upon the outer part of said nozzle, substantially as and for the purpose set forth.

2. In a ladle for containing and pouring molten steel, a nozzle composed of two parts, an outer and an inner part, the outer part being cemented to the refractory lining of the ladle and being provided with an interior conical surface, the inner part being provided with an exterior conical surface adapted to fit the interior conical surface of said outer part, the inner part being also provided with a cylindrical orifice through its center, for the purpose of permitting the passage of a clean solid stream of steel, the upper part of said cylindrical orifice being formed in the form of an inverted cone, for the purpose of converging the molten steel, so that it will form itself into a solid stream while passing through the said cylindrical part of the orifice, in combination with a stopper contained within the ladle and actuated by means of a rod passing through the molten steel contained within the ladle, said stopper being adapted to bear and fit upon the upper portion of said outer part of said nozzle and said stopper when in contact with said outer part of said nozzle not being in contact with said inner part of said nozzle, substantially as and for the purpose set forth.

3. In a ladle for containing and pouring steel, a nozzle composed of two parts, an outer and an inner part, the outer part being cemented to the refractory lining of the ladle, the inner part containing the orifice through which the steel passes and being detachably fitted to the outer part, for the purpose of being readily replaced, in combination with a stopper contained within the ladle and actuated by a rod extending through the ladle adapted to close the passage through which the metal passes while being poured, substantially as and for the purpose specified.

410,193. HYDROCARBON-MOTOR. ARTHUR G. PURDHAS and JOHN R. PRIEST, Auckland, New Zealand. Filed Aug. 16, 1888. Serial No. 282,905. (No model.)

Claim.—1. In a gas-motor, the combination, with a cylinder and piston constructed to operate as a working cylinder and piston and as a pump, of an air-reservoir connected with the admission-port of the cylinder, said reservoir containing water through which air is caused to pass prior to its admission to the cylinder, substantially as described, for the purposes specified.



2. In a gas-motor, the combination, with a cylinder and piston constructed to operate as a working cylinder and piston and as a pump, a source of gas-supply, and an air-reservoir containing water through which the air admitted thereto is caused to pass, and a connection between the inlet-port of the cylinder and the gas-supply and air-reservoir, respectively, of a regulating-valve interposed in said connection and adapted to cut off the communication between the inlet-port and gas-supply or between said port and air-reservoir, substantially as and for the purposes specified.

3. In a gas-motor, the combination, with a cylinder and piston constructed to operate as a working cylinder and piston and as a pump, a source of gas-supply, and an air-reservoir containing water through which the air admitted thereto is caused to pass, and a connection between the inlet-port of the cylinder and the gas-supply and air-reservoir, respectively, of a regulating-valve interposed in said connection, said valve being controlled by a moving element of the motor—as the governor, for instance—and adapted to cut off the communication between the inlet-port and gas-supply or between said port and air-reservoir, substantially as and for the purposes specified.

4. In a gas-motor, the combination, with a working cylinder and piston constructed to perform the function of a pump, admission-ports *b* and *c*, for the working and pump portions, respectively, of the cylinder, said ports being in communication with each other and with the source of gas-supply, and check-valves in said communications, of a regulating-valve interposed in the connection between the inlet-ports and gas supply, the valve-casing of which valve is provided with suitable ports in communication with the cylinder and with the gas-supply, respectively, and with said cylinder and the atmosphere, the opening and closing of said ports being controlled by the movements of the valve, for the purposes specified.

5. In a gas-motor, the combination, with a working-cylinder constructed to perform the function of a pump, admission-ports *b c*, for the working and pump portions, respectively, of the cylinder, said ports being in communication with each other and with an air and gas supply pipe, and check-valves V V' in said communications, of a carburetor and air-reservoir, the latter containing water through which the air admitted is caused to pass, and a regulating-valve *i*, whose casing is provided with a port or passage I^3 in communication with the cylinder through the supply-pipe, a port or passage i^4 in communication with the carburetor, and a port or passage i^5 in communication with the air-reservoir, said communications being controlled by the movements of the valve, substantially as and for the purposes specified.

410,194. HEEL-NAILING MACHINE. FREEBORN P. RAYMOND, 2d, Newton, Mass. Filed Apr. 16, 1887. Serial No. 234,966. (No model.)

Claim.—1. In a heel-attaching machine, a reciprocating head, in combination with a block carrying a gang or group of awls, and a block carrying a gang or group of drivers, and a heel-spanker, or any two of them, and a rotating cam having a slide connecting with said blocks for moving them automatically into and out of operative position, substantially as described.

2. In a heel-attaching machine, a block or arm carrying a gang or group of awls, a block or arm carrying a gang or group of drivers, and a block or arm carrying or supporting a heel-spanker, or any two of said blocks or arms, with a rotating cam having a slide connecting with said block or arms and adapted to move said awls, drivers, and spanker, or any two of them, successively into operative position, as and for the purposes described.

3. In a heel-attaching machine, an arm or block supporting a gang or group of awls, an arm or block supporting a gang or group of drivers, and an arm or block carrying or supporting a top-lift spanker, or any two of them, having the slide of a rotary cam in connection therewith and said cam to produce automatic intermittent movement in one direction to bring the said devices successively into operative position, and a continuous automatic return movement, as and for the purposes described.

4. The combination, in a heel-attaching machine, of a reciprocating head, a rotating cam having a slide-arm and an arm or block supporting a gang or group of awls, an arm or block supporting a gang or group of drivers, and an arm or block supporting a heel-spanker, or any two of them, connected with the said slide-arm of the cam to be moved thereby successively into operative position, and vertical guides with which said arms are successively brought into contact or engagement to direct and govern the course of their vertical movement in relation to the work, substantially as described.

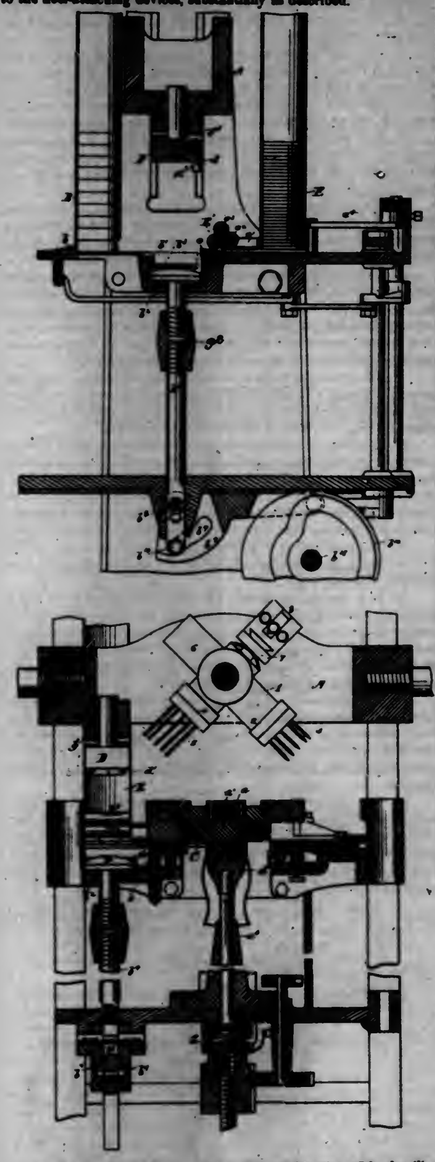
5. The combination of a rotating shaft carrying at its upper end a cam E, with said cam, and a block or arm supporting a gang or group of awls, a block or arm supporting a gang or group of drivers, and a block or arm supporting a spanker, and a slide-connection for connecting said arms or blocks with said cams, whereby the movement of the cam is communicated to said arms or blocks, as and for the purposes described.

6. In a heel-attaching machine, the combination of a last or work-support, a templet, a nail-carrier, a reciprocating head, a block or arm carrying a gang or group of awls, a block or arm carrying a gang or group of drivers, and a block or arm supporting a top-lift spanker, or any two of them, connected together and to the slide-arm of a rotary cam, to be simultaneously moved to bring them successively into operative position, with a rotating cam E and slide-arm connected therewith and adapted to provide them with an intermittent movement to bring them into operative position successively in relation to said templet, as and for the purposes described.

7. The combination, in a heel-attaching machine, of a cross-head A, having a plunger *g'*, with the plate or support G, carrying a slide-plate supporting a block carrying a gang or group of awls, a block carrying a gang or group of drivers, and a block carrying a spanker, or any two of them, and a cam E and its connecting slide-arm for moving said arms or blocks successively into position to be engaged and reciprocated by said plunger, substantially as described.

8. The combination, in a heel-attaching machine, of the cross-head, the awls, drivers, and spanker, or either of them, carried thereby, with the lower cross-head m^3, connected with the upper cross-head A, a lever m^2, operated by a cam M, said cam, and the toggle m^4, as and for the purposes described.

410,195. HEEL-NAILING MACHINE. FREEBORN P. RAYMOND, 2d, Newton, Mass. Filed Apr. 16, 1887. Serial No. 234,967. (No model.)



Claim.—1. In an organized heel attaching and compressing machine, the combination of heel-attaching devices comprising a gang of awls, a gang of drivers, a templet, and a heel-support with a heel-press and devices, substantially as specified, for causing the simultaneous operation of the press and of the heel-attaching mechanism, substantially as described.

2. In a heel-nailing machine, the combination of heel-attaching devices, a bed and movable head, substantially as described, for compressing the heel-blank, and a carrier for transferring the compressed heel-blank from the bed to the heel-attaching devices, substantially as described.

3. The combination, in a heel-attaching machine, of heel-attaching devices, a heel-blank holder or pocket *d'*, a bed and a head, substantially as described, movable in relation to the pocket to compress a heel-blank therein, and a transferrer for moving the compressed heel-blank from the pocket or bed to the heel-attaching devices, substantially as described.

4. The combination, in a heel-nailing machine, of the heel-attaching devices, a heel-compressing bed, a head, and a pocket or device, substantially as described, for holding the heel-blank between the bed and head, and a heel-blank-feeding plate or carrier for feeding the heel-blank to the heel-holding pocket or device, and a carrier for transferring the heel-blank from the bed or pocket to the heel-attaching devices, substantially as described.

5. The combination, in a heel-nailing machine, of heel-attaching devices, a bed and a head, substantially as described, between which a heel-blank is adapted to be compressed, a box for holding heel-blanks in stack, a heel-blank-carrying plate for moving the heel-blanks from the box or stack to a position between the bed and the head, and a transferrer for moving the compressed heel-blank from the bed to the heel-attaching devices, substantially as described.

6. In a heel-attaching machine, the combination of heel-nailing devices, a receptacle for holding heel-blanks in stack or quantity, heel-blank-transferring mechanism for transferring the blanks from the receptacle to the attaching devices, and a heel-blank press, substantially as described, between the said receptacle and the said heel-blank-attaching devices to form or mold the heel-blanks in successive order upon their passage to the attaching devices, substantially as described.

7. The combination of the heel-blank-attaching devices, the heel-blank carrier C, the pocket or receptacle *b'*, the bed b^3, a heel-blank press adapted to compress heel-blanks in said pocket, the box B, and the heel-blank carrier *b*, substantially as described.

8. The combination of the pocket or receptacle *b'*, the heel-blank press, substantially as described, the box or receptacle B, and the heel-blank carrier *b*, substantially as described.

9. The combination of the bed and head of a heel-blank press, substantially as described, with the heel-blank receptacle B and the heel-blank carrier *b*, for carrying blanks from the receptacle to a position in the heel-blank press, substantially as described.

10. The combination, in a heel-nailing machine, of heel-attaching devices, a heel-press, a box or receptacle for holding rands, and a carrier for feeding rands therefrom to the press, a box or receptacle for holding blanks, and a heel-blank carrier for feeding the heel-blanks therefrom to the press, substantially as described.

11. The combination, in a heel-nailing machine, of heel-attaching devices, a heel-press, a box or receptacle for holding rands, and a carrier for feeding rands therefrom to the press, a box or receptacle for holding blanks, a heel-blank carrier for feeding the heel-blanks therefrom to the press, and a heel-blank transferrer for carrying the heel-blank and rand from the press to the heel-attaching devices, substantially as described.

12. The combination of the bed and head of the heel-blank press, substantially as described, with the carrier *c* and the carrier *b*, substantially as described.

13. In a heel-press, the head D, having the heel-blank-centering device *d'*, substantially as described.

14. The combination, in a heel attaching and molding machine, of a bed or table having the pocket *b'*, provided with a straight vertical surface against which the rand or section of a heel-blank is adapted to be pressed, with the carrying device *c*, as described, shaped to center the rand or section of the heel against said straight surface, substantially as described.

15. The combination of the bed b^3, the slide-head b^4, and the cam-lever b^7, pivoted at b^8, having a cam-groove b^9, which receives a cam-pin b^{10} upon the slide-head, substantially as described.

16. The combination of the pocket *b'*, the bed b^3, the slide-head b^4, and the adjusting-nut adjustably connecting the bed with the slide-head, substantially as described.

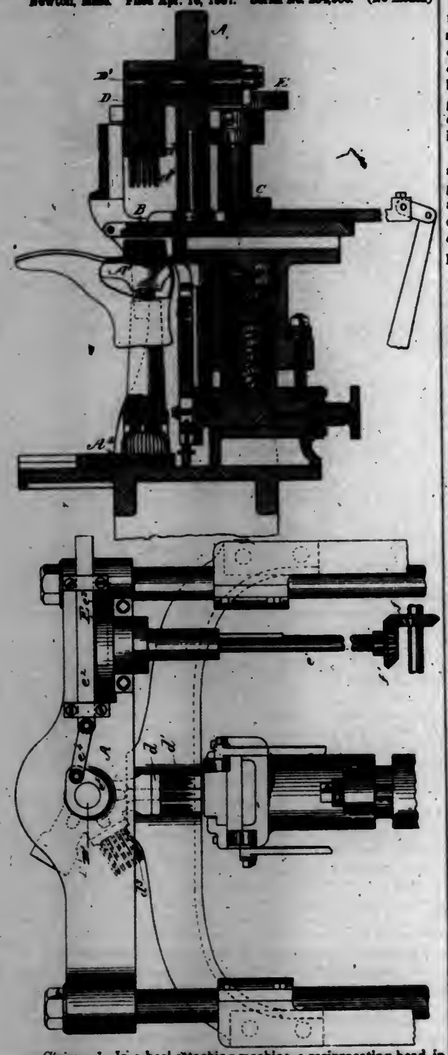
17. The combination of the rand or heel-section carrier plate *c* with the paste or glue applying device for applying glue or paste to its upper surface as it is fed or moved by the carrier-plate, substantially as described.

18. In a heeling-machine, the combination of a feedway through which a rand or heel-section is adapted to be fed, with an apparatus for applying a solution or liquid to the upper surface of said rand or heel-section—such as a roll the operating-surface of which extends into said feedway from above it—as and for the purposes described.

19. In a heel-nailing machine, the combination of the tank *e'* with the rolls e^2 e^3 E', substantially as described.

20. In a heeling-machine, the combination of a rand or heel-section carrier, a pocket or receptacle to which the rands or heel-sections are fed, an apparatus for applying glue or paste to the upper surface of the rand or heel-section—such as a roll—a second carrier for feeding a heel-blank or other heel-section to the said pocket or receptacle, and a heel-press to compress said rand and heel or said sections of the heel together in said pocket, and a heel transferrer or carrier to transfer said compressed heel-blank to the nail-driving devices, and the nail-driving devices, substantially as described.

21. The combination of a carrier for feeding rands or heel-sections to a pocket or receptacle, a paste or glue applying apparatus located to feed paste or glue to the upper surface of the rand or heel-section as it is moved by the carrier, a second carrier for feeding a heel-blank or additional heel-section to said pocket or receptacle, a heel-press to compress said sections in said pocket, a heel-blank transferrer or carrier to transfer said compressed heel-blank from the heel-press to the nail-driving devices, a paste or glue applying apparatus arranged between said heel-press and said nail-driving devices to deliver paste or glue to the said heel-blank, and the nail-driving devices, substantially as described.



22. The combination of the box or receptacle E, the carrier *c*, the paste, glue, or liquid applying apparatus E', the box or receptacle B, the carrier *b*, the receptacle or pocket *b'*, and a heel-press the bed of which forms the under surface of the said receptacle or pocket, substantially as described.

23. The combination of the box or receptacle E, the carrier *c*, the paste, glue, or liquid applying apparatus E', the box or receptacle B, the carrier *b*, the receptacle or pocket *b'*, a heel-press the bed of which forms the under surface of the said receptacle or pocket, the heel-blank transferrer C, and the nail-driving devices, substantially as described.

24. The combination, in a heel-attaching machine, of a heel-press comprising a bed and head, one of which has a yielding movement in relation to the other, with a transferrer C, for carrying the compressed heel-blank from the press to the heel-attaching devices, and said heel-attaching devices, substantially as described.

5. In a gas-motor, the combination, with a working-cylinder constructed to perform the function of a pump, admission-ports *b c*, for the working and pump portions, respectively, of the cylinder, said ports being in communication with each other and with an air and gas supply pipe, and check-valves V V' in said communications, of a carburetor and air-reservoir, the latter containing water through which the air admitted is caused to pass, and a regulating-valve *i*, whose casing is provided with a port or passage I^3 in communication with the cylinder through the supply-pipe, a port or passage i^4 in communication with the carburetor, and a port or passage i^5 in communication with the air-reservoir, said communications being controlled by the movements of the valve, substantially as and for the purposes specified.

410,194. HEEL-NAILING MACHINE. FREEMAN F. RAYMOND, 2d, Newton, Mass. Filed Apr. 16, 1887. Serial No. 234,966. (No model.)

Claim.—1. In a heel-attaching machine, a reciprocating head, in combination with a block carrying a gang or group of awls, and a block carrying a gang or group of drivers, and a heel-spanker, or any two of them, and a rotating cam having a slide connecting with said blocks for moving them automatically into and out of operative position, substantially as described.

2. In a heel-attaching machine, a block or arm carrying a gang or group of awls, a block or arm carrying a gang or group of drivers, and a block or arm carrying or supporting a heel-spanker, or any two of said blocks or arms, with a rotating cam having a slide connecting with said block or arms and adapted to move said awls, drivers, and spanker, or any two of them, successively into operative position, as and for the purposes described.

3. In a heel-attaching machine, an arm or block supporting a gang or group of awls, an arm or block supporting a gang or group of drivers, and an arm or block carrying or supporting a top-lift spanker, or any two of them, having the slide of a rotary cam in connection therewith and said cam to produce automatic intermittent movement in one direction to bring the said devices successively into operative position, and a continuous automatic return movement, as and for the purposes described.

4. The combination, in a heel-attaching machine, of a reciprocating head, a rotating cam having a slide-arm and an arm or block supporting a gang or group of awls, an arm or block supporting a gang or group of drivers, and an arm or block supporting a heel-spanker, or any two of them, connected with the said slide-arm of the cam to be moved thereby successively into operative position, and vertical guides with which said arms are successively brought into contact or engagement to direct and govern the course of their vertical movement in relation to the work, substantially as described.

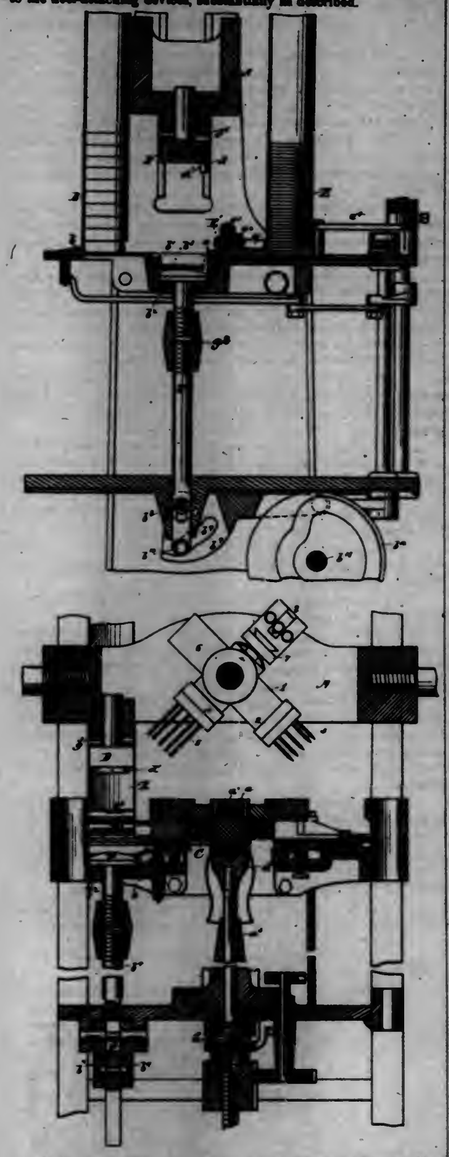
5. The combination of a rotating shaft carrying at its upper end a cam E, with said cam, and a block or arm supporting a gang or group of awls, a block or arm supporting a gang or group of drivers, and a block or arm supporting a spanker, and a slide-connection for connecting said arms or blocks with said cams, whereby the movement of the cam is communicated to said arms or blocks, as and for the purposes described.

6. In a heel-attaching machine, the combination of a last or work-support, a templet, a nail-carrier, a reciprocating head, a block or arm carrying a gang or group of awls, a block or arm carrying a gang or group of drivers, and a block or arm supporting a top-lift spanker, or any two of them, connected together and to the slide-arm of a rotary cam, to be simultaneously moved to bring them successively into operative position, with a rotating cam E and slide-arm connected therewith and adapted to provide them with an intermittent movement to bring them into operative position successively in relation to said templet, as and for the purposes described.

7. The combination, in a heel-attaching machine, of a cross-head A, having a plunger *g'*, with the plate or support G, carrying a slide-plate supporting a block carrying a gang or group of awls, a block carrying a gang or group of drivers, and a block carrying a spanker, or any two of them, and a cam E and its connecting slide-arm for moving said arms or blocks successively into position to be engaged and reciprocated by said plunger, substantially as described.

8. The combination, in a heel-attaching machine, of the cross-head, the awls, drivers, and spanker, or either of them, carried thereby, with the lower cross-head m^3, connected with the upper cross-head A, a lever m^2, operated by a cam M, said cam, and the toggle m^4, as and for the purposes described.

410,195. HEEL-NAILING MACHINE. FREEMAN F. RAYMOND, 2d, Newton, Mass. Filed Apr. 16, 1887. Serial No. 234,967. (No model.)



Claim.—1. In an organized heel attaching and compressing machine, the combination of heel-attaching devices comprising a gang of awls, a gang of drivers, a templet, and a heel-support with a heel-press and devices, substantially as specified, for causing the simultaneous operation of the press and of the heel-attaching mechanism, substantially as described.

2. In a heel-nailing machine, the combination of heel-attaching devices, a bed and movable head, substantially as described, for compressing the heel-blank, and a carrier for transferring the compressed heel-blank from the bed to the heel-attaching devices, substantially as described.

3. The combination, in a heel-attaching machine, of heel-attaching devices, a heel-blank holder or pocket *a'*, a bed and a head, substantially as described, movable in relation to the pocket to compress a heel-blank therein, and a transferrer for moving the compressed heel-blank from the pocket or bed to the heel-attaching devices, substantially as described.

4. The combination, in a heel-nailing machine, of the heel-attaching devices, a heel-compressing bed, a head, and a pocket or device, substantially as described, for holding the heel-blank between the bed and head, and a heel-blank-feeding plate or carrier for feeding the heel-blank to the heel-holding pocket or device, and a carrier for transferring the heel-blank from the bed or pocket to the heel-attaching devices, substantially as described.

5. The combination, in a heel-nailing machine, of heel-attaching devices, a bed and a head, substantially as described, between which a heel-blank is adapted to be compressed, a box for holding heel-blanks in stock, a heel-blank-carrying plate for moving the heel-blanks from the box or stock to a position between the bed and the head, and a transferrer for moving the compressed heel-blank from the bed to the heel-attaching devices, substantially as described.

6. In a heel-attaching machine, the combination of heel-nailing devices, a receptacle for holding heel-blanks in stack or quantity, heel-blank-transferring mechanism for transferring the blanks from the receptacle to the attaching devices, and a heel-blank press, substantially as described, between the said receptacle and the said heel-blank-attaching devices to form or mold the heel-blanks in successive order upon their passage to the attaching devices, substantially as described.

7. The combination of the heel-blank-attaching devices, the heel-blank carrier C, the pocket or receptacle *b'*, the bed b^3, a heel-blank press adapted to compress heel-blanks in said pocket, the box B, and the heel-blank carrier *b*, substantially as described.

8. The combination of the pocket or receptacle *b'*, the heel-blank press, substantially as described, the box or receptacle B, and the heel-blank carrier *b*, substantially as described.

9. The combination of the bed and head of a heel-blank press, substantially as described, with the heel-blank receptacle B and the heel-blank carrier *b*, for carrying blanks from the receptacle to a position in the heel-blank press, substantially as described.

10. The combination, in a heel-nailing machine, of heel-attaching devices, a heel-press, a box or receptacle for holding rands, and a carrier for feeding rands therefrom to the press, a box or receptacle for holding blanks, and a heel-blank carrier for feeding the heel-blanks therefrom to the press, substantially as described.

11. The combination, in a heel-nailing machine, of heel-attaching devices, a heel-press, a box or receptacle for holding rands, and a carrier for feeding rands therefrom to the press, a box or receptacle for holding blanks, a heel-blank carrier for feeding the heel-blanks therefrom to the press, and a heel-blank transferrer for carrying the heel-blank and rand from the press to the heel-attaching devices, substantially as described.

12. The combination of the bed and head of the heel-blank press, substantially as described, with the carrier *c* and the carrier *b*, substantially as described.

13. In a heel-press, the head D, having the heel-blank-centering device *d'*, substantially as described.

14. The combination, in a heel attaching and molding machine, of a bed or table having the pocket *b'*, provided with a straight vertical surface against which the rand or section of a heel-blank is adapted to be pressed, with the carrying device *c*, as described, shaped to center the rand or section of the heel against said straight surface, substantially as described.

15. The combination of the bed b^3, the slide-head b^4, and the cam-lever b^7, pivoted at b^8, having a cam-groove b^9, which receives a cam-pin b^{10} upon the slide-head, substantially as described.

16. The combination of the pocket *b'*, the bed b^3, the slide-head b^4, and the adjusting-nut adjustably connecting the bed with the slide-head, substantially as described.

17. The combination of the rand or heel-section carrier plate *c* with the paste or glue applying device for applying glue or paste to its upper surface as it is fed or moved by the carrier-plate, substantially as described.

18. In a heeling-machine, the combination of a feedway through which a rand or heel-section is adapted to be fed, with an apparatus for applying a solution or liquid to the upper surface of said rand or heel-section—such as a roll the operating-surface of which extends into said feedway from above it—as and for the purposes described.

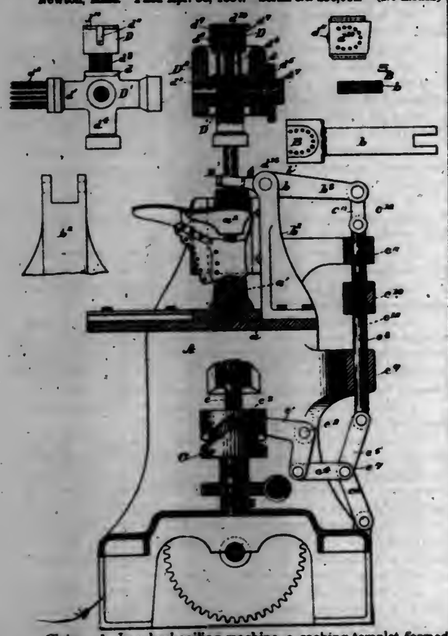
19. In a heel-nailing machine, the combination of the tank *e'* with the rolls e^5 e^6 E', substantially as described.

20. In a heeling-machine, the combination of a rand or heel-section carrier, a pocket or receptacle to which the rands or heel-sections are fed, an apparatus for applying glue or paste to the upper surface of the rand or heel-section—such as a roll—a second carrier for feeding a heel-blank or other heel-section to the said pocket or receptacle, and a heel-press to compress said rand and heel or said sections of the heel together in said pocket, and a heel transferrer or carrier to transfer said compressed heel-blank to the nail-driving devices, and the nail-driving devices, substantially as described.

21. The combination of a carrier for feeding rands or heel-sections to a pocket or receptacle, a paste or glue applying apparatus located to feed paste or glue to the upper surface of the rand or heel-section as it is moved by the carrier, a second carrier for feeding a heel-blank or additional heel-section to said pocket or receptacle, a heel-press to compress said sections in said pocket, a heel-blank transferrer or carrier to transfer said compressed heel-blank from the heel-press to the nail-driving devices, a paste or glue applying apparatus arranged between said heel-press and said nail-driving devices to deliver paste or glue to the said heel-blank, and the nail-driving devices, substantially as described.

22. The combination of the box or receptacle E, the carrier *c*, the paste, glue, or liquid applying apparatus E', the box or receptacle B, the carrier *b*, the receptacle or pocket *b'*, and a heel-press the bed of which forms the under surface of the said receptacle or pocket, substantially as described.

23. The combination of the box or receptacle E, the carrier *c*, the paste, glue, or liquid applying apparatus E', the box or receptacle B, the carrier *b*, the receptacle or pocket *b'*, a heel-press the bed of which forms the under surface of the said receptacle or pocket, the heel-blank transferrer C, and the nail-driving devices, substantially as described.



24. The combination, in a heel-attaching machine, of a heel-press comprising a bed and head, one of which has a yielding movement in relation to the other, with a transferrer C, for carrying the compressed heel-blank from the press to the heel-attaching devices, and said heel-attaching devices, substantially as described.

25. The combination, in an organized heel-attaching machine, of a heel-press, heel-attaching devices, the main shaft of the machine, and levers and cams in connection with the main shaft, whereby the heel-press and heel-attaching devices are simultaneously operated upon separate or independent heels, substantially as described.

26. The combination, in a heel-attaching machine, of a heel-press, the heel-attaching devices, the main shaft of the machine, and connecting mechanism, substantially as specified, and a heel-blank transferrer for carrying the compressed heel-blank to the heel-attaching devices, whereby the heel-blank is compressed simultaneously with the attachment of another compressed heel-blank, and a transferrer actuated to move a compressed heel-blank into position for attachment to the next boot or shoe to be heeled, substantially as described.

27. The herein-described method of forming and attaching heels, consisting in simultaneously and automatically feeding two or more sections of a heel-blank to a predetermined point, applying an adhesive substance to a part of said sections, uniting them by pressure, automatically transferring the completed heel to an attaching device, and finally securing the heel to the sole, as set forth.

410,196. HEEL-NAILING MACHINE. FREDERICK P. RAYMOND, 2d, Newton, Mass. Filed Apr. 30, 1887. Serial No. 236,611. (No model.)

Claim.—1. In a heel-nailing machine, a rocking templet formed on or supported by a pivoted lever, plate, or jaw and provided thereby with a movement to and from the last or work-support, as and for the purposes specified.

2. In a heel-nailing machine, the combination of a last or work-support with a rocking templet B, mounted on or formed in a pivoted plate, lever, or support, and said pivoted plate, lever, or support adapted to have movement imparted to its end to cause the templet to be moved toward and from the last or work-support, as and for the purposes specified.

3. In a heel-nailing machine, the combination of the last or work-support, a rocking-templet B, mounted upon or formed in the end of a lever, and a cam connected with the end c^9 of the said lever, as and for the purposes specified.

4. The combination, in a heel-nailing machine, of the last or work-support, a templet B, mounted upon a lever, pivoted plate or support b, the cam C, and intermediate connecting mechanism, comprising the lever c^7, the toggle c^8, connected with and operated by the lever, the slide bar or block c^9, and a link connecting the slide-block with the end of the said lever or support b, as and for the purposes specified.

5. The combination, in a heel-nailing machine, of the lever b, supporting at its end a templet having an arm b^3, the slide-block c^9, operated substantially as specified, and an intermediate adjustable connection between the slide-block and the end of the lever, substantially as described.

6. The combination of the lever b, supporting at its front end the templet B, the slide-block, and means, substantially as shown, for varying the line or point to which the templet B is moved, as and for the purposes specified.

7. The combination, in a heel-nailing machine, of a lever b, the templet B, supported thereby, the slide-head c^9, and the connection between the slide-head and the lever, comprising the parts c^{11} c^{12} having oppositely-arranged screw-threads formed upon their contiguous ends, and an adjusting-nut c^{10}, as and for the purposes described.

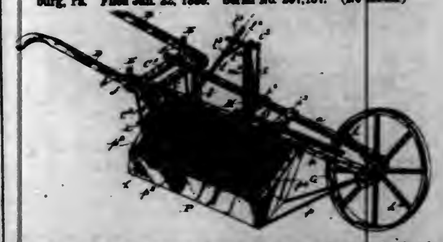
8. The combination, in a heel-nailing machine, of the rocking templet B, having the movement in relation to the last or work-support specified, the last or work-support, and nail-driving devices, substantially as described.

9. The combination, in a heel-attaching machine, of a rocking templet B, pivoted to have movements in relation to the last or work-support imparted to it, substantially as specified, the last or work-support, and the nail-carrier D, substantially as described.

10. The combination, in a heel-attaching machine, of a rocking templet provided with a movement relative to the last or work-support, substantially as specified, the last or work-support, a gang or group of awls, the nail-carrier, and a gang or group of drivers adapted to be moved successively into operative position in relation to the templet, and then to be operated, substantially as specified.

11. The combination, in a heel-attaching machine, of a rocking templet provided with movements in relation to the last or work-support, as specified, said last or work-support, the nail-carrier D, and the gang or group of drivers d^3, substantially as described.

12. In a heel-attaching machine, the combination, with a suitable automatic nail-supplying apparatus, of a nail-carrier D, movable in the arc of a vertical ellipse from the nail-supplying apparatus to the point of driving, and whose holes are open when in its highest position and closed during the remainder of its rotation by devices set forth, and held closed until the time of driving, as described.



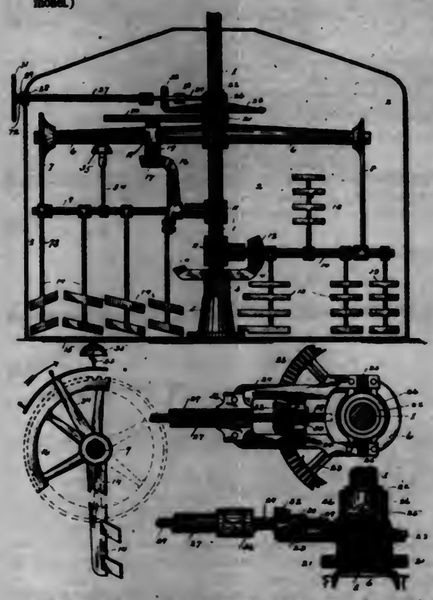
13. The combination, in a heel-attaching machine, of the rotary nail-carrier D, the slide-plate d^{10}, spring d^{11}, and projection d^{12}, substantially as described.

14. In a heel-nailing machine, a rotary nail-carrier D, having a horizontally-moving slide-plate for covering and uncovering the nail holes or apertures therein, controlled in its movements by mechanism as set forth, and adapted to be automatically opened when in its highest vertical position, automatically closed during its rotation, and again opened at the time of delivering, as described.

15. The combination of a reciprocating head D^2, carrying a rotary head D', the nail-carrier D, movable in relation to the arm d of the rotary head, as specified, the drivers d^3, and the slide-plate d^{10}, having a vertical and rotary movement and adapted to be moved to cover and uncover the holes of the carrier D, as and for the purposes specified.

16. The combination, in a heel-attaching machine, of the reciprocating head D^2, the rotary head D', carried thereby, an arm d, supporting a gang or group of drivers d^3, a nail-carrier D, carried by said arm d, its hole-covering plate d^{10}, adapted to be moved to uncover its holes to receive and discharge nails, and a suitable automatic nail-supplying apparatus, substantially as specified.

410,197. POTATO-BUG CATCHER. GEORGE F. RATHBUN, Myersburg, Pa. Filed Jan. 22, 1889. Serial No. 297,137. (No model.)



Claim.—1. An apparatus for catching potato-bugs and other insects, consisting of a one-wheeled vehicle provided with handles, and a standard rising from the center of the vehicle and extending over to one side thereof, in combination with a brush pivoted to said standard, a spring and lever mechanism connected with pins on the single wheel of said vehicle and with said brush, and an open box secured to one side of the vehicle, whereby when said vehicle is pushed along as a wheelbarrow the said lever mechanism will be operated by said wheel to strike by successive blows the brush extending over the vines and knock the insects into said box, substantially as herein described.

2. The frame-work of the vehicle, composed of two longitudinal arms, in combination with a support consisting of the legs b, top cross-pieces c c', the piece c extending over the tops of the said arms and bolted to the legs b, the said cross-piece c' in rear of the piece c and extending under the arms a, and to which the said arms are secured, the diagonal braces c^3, for connecting the cross-piece to said legs, the handles D D, secured to the cross-piece c, legs E E, attached to said cross-piece c', provided with holes and pins to adjust the handles as to height, and a wheel supported between said arms, all substantially as shown, and for the purpose described.

3. In combination with the frame-work of the vehicle provided with handles, a single wheel the spokes of which are provided with pins h, the central standard I, the brush L, the bar l, pivotally connecting the said brush and standard, the lever O, pivoted centrally to a cross-piece on the frame-work, adapted at one end to engage with the pins on the wheel, and provided at the other end with a spring o' to hold it in place, a rod M, provided with a spiral spring m', and secured at one end to the said lever O and at the other end to the said bar l', whereby when the wheel is rotated the said lever O coming in contact with the pins in said wheel, one end is raised and the other end depressed, and the bar l' and the lever M, operated by the springs to throw the brush one way, and when said lever O is released it and the lever M, operated by the springs, throw the brush in the opposite direction, whereby the brush is operated to give quick, sharp, successive blows against the vines, substantially as and for the purpose described.

410,198. MASH-MACHINE AND GRAIN-REMOVER. GEORGE KERNOCK, Allegheny, Pa. Filed Jan. 28, 1889. Serial No. 297,808. (No model.)

Claim.—1. In a mash-machine and grain-remover, the combination consisting of the central shaft 1, the beam 6, secured thereto and having suspended thereto in suitable bearings 7 11 the grain-moving shaft 9, the arms with oblique paddles 14, attached to said shaft 9, and the stationary arm 73, having oblique paddles 14 arranged opposite to those on shaft 9, the segmental bevel-wheel 16, attached to the shaft 9, the bevel-pinion 17, meshing with the wheel 16, the toothed wheel 20, operating on the same shaft 19 with the bevel-pinion 17, and meshing with a pinion 21, loosely journaled on the driving-shaft 1, the bevel-wheel 23, secured to the said pinion 21, and the bevel-pinion 32, mounted in a frame 24 and capable of being thrown into or out of gear with the bevel-wheel 23 by means of the sliding shaft 29, and a clutch 72 for the purpose of locking the bevel-pinion 32 to prevent the same from revolving, substantially as and for the purpose set forth.

2. In a mash-machine, the combination of a vertical rotary shaft carrying a horizontal beam, an axially-turning shaft 9, suspended from said beam and carrying a series of paddles, a short vertical counter-shaft journaled on said horizontal beam and geared to the shaft 9, mechanism, substantially as described, for rotating the counter-shaft and the shaft 9, the knockers carried by the shaft 9 to rotate therewith, and a bell on the horizontal beam in the path of said knockers, all arranged and combined for service substantially as described.

3. In a mash-machine, the combination, with a vertical power-shaft and a mash-tub, of a pinion fitted loosely on said shaft, a horizontal frame 24, pivoted on an extended hub of said pinion and having a tubular arm which is fixed at its outer end to the mash-tub, a horizontal shaft supported in said tubular arm and having a pinion which meshes with the loose pinion, a horizontal beam, a horizontal shaft 9, supported by said beam, and gearing intermediate of said horizontal shaft and the loose pinion, substantially as described.

4. The combination of a vertical rotary shaft carrying a horizontal beam, a horizontal axially-turning shaft 9, suspended from said beam by stationary bearings and having the arms and paddles, a vertical counter-shaft journaled on the horizontal beam and geared to the horizontal shaft 9, a toothed wheel 21, fitted loosely on the vertical rotary shaft and gearing with the counter-shaft, and an endwise-movable shaft having a pinion adapted to gear with said wheel 21 to rotate the latter, substantially as and for the purpose described.

5. A mash-machine and grain-remover such as described, consisting of the central driving-shaft 1, having a beam 6 attached thereto, the two horizontal shafts 9 10, supported thereby and by the driving-shaft 1, the stationary bevel gear-wheel 4, the pinion 12, attached to the shaft 10, the mash-paddles 13, secured to the said shaft 10, the paddles 14, arranged in an oblique position on the shaft 9, the bevel-wheel 16, meshing with a pinion 17, mounted on the beam 6, the toothed wheel 20, meshing with a pinion 21, loosely journaled to the driving-shaft 1, and said pinion 21 having an upwardly-extending hub 22, to which is secured the bevel-wheel 23 and collar 26, the frame 24, journaled to the said collar 26 and supported at the other end by the tube 27, the shaft 29, extending through the said tube 27, having a bearing 30 in the frame 24, and having a bevel-pinion 32 meshing with the bevel-wheel 23, the clutch 72, for locking the pinion 32, and the wheel 31, secured to one end of the shaft 29 as a means of operating the apparatus automatically and by hand, substantially as described.

6. The combination of a vertical rotary shaft carrying a horizontal beam, a horizontal axially-turning shaft 9, supported by said beam and vertical shaft and carrying the mash arms and paddles, a vertical counter-shaft journaled on the beam and geared at its lower end directly to said shaft 9, and mechanism, substantially as described, for rotating the counter-shaft and horizontal shaft 9 on their axes, substantially as and for the purpose described.

7. The combination of a vertical rotary shaft carrying a horizontal beam, a horizontal axially-turning shaft supported by said beam and vertical shaft and carrying the mash arms and paddles, a vertical counter-shaft journaled on the beam and geared to the horizontal shaft, a stationary frame arranged above the beam adjacent to the vertical shaft, an endwise-movable shaft supported at its inner end in said stationary frame, and gearing intermediate of said endwise-movable shaft and the counter-shaft, substantially as and for the purpose described.

8. The combination of a vertical rotary shaft carrying a horizontal beam, a horizontal shaft 9, supported by said beam and vertical shaft and having the arms and paddles, a vertical counter-shaft geared to the shaft 9 and journaled on the horizontal beam, a toothed wheel fitted on said vertical shaft and geared to the counter-shaft, a stationary frame arranged adjacent to the vertical shaft and said toothed wheel, and an endwise-movable shaft fitted in said frame to gear with the toothed wheel and adapted to be locked against rotation by a suitable locking device, substantially as and for the purpose described.

9. The combination, with a vertical power-shaft, a horizontal beam carried by said shaft, and a horizontal axially-turning shaft 9, supported by said beam and vertical shaft and having the paddles, of a vertical counter-shaft journaled on said beam and geared with the shaft 9, a pinion loosely fitted on the vertical rotary shaft and geared to the counter-shaft, and mechanism, substantially as described, for rotating said pinion independently of the vertical driving-shaft or from the latter, substantially as and for the purpose described.

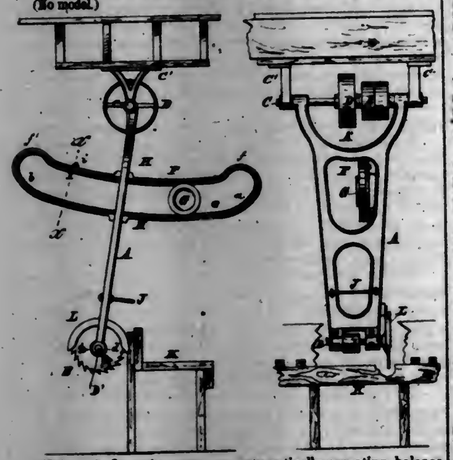
10. The combination, with a vertical power-shaft, a horizontal beam carried by said shaft, and a horizontal axially-turning shaft 9, supported by said beam and vertical shaft and having the paddles, of a vertical counter-shaft journaled on said beam and geared to the horizontal shaft 9, a pinion fitted loosely on the vertical power-shaft and geared to the counter-shaft, and a shaft geared to said pinion for rotating the latter, substantially as and for the purpose described.

11. The combination, with a vertical power-shaft, a horizontal beam carried by said shaft, and a horizontal axially-turning shaft 9, supported by said beam and vertical shaft and having the paddles, of a vertical counter-shaft journaled on said beam and geared to the horizontal shaft 9, a pinion fitted loosely on the vertical power-shaft and

geared to the counter-shaft, and a shaft and connections between the latter shaft and the vertical rotary shaft to automatically rotate the same, the pinion, the counter-shaft, and the horizontal shaft 9, all arranged and combined for service substantially as described, for the purpose set forth.

12. The combination, with a vertical power-shaft, a horizontal beam carried by said shaft, and a horizontal axially-turning shaft 9, supported by said beam and vertical shaft and having the paddles, of a vertical counter-shaft journaled on said beam and geared to the horizontal shaft 9, a pinion fitted loosely on the vertical power-shaft and geared to the counter-shaft, and a shaft geared to said pinion and having a clutch mechanism, and gearing intermediate of the vertical power-shaft and the clutch mechanism of the last-named shaft, all arranged and combined for service substantially as described.

13. The combination, with a vertical power-shaft, a horizontal beam, and a horizontal shaft 9, supported by said beam and vertical shaft and carrying the mash arms and paddles, of a vertical counter-shaft journaled on the beam and geared to the horizontal shaft 9, a pinion fitted loosely on the vertical power-shaft to gear with the counter-shaft and having a tubular extension or sleeve, another wheel fitted on said extension or sleeve, and a shaft geared to this last-named wheel for rotating the same, and the pinion to drive the counter-shaft, substantially as described.



14. The combination, with a vertical power-shaft, a horizontal beam, and a horizontal shaft 9, supported by said beam and vertical shaft and carrying the mash arms and paddles, of a vertical counter-shaft journaled on the beam, a pinion fitted loosely on the vertical power-shaft, a horizontal stationary frame loosely connected at its inner end to the vertical power-shaft and rigidly connected at its outer end to the mash-tub, and a horizontal shaft supported in said stationary frame and geared to the pinion, substantially as and for the purpose described.

15. The combination of a vertical power-shaft carrying a horizontal beam, a pinion fitted loosely on the shaft and having a tubular extension, a wheel fitted on said tubular extension or sleeve, a horizontal stationary frame fitted loosely around said sleeve of the pinion above the hub of said wheel and rigidly connected at its outer end to the mash-tub by a tube, a shaft journaled in said frame and its tube, a horizontal shaft 9, carrying the mash arms and paddles, and a counter-shaft geared to the pinion and the shaft 9, substantially as and for the purpose described.

16. The combination of a vertical power-shaft carrying a horizontal beam, a horizontal frame loosely connected at its inner end to said power-shaft, an arm or tube rigidly connected to the opposite end of said frame and the mash-tub to support the horizontal frame in a stationary fixed position, a horizontal shaft journaled in said frame, a pinion fitted loosely on the vertical power-shaft and geared to said horizontal shaft, a shaft 9, carried by the beam and the vertical power-shaft and having the mash arms and paddles, and a vertical counter-shaft intermediate of the loose pinion and the shaft 9, all arranged and combined substantially as and for the purpose described.

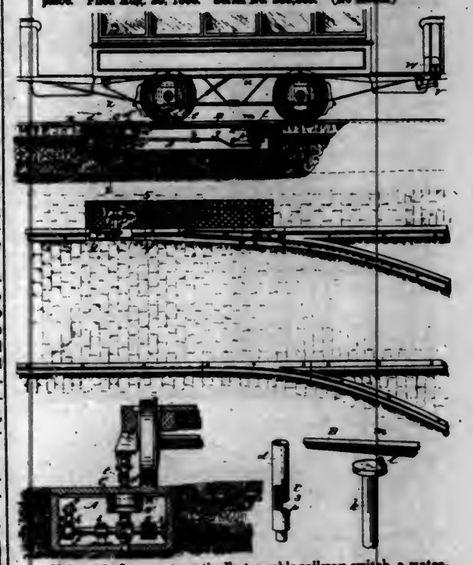
410,199. AUTOMATIC BALANCING DEVICE FOR SWING-SAWS.

JOHAN ROSS, Buffalo, N. Y. Filed Nov. 23, 1888. Serial No. 292,053. (No model.)

Claim.—1. In swing-saws, an automatically-operating balance consisting of the pendent saw-frame, a curved track secured to said frame, and an automatically-shifting weight operating upon said track, as and for the purpose set forth.

2. In swing-saws, an automatically-operating balance for the saw-frame, consisting of an automatically-shifting weight arranged upon a curved track having stops for said weight to limit its travel, said track being attached to and operating in combination with the swinging frame, as and for the purpose stated.

3. In swing-saws, an automatic balance for the swinging frame, consisting of an automatically-shifting weight operating upon a curved track having curved end stops, as stated, said curved track being secured to the swinging frame and operating in combination therewith, as and for the purpose specified.



4. In swing-saws, the combination, with the swinging frame, of the curved track-frame F, having the gap, as described, and the rolling weight, said gap being provided with the inset I, as set forth.

5. In swinging saws, the combination, with the pendent saw-frame, of the curved track-frame having circular track-weight and curved end stops, as stated.

6. In swing-saws, the combination, with the swinging saw-frame, of the track-frame having the web *e*, the weight G, having the groove *g*, and the removable inset I, secured by a bolt *i*, as stated.

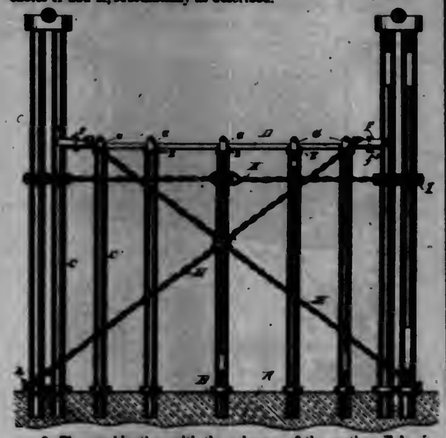
410,200. AUTOMATIC RAILWAY-SWITCH.

ROBERT C. ROWELL, Boston, Mass., assignor to the Rowell American Switch Company, same place. Filed Aug. 26, 1888. Serial No. 283,305. (No model.)

Claim.—1. In an automatically-movable railway-switch, a water-tight casing enveloping and containing the switch-operating devices, and provided with packing-boxes through which the externally projecting or actuating parts of the mechanism operate, substantially as described, and for the purpose specified.

2. In an automatically-movable railway-switch, one or more upwardly-projecting actuating-plungers connected with switch-operating levers *e* by elastic bearings, substantially as described, and for the purpose specified.

3. In a railway-switch, a rotating spindle having a disk upon its upper end provided with a crank-pin thereon, combined with a slotted switch-rail to be operated thereby, substantially as described.



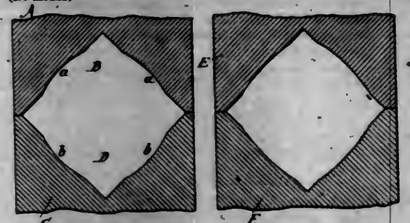
4. In an automatically-movable railway-switch, the combination of one or more upwardly-projecting actuating-plungers having elastic bearings upon the intermediate switch-operating mechanism, and a rotary spindle provided with a crank-pin at its upper end engaging with a switch-rail, substantially as described.

410,201. REST FOR SUSPENSION-BRIDGES.

EDWIN H. RENTON, Mountain Spring, Tex. Filed Apr. 1, 1889. Serial No. 305,589. (No model.)

Claim.—1. In a bridge-bent, the combination, with vertically-arranged columns, of a cross-bar uniting the inner columns, and obliquely-arranged cable-braces for giving rigidity to the bent, substantially as described.

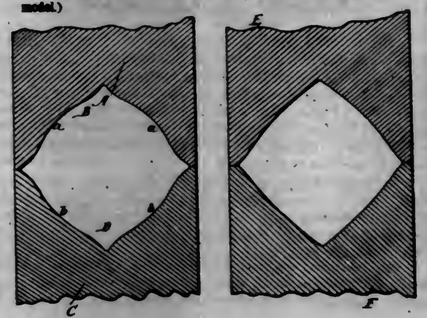
2. The combination, with the outer columns, of the inner columns, the castings E on the latter, the cross-bar D on the castings, the saddles G, resting on the castings and bar, the yokes F on the ends of the bar, the clasps I on the outer columns, and the twisted-wire brace-cables H and K, substantially as described.



3. The combination, with the columns, of the castings E, having extension *e* and lugs *d'*, the bar D, resting on the castings, the saddles G, having flanges *g* on their under sides which fit over the bar and between the lugs on the casting, and the yokes F, substantially as described.

4. The bridge-bent composed of a series of hollow columns united by wire braces and a cross-bar on the top of the central column, substantially as described.

410,202. ROLLS FOR THE MANUFACTURE OF SQUARE PIPE.



WILLIAM B. SANFORD, Kewanee, Ill., assignor to the Hazlan Steam Heater Company, same place. Filed June 7, 1888. Serial No. 276,810. (No model.)

Claim.—A pair of rolls each having in its face a groove that is concaved between the straight portions that constitute the four corners of the pass between said rolls, substantially as and for the purpose specified.

410,203. METHOD OF MAKING SQUARE METAL PIPE.

WILLIAM B. SANFORD, Kewanee, Ill., assignor to the Hazlan Steam Heater Company, same place. Filed July 23, 1889. Serial No. 318,623. (No model.)

Claim.—The mode of making square tubes from round tubes, which consists in passing a round tube, unsupported internally, through rolls, which, by their impact upon said round tube, will gradually mold the tube into a square form, substantially as described.

410,204. PYROXYLINE COMPOUND.

CHARLES R. SCHUPPIANS, Adams, Mass., assignor to the American Xylonite Company, New York, N. Y. Filed Oct. 14, 1886. Serial No. 216,373. (No specimens.)

Claim.—1. In the manufacture of pyroxyline compounds, a varnish or plastic composition consisting of nitro-cellulose in conjunction with propylic alcohol, substantially as described.

2. In the manufacture of pyroxyline compounds, a varnish or plastic composition consisting of nitro-cellulose, in conjunction with isobutylic alcohol, substantially as described.

410,205. PYROXYLINE VARNISH.

CHARLES R. SCHUPPIANS, Xylonite, Mass., assignor to the American Xylonite Company, New York, N. Y. Filed Dec. 20, 1888. Serial No. 294,155. (Specimens.)

Claim.—In the manufacture of pyroxyline compounds, a varnish or plastic compound consisting of nitro-cellulose in combination with anthraquicone and alcohol, substantially as described.

410,206. PYROXYLINE VARNISH.

CHARLES R. SCHUPPIANS, Xylonite, Mass., assignor to the American Xylonite Company, New York, N. Y. Filed Dec. 20, 1888. Serial No. 294,156. (Specimens.)

Claim.—As a solvent or converting agent for the conversion of plastic compounds having pyroxyline as a base, isovaleric aldehyde or its derivatives, amylidon-dimethyl ether and amylidon-diethyl ether, substantially as described.

410,207. PYROXYLINE COMPOUND.

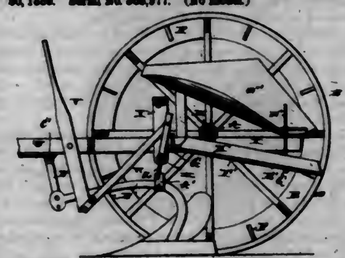
CHARLES R. SCHUPPIANS, Xylonite, Mass., assignor to the American Xylonite Company, New York, N. Y. Filed Dec. 20, 1888. Serial No. 294,157. (No specimens.)

Claim.—In the manufacture of pyroxyline compounds, a varnish or plastic composed consisting of nitro-cellulose in conjunction with alpha or beta naphthol in alcoholic solution, substantially as described.

410,208. PYROXYLINE VARNISH.

CHARLES R. SCHUPPIANS, Xylonite, Mass., assignor to the American Xylonite Company, New York, N. Y. Filed Dec. 20, 1888. Serial No. 294,158. (Specimens.)

Claim.—In the manufacture of pyroxyline compounds, a varnish or plastic compound consisting of nitro-cellulose in conjunction with acetate of glycerine, substantially as described.



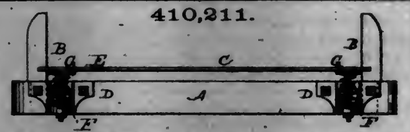
410,209. PYROXYLINE COMPOUND.

CHARLES R. SCHUPPIANS, Xylonite, Mass., assignor to the American Xylonite Company, New York, N. Y. Filed Dec. 20, 1888. Serial No. 294,159. (No specimens.)

Claim.—In the manufacture of pyroxyline compounds, a varnish or plastic compound consisting of nitro-cellulose, in conjunction with palmitine or its described equivalent, stearine, in alcoholic solution, substantially as described.

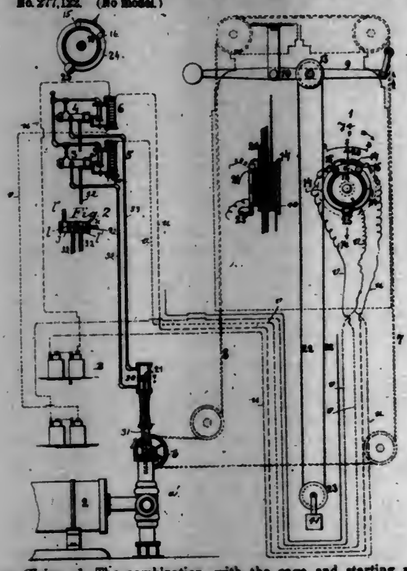
410,210. POTATO-DIGGER.

OLE SIMON, Arkdale, Wis. Filed Mar. 20, 1889. Serial No. 303,977. (No model.)



Claim.—In a potato-digger, the combination of a transporting-wheel having a broad tread or flange equipped on its inner periphery with flights or elevating-buckets, a plow arranged to turn the soil over upon the flange of said wheel, a chute extending under the upper portion of said flange, a shaking-screen pivoted to the front part of the frame and extending rearwardly under said chute, a shaft extending transversely over said screen and having radial arms or agitators, and operating mechanism for the said shaking-screen and agitator-shaft geared to one of the supporting-wheels of the machine, substantially as and for the purpose herein shown and specified.

410,211. WAGON-SPRING.



BENJAMIN SMITH, Mechanicsburg, Ohio. Filed Apr. 13, 1889. Serial No. 306,998. (No model.)

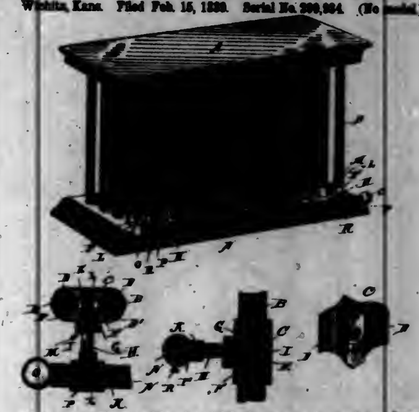
410,211.

Claim.—In combination with a wagon-bolster having standards, the brackets D, having flanges for bolts and annular recesses, spiral coils F, front and rear, cross-plates G G, and bar C, connecting said plates and engaging said standards, substantially as shown and described.

410,212. ELEVATOR. RUDOLPH C. SMITH, Yonkers, N. Y., assignor to Otis Brothers & Company, same place. Filed June 14, 1888. Serial No. 277,122. (No model.)

Claim.—1. The combination, with the cage and starting and stopping device and controlling electro-magnets of an elevator, of circuits including said magnets and extending to the cage, and a circuit-breaker in two parts, one connected with an operating-handle within the cage and the other connected with the stopping and starting device to be moved with the latter to break the circuit as the said device attains its desired position, substantially as described.

2. The combination, with the cage, stopping and starting device, and controlling electro-magnets of an elevator, of electric circuits including said magnets, a circuit-breaker consisting of two parts movable about a common center, one capable of being moved by the attendant and the other connected to move with the stopping and starting device, substantially as described.

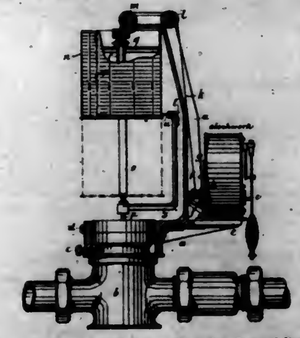


3. The combination, with the cage, stopping and starting device, and controlling-magnets and circuits of an elevator, of two disks, one carrying two contacts in each circuit with one of the magnets, another carrying a contact in circuit with both magnets, arranged, substantially as described, to permit the latter contact to be brought into connection with either of the former, one of the disks being connected with the stopping and starting device to move therewith, substantially as set forth.

4. The combination, with the controlling-magnets of an elevator, of a circuit-breaker in circuit with said magnets and consisting of two disks, one carrying two contacts 15 16, and the other carrying a contact 18, and with a peripheral non-conducting material cut away to permit the contact 15 or 16 to meet the contact 18 at one point on the revolution of either disk, substantially as set forth.

5. The combination, with the cage, stopping and starting device, its pulley *b*, the controlling electro-magnets and circuits, of a circuit-breaker in the cage consisting of independent disks carrying contacts, and a cable passing round a drum connected with one of said disks, round guide-pulleys, and round the pulley *b*, substantially as set forth.

6. The circuit-breaker combined with the cage and stopping and starting device of an elevator, and consisting of two parts, one provided with an operating-handle, the other provided with a pointer and connected with the stopping and starting device to move therewith, substantially as set forth.

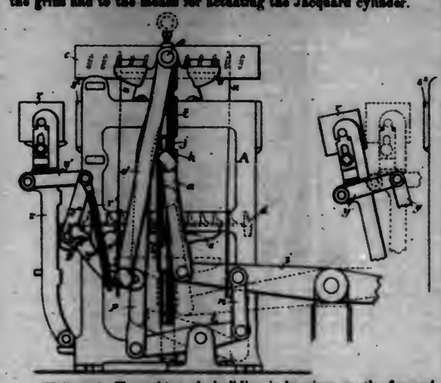


410,213. FOOT-REST FOR STEAM-RADIATORS. JACOB A. SOHN, Wichita, Kans. Filed Feb. 15, 1889. Serial No. 300,204. (No model.)

Claim.—1. The combination, with the steam-pipes, of the clamps C and F, the rods or arms H, passed through the latter and screwed to the inner clamp C, the washer L, screwed on the said rods or arms and bearing against the outer clamp F, the coupling attached to said rods or arms, and the tube or rod N, supported in the said couplings, substantially as described.

2. The combination of the clamps C F, having the two vertical grooves on their inner sides adapted to engage the front and rear faces of the steam-pipes of the radiator, the rods or arms H, having the screw-threads I, for the purpose set forth, the washers L, the couplings attached to the rods or arms H and having the set-screws R, and the tube or rod N, adapted to be secured in the said couplings, substantially as described.

410,214. APPARATUS FOR RECORDING AUTOMATICALLY THE FLOW OF WATER, &c. HENRY H. SPORTON and ERNEST WEBB, Enfield, County of Middlesex, England. Filed Apr. 2, 1889. Serial No. 305,676. (No model.)



Claim.—1. Apparatus for recording the flow of liquid through fluid-meters, comprising a non-revolving drum or cylinder adapted for carrying a diagram-paper surrounding the same and to be moved lengthwise on an axial support, a clock mechanism for actuating said drum, and an arm carrying a pencil attached to one of the index-spindles of the meter, whereby when the meter is operated the pencil will be caused to travel around the cylinder and over the paper, substantially as shown and described.

2. The combination of the frame *a*, a clock having a barrel carrying a cord, a drum *x*, suspended from the said cord, and a pencil-carrier *s*, adapted to be secured to one of the index-spindles of a fluid-meter and to be moved around the said drum, all substantially as and for the purposes described.

3. In recording apparatus for fluid-meters, the combination of a gravitating diagram-carrier, a clock-work, and a cord connecting the carrier to the clock-work, substantially as set forth, the weight of the carrier serving to assist in operating the clock-work, and the latter serving to control the movements of said carrier, all as and for the purpose described.

410,215. JACQUARD ATTACHMENT FOR LOOMS. THOMAS W. STAFFORD and SAMUEL D. BARNEY, Providence, R. I., assignors to the George W. Stafford Manufacturing Company, same place. Filed Feb. 14, 1889. Serial No. 300,225. (No model.)

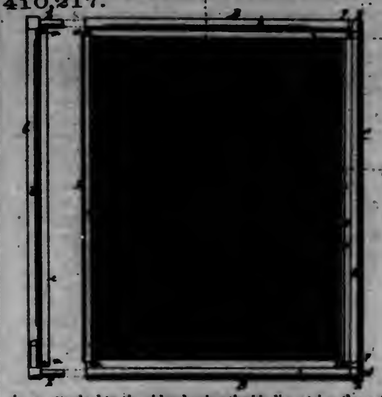
Brief.—The invention relates to the means for lifting and tilting the griffs and to the means for actuating the Jacquard cylinder.

Claim.—1. The guide-rods *j*, sliding in bearings on the frame A, and having pivotal bearings at their upper ends, the griff *c*, the table *e*, the cam *f*, and means for adjustably securing it to the said table, in combination with frame A and guide-roll *b*, secured thereto, and means for moving said rods *j* up and down in their bearings, substantially as specified.

2. In combination with the swinging frame *v* and end frame A, having a stud secured therein, a knee-lever made in two parts, both of which are pivoted on said stud and are formed to engage one with the other to give a positive movement to the swinging frame outwardly, and the spring *o'*, attached to the two parts of the said lever, whereby the lower part may make its downward movement if the frame *v* should be impeded in its inward movement, a link *y'*, a bar *o'*, and means to actuate said bar, substantially as and for the purpose set forth.

3. The combination, with the griff *c*, plate *a*, rod *j*, rod *p*, and needle-beam *l*, of lever *i*, a connection *n*, pivoted to one end of the needle-beam *l* and to the lever *i* at a point between its fulcrum and its inner end for the movement of said griff *c*, and the plate *d'*, plate or rest *d*, box *h*, and the connection *a*, pivoted to the inner end *i* and to the box *h* for the movement of the plate or rest *d*, substantially as herein set forth.

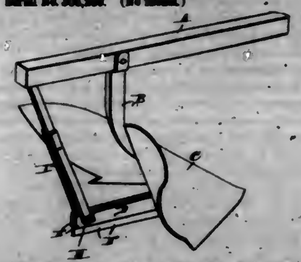
410,216. DOOR-KNOB ATTACHMENT. CHARLES H. STELLER, Milwaukee, Wis. Filed Apr. 6, 1889. Serial No. 306,268. (Model.)



Claim.—In a door-knob attachment, the combination, with the knob-shank F and spindle C, provided with a series of retaining notches I, of the cam-lever E, pivoted eccentrically to said shank F, the eccentric bearing of said cam-lever being located between the cam-supporting pivot and the retaining-notches of said spindle, and adapted to engage in one of the notches of and act as a wedge between the retaining-pivot and said spindle, substantially as and for the purpose specified.

410,217. WINDOW-SCREEN. DRAPER STONE, Pittsford, N. Y. Filed Jan. 30, 1889. Serial No. 298,066. (No model.)

Claim.—The screen herein described, consisting of a wire net, end pieces seamed to two of the sides, separate binding-strips seamed to the other two sides, and separate side pieces provided with corner-



410,217.

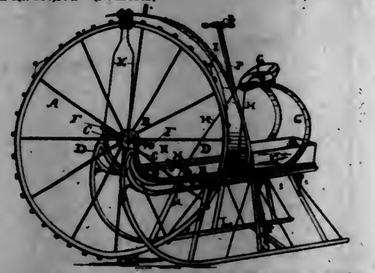
pieces attached to the sides, having the binding-strips, the outer edges of the end and side pieces being rolled up in tubular form, as shown and described, and for the purpose specified.

410,218. PLOW. IRA W. SYLVESTER, Palmetto, La. Filed Apr. 23, 1888. Serial No. 308,269. (No model.)

Claim.—In a double plow, the combination of the standard carrying the mold-board, the lister-plates secured to and extending rearwardly from the foot of said standard, the guide-plate having a cutting-edge and mounted adjustably between said lister-plates, and the adjusting-brace connecting the heel ends of the latter with the plow-beam, substantially as set forth.

410,219. INKSTAND. RICHARD S. TRAIN, Oak Park, Ill. Filed Oct. 6, 1888. Serial No. 287,377. (No model.)

Claim.—1. The herein-described inkstand, having a body formed from a single sheet of metal, and having an appropriate opening for the ink-well and a suitable cover, substantially as described.



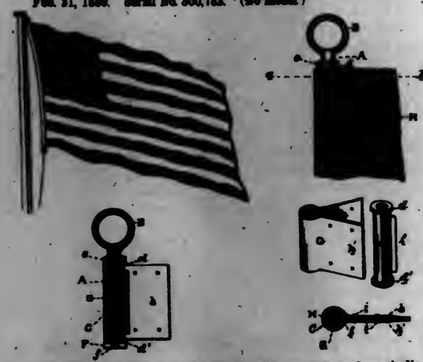
2. An inkstand having its body formed from a single sheet of metal, with a central ink-well opening and projections integral with the body to serve as pen-racks, and a suitable cover, substantially as described.

3. An inkstand having the body formed from a single sheet of metal and provided with projections adapted to confine the side portions of the body, and a suitable cover, substantially as described.

4. An inkstand having the body formed from a single sheet of metal and provided with a central opening for an ink-well, and having slotted turned-down portions adapted to furnish a bearing for a cover, and a cover having plates adapted to said slots, substantially as described.

5. An inkstand comprising a pyramidal body formed from a single sheet of metal, and having a suitable ink-well opening and a hinged cover, substantially as described.

410,220. SLED-PROPELLER. JOHN D. THOMAS, Petoskey, Mich., assignor of one-half to Amos H. Tyler, same place. Filed Oct. 9, 1888. Serial No. 287,904. (No model.)



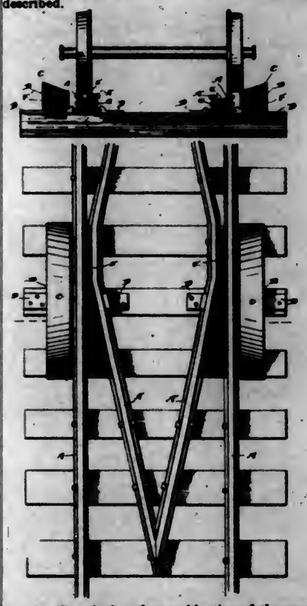
Claim.—1. The combination, with a sled, of the propeller-frame consisting of the arms D, removably secured upon the upper rails of the sled, and having upturned forward spring ends D' terminating in bearings C, and propeller-wheel A *a*, having crank-axle B journaled in said bearings C of the spring-arms D', as described, for the purposes specified.

2. The combination, with the frame of the propeller, of the shield attached to and forming part thereof, and the brace-rods adapted to be secured to the knees of the sled to support the forward end of the shield over the wheel, substantially as specified.

3. The combination, in a sled-propeller, with the sled and arms D, removably secured upon the top rail of the sled and having the forward upturned spring-arms D' terminating in bearings C, of the body E, seat G, supported upon spring standards G', propeller-wheel A *a*, having crank-axle B journaled in the ends of the spring-arms D', and brake-lever P, with cross-head R, all constructed and arranged to operate as described, for the purposes specified.

410,221. SWIVEL FOR FLAG-HALYARDS. HENRY B. THOMPSON, Philadelphia, Pa., assignor to Isabe Townsend, same place. Filed Feb. 21, 1889. Serial No. 300,732. (No model.)

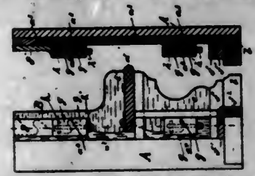
Claim.—1. A swivel for flag-halyards, consisting of a spindle or axis provided with an eye or opening for the rope and inverted to rotate within a barrel or tube attached to the material of the flag, substantially as and for the purpose specified.



2. In a swivel for flag-halyards, the spindle A, provided with an eye or ring B, shoulder *c*, stem or pin *f*, and washer F, in combination with the barrel C, flanges *d d'*, lug *l*, clamp G, and rivets *i i*, substantially as shown and described.

410,222. RAILROAD ROLLING-STOCK RERAILING DEVICE AND BRIDGE-GUARD FOR SAFETY. DORR B. TILDEN, Cleveland, Ohio. Filed May 1, 1889. Serial No. 309,203. (No model.)

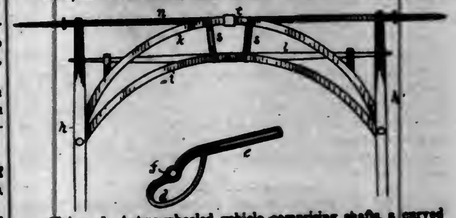
Claim.—1. In a rerailing device, the rerailing-frog B, being placed clear of the rail A, having its bearing-surface inclined toward the rail, as herein described, and having its upper bearing-surface higher than the top of the rail, substantially as and for the purpose described.



2. In a rerailing device, the combination of the rerailing-frog B, placed clear of the rail and inclined, as herein described, with rail A and guard-rails A' A', substantially as and for the purpose described.

3. In a rerailing device, the combination of the frog B with the fastening-plate D and rails A and A' A', substantially as and for the purposes described.

4. In a rerailing device, the combination of the rerailing-frog B with the plate D, rails A and A', lifter E, and bolt G, substantially as shown, and for the purposes described.

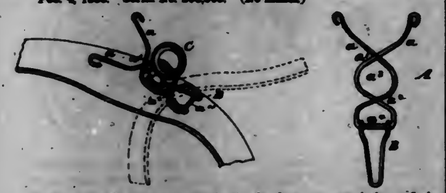


410,223. DIVISIBLE UPRIGHT PIANO. WILHELM UHLARK, New York, N. Y. Filed Aug. 20, 1888. Serial No. 283,315. (No model.)

Claim.—1. An improved divisible upright-piano case, the front section of which is shorter than the rear section, and which, when the sections are placed together, rests on the feet of the rear section.

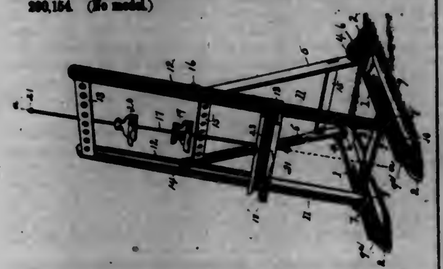
2. An upright-piano case divisible into longitudinal sections and provided with beveled pieces, (having a series of inclined planes,) lock blocks or brackets with screws and nuts, as described, for the purpose specified.

410,224. TWO-WHEELED VEHICLE. WILLIAM J. WATSON, Decatur, Ill. Filed Feb. 15, 1889. Serial No. 300,003. (No model.)



Claim.—1. A two-wheeled vehicle comprising shafts, a curved axle, a truss-brace connecting the shafts and axle and carrying a whiffletree, a circle-bar carrying a seat over the axle and connecting pivotally with the shafts, and a spring on the axle under the circle-bar, as set forth.

2. A two-wheeled vehicle comprising shafts, a curved axle, a truss-brace connecting the shafts and axle and carrying a whiffletree, a circle-bar carrying the seat, a spring on the axle carrying the rear part of the circle-bar, and stirrup-bars longitudinally adjustable on the ends of the circle-bar and pivotally connected with the shafts, as set forth.



3. A two-wheeled vehicle comprising shafts *h h'*, curved axle *n*, truss-brace *i k s s*, connecting the shafts and axle and carrying whiffletree *l*, the circle-bar *b*, carrying seat *a*, the spring comprising parts *m*, *m'*, *m''*, and *o*, supporting the circle-bar and seat from the axle, and the stirrup-bars having loops *d d'* and slotted portions *e e'*, the said stirrup-bars being pivotally connected with the shafts and adjustably connected with the ends of the circle-bar, as set forth.

410,225. REIN-HOLDER. EDWARD WILSON, Hallsville, Ill. Filed Feb. 4, 1889. Serial No. 298,868. (No model.)

Claim.—A line, strap, or rein-tie for harness, consisting of the spring-wire A, made with elastic jaws *a a*, crossed at *a' a''* to form the expansible and contractible loop *a*², and provided with the hinged loop-piece B, whereby said tie may be used in the manner set forth.

410,226. EASEL. JAMES H. WHITE, Bennington, Vt., assignor of one-half to William C. Ball, same place. Filed Nov. 6, 1888. Serial No. 290,154. (No model.)

Claim.—1. An easel comprising a base, a vertically-slotted upright or frame removably pivoted thereto, a brace pivoted to said base and adjustably connecting said base or support and frame, and a thumb-screw connecting said brace and frame and adapted to clamp said brace and hold the frame in its adjusted position.

2. An easel comprising a slotted base, a frame or upright adapted to be removably pivoted at its lower end within said slots and having a vertically-slotted rear portion, a frame-brace pivotally connected at its bottom portion to said base, and means, as a thumb-screw, for adjustably connecting said frame and base in either vertical or angular position.

3. An easel comprising a base having open-ended slots respectively in its front portion and also rearwardly thereof, a frame having on its lower end one or more horizontally-extending pins or studs adapted to enter either of said slots, as desired, and to constitute journals for supporting said frame in either a vertical or angular or closed position upon said base, hooks pivoted to said base and adapted to engage said journals and hold the frame respectively in its adjusted and folded positions, a frame-brace pivotally secured at its lower end to said base, and a clamp or clamps for adjustably connecting the upper end of said frame-brake and frame together in their adjusted positions, and work-supports adjustably attached to said frame, substantially as and for the purpose set forth.

4. In an easel, the combination of a base, a frame having removable and adjustable pivotal bearing upon said brace, and a brace pivotally secured at its lower end to said base and adapted at its upper end to hold said frame in either vertical, angular, or parallel position upon and relatively to said base.

5. In an easel, the combination of a base, a frame pivotally connected to said base, a vertical rod secured to said frame, and shelves or work and tool supports carried by said rod and adapted to be vertically adjusted in position thereon.

6. An easel comprising a suitable frame, a vertical rod supported thereon, work-supporting devices having curved or flanged outer edges, a material-holding tray having vertical division-walls therein, provided with curved or dish-shaped upper edges to serve as rests for brushes and the like, said work and material supports having guide-bearing on said rod, as explained, and clamps for adjustably clamping said work and material supports in position upon said rod, substantially as set forth.

7. An easel having a base, a frame pivoted thereto, a brace pivotally attached at its lower end to said base and having adjustable connection at its upper end to said frame, a vertical rod supported on said frame, sleeves vertically adjustable upon said rod, and one or more shelves pivoted to said sleeves.

8. An easel comprising a base or support, a frame having pivotal connection with said support, a brace pivotally connected with said base and having adjustable connection with the frame to permit of the angular adjustment thereof, and the folding together of said base, frame, and brace, a vertical rod attached to said frame, sleeved work and material supports mounted upon said rod with capability of vertical adjustment thereon, and clamping devices for holding said work and material supports in adjusted position.

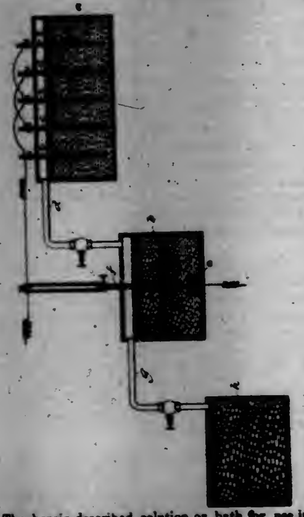
9. An easel comprising a base or support, a frame having pivotal connection therewith, a pivotal brace adjustably connected with said frame to permit of the angular adjustment thereof and also of the folding together of said base, frame, and brace, a vertical rod attached to said frame, material and work supports or clamps vertically adjustable upon said rod, and shelves having loose bearing upon the vertical rod.

10. An easel comprising a base or support, a frame having pivotal connection therewith, a pivotal brace adjustably connected with said frame to permit of the angular adjustment thereof and also of the folding together of said base, frame, and brace, a vertical rod attached to said frame, material and copy or work supports or clamps vertically adjustable upon said rod, and work-gripping fingers pivotally attached to the material-support and also to one or more of the work-supports.

410,227. STEAM-BOILER. JAMES R. WILSON, Reston, Pa., assignor of one-half to Frank Wilson, same place. Filed July 3, 1889. Serial No. 316,425. (No model.)

Claim.—1. The combination, with the casing A', of the detachable covering-plate a^5, having exit-opening for the products of combustion, and the pendent vertically-detachable boiler B, having central vertical imperforate interiorly-unobstructed dividing-chamber *b*, extending from front to rear of the combustion-chamber, and provided with the series of right and left horizontal water-tubes b' and b^2, extending to the walls of such combustion-chamber, whereby the interior space is divided centrally into two vertical right and left upwardly discharging chambers.

2. The combination, with the casing A', and with its detachable covering-plate, provided with smoke-exit opening, of the pendent upwardly-detachable boiler B, having central rectangular closely-fitting chamber *b*, extending from the front to rear of the interior space and dividing the same into two separate right and left chambers, which discharge upwardly, and provided with horizontal water-tubes b' and b^2, extending from the central chamber across the separated parts of the combustion-space, the supply-pipe b^3, extending through the casing at one side thereof, and the return-pipe b^4, extending through the casing at the opposite side thereof.



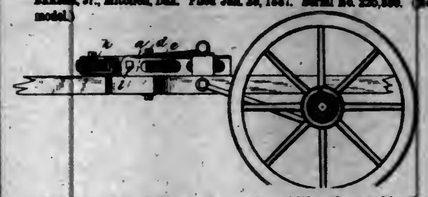
3. The combination, with the casing A', having vertical ways in the front and rear walls thereof, extending from the top of the wall downwardly and terminating in seats a^6 and a^7, of the boiler B, having projecting lugs B^2 and B^3, adapted to the vertical ways and to the seats a^6 and a^7.

4. The pendent upwardly-detachable steam-generator B, having central imperforate dividing-chamber *b*, right and left outwardly-closed horizontal water-tubes b' and b^2, and superposed superheating-chamber or steam-drum B', in combination with the inclosing-casing A', the combustion-chamber of which is of like horizontal area with the boiler and its tubes, and with the detachable covering plate or cap a^5 of such casing.

5. In a steam-boiler, the combination, with an inclosing-casing

which is provided with a detachable covering-plate and with supporting bearings or seats, of a boiler which is provided with projecting lugs which engage the supporting-bearings in the casing, whereby the boiler in its entirety is rendered vertically removable and replaceable.

410,228. SOLUTION FOR USE IN SEPARATING METALS FROM THEIR ORES. JACOB C. WHEWELL, Medford, Mass., assignor to the Electric Gold and Silver Chlorination Company, Kittery, Me. Filed Nov. 3, 1888. Serial No. 289,919. (Specimens.)



Claim.—The herein-described solution or bath for use in separating metals from their ores, consisting of chlorine in solution, sodium chloride, ammonium chloride, hydrochloric acid, and bichloride of mercury, as set forth.

410,229. HEATING-STOVE. CHARLES C. AUGUSTINE, Philadelphia, Pa., assignor to Steel, Van Rossum & Co., same place. Filed June 7, 1889. Serial No. 313,499. (No model.)

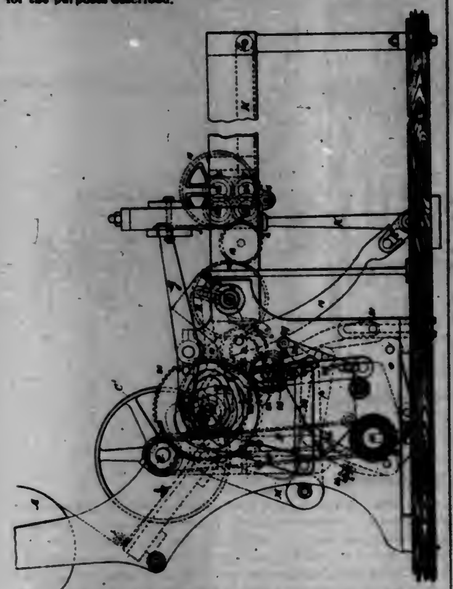
Claim.—In combination, the fire-pot, the dome, the inner and outer concentric cylinders, the ring interposed between the fire-pot and the dome and cylinders, said ring being constructed with flanges for seating the cylinders and dome and with flues inclining upwardly and outwardly to the smoke-space between the cylinders, with a horizontal flange extending between the seat-flanges c' c^2, said flange being inclined on its upper side to the flues and constituting the bottom of the smoke-space and having also an exit-opening X therein, the flue-sheets on either side of the opening, and the feed-door located in the fire-pot below the ring and the ports thereof, substantially as described.

410,230. SPRING DRAFT ATTACHMENT FOR VEHICLES. HIRAM BARBER, Jr., Mitchell, Dak. Filed Jan. 30, 1887. Serial No. 226,899. (No model.)

Claim.—1. In a draft attachment for vehicles, the combination, with the pole, of the tubular casing adapted to slide thereon, provided with a hook or clevis at its forward end and longitudinal slots in its top and bottom, a vertical bolt passing through the slots and the pole and provided at its upper end with a head and at its lower end with a nut, and the coiled spring interposed within the casing between its rear end and the fixed vertical bolt, whereby the spring is compressed when the casing is moved longitudinally forward on the pole, substantially as specified.

2. In a draft attachment for vehicles, the combination, with the pole, of the tubular casing adapted to slide longitudinally thereon and provided with the longitudinal slots in its top and bottom, the headed bolt passing downward through the slots in said casing and through the pole and secured by a nut on its lower end, the spring interposed between the bolt and the closed end of the casing, and the clasp or band g, secured to the pole and extending over the casing as a guide for its longitudinal movement, substantially as described.

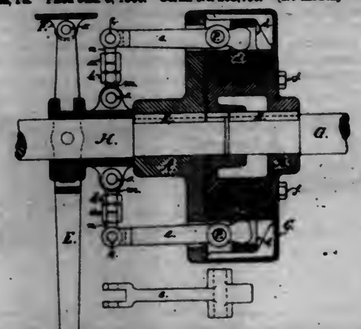
3. In a draft attachment for vehicles, the combination, with the pole, of the tubular casing provided with the slots b c in its top and bottom, the rigid bolt d in the pole projecting through the slots in the casing, the clasp or band g, secured to the pole and extending over and around the casing, the hammer-strap connecting the head of the bolt and the fixed band g, and the coiled spring within the casing between its closed end thereof and the fixed bolt, substantially as specified.



4. In a draft attachment for vehicles, the tubular casing a, provided with longitudinal slots in its top and bottom, the headed bolt d, projecting through the slots of the casing and through the pole and provided with a nut on its lower end for securing the casing to the pole, whereby it is adapted to move longitudinally back and forth thereon, the band g, secured to the pole and surrounding the casing as a guide to its longitudinal movement, the strap i, connecting the head of the bolt d with the band g, the coiled spring within the casing and bearing against its rear end, and the core f within the coil, having its head resting against the fixed bolt d, all combined and arranged substantially as and for the purpose described.

410,231. CIGARETTE-MACHINE. AMBROSE R. ROSS, London, England. Filed Sept. 3, 1886. Serial No. 294,403. (No model.) Patented in England July 8, 1887, No. 9,042.

Claim.—1. The combination, with the driving-shaft b and means for continuously rotating the same, of the eccentric and rod 10, transmitting motion therefrom, the pawl 9 and its carrying-lever actuated by said rod, the ratchet wheel, 8, intermittingly turned by said pawl, gearing driven by said wheel, comprising the large spur-wheel 11, on the same axis as the ratchet-wheel and fast therewith, the idle spur-wheel 12, large spur-wheel 13, pinions 14 15, and double-width pinion 16, as shown, the tobacco-feed rollers h h^2, driven by said gearing, and endless tobacco-feed band H, driven by said roller A, and the tobacco-pressing rollers h^3 h^4, substantially as described.

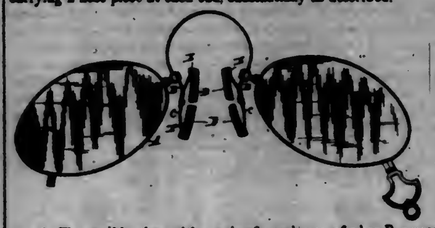


2. In combination with an endless cigarette-rolling band G, means for rotating the same, and suitable supporting, tightening, and right-forming devices, the pressing-roller 27, the bell-crank 28, carrying said roller, the bell-crank M, carrying said bell-crank 28, the cams 32 33, means for rotating said cams, and lever connections transmitting motion from the respective cams to the respective bell-cranks, substantially as described, for the purpose set forth.

3. In combination with an endless cigarette-rolling band G, means for rotating the same, and suitable supporting, right-forming, and pressing devices, the tightening-roller L, located at the side of the band opposite that on which the cigarette is discharged, and means for carrying, actuating, and adjusting said roller, comprising rocking levers l, in which the roller is mounted, a bell-crank N, which rocks said levers, and a set-screw 34, which is carried by one of these parts and adjusts said levers relatively to said bell-crank, substantially as and for the purposes described.

4. The combination, with the driving-shaft b and means for continuously rotating the same, of the segmental wheels 25 26, of different diameters, carried by said shaft, the pair of pinions 24, meshing both of said wheels successively, the rollers 22 23, carried by said pinions, and the endless cigarette-rolling band G, driven by said rollers, whereby said band is given an especially-accelerated motion at the moment when the cigarette is to be discharged, substantially as described.

410,232. FRICTION-COUPLING. RICHARD C. DURCHSLER, Philadelphia, Pa. Filed Jan. 8, 1889. Serial No. 296,708. (No model.)



Claim.—The friction-coupling consisting of the hub B, adapted to be secured to shaft G, said hub being provided with annular V-shaped grooves upon its periphery, the hubbed plate A, adapted to be secured to shaft H, the levers c, fulcrumed in said plate A, the wedges d, provided with V-shaped projections and with yokes d', the adjustable toggle-links m n, and the sleeve D, all arranged to operate substantially as set forth.

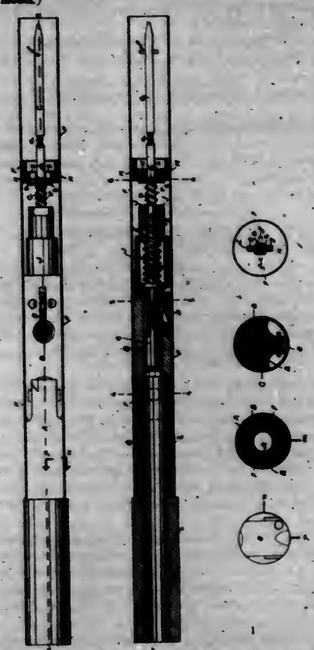
410,233. EYEGLASSES. JOHN L. BORDEN, Philadelphia, Pa. Filed Mar. 28, 1889. Serial No. 304,462. (No model.)

Claim.—1. Eyeglasses having duplex nose-pieces attached to a carrier having a central connection with the eyeglasses and adjustable at right angles to the lenses, substantially as described.

2. The combination, with a pair of eyeglasses, of a bar B, a nose-piece carrier adjustably connected at its center with said bar B and carrying a nose piece at each end, substantially as described.

3. The combination, with a pair of eyeglasses, of a bar B, a nose-piece carrier adjustably connected to said bar B and having nose-pieces flexibly connected to each of its ends, substantially as described.

4. The combination, with a pair of eyeglasses, of a bar B, a spring attached thereto, and a nose-piece at each end of the spring, substantially as described.

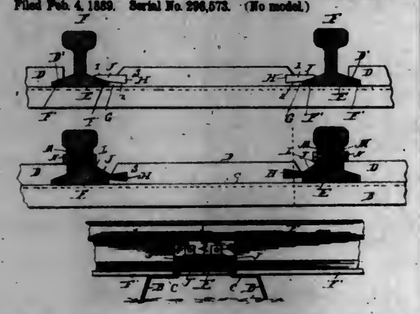


5. The combination, with a pair of eyeglasses, of a bar B, a carrier C, and nose-pieces D, pivotally attached to each end of the carrier, substantially as described.

410,234. SPECTACLE-CASE. WILLIAM W. BEILHART, Indiana, Pa. Filed Dec. 3, 1888. Serial No. 292,479. (No model.)

Claim.—In a spectacle-case, the shell having the longitudinal swell portions, the depressed portions at the sides thereof, and the longitudinal partition having the soft lining and having the extended end, substantially as specified.

410,235. FIRE-ARM. DANIEL A. DRAPER, East Cambridge, and ALFRED TORES, Malden, Mass. Filed Jan. 30, 1889. Serial No. 298,152. (No model.)



Claim.—1. The combination, with a barrel A, a breech-block B to open and close the barrel, and having a firing-pin C, a spring E, to actuate said firing-pin, and a trigger D, all substantially as described, of an extension G of the firing-pin, having a projection f, and a sleeve

F, having a partition H, to slide on and to abut against the projection *f* of said extension, substantially as described, for the purpose specified.

2. The combination, with a barrel A, a breech-block B to open and close the barrel, and having a firing-pin C, a spring E, to actuate said firing pin, and a trigger D, all substantially as described, of an extension G of the firing-pin, and which is of polygonal shape in cross-section, and has a projection *f* and a depression *a* between said projection *f* and the firing-pin, and of a sleeve F, having a partition H, with a hole *b* to fit said extension and its projection *f*, and to slide and rotate on said extension and to abut against and pass over its projection *f*, substantially as described, for the purposes specified.

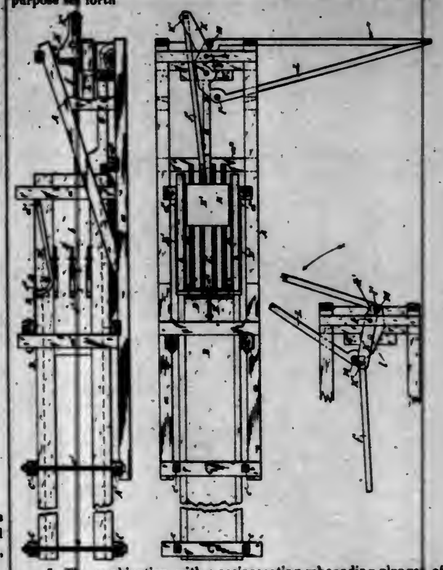
410,236. RAILWAY-TIE. ALVAN B. FITCH, Franklin Grove, Ill. Filed Feb. 4, 1889. Serial No. 298,573. (No model.)

Claim.—1. In a railway-tie, the combination of the base-plates C, exterior cap D, provided with the recess D', interior cap S, provided with recess H, and the key J, provided with the flange or ledge L, substantially as shown, and for the purpose described.

2. The combination of the downwardly-divergent flanges B, the horizontal base-plates C, exterior cap D, provided with recess D', adapted to fit the outer rail-flange, interior cap S, provided with recess H, a suitable key J, provided with a level upper surface 1 and a lower beveled surface 2, and adapted to be received and held in said recess H, and rail F, provided with flanges F', substantially as shown, and for the purpose described.

3. The combination of the tie A, provided with lateral flanges B, base-plates C, outer cap D, provided with recess D', inner cap S, provided with recess H, rail F, provided with flanges F', and key J, provided with flange L, substantially as shown, and for the purpose described.

4. The combination of the tie A, provided with the lateral flange B, base-plates C, outer cap D, provided with recess D', inner cap S, provided with recess H, rail F, provided with lateral flanges F', key J, provided with flange L, fish-plates M, and transverse bolts N, substantially as shown, and for the purpose described.

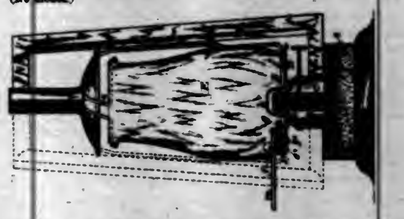


410,237. HAY-PRESS. JOHN H. GARDNER, Dalton, Ga. Filed Apr. 20, 1889. Serial No. 307,980. (No model.)

Claim.—1. The combination, with the press-chamber, of the folder at the top of the press-chamber, the long folder-arms pivoted to the press-chamber sides in line with the folder and having downwardly-bent guide portions bearing against the sides of the press-chamber, and a flat spring secured to the top of the press-chamber and bearing downwardly upon the folder, substantially as and for the purpose set forth.

2. The combination, with a press-chamber provided with longitudinal bars at its bottom and a frame supporting the said press-chamber and provided with a cross-sill under the ends of said bars, of a reciprocating rebounding plunger provided with a projecting buffer-bar sliding on said sill, and a downwardly-extending guide at the bottom of the buffer-bar between the said longitudinal bars of the press-chamber, and a buffer-block secured to the supporting-frame for the said buffer-bar to strike against, substantially as and for the purpose set forth.

3. The combination, with a press-chamber, and a frame supporting the said press-chamber, of a reciprocating rebounding plunger provided with a projecting buffer-bar at its lower part, said bar being adapted to slide upon a cross-sill of the frame and keep the plunger-face vertical, and a buffer-block secured to the said frame for the buffer-bar to strike against, substantially as set forth.

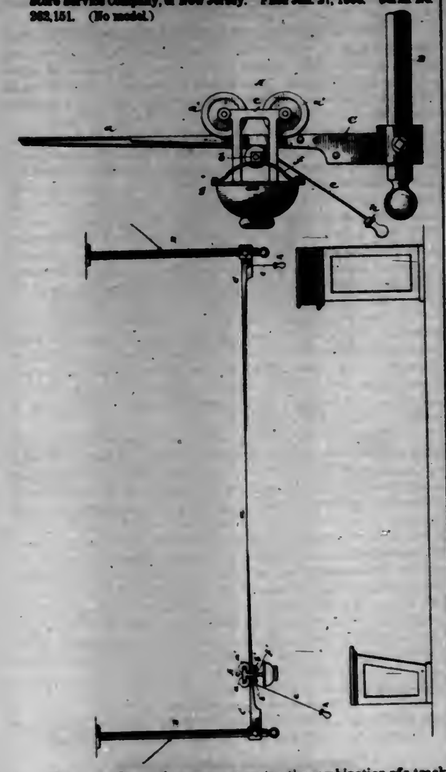


4. The combination, with a reciprocating rebounding plunger, of the push-lever provided with a short rearwardly-projecting limb and mounted on a vertical shaft, the pitman pivoted to the plunger and to the said lever, and an operating-lever pivoted between the said shaft and the plunger and provided with projections bearing against the said push-lever and its short limb, substantially as and for the purpose set forth

5. The combination, with a reciprocating rebounding plunger, of the bifurcated push-lever mounted on a vertical shaft and provided with a short rearwardly-projecting limb, the pitman pivoted to the plunger and to the said lever, and an operating-lever pivoted between the said shaft and the plunger and provided with vertical anti-friction rollers bearing alternately against the opposite sides of the push-lever and running along them, whereby the power of the operating-lever upon the plunger is increased during the stroke of the plunger, and adapted to strike against the said limb near the ends of the strokes of the operating-lever and throw the push-lever over the center, substantially as set forth.

6. The combination, with a press-plunger having its rear end higher than its face, of a top for the plunger, consisting wholly of a single plate of spring metal secured to the said higher rear end of the plunger and extending forwardly over the face-plate in a normally-horizontal straight line, substantially as set forth.

410,238. LAMP OR LANTERN LIGHTING DEVICE. LEWIS GERHARDT, Washington, D. C. Filed Dec. 11, 1888. Serial No. 293,263. (No model.)



Claim.—1. A lamp-burner in which one of the chimney-retaining springs is provided with an enlarged portion adapted to cover an aperture formed in the chimney or globe, in combination with a chimney or globe provided with an aperture in the side and adapted to be turned, substantially as described.

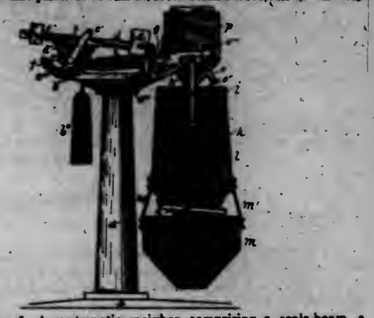
2. The combination of an oil-reservoir, a lamp-burner and its glass globe provided with a perforation therein on the same level with said burner, a frictional plate secured at both of its ends to the globe-supporting plate of the burner, and a shutter secured to said supporting-plate, substantially as and for the purpose described.

3. The combination of a chimney or globe having a perforation in the side thereof with a lamp-burner having one of its chimney or globe retaining springs provided with a disk or enlarged portion and with a roughened plate secured at both ends to the burner, substantially as set forth.

410,239. STORE-SERVICE APPARATUS. JOHN H. GOSSELLOW, Troy, N. Y., assignor, by mesne assignments to the Lamson Consolidated Store Service Company, of New Jersey. Filed Jan. 27, 1888. Serial No. 262,151. (No model.)

Claim.—1. In a cash-carrier apparatus, the combination of a track having a wedge-formed extension, a propelling-cord below the track, and a carriage movable on the said track and having in its frame below the track a yielding roller to bind on said extension and constructed to receive the propelling-cord, substantially as set forth.

2. The combination, with the track of a store-service apparatus, of a wedge-shaped arm constituting a terminal extension of the track, a carrier provided with upper wheels running upon the track and with a lower yielding roller, and a propelling-cord extending between the track and the lower wheel, substantially as set forth.

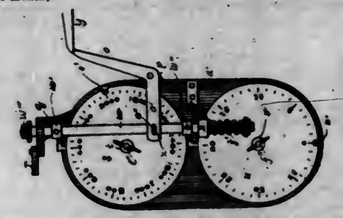


3. The combination, in a cash-carrier apparatus, of a wedge-shaped arm, a track, a propelling-cord, and a carriage provided with a yielding roller arranged to bear upon the arm, substantially as and for the purpose set forth.

410,240. WRENCH. HENRY HARRISON, New Haven, Conn. Filed Nov. 22, 1888. Serial No. 291,521. (No model.)

Claim.—The handle A, having the side rabbets *p* and the socketed leg *c*, combined with the jaw B, having the parallel bars *a*, provided in their edges with the grooves terminating in the shoulders *h*, as described, said bars fitting and secured by their outer end portions in said handle-rabbets, the sliding jaw having a longitudinal screw-socketed shank *x*, said shank being of H shape in cross-section engaging and movable on said parallel jaw-bars, and an operating-screw engaging said sliding jaw screw-socket provided with the enlarged thumb-rim *l*, confined against endwise movement between said handle-lug and bar-shoulders and provided with the axial stud-bearing in the said handle-lug socket, substantially as described.

410,241. AUTOMATIC GRAIN-WEIGHER. CHARLES J. HARTLEY, Decatur, Ill., assignor of two-thirds to John K. Warren and Bradford K. Durbin, same place. Filed Jan. 30, 1889. Serial No. 298,041. (No model.)



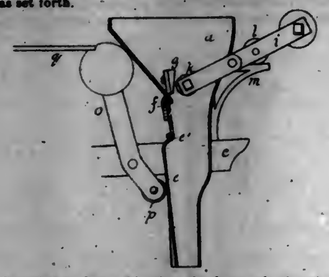
Claim.—1. An automatic weigher comprising a scale-beam, a weighing-receptacle supported from an end of the scale-beam, and a weight-beam acting on the opposite end of the scale-beam and having two fulcrums at different distances from said end, as and for the purpose set forth.

2. An automatic weigher comprising a weighing-receptacle supported from an end of a scale-beam, a weight-beam acting on the opposite end of the scale-beam and having two fulcrums at different distances from said end, a supply-hopper, and a partial closure for the hopper adapted to operate at the time the weight-beam shifts from one fulcrum to the other, as and for the purpose set forth.

3. In automatic weighers, in combination, the scale-beam *b*, the weighing-receptacle *l*, dependent from the scale-beam, the weight-beam *d*, fulcrumed in frame *c* and resting on the scale-beam, and frame *c*, embracing the weight-beam and pivoting on the permanent pivot *c'*, as and for the purpose set forth.

4. In automatic weighers, in combination, hopper *p*, having contracted outlet *p'*, compartment *w*, having contracted outlet *w'*, spout *u*, adapted to swing under outlet *w'*, and swinging partition *t* in outlet *p'*, having arm *t'* presented to the spout, as and for the purpose set forth.

410,242. REGISTER AND AUTOMATIC STOP. CHARLES J. HARTLEY, Decatur, Ill., assignor of two-thirds to John K. Warren and Bradford K. Durbin, same place. Filed Feb. 11, 1889. Serial No. 299,599. (No model.)

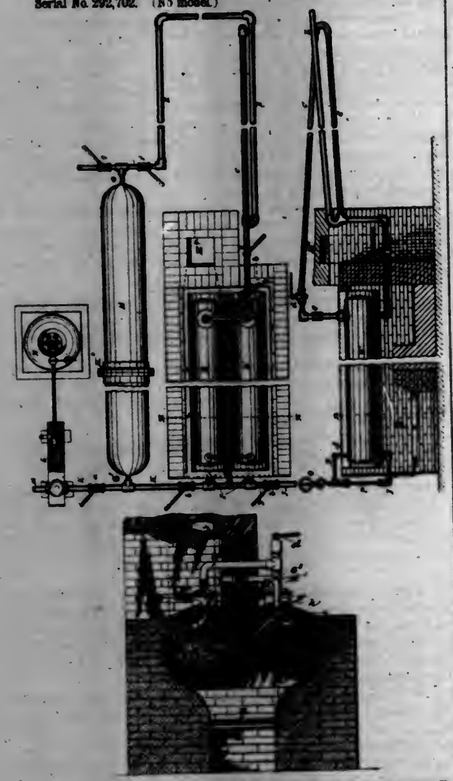


Claim.—1. A stop for registers comprising the graduated and numbered disks, the disks rotatingly adjustable on the disks, numbered to correspond with the disks, but in the reverse direction, and having peripheral notches at the zero-points, and a longitudinally-movable bar having catches adapted to the notches and resting ordinarily on the peripheries of the disks, as set forth.

2. A stop for registers comprising the graduated and numbered disks, the disks rotatingly adjustable on the disks, numbered to correspond with the disks, but in the reverse direction, and having peripheral notches at the zero-points, a longitudinally-movable bar traversing the faces of the disks, and catches movable on the bar and adapted to the notches of the disks, as set forth.

3. In register-stops, in combination, disks *s* and *u*, rotatingly adjustable and having notches *s'* and *u'*, bar *w*, longitudinally movable in brackets *q* and *z*, catch-arms *w'* and *w''*, adjustable on the bar, spring *x'*, tending to draw the bar downward, and lever *o o'*, connected with the bar, as set forth.

410,243. AUTOMATIC GRAIN-WEIGHER. CHARLES J. HARTLEY, Decatur, Ill., assignor of two-thirds to John K. Warren and Bradford K. Durbin, same place. Filed May 17, 1889. Serial No. 311,107. (No model.)



Claim.—1. In weighers, in combination, the beam supporting the weighing-receptacle, the hopper having the swinging side, the arm on the swinging side carrying the adjustable incline, and the weighted lever resting ordinarily on the beam and acting intermittently on the incline, as set forth.

2. In weighers, in combination, the hopper having the swinging side, the weighted arm having the extension adapted to the lower end of the swinging side, and the trip-bar to hold the weight in unstable equilibrium, as and for the purpose set forth.

410,244. APPARATUS FOR DISTILLING ANHYDROUS AMMONIA.

JOSEPH E. HOLMES, Washington, D. C., assignor to the American Automatic Refrigerating Company, Richmond, Va. Filed Dec. 5, 1888. Serial No. 292,702. (No model.)

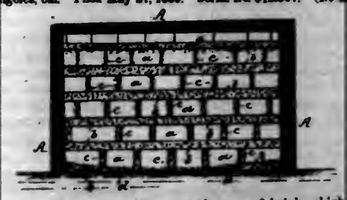
Claim.—1. The combination of the water-tank A, the furnace R, the stills B B, located in the tank, the vapor-eduction pipe C, connected to the drip-pipe D, said drip-pipe and inlet-pipe K, provided with stop-cocks *b* and *b'*, substantially as and for the purpose described.

2. In combination, the transferring-receptacle H, having a movable diaphragm, the pipe K, provided with the stop-cocks *a* and *b*, the pipe E, the pump L, and the stills B B', as and for the purposes described.

3. In combination, the transferring-receptacle H, the pipe K, vapor-pipe E, provided with the stop-cock *f*, and suitable tanks, holders, or mains communicating with pipe E by a pipe having stop-cock *g*, all as and for the purposes described.

4. The combination of a still, the receptacle provided with a flexible diaphragm, pipes connecting the still with the receptacle on each side of the diaphragm, and stop-cocks, whereby the pressure of gas or vapor in the still can at times desired be made to discharge liquid from the receptacle into the still, substantially as and for the purposes described.

5. The combination of a still, a receptacle divided by a sack-like flexible diaphragm, a pipe communicating with the still and also with the receptacle on one side of the diaphragm, a second pipe communicating with the upper part of the still and with the receptacle on the opposite side of said diaphragm, and stop-cocks and inlets and outlets, substantially as set forth, whereby the still and the receptacle can be filled with ammonia-water and ammonia simultaneously delivered from the other side of the diaphragm, and whereby also ammonia-water can be subsequently expelled from the receptacle and the receptacle simultaneously filled with ammonia on the opposite side of the diaphragm.



6. The combination, with a holder or receptacle for anhydrous ammonia, of stills, a pump, and a transferrer, as H, the latter being connected with the pump and stills by pipes to receive water from or discharge it into either still, and also to receive ammonia from a still and simultaneously with its reception of water to discharge said ammonia into a holder in a refrigerator or elsewhere without loss of pressure, substantially as specified.

7. The combination, with a holder or receptacle for anhydrous ammonia and with one or more water-vessels connected by pipes having suitable cocks to receive alternately spent ammonia from a vessel for expanding the same, and connected by similar pipes having cocks with stills, of said stills, a pump, and a transferrer, as H, the latter being connected with the pump and stills by pipes to receive water from or discharge it into either still, and also to receive ammonia from a still and simultaneously with its reception of water to discharge said ammonia into a holder in a refrigerator or elsewhere without loss of pressure, substantially as specified.

8. In a distilling apparatus, the combination of a tank or boiler, a still, and a pipe or conduit, the still being located in the water-space of the boiler and the pipe communicating with the steam-space of the boiler and passing through the interior of the still, whereby the latter can be externally heated by water and internally by steam, substantially as set forth.

410,245. PROCESS OF BURNING BRICK.

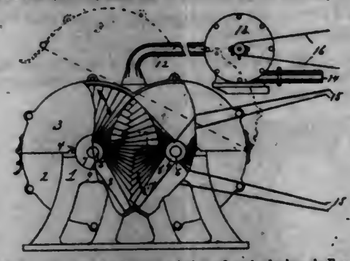
JAMES M. JAMESON, Los Angeles, Cal. Filed May 27, 1889. Serial No. 312,307. (No model.)

Claim.—The process in the manufacture of brick which consists in placing a layer of fuel—such as coal, brea, or crude petroleum—upon the floor of the kiln, which floor of the kiln is made to incline toward the center, placing a layer of brick in zigzag rows, each brick and row being slightly separated to form interstices between the brick, filling such interstices with similar fuel used to form the first layer, and covering the brick with said fuel to form a bed for the second layer of brick, again placing a layer of brick in zigzag rows, with interstices between the brick and rows, upon the second bed of fuel, again filling such interstices with fuel and forming a third bed of fuel, and so on, alternately forming a bed of fuel and layer of brick in zigzag rows with interstices between the same until the top of the kiln is reached, the interstices between the brick in each succeeding layer decreasing in width as the pile approaches the top of the kiln, where they disappear, as and for the purposes described and shown.

410,246. MACHINE FOR FOLDING AND STITCHING THE EDGES OF CANVAS.

BURR A. KENNEDY and JOHN P. STEWARD, Chicago, Ill. Filed June 26, 1888. Serial No. 278,161. (No model.)

Claim.—1. The bed or table and the two folding mechanisms at opposite sides, in combination with the intermediate pressure-plate, the rolls beyond said plate, and the two sewing-machines beyond the rolls, whereby the machine is adapted to fold, press down, and finally stitch down the two edges of the fabric.



2. In combination with the table, the overlying plate F to act on top of the fabric, its sustaining-arms, the folding-plates f^1, and the folding-plate *g*, overreaching the end of plate F, as shown.

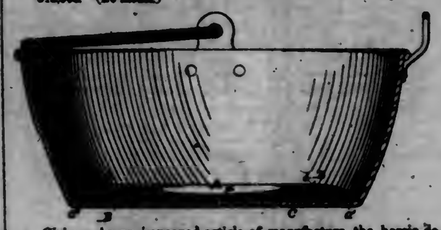
3. In a machine for folding and stitching the opposite edges of a fabric simultaneously, the combination of a supporting bed or table, a folding mechanism and a sewing mechanism at each side of the table, and a feed mechanism located between the folding and the sewing mechanisms and extending across the path of the fabric from side to side, whereby the fabric is advanced equally at the two sides and the feed devices of the sewing-machines relieved from labor.

410,247. APPARATUS FOR ATOMIZING SOLID SUBSTANCES.

SMITH W. KIESER, Denver, Colo., assignor of two-thirds to Charles H. Abbott and Sidney McClanahan, same place. Filed Apr. 16, 1889. Serial No. 307,394. (No model.)

Claim.—1. A pulverizer consisting of an inclosing shell or casing, two shafts mounted to rotate therein, and a series of fingers or beaters on and projecting from each shafts and arranged thereon spirally, the pitch of the spiral on one shaft being different from that on the other shaft, and the fingers or beaters on one shaft passing on rotation through the inter-finger spaces of those on the other shaft, substantially as set forth.

2. The combination of the inclosing case or shell, two shafts mounted to rotate therein parallel to each other, and the fingers or beaters 8, constructed in pairs projecting from a hub 9 and inclined or tapered on their opposite edges 17 and on their faces 18, said fingers or beaters being arranged spirally on the shafts, the pitch of the spiral on one shaft being twice that of the spiral on the other shaft, substantially as set forth.



3. The combination of the shell or casing made in two parts pivotally or detachably secured together and having inlet and outlet openings at opposite ends, two shafts mounted to revolve within the shell or casing and parallel to each other, the series of beaters or fingers arranged spirally thereon, the pitch of the spiral on one shaft being different from that on the other, and an exhaust apparatus connected to the outlet, substantially as set forth.

4. The combination of the shell or casing formed of the parts 2 3, the shafts arranged to rotate therein and parallel to each other, the fingers or beaters 8, formed in pairs and projecting each pair from a hub 9 and arranged spirally on the shafts, the pitch of the spiral on one shaft being different from that on the other, the exhaust 12, and pipe 12, connecting such fan to the outlet 11, substantially as set forth.

5. The combination, with the shafts 5 6, each having the spirally-arranged series of beaters or fingers 8, the pitch of the spiral on one shaft being different from that on the other, of a casing having the contour in cross-section of the intersecting circles described by such beaters or fingers when rotated, substantially as set forth.

410,248. FALSE BOTTOM FOR BOILING KETTLES, PANS, &c.

THEODORE A. KNEISEL, Kansas City, Mo. Filed June 6, 1889. Serial No. 313,202. (No model.)

Claim.—As an improved article of manufacture, the herein-described false bottom for culinary vessels, the same struck from sheet metal and having a central concavity or depression surrounded by a raised and rounded rib *b*, which is provided with a series of perforations B, and a depending outwardly-flared flange *c'*, the lower edge of which is slightly below the plane of the lowest point of the central depression, all arranged substantially as and for the purpose specified.

410,249. ROAD-SCRAPER.

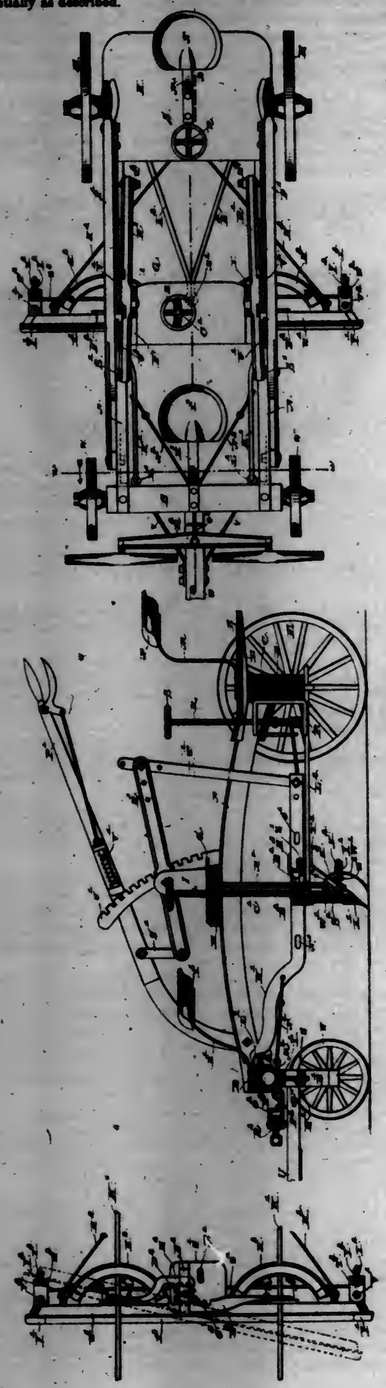
MARY P. LOMONT, Fort Wayne, Ind., administratrix of Francis T. Lomont, deceased. Filed Jan. 31, 1889. Serial No. 298,302. (No model.)

Claim.—1. The combination, in a road-scraper, of the draft-bars, the scraper having the plates or ears connected to and adapted to slide on the draft-bars, and the rearward-extending brackets or guides secured to the scraper and engaging the draft-bars, substantially as described.

2. The combination, in a road-scraper, of the draft-bars, the pivoted scraper, the racks guided on the scraper and having the pins or keys adapted to engage openings in the draft-bars, and the gear to operate the said rods, substantially as described.

3. The combination, in a road-scraper, of the draft-bars, the scraper connected thereto and adapted to oscillate thereon, the levers E', connected to the draft-bars, the hand-levers, and the links connecting the same to the levers E', substantially as described.

4. In a road-scraper, the combination of the main frame having the depending pivot-shaft A^1, the scraper pivotally connected to the said shaft and adapted to move vertically thereon, the draft-bars connected to the scraper and forming guides and support for the same, and the levers connected to the draft-bars and adapted to raise and lower them, substantially as described.



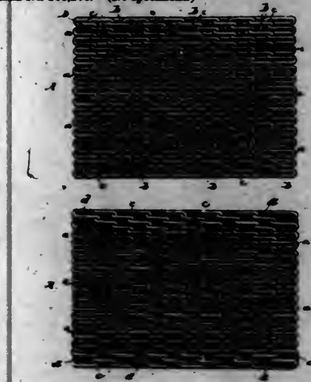
5. The combination, in a road-scraper, of the main frame having the depending pivotal shaft, the scraper pivoted thereon, the draft-bars connected to and forming the guides and supports for the scraper, the levers to raise and lower the draft-bars, the shaft journaled in bearings on the scraper and having the pinion and the racks engaging said pinion, and having the keys or pins to engage openings in the draft-bars, for the purposes set forth, and means, substantially as described, to adjust the scraper, substantially as set forth.

6. The combination, in a road-scraper, of the main frame having the depending central pivotal shaft, the draft-bars, the scraper pivoted on the depending shaft and connected to the draft-bars, and the bounds or braces connecting the lower ends of the pivotal shaft to the rear trusk, for the purpose set forth, substantially as described.

7. In a road-scraper, the combination, with the scraper having the ears or brackets on its rear side, of the pivotal bolts in said ears or brackets, the plows or shovels loosely connected to the upper ends of said pivotal bolts, the springs bearing on the plows or shovels, and the transverse rods connecting the same, for the purpose set forth, substantially as described.

8. The combination, with the scraper having the ears or brackets on its rear side, of the pivotal bolts in said ears or brackets, the plows or shovels loosely connected to the upper ends of said pivotal bolts, the eyebolts engaging the pivotal bolts and extending rearward to the plows or shovels, the adjusting-nuts on said eyebolts, and the springs

bearing against the adjusting-nuts and against the plows or shovels, substantially as described.



9. The combination, with the scraper, of the plows or shovels flexibly connected thereto and having the extended points at their inner lower corners, for the purpose set forth, substantially as described.

10. In a road-scraper, the combination, with the frame and its truck, the latter provided with a tongue, of the scraper-bar suspended loosely by the frame, a hammer-strap mounted on the draft-bar and connected to the whiffletree, and links for connecting the hammer-strap directly to the scraper-bar in rear of its connection with the frame, substantially as specified.

11. In a road-scraper, the combination, with a main scraper-blade, of detachable scraping-blades arranged in rear thereof, and means for adjusting the same to and from the main blade, substantially as specified.

410,250. WIRE BELTING. THOMAS MIDDLEY, Beaver Falls, Pa., assignor of one-half to James R. Emerson, same place. Filed Apr. 6, 1889. Serial No. 306,276. (No specimens.)

Claim.—1. Wire belting composed of intertwined transverse sections of elongated helices, the ends of one section being bent back into the body of an adjacent section and crossing the ends of said sections longitudinally on the edges of the belting, substantially as described.

2. Wire belting composed of intertwined transverse sections of elongated helices, having the ends of the sections bent back into the body of the belting and the interstices on the edges filled with rubber, substantially as described.

410,251. WIRE BELTING. THOMAS MIDDLEY, Beaver Falls, Pa., assignor of one-half to James R. Emerson, same place. Filed July 15, 1889. Serial No. 317,537. (No model.)

Claim.—1. Wire belting composed of layers of intertwined transverse sections of coiled spring-tempered wire, having the ends of adjacent sections interlocked at the edge of the belt, substantially as described.

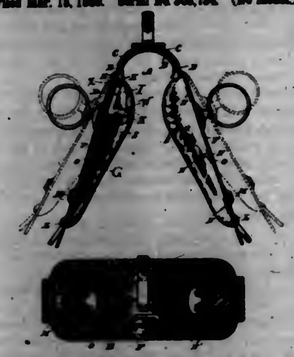
2. Wire belting composed of a plurality of layers of intertwined transverse sections of coiled wire, having the edges of the belting formed of interlocked ends of the sections in one layer with the ends of the sections in an adjacent layer, substantially as described.

3. Wire belting composed of a plurality of layers of intertwined transverse sections of coiled wire, the edges of the belting having a plurality of separate longitudinal layers or rows of interlocked ends of the sections of which the belting is composed, substantially as described.

410,252. CUSPIDOR. PARKER I. PERRY, Oakland, Cal., assignor of one-half to R. P. M. Crosby, same place. Filed May 23, 1888. Serial No. 311,886. (No model.)

Claim.—1. As an improved article of manufacture, the herein-described cuspidor, the same comprising a cylindrical body B, a funnel F, carried by the upper end thereof, and a receiver R, pivoted within the body on a transverse axis, substantially as described.

2. As an improved article of manufacture, the herein-described



cuspidor, the same comprising a cylindrical body B, having its lower end open, a funnel F, mounted on the upper end of said body, an oval receiver R, arranged within the body with one of its longer sides adjacent to the sides of said body, and pivots at the ends of said receiver connecting it with said body, substantially as described.

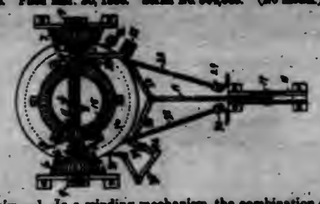
3. As an improved article of manufacture, the herein-described cuspidor, the same comprising a cylindrical body B, having its lower end open, a funnel F, mounted on the upper end of said body, an oval receiver R, arranged within the body with one of its longer sides adjacent to the side of said body, pivots at the ends of said receiver connecting it with said body, a spring-tongue T, carried by the body and having a depression *t* near its free end, and a rib *r* at one side of the receiver adapted to engage said depression to hold the parts in their normal positions, substantially as described.

4. As an improved article of manufacture, the herein-described cuspidor, the same comprising the cylindrical body B, having its lower end open, a funnel F, mounted in the upper end of said body and having a reduced lower open end, perforated loops L, attached to the inner side of the body near its lower end, and an oval receiver R, arranged within the body with one of its longer sides adjacent to the side of the body, said receiver having studs S at its ends near its lower edge adapted to pivotally connect it with the body, substantially as described.

5. As an improved article of manufacture, the herein-described cuspidor, the same comprising a cylindrical body B, having its lower end open, a funnel F, mounted on the upper end of said body and having a reduced lower open end, a downwardly-projecting flange J, surrounding said lower open end, an oval receiver R, arranged within the body with one of its longer sides adjacent to the side of the body, the other free side projecting to a point beyond said flange, and pivots at the ends of said receiver connecting it with said body, substantially as described.

410,253. HARNESS-SADDLE. JOSEPH I. RICHARDS, Pentwater, Mich. Filed Mar. 18, 1889. Serial No. 303,734. (No model.)

Claim.—1. The combination, in a harness-saddle, of an arched plate mounted upon a foundation of leather having its opposite ends extended downward, a metallic pad provided with a bracket upon its inner side and having a threaded aperture, a perforated metallic plate, an outer covering over the plate and downwardly-extending ends of the leather foundation, and a terret having a threaded shank arranged to pass through said cover, plate, and end and to screw into the threaded aperture in the bracket, whereby these parts are clamped together, in the manner and for the purpose described.



2. In a harness-saddle, the combination of a metal pad, a bracket located upon the inner side of the pad, a perforated metallic plate forming a seat for the pad, a saddle provided with downwardly-extending ends overlapping said plate, and a terret provided with a threaded shank passing through said ends and plate and screwing into a threaded aperture in the bracket, all arranged and adapted to operate substantially as described.

3. In combination with a saddle-tree mounted upon a leather foundation having downwardly-extending ends, a terret provided with a threaded shank, a metallic pad having a threaded bracket upon its inner side, a perforated metallic plate forming a seat for the pad, said plate being provided with an eye upon its lower end to receive a buckle, and an extension upon the lower end of the pad, which extension is arranged to be fastened down upon the outside of the saddle, in the manner and for the purpose described.

4. In a harness-saddle, a metallic pad provided with a threaded bracket upon its inner side, a perforated metallic plate forming a seat for the bracket, and integral flaps arranged along the edges of the pad, whereby it is riveted to the saddle, in combination with a terret having a threaded shank arranged to pass through the perforation in said plate and to engage the threaded aperture in the pad-bracket, in the manner and for the purpose set forth.

5. In a harness-saddle, a metal pad provided with devices for securing it to the under side of the saddle, and having its lower end bent over and fastened down upon the outside of the saddle, in the manner and for the purpose described.

410,254. WINDING MECHANISM. SAMUEL S. EMERSON, Denver, Colo. Filed Mar. 20, 1889. Serial No. 304,023. (No model.)

Claim.—1. In a winding mechanism, the combination of a shaft, gear-wheels loose thereon, a gear-wheel rigid thereon, a main driving-wheel meshing with the loose gear-wheels, a clutch mechanism on such shaft for locking and unlocking the loose gears to and from the shaft, means for operating such clutch mechanism, a winding-drum, and a gear-wheel thereon meshing with the gear-wheel rigid on the shaft, substantially as described.

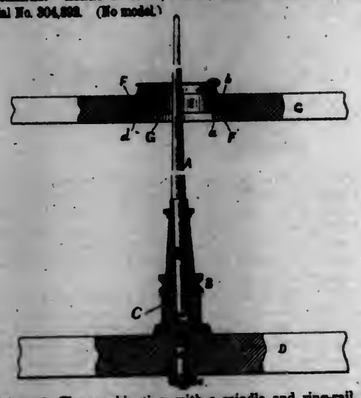
2. In a winding mechanism, the combination of a shaft, gear-wheels loose thereon, a gear-wheel rigid thereon, a main driving-wheel meshing with the loose gear-wheels, a clutch mechanism sliding on such shaft and at will locking one loose gear to and unlocking the other from the shaft or disconnecting both therefrom, a brake, means for operating the clutch mechanism and applying the brake in the intermediate position thereof, a winding-drum, and a gear-wheel thereon meshing with the loose gear-wheels, substantially as set forth.

3. The combination of a shaft, gear-wheels loose thereon, a gear-wheel rigid thereon, a main driving-wheel meshing with the loose gear-wheels, a clutch mechanism sliding on the shaft, a winding-drum, and a gear thereon meshing with the gear rigid on the shaft, the shaft and winding-drum and its gear being located in planes parallel to the plane of and immediately beneath the main driving-wheel, substantially as set forth.

4. The combination of main driving-wheel 4, shaft 8, loose gears thereon, rigid gear 11, winding-drum 16, with gear 15, the clutch mechanism sliding on the shaft, the collar on the clutch mechanism, the angled lever 20 21 21, rod 19, and lever 17, substantially as set forth.

5. The combination of the main driving-wheel, the transverse shaft, loose gears thereon, a gear rigid thereon, a winding-drum having a gear meshing with the gear rigid on the shaft, a clutch mechanism sliding on the shaft, means, as described, for moving such clutch mechanism, a brake adapted to take on the winding-drum, and a lever 35, connected to and adapted to operate such brake, and a lever connected to the clutch mechanism for operating or moving such first lever, substantially as set forth.

410,255. RING-SPINNING FRAME. WILLIAM R. SHARPLES, Fall River, Mass. Filed Aug. 20, 1888. Serial No. 284,147. (No model.)

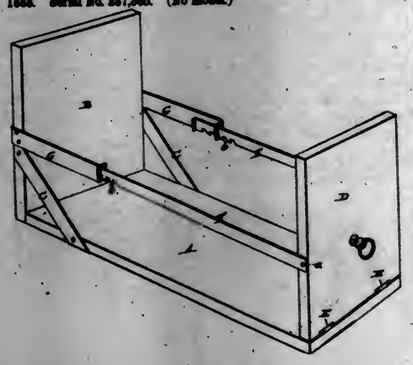


Brief.—The invention relates to the construction of the separator-plates and to the means for retracting them to allow the rail to rise.

Claim.—1. The combination, with the ring-rail and its rings, of a series of separators, each composed of the plate portion *m* and a rib portion *m'*, projecting laterally from the plate portion, and having its edge inclined, as described, between the points 3 4, the said separators being located above the rings, whereby both the plate and rib portions can act upon the threads, and a support for the separators, substantially as set forth.

2. The combination, with the ring-rails, the lifting-rods, the levers J J, rock-shafts J', the arms K, and the connecting-rod L, of a series of separators, the crank-arms O, for supporting the separators, a lever P, connected with the separators, and a block R, located on the rod L, for engaging the lever P and moving the separators rearwardly, said block having an inclined plane *r* and face *r'*, substantially as set forth.

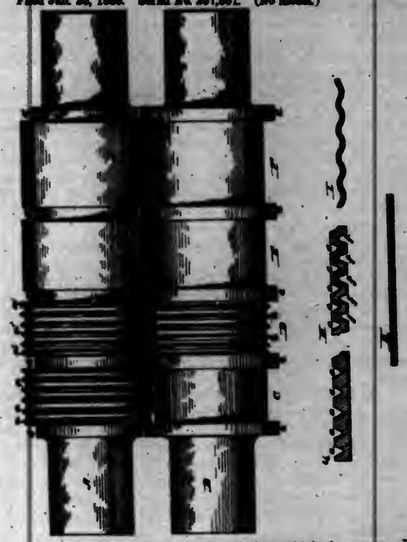
3. The combination, with the ring-rail, the lifting-rods, the levers J, rock-shafts J', arms K, and connecting-rod L, of a series of separators, crank-arms O, for supporting the separators, a lever P, connected with the separators, a block R, located on the rod L, for engaging the lever P and moving the separators backward, said block having an inclined plane *r* and face *r'*, and means, substantially as described, for returning the separators to normal position, substantially as set forth.



410,256. **FLEXIBLE SUPPORT FOR RINGS OF RING-SPINNING MACHINES.** HENRY F. SHAW, Boston, Mass. Filed Mar. 26, 1889. Serial No. 304,892. (No model.)

Claim.—1. The combination, with a spindle and ring-rail, of a ring surrounded by a rubber spring, which contacts with the said ring and ring-rail, so as to form a flexible connection between the same, as and for the purposes set forth.

2. The combination, with a spindle, ring-rail, and ring, of a flexible ring-support interposed between the said ring and ring-rail, whereby the said ring is permitted to move horizontally about the axis of the spindle or its proper center of rotation, so as to coincide with any gyratory motion which may be imparted to the spindle while in motion.



410,257. **FILE-BOX.** ISRAEL S. SMITH, Sr., Washington, D. C., assignor of one-half to Charles M. Martin, same place. Filed Oct. 6, 1888. Serial No. 287,205. (No model.)

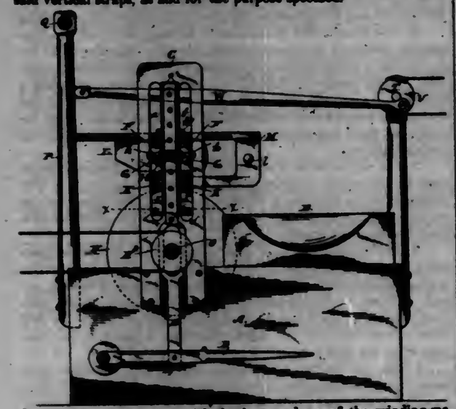
Claim.—1. In a file-box, the base-board and the two end boards, one fixed rigidly thereto and the other hinged thereto, in combination with the side bars connecting said end boards and serving also to retain the papers in position, each side board consisting of a slotted portion G, attached to one of the end boards, and of a toothed portion F, attached to the opposite board.

2. In a file-box, the base-board, the rigid end board rising therefrom, and the arm G, rigidly attached to said end board and having the laterally-bent and slotted ends, in combination with the end board D, hinged to the base-board, and the toothed side bars F, pivoted at one end to the board D and extended at the opposite end through the arms G, as shown.

410,258. **ROLLS FOR ROLLING BARS INTO SHEETS.** EDWIN D. WASSELL, Pittsburg, Pa., assignor to Ann Isabell Wassell, same place. Filed Jan. 26, 1889. Serial No. 297,861. (No model.)

Claim.—1. The rolls herein described, in which the upper roll in the first pass is provided with a series of bead-like projections and the lower roll is a plain cylinder, the second pass having projections corresponding with those of the first pass for holding the bar, and bead-like projections on the lower roll for corrugating the bar, and a pass or passes having plain surfaces on both rolls for distending the bar laterally, substantially as set forth.

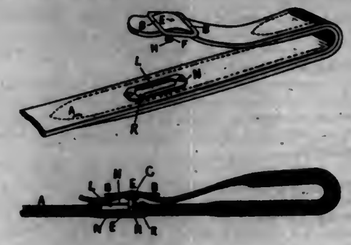
2. The rolls herein described, in which the upper roll in the first pass is provided with a series of bead-like projections and the lower roll is a plain cylinder, the second pass of the same width as the first, and the upper roll having projections like those of the first pass for holding the bar, and bead-like projections on the lower roll alternating with or intermediate of the projections on the upper roll for corrugating the bar, and a pass or passes for flattening and distending the bar laterally, substantially as set forth.



410,259. **MACHINE FOR GRINDING AND POLISHING CUTLERY.** HENRY A. AXTELL, Turner's Falls, Mass. Filed Dec. 19, 1888. Serial No. 294,066. (No model.)

Claim.—1. In a machine for grinding and polishing cutlery, the combination, with the grindstone having a motion away from the operator, of the knife-holder, substantially as described, supported on a suitable carriage and moved away from the operator by the motion of the stone, and the vibrating tongue moved by suitable means from the source of power to return the holder toward the operator, as set forth.

2. The knife-holder formed with a head, hand-holes, and two limbs, one long and one short, adapted to straddle the rollers of the carriage, the longer adapted to enter into an opening of the capping-block and extend within reach of the vibrating tongue, and the shorter serving as a flat base to receive the knife to be ground, substantially as set forth.



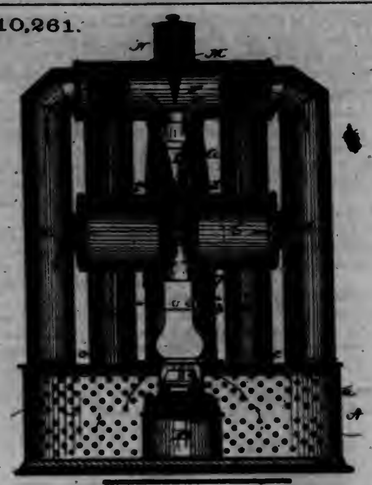
3. The combination, with the carriage for the knife-holder, formed as set forth, and the movable journal-blocks cushioned upon suitable springs, of the metal straps, the bars adjustably fixed thereto by pins and bearing upon the ends of the shafts of the knife-holder carriage,

and the foot-levers pivoted to the base of the box and hinged to the said vertical straps, as and for the purpose specified.

4. The combination, with the box or base of the grinding-machine and opposite uprights provided with vertical slots, of blocks, as described, fitting in said slots and adjustably clamped to said uprights, movable blocks fitting in the slots of said uprights, forming journal-bearings for the shafts of the knife-holder carriage, springs, as bearings, fixed between the said fixed bearings and the said movable bearings, and the carriage formed of two shafts journaled in the said movable bearings, side pieces collared on said shafts, and a capping-piece provided with an opening for a guide-rod of the knife-holder, and spools encircling the said carriage-shafts, substantially as and for the purpose set forth.

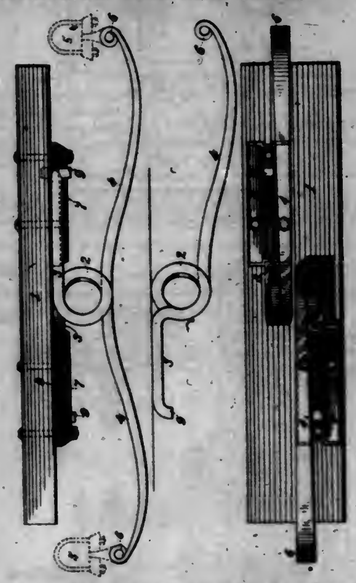
410,260. **FASTENING FOR REINS.** CHARLES H. BAGLEY, Boston, Mass. Filed Feb. 5, 1889. Serial No. 299,743. (No model.)

Claim.—A rein-fastening consisting of the loop-frame B, having a cross-bar C, provided on one side with a stud E and on the opposite side with a stud F, having a head H, and the rein A, provided with slotted plates N, adapted to receive the said stud F, as shown and described, as and for the purposes set forth.



410,261. **HOT-AIR FURNACE.** JAMES BAKER, St. Louis, Mo. Filed Oct. 24, 1888. Serial No. 289,057. (No model.)

Claim.—1. A hot-air furnace having a lamp or burner located in the base, a central flue arranged around the lamp or burner, said flue communicating with the base and with horizontal drums, an inverted cone or deflector O, located above the central flue, and the pipes K, communicating with the horizontal drums and with the base, substantially as described.



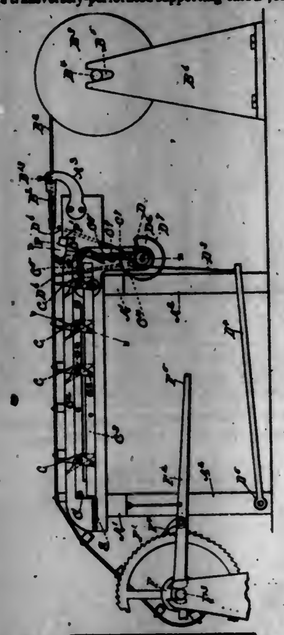
2. A hot-air furnace having a lamp or burner located in the base, a central flue arranged around the lamp or burner receptacle, a central tapering pipe arranged within the flue and provided with an extension parallel with the central flue, an inverted hollow cone secured to and above the central flue, the pipe K, and the horizontal drums, the central flue and pipes communicating with the drums and base, substantially as described.

3. A hot-air furnace having a base in which the lamp or burner is placed, a central flue arranged around the burner, said flue communicating with the base, horizontal drums with which the flue communicates, pipes communicating with the base and with the drums, and pipes communicating with the upper drum and having openings near the base for the discharge of air, substantially as set forth.

410,261.

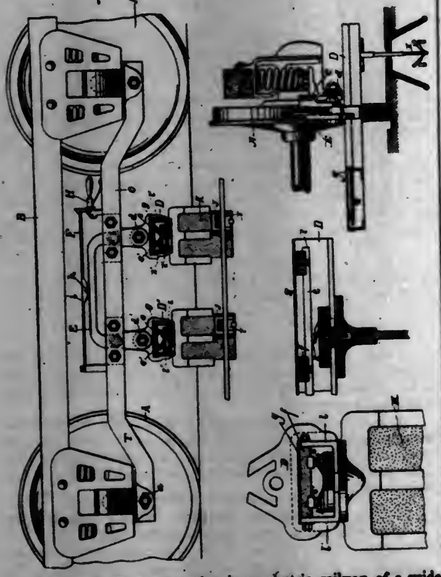
410,262. **VEHICLE-SPRING.** GEORGE RAIDEMEIER, Allegheny, Pa. Filed Dec. 13, 1888. Serial No. 293,492. (No model.)

Claim.—1. A vehicle-spring consisting of a coil provided with tangential arms, one of said arms being straight, in combination with a box constructed to fit said arm and clamp it to the vehicle-body, substantially as set forth.



2. A vehicle-spring consisting of a coil provided with tangential arms projecting outwardly in the same direction, one of said arms being provided with a toe or projection, in combination with a box constructed to clamp one of said arms to the vehicle-body, substantially as set forth.

410,263. **WIRE-FENCE MACHINE.** ALBERT G. BUTTS, Brunswick, N. Y. Filed Mar. 27, 1889. Serial No. 304,990. (No model.)



Claim.—1. In a wire-fence machine, the combination, with a supporting-frame of picket-stops C, pivotally secured upon opposite sides of such frame, spring-controlled stop-connecting slats C^3, spring-controlled detent-lever C^5, tripping-lever C^6, and treadle-actuated tripping-cam, substantially as described.

2. In a wire-fence machine, a tension device consisting of a guide-

block having in its body part oppositely-inclined ways B^9 and B^9 for the wire, open at their point of junction near the center of the block, and closed at the ends B^{10} and B^{11} of the block, one end B^{10} being provided with the transversely-perforated supporting-ears B^7, substantially as described.

410,264. ELECTRIC-RAILWAY PLOW. FRANCIS O. BLACKWELL, New York, N. Y. Filed Mar. 5, 1888. Serial No. 301,850. (No model.)

Claim.—1. The combination, in an electric railway, of a guide upon a vehicle and a conductor-slide extending along the guide, with a contact device comprising a traveler, and an exposed contact in circuit with the conductor of the contact device, said traveler and contact occupying the same positions relatively to each other upon the contact device as do the guide and slide upon the vehicle, whereby, when the contact device is placed in position on the guide, the conductor-slide will be engaged by the contact, substantially as described.

2. The combination, in an electric railway, of a transverse mechanical guide and an insulated conducting-slide extending along the guide, with a contact device for maintaining the electrical connection, with a supply-conductor inclosed in a slotted conduit comprising a traveler and a contact in circuit with the conductor of the contact device, the traveler and contact being so located as to engage the guide and slide, respectively, and maintain traveling electrical connection therewith.

3. The combination, in an electric railway, of a transverse guide upon a vehicle and a conducting-slide extending along the guide, with a contact device carrying a traveler and an exposed contact which engage the guide and slide, respectively, when the contact device is placed in operative position.

4. The combination, in an electric railway, of a transverse guide and a plow movable along the same, having contact-shoes for maintaining the electrical connection, with line-conductors of opposite polarity inclosed in a slotted conduit, with two exposed contacts, insulated from each other, carried by the plow and in circuit with said shoes, respectively, and two conducting-slides engaged by said contacts when the plow is placed in operative position.

5. The combination, in an electric railway, of a transverse guide and a contact device having a traveler movable along said guide, with a conductor-slide and a contact carried by the traveler and engaging the slide when the plow is in place.

6. The combination, in an electric railway, of a traveler connected to a contact device and a guide embracing the same, with an independent conductor within the guide and a traveling electrical connection between the said conductor and the contact device.

7. The combination, in an electric railway, of a transverse guide with an insulated conductor extending along the guide and protected thereby, and a contact device movable along said guide and maintaining a traveling electrical connection with said conductor.

8. The combination, in an electric railway, of an electrically-propelled vehicle and a bared conductor thereupon, with the contact device for taking current from the supply-conductor, and a traveling spring electrical connection between the contact device and conductor upon the vehicle.

9. A plow adapted to extend into a slotted conduit for engagement with a supply-conductor therein, having a spring-contact at its upper end in circuit with the conductor of the plow and adapted to engage a fixed conductor upon the car.

10. A contact device adapted to complete the circuit between a line-supply conductor and an electrically-propelled vehicle, comprising an insulated conductor, and an exposed spring-contact for engagement with a conductor upon the car when the contact device is connected to the vehicle.

11. A contact device for an electric railway, consisting of a traveler forming a mechanical connection with an electrically-propelled vehicle, permitting movement of the contact device relatively to the vehicle, and a spring-contact maintaining a constant electrical connection between a conductor carried upon the vehicle and the contact device, respectively.

12. A contact-plow adapted to extend into a slotted conduit for engagement with a supply-conductor, comprising the conducting-core, the protecting-sheath therefor, and the traveler and spring contact, the last two being adapted to maintain a traveling mechanical and electrical connection with the car, substantially as described.

13. The combination, in an electric railway, with a transverse guide and a contact device movable along said guide, of an independent conductor extending along the guide, and a spring-contact carried by the contact device and engaging said conductor.

14. The combination, with an electrically-propelled vehicle, of a hollow transverse guide for the traveler of a contact device, having on its inside an insulated conductor-slide, and having an opening for the connection leading to the contact device.

15. In an electric railway, the transverse guide consisting of the two angle-irons secured together, in combination with a contact device free to travel along said guide.

16. The transverse guide consisting of the two L-shaped angle-irons placed with their lower flanges facing each other, and a cover for the upper end of said guide, in combination with a contact device free to travel along said guide.

17. In an electric railway, the combination of a transverse guide and a contact device having a traveler engaging said guide, with an insulated conductor extending up through the said head for establishing the electrical connection with the car-circuit.

18. The combination of the plow-shank, and a contact-shoe pivoted thereto, with a spring-plate between the shoe and shank normally holding the shoe in engagement with the line-conductor.

19. The combination, in a plow for maintaining traveling electrical connection with a supply-conductor inclosed in a slotted conduit, of a shank and a contact-shoe pivoted thereto at a point within the conduit, with a spring-plate connected to the shoe and shank, respectively, and holding the shoe in engagement with the supply-conductor.

20. The combination, with the plow-shank extending into a slotted conduit, and a contact-piece pivoted to the shank and movable relatively thereto, of an independent spring-plate between the shank and contact-piece, holding the latter in engagement with the supply-conductor.

21. The combination, in an electric railway, of the plow-shank, and the contact-shoe I with the spring-plate J, substantially as described.

22. The combination, in a contact device for electric railways, of an insulated conducting-core and a contact-shoe connected thereto and in circuit therewith, with a spring-plate holding the contact-shoe in engagement with the supply-conductor and forming an auxiliary conducting-connection between the shoe and the core.

23. The combination, in an electric railway, of a plow-shank and contact-piece having a movable connection therewith, with a spring-plate connected to the plow and bearing at its free end upon the moving contact-piece, whereby the latter is held in engagement with the supply-conductor.

24. The combination, in a contact device for use upon electric railways, of a plow-shank extending through a slotted conduit, and a hinged contact-piece, with a spring-plate holding the contact-piece normally at an angle to the shank.

25. The combination, in an electric railway, of a plow-shank extending into a slotted conduit and a hinged contact-shoe standing normally at an angle to the shank, but free to move in either direction, with a spring-plate between the plow-shank and shoe, tending to hold the shoe in its normal position.

26. The combination of a conduit and a contact device extending into the conduit, with a yielding catch normally holding the contact device in operative position, but adapted to give way automatically on meeting an obstruction, with means for disengaging the members of said catch at will, whereby the contact device may be operated without having to overcome the tension of said catch.

27. The combination of a conduit, a contact device extending into the conduit, and a spring-catch therefor normally holding the contact device in operative position, with means for maintaining the said catch under tension and for releasing it from tension at will, whereby the contact device when desired may be operated without having to overcome the tension of said catch.

28. The combination, in an electric railway, of a contact device and a spring-catch normally holding the contact device in its operative position, with a latch for the spring-catch.

29. The combination, in an electric railway, with a contact device, of a spring-catch therefor located so as to engage the contact device automatically when the latter is in operative position, and a latch for the spring-catch.

30. The combination, in an electric railway, of a movable contact device and a keeper normally holding the same in operative position, said keeper consisting of a spring-plate engaging the contact device and a latch engaging the free end of said plate.

31. The combination, in an electric railway, of two contact-plows extending into a slotted conduit and having free independent lateral movement to conform to irregularities in the slot, with a common catch normally holding both plows in operative position, but adapted to give way when either plow strikes an obstacle.

32. The combination, in an electric railway, of the two transverse guides connected together so as to have a common movement, with a contact device free to travel along each guide, and a yielding catch normally holding the contact devices in their operative positions, but adapted to give way on striking an obstacle.

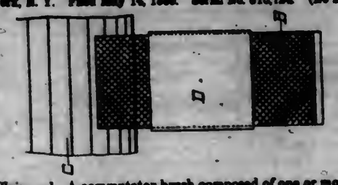
33. The combination, in an electric railway, of the contact devices, the movable transverse guides, and a link joining the guides, with a spring-catch connection between said link and the vehicle, whereby the contact devices are normally held in operative position.

34. The combination, in an electric railway, of a truck-frame independent of the spring-supported car-body, an inclosed supply-conductor, and a contact device for engagement therewith, with a spring-catch connection between the contact device and truck-framing, normally holding the contact device in operative position, but adapted to give way on meeting an obstruction.

35. The combination, with a truck-framing joining the opposite axles of the car and outside the wheels, with a transverse guide supported by said framing, and a contact device free to travel along said guide.

36. The combination, with a truck-framing joining the axles of a railway-truck and having a loose connection therewith, of the contact devices carried by the framing.

37. The combination, in an electrically-propelled vehicle, of the spring-supported car-body, and a truck-framing independent of the car-body, joining the opposite axles of the truck and having a yielding connection therewith permitting the come and go of the framing, with electrical apparatus supported on the said truck-framing.



38. The combination, with a framing joining the axles of a railway truck and having a slotted connection therewith permitting the come and go of the framing, of a transverse guide connected to said framing and a contact device free to travel along said guide.

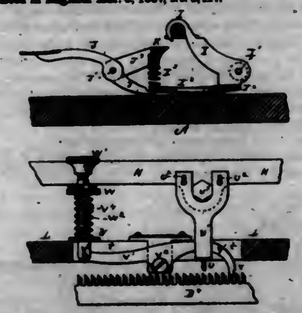
39. The combination of a bar attached to the journal-boxes below the axles of an electrically-propelled vehicle, with a transverse guide below and supported by said bar and a contact device free to travel along said guide.

40. The combination of a conduit, and a supply-conductor therein, with an electrically-propelled vehicle, a frame-bar above the axles but extending downward and attached to the under sides of the journal-boxes, a transverse guide attached to said bar, and a contact device free to travel along said guide.

41. In an electric-motor truck, the combination, with a curved side bar attached to a journal-box of the truck below the journal, of a contact device for engagement with a supply-conductor in a conduit below the said side bar, whereby the side bar does not interfere with the free movement of the contact device.

410,265. COMMUTATOR-BRUSH. FRANCIS O. BLACKWELL, New York, N. Y. Filed May 14, 1889. Serial No. 310,794. (No model.)

Claim.—1. A commutator-brush composed of one or more layers of wire-gauze, having the individual wires in a line diagonal to the axis of the commutator.



2. A commutator-brush made up of two or more layers of wire-gauze, fastened together at their rear ends and provided with a surrounding sleeve.

3. A commutator-brush made up of two or more layers of wire-gauze, secured together at their rear ends and having the individual wires in a line diagonal to the axis of the commutator.

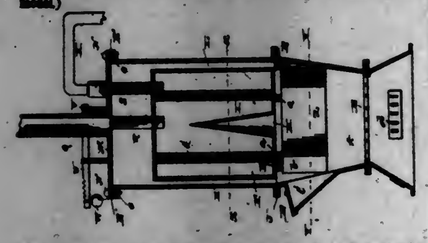
4. A commutator-brush made up of a number of layers of wire-gauze, secured together at their rear ends and surrounded by a sliding sleeve.

5. A commutator-brush made up of a number of layers of wire-gauze, having their forward ends placed in contact with the commutator and their rear ends secured together.

410,266. TYPE-WRITING MACHINE. BENJAMIN I. BLOUNT, Somerville, DANIEL B. KIMBALL, Boston, JAMES H. CORBIN, Somerville, and BENJAMIN DOLE, Lynn, assignors to the Boston Type Writer Company, Boston, Mass. Filed Feb. 28, 1887. Serial No. 229,094. (No model.) Patented in England Mar. 5, 1887, No. 3,417.

Claim.—1. In a type-writer, a guide-plate held normally in a raised position from the carriage by means of supporting-arms pivotally secured to said carriage, said guide-plate being adapted to be swung down upon the paper to be operated upon near the printing-bar, substantially as and for the purpose described.

2. The combination of the movable feed-roll d', provided with the gear-wheel F', the vertically-stationary feed-roll c, provided with the gear-wheel F, the carriage B, the gear-wheel E, the lever F', pivoted to the carriage, spring c^5, pawl P, spring P', and the arm H, provided



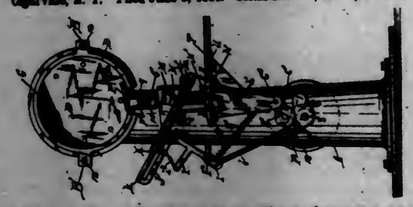
with the stop-pin H^3, said arm being pivotally secured to the carriage and adapted to swing horizontally, whereby said stop-pin may be swung into and out from a corresponding perforation H^2 in the carriage for varying the spacing between the lines, substantially as set forth.

3. In a type-writer, the combination, with the carriage B, of the frame I^2, provided with the spring I^3, said frame being farther provided with the arms I, supporting the roll i' and pivotally secured to the carriage, and with the lever J, pivotally secured to the frame of said carriage, substantially as and for the purpose described.

4. In a type-writer, the combination, with the beveled toothed rack D^4 on the carriage, of beveled pawls U V, for actuating said rack, substantially as and for the purpose set forth.

5. In a type-writer, the combination of the beveled toothed rack on the carriage, the pawl U, adjustably supported by the frame N, the pawl V, lever V', and adjustable spring-bolt V^4, substantially as and for the purpose hereinbefore described.

410,267. STEAM-GENERATOR. HARDY M. CLARK, JAMES TAYLOR, and JAMES B. HENSHAW, Manning, Iowa; said Taylor assignor to said Clark and Henshaw. Filed Apr. 16, 1888. Serial No. 307,479. (No model.)



Claim.—1. In a steam-generator, the combination of an annular fire-box or furnace provided near its upper end with inwardly-extending lugs or brackets, a vertical tubular boiler mounted upon the said brackets, and an annular water-chamber arranged within the fire-box and connected with the bottom of the boiler by means of vertical tubes, substantially as and for the purpose set forth.

2. In a steam-generator, the combination of an annular furnace or fire-box having an inclined chute provided with a suitable lid or door, and provided near its upper edge with inwardly-extending lugs or brackets, a vertical tubular boiler mounted upon the said brackets, an annular water-chamber arranged within the fire-box, suitably connected with the bottom of the boiler, and having an opening in its front side registering with the inclined feed-chute of the fire-box, and a shell or casing attached to the upper side of the furnace or fire-box and enveloping the boiler, substantially as herein described, and for the purpose set forth.

3. In a steam-generator, the combination of an annular furnace or fire-box having an inclined feed-chute, an annular water-chamber arranged within said fire-box and having an opening to register with the said chute, a vertical tubular boiler mounted upon lugs or brackets at the upper end of the fire-box and suitably connected with the annular water-chamber, a shell or casing attached to the upper side of the furnace or fire-box and enveloping the boiler, a cover secured detachably to the said shell or casing and having an upwardly-extending smoke-stack, and steam-pipes and try-cocks extending from the boiler respectively through the top and sides of the casing, substantially as and for the purpose set forth.

410,268. CIGAR-BUNCHING MACHINE. JOHN W. COVERTRY, Cigarville, N. Y. Filed June 9, 1888. Serial No. 276,636. (No model.)

Claim.—1. The combination, with a stationary hopper or receptacle for the tobacco, having an inclined side and a revolving vertical side, of a charge-gage and a cut-off between the hopper and gage, whereby the feed from the hopper into the charge-gage is automatically determined by the revolving side, substantially as and for the purpose set forth.

2. The combination of a feed-hopper secured rigidly to the frame of the machine and having an inclined side, with a rigidly-mounted charge-gage connected therewith and opening into the hopper, a revolving section carrying stirrers forming one side of the hopper and carrying a cut-off for closing the opening between the hopper and charge-gage, substantially as and for the purpose set forth.

3. The combination, in a cigar-machine, of a feed-hopper, a charge-gage, a revolving side extending over the charge-gage provided with a cut-off, and a slot located in relation to each other so that the cut-off stops the feed from the hopper into the charge-gage and the slot opens the charge-gage to discharge its contents, substantially as and for the purpose set forth.

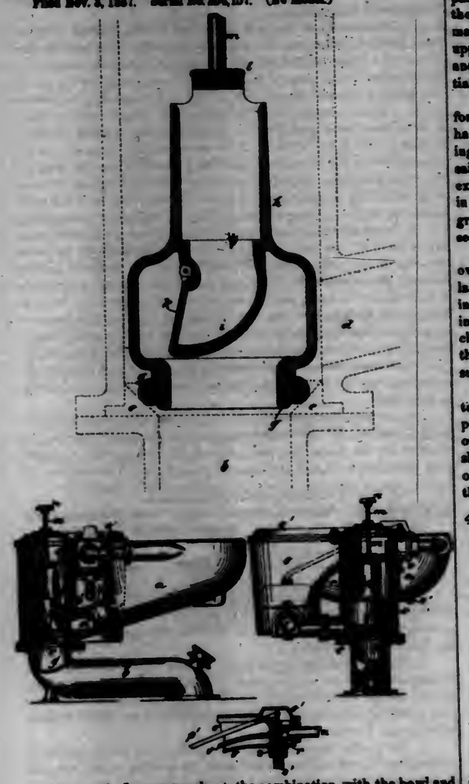
4. The combination, in a cigar-machine, of a combined feed-hopper and charge-gage, the hopper having an inclined side flaring upward from the opening in the charge-gage, and a vertically-arranged revolving side forming a moving side wall for both the hopper and charge-gage, the aforesaid moving side having a projecting cut-off extended in line with the top of the charge-gage, and a slot or cut-out below the cut-off, whereby the feed from the hopper into the charge-gage may be cut off and the charge-gage simultaneously opened to remove the charge, substantially as and for the purpose set forth.

5. In combination, the hopper H, having charge-gage G', inclined side E', vertical rotating side D, having pins p, cut-off F, slot F', and the shaft 2, for rotating the side D, all substantially as and for the purpose set forth.

6. The combination, in a cigar-machine, of a hopper and charge-gage, the hopper having a revolving side provided with a cut-off for the feed into the charge-gage and an exit for the tobacco from the gage, an oscillating spreader-tube N for receiving the charge, a plunger for forcing it into a pocket in the apron, and means, substantially as described, for rolling the charge into a bunch in the apron and applying the binder, substantially as set forth.

7. The combination of the hopper provided with the charge-gage, means, substantially as described, for cutting off the feed between the hopper and the gage, an oscillating receptacle M, a discharge-passage N, connected to the receptacle M, the plunger K, operating through the discharging-passage N, with a forming device for molding the charge into a bunch and applying the binder, all constructed and operating substantially as and for the purpose set forth.

8. The combination of the receptacle M and tube N, pivoted to the standard A, the tube N having the spring discharge-gate n, the plunger K, and operating levers I J, having suitable connections to transmit motion to the plunger, substantially as and for the purpose set forth.



9. The combination, with the table T, the independent journal bearings or levers U, secured at or near their rear extremities to the table T, with their forward extremities free, and the bunching-rollers r r, spaced apart from each other and journaled at their opposite ends in the free extremities of said independent journal bearings or levers U, of the rocking table having the recess E, an apron A, carried by the rocking table and passing over both of the bunching-rollers r r, and means for approximating either or both of the journal bearings or levers U to the rocking table or changing the plane of the rollers, whereby the shape and size of the bunch may be varied, substantially as and for the purpose set forth.

10. The combination, with the apron A, the central portion of which is of uniform thickness in cross-section and the edges of which are folded or re-enforced with ribs r' r' for preventing the tobacco from spilling, and the rocking table carrying the apron A and having the recess E, of the bunching-rollers r r, spaced apart from each other and arranged beneath the apron A, the independent journal bearings or levers U, mounted in which are the opposite extremities of the rollers r r, and means for approximating either or both of the journal-bearings to the rocking table or changing the plane of the rollers, whereby the shape and size of the bunch may be varied, substantially as and for the purpose set forth.

11. The combination, with the independent journal bearings or levers U, bunching-rollers r r, spaced apart from each other and having their opposite extremities journaled in said journal bearings or levers, the apron A, passing over the rollers r r, the rocking table carrying the apron A and having the recess E, and means for approximating either or both of the journal-bearings to the rocking table or changing the plane of the rollers, whereby the shape and size of the bunch may be varied, of the clamp O, the bracket k', and the adjusting-screw l', substantially as and for the purpose set forth.

12. The combination of the table T, provided with the beveled inner edge, independent journal bearings or levers U, and bunching-rollers r r, located opposite to the beveled edge of the table, said rollers being spaced apart from each other and journaled at their opposite extremities in said independent journal bearings or levers U, with the apron A passing over the bunching-rollers, and the rocking table carrying the belt A and having the recess E, and means, substantially as described, for approximating either or both of the journal-bearings to the rocking table or changing the plane of the rollers, whereby the shape and size of the bunch may be varied, substantially as and for the purpose set forth.

410,269. WATER-CLOSET. HUGH H. CRAMER, New York, N. Y. Filed Nov. 3, 1887. Serial No. 254,157. (No model.)

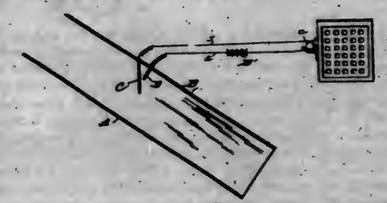
Claim.—1. In a water-closet, the combination, with the bowl and a valve controlling the discharge thereof, of a float-chamber communicating at the base with the base of the bowl, with a check-valve in the communicating passage opening outwardly from the float-chamber, a float in said float-chamber, and a water-supply valve governed by said float discharging into the bowl and into said float-chamber, substantially as set forth.

2. In a water-closet, the combination, with a bowl, a discharge-pipe, and a valve or plunger between the two, of a chamber inclosing said plunger and communicating with the bowl, a float-chamber distinct from the bowl and plunger-chamber, a passage between the base of the float-chamber and plunger-chamber, a check-valve in said passage opening toward the plunger-chamber, and a float-valve in the float-chamber discharging into the bowl and the float-chamber, substantially as herein set forth.

3. The combination, in a water-closet, with a bowl and a valve controlling the discharge thereof, of a float-chamber communicating at the base with the base of the bowl, a check-valve in said communication opening outwardly from the float-chamber, a float in said float-chamber, a supply-valve governed by said float, and two discharge-jets from said valve of different volumes, the main jet discharging directly into the bowl and the minor jet into the float-chamber, substantially as and for the purpose set forth.

4. In a water-closet of the described class, the combination, with the separate float-chamber having no direct connection with the bowl, but communicating therewith through a passage at the base having a check-valve, with a float in said chamber, and a supply-valve controlled thereby having a main discharge-pipe u, connected to the bowl, and minor pipe v, prolonged into the body of the float-chamber, substantially as and for the purpose set forth.

5. In a plunger-closet, a hollow plunger formed with a trapless overflow-passage through it, in combination with a gravity check-valve closing said passage to exclude sewer-gas, and which valve alone is interposed between the soil-pipe and the exterior air, whereby the retention in said passage of water to constitute a water seal is prevented, substantially as set forth.



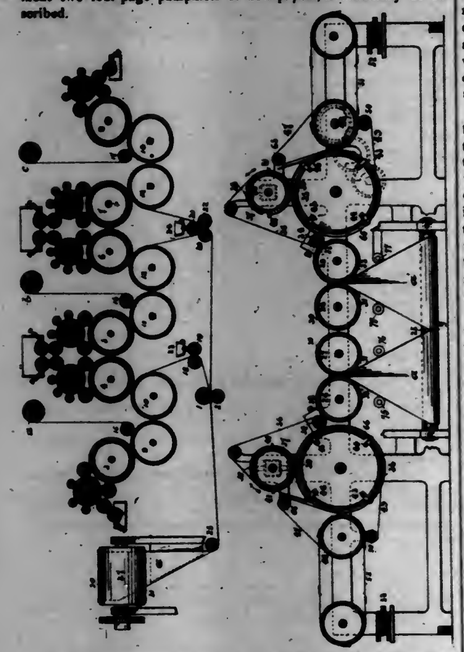
6. In a plunger-closet, a hollow plunger formed with an overflow-passage within it extending directly downward to the lower part of the plunger, bending laterally therein and terminating in an approximately vertical seat, in combination with a check-valve hinged at its upper edge seating against said seat by gravity to exclude sewer-gas and opening freely to permit the escape of overflow-water, substantially as set forth.

7. In a plunger-closet, the combination of a hollow plunger formed with an enlarged base and a contracted upper portion and having an overflow-elbow fastened within its enlarged base and forming a downward continuation of the contracted upper portion, whereby said upper portion and elbow constitute a trapless overflow-passage extending down from the top of the plunger and terminating laterally in an approximately vertical seat within the enlarged base, and a gravitating check-valve consisting of a hinged flap seating against said seat, substantially as and for the purpose set forth.

8. In a plunger-closet, a hollow plunger formed with a trapless overflow-passage extending directly downward within it and thence laterally and terminating in an approximately vertical seat, with an inclined surface opposite said seat and adapted to deflect the descending water laterally toward said seat, in combination with a gravity check-valve adapted to close against said seat and to be opened by the impact of the descending water deflected by said inclined surface, substantially as set forth.

9. A plunger in a plunger water-closet comprising an overflow-tube slightly curved at its lower end so that the opening is out of perpendicular, a flap-valve hinged at its upper sides and covering said opening, said opening being sufficiently inclined to permit the valve to shut by gravity, and an enlargement around the lower end of the overflow-tube to hold the packing and fill the seat at the bottom of the plunger-chamber.

410,270. SIGNAL. WILL H. DENNIS, Columbus, Ind. Filed Aug. 4, 1888. Serial No. 281,942. (No model.)



Claim.—In combination with an inclined spout, a plate freely suspended from the upper side of said spout above the normal current of the flowing material, so as not to be moved thereby, the stop or pin D, projecting into said spout, so that the plate may swing into contact therewith, a bell or indicator, and connections whereby the contact of the plate and stop will operate the bell or indicator, substantially as described.

410,271. ROTARY PRINTING-MACHINE. JOSEPH L. PIRE, Jersey City, N. J. Filed Oct. 27, 1886. Serial No. 216,293. (No model.)

Claim.—1. In combination, the form and impression cylinders adapted for printing separately the two webs a and b, so that each shall contain four pages abreast upon each side, rollers whereby said webs are brought together so as to register, a knife whereby they are split longitudinally along the central margin, rollers at right angles to the printing-cylinders, whereby each longitudinal half of the split web is folded longitudinally, the knife whereby the same is severed transversely, two duplicate pairs of cylinders 35 and 37, whereby each pair of the split webs is received once folded, each of said pairs of cylinders being provided on one member of the pair with grippers adapted to grip four thicknesses of paper and upon the other member of the pair with tucking projections and impaling-pins, substantially as described.

2. In a rotary printing-machine adapted for printing four pages abreast on the web, in combination, the form and impression cylinders, a knife whereby said web is split longitudinally on the central margin, two pairs of rollers at right angles with the cylinders for folding each half of the split web longitudinally, and so arranged that the bite between each pair of folding-rollers is opposite the point of the delivery-roller where the margin to receive the fold passes over, and a knife for severing each longitudinal half of the split web, whereby the web received from the printing-machine is, without reversing, divided, fold-

ed, and severed so as to produce simultaneously and by direct movement two four-page pamphlets or newspapers, substantially as described.

3. In combination with a rotary printing-machine adapted for printing four pages abreast upon the web, a folding-machine having in combination the roller 25, arranged at the bottom thereof, the folding-rollers 26 27 and 28 29 at right angles with the roller 25, and having their axes in substantially the same horizontal plane above the roller 25, a knife to sever that portion of the web which is folded by each pair of folding-rollers, mechanism whereby the longitudinally-folded halves of the web are conducted over the folding-rollers 26 and 29 toward opposite ends of the folding-machine, mechanism whereby the cuts from the longitudinal halves of the web are delivered, respectively, at opposite ends of the folding-machine, substantially as described.

4. In a rotary press, in combination, the impression-cylinders, the form-cylinders, the page-forms so arranged upon the form-cylinders as to print four pages abreast upon the web, those upon one longitudinal half of the web being the inverse of those upon the other, a knife whereby the web is split longitudinally on the central margin, the folding-rollers at right angles with the printing-rollers, whereby each half of the split web is folded longitudinally, knives whereby each half of the web is severed transversely, mechanism whereby the halves of the web are conducted from the folding-rollers, respectively, to the right and to the left of the press, and mechanism whereby each cut is folded transversely, substantially as described.

5. In a rotary press adapted for printing a plurality of webs, in combination, the form-cylinders located in a horizontal row, the impression-cylinders located in a second horizontal row beneath the first, the rollers whereby the several webs are brought together and conveyed to the folding mechanism, rollers located substantially on a level with the printing-cylinders and at right angles thereto, whereby the webs are folded longitudinally, knives whereby the folded webs are severed transversely, mechanism whereby the webs are conveyed horizontally to the side of the machine, and mechanism whereby each cut on the webs is folded transversely, substantially as described.

6. In combination, the form and impression cylinders adapted for printing a plurality of webs, the rollers by which said webs are collected one upon another, the rollers by which said collected webs are folded longitudinally, and a knife by which the same are severed transversely, the said folding-rollers and transversely-severing knife being located at right angles with the printing-rollers, whereby the webs, having been printed and collected, make only one change in the direction of feed while being printed, folded, and cut, substantially as described.

7. In combination, the form and impression cylinders adapted to print a plurality of webs, the rollers parallel thereto, by which said webs are collected, the knife by which said webs are split longitudinally, the folders at right angles with the printing-cylinders, whereby each half of the webs is folded longitudinally, the rotary knives parallel with said folders, whereby each half of the webs is severed transversely, and mechanism whereby the cuts from the respective halves of said webs are delivered to the right and to the left of the machine, substantially as described.

8. In combination, the cylinders 35 and 37, the grippers mounted upon the former, the projections mounted upon the latter and adapted to tuck the paper into the jaws of the grippers, pins also mounted on the cylinder 37 and adapted to impale the forward edge of the paper, whereby the forward edge is held so long as it is traveling in advance of the portion tucked within the jaws of the gripper, and by which it is released when pulled by the grippers in the opposite direction to that in which the cylinder 37 revolves, and the tapes 49 and 47, whereby the paper is received upon being released from the grippers, the whole being so arranged that the paper while undergoing the operation of folding and delivering is under constant control of the parts named to avoid clogging of the machine, substantially as described.

9. In combination, the cylinder 35, the grippers mounted thereon, the cylinder 37, the tucking projections and impaling-pins mounted thereon, the severing-cylinders 26 and 27, and the tapes 36, passing between the cylinders 35 and 37 and adapted to hold the paper upon the surface of the latter as it passes to the tucking operation, the severing-knife, the grippers, the tucker, and the impaling-pins being so arranged on their respective cylinders and the motions of said cylinders being so timed that the paper is impaled upon the pins just behind each cut of the severing-knife and the tucker and grippers operate upon the paper half-way between every two cuts, substantially as described.

10. In combination, the cylinder 35, the grippers mounted thereon, the cylinder 37, the tucker and impaling-pins mounted thereon, the cylinder 48, the tapes 49, passing around the cylinder 35 in contact with the cylinder 48, and the tapes 47, passing around the cylinder 48 and in contact with the cylinder 35, substantially as described.

410,272. MANUFACTURE OF PENS. JOHN T. FOSTER, Arlington, N. J. Filed Mar. 7, 1888. Serial No. 302,212. (No model.)

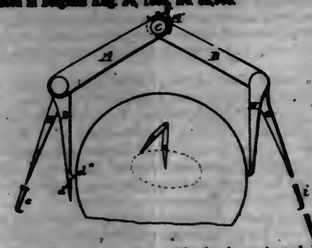
Claim.—1. The improvement in the art of making pens which consists in striking the nib portion of the blank with a punch in order to compact it and impart elasticity, whereby the operation of hammering the nibs is avoided.

2. The improvement in the art of making pens which consists in cutting out the blank to the proper outline and subsequently striking the nib portion thereof with a punch in order to compact it and impart elasticity, whereby the metal is rendered more dense without being spread laterally.

3. The improvement in the art of making pens which consists in roughening the nib portion of the blank by striking it with a punch having a roughened surface.

4. The improved process of making gold and other analogous pens which consists in, first, rolling the strip; second, stamping out the blanks; third, pointing the blanks with iridium; fourth, rolling them down to the proper thickness; fifth, cutting them out to exact outline; sixth, striking the nib portion of the blank with a punch in order to compact the metal and impart elasticity; seventh, raising to curved shape; eighth, slitting and grinding, and, ninth, polishing.

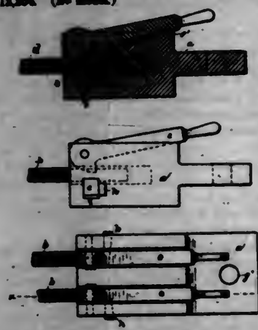
5. The improvement in the art of making pens which consists in roughening the nib portion of the blank by striking it with a punch having its surface formed with projections, whereby corresponding indentations are formed in the blank, thereby compressing the metal, imparting elasticity to the pen, and avoiding the necessity of the process of nibbing or stoning.



6. A metallic pen the surface of the nibs of which is roughened by indentations at intervals, the metal at each indentations being displaced and of greater density than elsewhere.

410,273. UMBRELLA OR PARASOL. EDWIN R. GARD, London, England. Filed July 11, 1887. Serial No. 243,940. (No model.) Patented in England June 20, 1885, No. 7,088, and Sept. 17, 1886, No. 11,814.

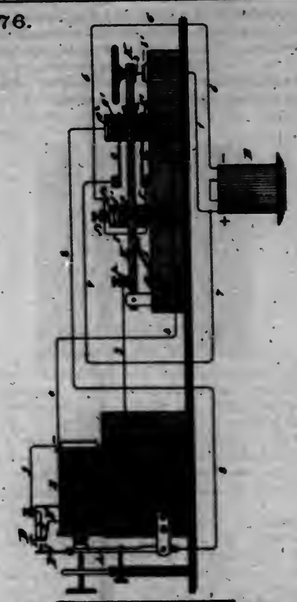
Claim.—In the construction of umbrellas and parasols, the combination, with the cover and ribs, of sheet-metal clips D, of inverted-U shape in cross-section and having oblique ends, the angle at one end being less than at the other end to form projecting points 5, there being holes for the sewing that unites the clips to the umbrella or parasol cover, said clips being adapted to be sprung over the umbrella-rib and to be removed therefrom by raising the projecting points and springing said clips off, substantially in the manner and for the purpose set forth.



410,274. CALIPERS AND DIVIDERS. WALTHER GLEISER, Geneva, Switzerland. Filed Mar. 14, 1888. Serial No. 267,207. (No model.) Patented in Belgium Aug. 24, 1888, No. 83,008.

Claim.—1. The combination, with the bars A and B, pivoted together, of the legs pivoted to the outer ends of the bars A and B, and sockets having lateral projections and adapted to fit upon the ends of the legs, substantially as set forth.

2. The combination, with the bars A and B, pivoted together, of the pairs of legs pivoted to the outer ends of the bars A B, one pair of said legs having permanent lateral projections, and sockets with points or lateral projections and adapted to fit upon the ends of the other pair of legs, substantially as set forth.



410,275. CLUTCH FOR HOOK. REUBEN HARTMAN, Akron, Ohio, assignor to the Akron Iron Company, same place. Filed May 27, 1889. Serial No. 312,264. (No model.)

Claim.—1. In a clutch for drawing metal rods, a holder or frame, in combination with a hinged lever and a bar, each formed with an edge to enter the rod on opposite sides of the latter, substantially as described.

2. In a clutch for drawing metal rods, a holder or frame, in combination with a hinged lever and an adjustable bar, each formed with an edge to enter the rod, the lever being adapted on lifting the same to allow the rod to enter the holder, and the latter formed and adapted to arrest the lever when the edge of the latter has sufficiently entered the rod, substantially as described.

410,276.

410,277. SEWING-MACHINE. THOMAS C. HARRIS, Troy, N. Y., assignor to T. C. Harris & Co., same place. Filed Sept. 27, 1887. Serial No. 250,535. (No model.)

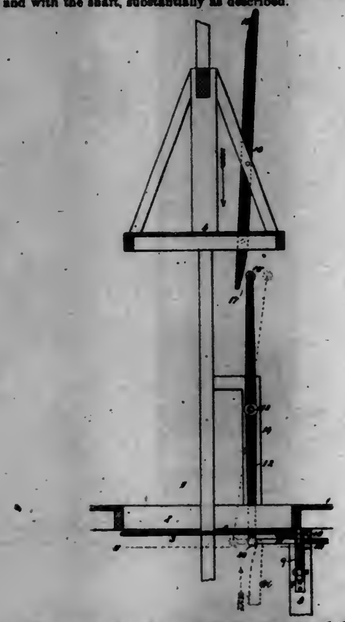
Claim.—1. In a sewing-machine, the rotary looping-hook, the stationary bobbin-support, and the intermediate bobbin, as usual, in combination with the central reciprocating spindle adapted to enter the bobbin and serve as its sole support, and suitable operating mechanism, substantially as shown, acting to thrust the spindle into and withdraw it from the bobbin during each rotation of the hook.

2. In a sewing-machine, the rotary looping-hook, the bobbin, and the stationary bobbin-support, in combination with a spindle to enter the bobbin, its sustaining-slide, and the cam and spring to actuate the slide at each rotation of the hook.

3. In combination with the looping-hook, its shaft, and the cam thereon, the rock-shaft, the brush carried at one end of said shaft, the cam-actuating arm at the other end of said shaft, and the spring.

4. In a sewing-machine, the rotary looping-hook, the needle and the peripherally-acting brush at the lower part of the hook to retain the needle-thread loop, as usual, and the freely-movable brush-support, in combination with mechanism, substantially as described, for moving said brush to and from the hook at each rotation of the latter.

410,278. HATCHWAY. EMILE J. HERMAN, St. Louis, Mo., assignor to the Safety Hatch Door Company, same place. Filed Sept. 1, 1888. Serial No. 284,361. (No model.)



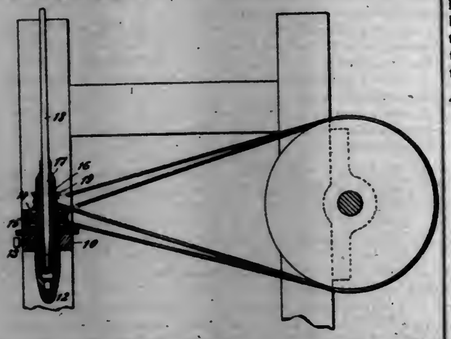
Claim.—1. The combination of a car 4, the bar 16, secured thereon, the horizontal door 3, having vertical shaft 7, the rock-bar 12, with which the bar 16 engages, pivoted to the side of the elevator-well, and the sliding bar 11, connected with the lower end of the rock-bar and with the shaft, substantially as described.

2. The combination of a car 4, the bar 16, secured thereon, having end inclines 17 and 18, the horizontal doors 3, having a vertical shaft 7, the rock-bar 12, with which the bar 16 engages, pivoted to the side of the elevator-well, and the sliding bar 11, connected with the lower end of the rock-bar and with the shaft, substantially as described.

410,278. METHOD OF NEUTRALIZING THE RESIDUAL MAGNETISM IN ELECTRO-MAGNETS. FREDERICK HAMMESEN and OTTO HAMMESEN, Philadelphia, Pa., assignors to themselves and Oscar Sostman, New York, N. Y. Filed Sept. 13, 1888. Serial No. 177,482. (No model.)

Claim.—The method herein described of neutralizing the residual magnetism in electro-magnets, which consists of the following steps: first, sending a current in one direction through an electric circuit and the coils of an electro-magnet in the same; secondly, sending a current of the same strength, but of the reverse direction, through said circuit, so as to neutralize completely the residual magnetism in the cores of the electro-magnet, and, thirdly, interrupting the circuit automatically by the action of said reversed current as soon as the neutralization of the residual magnetism in the cores has taken place, substantially as set forth.

3. The combination of a car 4, the bar 16, secured thereon, the horizontal door 3, having vertical shaft 7, the rock-bar 12, with which the bar 16 engages, pivoted to the side of the elevator-well, the journal-boxes 8 8 for the shaft, the closing spring 9, coiled around the shaft, and the sliding bar 11, connected with the lower end of the rock-bar and with the shaft, substantially as described.



4. The combination of a car 4, the bar 16, secured thereon, the horizontal door 3, having vertical pivot 7, provided with a rack-segment 10, the rock-bar with which the bar engages pivoted to the side of the elevator-well, and the sliding rack-bar 11, connected with the lower end of the rock-bar and with the rack-segment on the shaft, substantially as described.

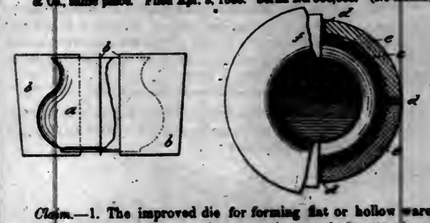
5. The combination of the car 4, provided with the bar 16, having the end inclines 17 18, the rock-bar 12, pivoted to the side of the elevator-well, the door 3, short vertical shaft 7, journal-boxes 8, spring 9, rack-segment 10, and rack-bar 11, substantially as described.

410,279. SUPPORT FOR SPINNING-SPINDLES. JOHN J. HEYWOOD, Fall River, Mass., assignor of one-half to Francis Seymour, Paterson, N. J. Filed Nov. 12, 1886. Serial No. 218,708. (No model.)

Brief.—The object of the invention is to distribute the friction caused by the revolution of the spindle, so that the spindle can be run at higher speed.

Claim.—1. The combination, with a hollow supporting-case, of a spindle-bearing provided with a whirl, which bearing is stepped into said case and is capable of revolving therein, as described, and a spindle extending down into and stepped within said bearing and provided with a whirl, substantially as set forth.

2. The combination, with the rail of a spinning-frame, of a hollow supporting-case secured thereto, a bearing having a whirl and stepped into said case, so as to revolve therein, as described, a spindle provided with a whirl and extending down into and stepped within said bearing, a driving-band common to the two whirls, and means, substantially as described, for driving the band, substantially as set forth.



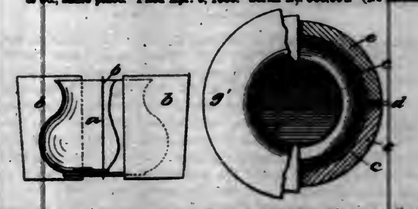
3. The combination, with the supporting-case 12, of a spindle-bearing 14, stepped into said case and having a whirl 15 and an upwardly-extending sleeve 16, and the spindle 18, extending down through said sleeve and whirl and stepped at its lower end into said bearing and having a whirl 19, surrounding the sleeve 16, substantially as set forth.

4. The combination, with the hollow supporting-case 12, of the bearing 20, stepped therein, the spindle-bearing 14, stepped within the bearing 20, and the spindle 18, having a whirl and extending down into and stepped within the bearing 14, substantially as set forth.

5. The rotating or live spindle and the tube containing bolster and step bearings for the spindle and provided with a whirl whereby the said tube may be rotated, combined with a case or holder for the tube and a step for the tube, substantially as set forth.

6. The spindle, the bearing-tube provided with a whirl, and a step for the tube, combined with means to rotate the said spindle and bearing-tube, substantially as set forth.

410,280. DIE FOR FORMING FLAT OR HOLLOW WARE. ARTHUR R. HOBSON, Hartford, Conn., assignor of one-half to I. J. Hobson & Co., same place. Filed Apr. 9, 1889. Serial No. 306,603. (No model.)



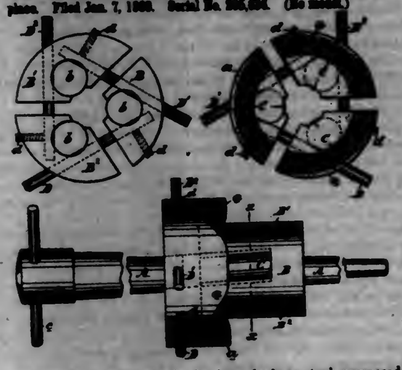
Claim.—1. The improved die for forming flat or hollow ware, provided with a working-face consisting of a metal electrotypic reproduction of a hand-made or hand-ornamented pattern, and a backing composed of a metal fusible at a lower temperature than the metal of the working-face, all substantially as described, and for the purpose specified.

2. The improved die for forming flat or hollow ware, provided with a working-face consisting of a metallic electrotypic reproduction of a hand-made or hand-ornamented pattern, and a metallic backing to support and hold the metallic face, substantially as described, and for the purpose specified.

3. In combination, a shaped die having a working-face consisting of a metallic electrotypic reproduction of a hand-made or hand-ornamented pattern, and a metallic backing to support and hold the working-face, a quantity of liquid—as water—held in a hollow blank placed within the die, and a press adapted to exert pressure upon the said liquid, all substantially as described, and for the purpose specified.

4. An improved die consisting of the several die-sections, each having the working-face of a metallic electrotypic reproduction of a hand-made or hand-ornamented pattern, the radially-extending integral flanges, and a metallic backing fusible at a lower temperature than the working-face of the die, all substantially as described, and for the purpose specified.

410,281. DIE FOR FORMING FLAT OR HOLLOW WARE. ARTHUR R. HOBSON, Hartford, Conn., assignor of one-half to I. J. Hobson & Co., same place. Filed Apr. 9, 1889. Serial No. 306,604. (No model.)



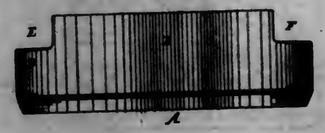
Claim.—1. The within-described method of making a sectional die having a working-face and integral flanges formed by the electro-deposition of metal, that consists in, first, making a pattern; second, dividing the outer surface of the pattern into a number of sections by projecting feathers of thin metal, and, third, suspending such pattern in an electro-bath and changing from time to time the position of the axis of the work or pattern with reference to a vertical line or plane, all substantially as described.

2. The method of making a sectional die by the electro-deposition of metal, that consists in providing a pattern having projecting feathers and changing at intervals the position of said pattern in the bath with reference to a vertical line or plane while the bath is active, all substantially as described.

3. As an improved article of manufacture, a sectional die having its working-face formed by the electro-deposition of metal with radially-extending integral flanges, between which are the parting planes of the sections, all substantially as described.

410,282. PIPE-EXPANDER. JOHN JARDINE and PETER JARDINE, Hespeler, Ontario, Canada, assignors, by direct and mesne assignments, to Andrew Bell Jardine, James Jardine, and Peter Jardine, all of same place. Filed Jan. 7, 1889. Serial No. 295,694. (No model.)

Claim.—In a tube-expander having a body or stock composed of radially-converging sections B B' B², each having a swage-roller C, the equiangularly-arranged bars D D' D², connecting said sections expansively, as and for the purpose set forth.



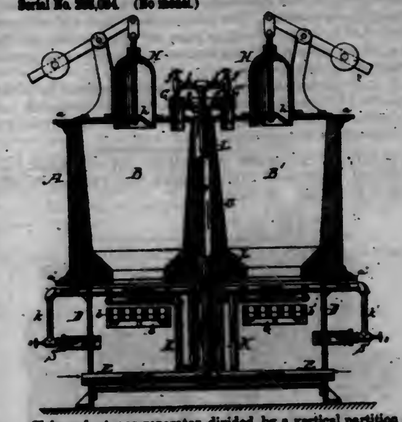
410,283. FENCE-WIRE TIGHTENER. THOMAS W. JENKINS, Sherman, Tex., assignor of one-half to Charles F. Davis, same place. Filed May 15, 1889. Serial No. 310,898. (No model.)

Claim.—1. The herein-described wire-tightener, formed of a single piece of material and consisting of the intermediate shank portion L, bent at an angle at one end to form a plain crank which is adapted to be journaled in the fence-post, and having a notch or aperture to receive the fence-wire, the other end being bent at an angle in the same direction as the crank and terminating in a curved wire-embracing hook, substantially as described.

2. The combination, with a fence-post provided with an opening and a wire crossing the same, of the herein-described tightener consisting of the intermediate shank L, terminating at its rear in a crank J at a right angle to the shank, mounted in the opening and provided with an opening through which the wire is passed, and at its other end bent at a right angle to the shank and crank and terminating in a hook adapted to engage the wire, substantially as specified.

410,284. SOLE-CUTTING DIE. JAMES B. KEANEY, Milford, Mass. Filed May 25, 1889. Serial No. 312,096. (No model.)

Claim.—The cutting-die A, of less height at its end or toe and heel portions B and C on its back than in its middle portion D, whereby are formed the openings or notches E and F, as set forth.



410,285. MOLD FOR TUBULAR ARTICLES. JACOB KUNZE, Pittsburg, Pa., assignor, by mesne assignments, to the Kunze Manufacturing Company, same place. Filed Mar. 5, 1889. Serial No. 301,970. (No model.)

Claim.—1. A mold for tubular articles, having, in combination, a matrix provided at its ends with core-seats and open at one end, the matrix and core-seats being formed in the same body of sand, a core having centering prints or bearings at each end, the print at the upper end serving as a cope to close the matrix, a runner extending entirely through the body of sand containing the matrix from the upper to the under faces thereof, and gates formed in the under side of the body of sand containing the matrix and connecting the runner and matrix, substantially as set forth.

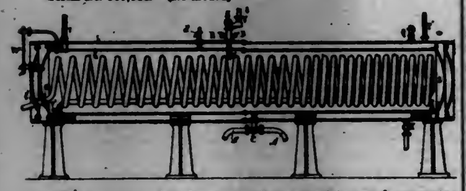
2. A mold for tubular articles, having, in combination, a series of two or more matrices, each provided at its end with core-seats and open at one end, the matrices and core-seats being formed in one body of sand, a series of two or more cores having centering-prints at their ends, the upper ends or prints of the cores serving as copes to close the matrices, a centrally-arranged runner extending entirely through the body of sand containing the matrices from the upper to the under faces thereof, and gates formed in the under side of the body of sand containing the matrices and connecting the runner and matrices, substantially as set forth.

410,286. APPARATUS FOR MANUFACTURING NON-LUMINOUS HEATING-GAS. ARTHUR KITSON, Philadelphia, Pa. Filed Dec. 8, 1888. Serial No. 293,694. (No model.)

Claim.—1. A gas-generator divided by a vertical partition into two fuel-chambers and having a connecting base-chamber, in combination with a steam and air injector connecting with the top of each fuel-chamber, an air-heating pipe arranged in the generator and connecting with such injectors, and a gas-take-off pipe also leading from the top of each chamber, for the purpose described.

2. In combination with a gas-generator containing two fuel-chambers and a connecting base-chamber, the steam generating and superheating coils located in the base-chamber between the grates of the fuel-chambers, and pipes connecting such coils with steam and air injectors, one for each fuel-chamber, as and for the purpose described.

3. The gas-generator divided by a vertical partition of refractory material into two fuel-chambers and having a connecting base-chamber in combination with an air-heating pipe, and a steam-superheating pipe extending through the dividing-partition and connecting with



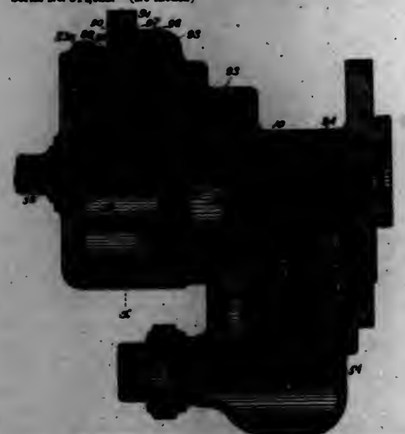
injectors discharging into the tops of the furnaces, as and for the purpose described.

4. In combination with a gas-generating furnace, the steam and air heating pipes or coils located in the ash-chamber and wall of the generator, and both connecting with a blast-injector arranged to discharge into the fuel of the generator, as and for the purpose described.

5. In combination with the two-chambered generator and a connecting base-chamber, the steam and air blast injector connecting with such base-chamber, and a steam and air blast injector connecting with the top of each fuel-chamber of the generator, whereby the fuel may be blasted either up or down and the current passed from one chamber to the other in either direction for uniformly heating and consuming the fuel, and a mixed gas simultaneously generated from air and steam.

410,287. APPARATUS FOR THE PASTEURIZATION OF BEER.

WILLIAMS KUHN, Clermont-Ferrand, France. Filed Apr. 20, 1889. Serial No. 308,011. (No model.)



Claim.—1. A series of apparatus for pasteurizing, each apparatus comprising a receptacle for the liquid to be treated, a coil in length and diameter nearly equal to the corresponding dimensions of the receptacle in which it is placed, and a pressure-gage and thermometers for said receptacle, the several apparatus having their lower parts connected by pipes with valves or stop-cocks and their upper parts similarly connected, and the first at least of the series being provided with a safety-valve, substantially as described.

2. A series of three apparatus for pasteurizing, each apparatus comprising a receptacle for the liquid to be treated, a coil in said receptacle approximating in length and diameter the corresponding dimensions of the receptacle, a pipe and stop-cock for admitting air or gas under pressure into the receptacle, and a pressure-gage and thermometers for said receptacle, the several receptacles being connected with one another at their lower parts by pipes with valves or cocks and at their upper parts by pipes similarly provided, and the first apparatus of the series being further provided with a safety-valve, substantially as described.

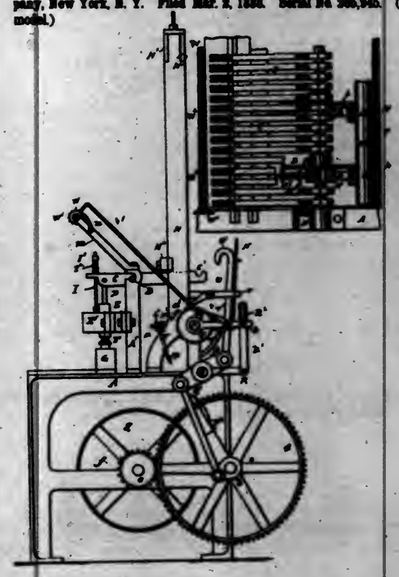
3. A pasteurizing apparatus comprising an elongated horizontal receptacle, a helical coil extending lengthwise of said receptacle and having the convolutions more closely set toward the outlet end of the coil, substantially as described.

410,288. RELEASING ATTACHMENT FOR AUTOMATIC AIR-BRAKES.

ELLSWORTH J. LEWIS, Warrenton, Ohio. Filed June 20, 1889. Serial No. 314,922. (No model.)

Claim.—1. In an automatic brake mechanism, the combination, with a triple valve, of a discharge-passage for air under pressure from an auxiliary reservoir to the atmosphere, and a supplemental-valve mechanism actuated by pressure from a brake-pipe and controlling said discharge-passage, substantially as set forth.

2. In an automatic brake mechanism, the combination, with a triple valve, of a movable abutment which is subject to variations of brake-pipe pressure on opposite sides, a relief-valve controlling a discharge-passage for air under pressure from an auxiliary reservoir to a discharge-valve, and located in position to be unseated by movement of the abutment, a discharge-valve controlling a passage for air from the relief-valve opening to the atmosphere, and a disk actuated by pressure delivered by the relief-valve and adapted to unseat the discharge-valve, substantially as set forth.



3. In an automatic brake mechanism, the combination, with a triple valve, of an abutment-chamber communicating at one end with a main air or brake pipe, a supplemental reservoir communicating with the opposite end of said chamber, an abutment fixed upon a stem and fitted to move in said chamber, a charging groove or passage establishing communication between opposite sides of the abutment, a relief-valve controlling a passage for air from an auxiliary reservoir to a discharge-valve, said relief-valve being located in position to be unseated by the movement of the abutment stem, a discharge-valve controlling a passage from the relief-valve to the atmosphere, and a disk subject to pressure delivered by the relief-valve and bearing against the discharge-valve, substantially as set forth.

4. In an automatic brake mechanism, the combination, with a triple valve, of a supplemental reservoir adjoining and exterior to the drain-cup of the triple valve, an abutment-chamber closed at its outer end and fitting an opening in the supplemental reservoir, a port leading from the drain-cup to the abutment-chamber, a port leading from the abutment-chamber to the supplemental reservoir, a valve-chamber and a disk-chamber located on the outer and inner ends of the head of the abutment-chamber, respectively, a relief-valve controlling an opening or port from the valve-chamber to the piston-chamber, a piston fitted to work in the abutment-chamber and having a stem which bears against the stem of the relief-valve, a discharge-valve fitting freely on the abutment-stem and controlling ports leading from the abutment-chamber to the atmosphere, a passage leading from the triple-valve-piston chamber to the relief-valve chamber, and a disk fitted to work in the disk-chamber and bearing against the discharge-valve, substantially as set forth.

5. An abutment-chamber having a closed top adapted to be fixed upon a drain-cup, an internal disk-chamber and external valve-chamber integral with its body, and ports leading from the abutment-chamber and valve-chamber, respectively, to openings on the face of its top, which abuts against the drain-cup casting, said openings being adapted to communicate with a triple-valve-piston chamber and with a supplemental reservoir, respectively, substantially as set forth.

410,289. MACHINE FOR MOLDING BUTTONS.

WILLIAM F. NILES, Jersey City, N. J., assignor to the Vulcanite Manufacturing Company, New York, N. Y. Filed Mar. 2, 1888. Serial No. 265,945. (No model.)

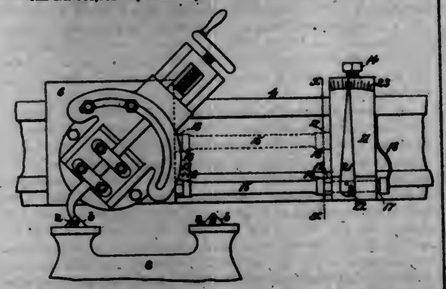
Claim.—1. In a machine for making buttons or other articles, the combination, with molds, of plungers, levers for pressing down the plungers, springs connected with said levers, a rock-shaft provided with a hook-bar for drawing down the outer ends of the levers in raising the plungers, and mechanism, substantially as shown and described, for shifting the hook-bar, substantially as set forth.

2. In a machine for molding buttons or other articles, the combination, with a series of plungers, of pivoted levers acting on the same, springs acting on the levers, a series of hook-arms which act on the levers, and mechanism for swinging the hook-arms toward the ends of the levers, substantially as shown and described.

3. In a machine for molding buttons or other articles, the combination, with a series of plungers, of levers acting on the same, springs acting on the levers, a rock-shaft carrying hook-arms which can act on the levers, a shaft operated from the rock-shaft and provided with wheels having cam teeth or projections, levers mounted to swing on the shaft carrying the wheels provided with the cam projections, on which levers the cam projections can act, said levers having springs acting on the hook-arms on the rock-shaft and moving them toward the ends of the levers connecting with the plungers, substantially as shown and described.

4. In a machine for molding buttons or other articles, the combination, with plungers, levers connected with the same, hook-arms acting on the levers, and springs acting on the levers, of the levers L, mounted loosely on the shaft K and adapted to act on the hook-arms, and wheels mounted on the shaft K and provided with cam teeth or projections that act on the levers L, substantially as shown and described.

5. In a machine for molding buttons or other articles, the combination, with plungers, levers acting on the same, and springs acting on the levers, of the shaft K, the levers L, mounted loosely on the same and carrying sliding bolts M, the cam-wheels K' on the shaft K, and springs secured to the levers and acting on the hook-arms, substantially as shown and described.



6. In a machine for molding buttons or other articles, the combination, with plungers, levers acting on the same, springs acting on the levers, and hook-arms adapted to act on the levers, of the shaft K, the levers L, mounted loosely on the same and operated by cam-wheels on the shaft K, said levers L being adapted to act on the hook-arms, the ratchet-wheel U on the end of the shaft K, and a pick-arm and pawl for revolving said ratchet-wheel from the shaft that operates the hook-arms, substantially as shown and described.

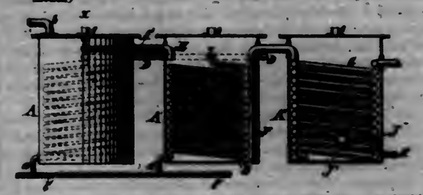
7. In a machine for molding buttons or other articles, the combination, with a series of groups of plungers, of levers acting on the plungers, a rock-shaft provided with a hook-arm for each group of levers, an indicator-shaft provided with a mark for each group of levers, and gearing for operating the indicator-shaft from the same mechanism that operates the hook-arms, substantially as shown and described.

8. In a machine for molding buttons or other articles, the combination, with a series of groups of plungers, of levers acting on the plungers, a rock-shaft having a hook-arm for each group of levers, a shaft carrying cam-wheels, levers actuated by said cam-wheels and mounted on the shaft carrying the latter, which levers act on the hook-arms, gearing for driving the shaft carrying the cam-wheels from the rock-shaft, an indicator-shaft provided with a mark for each group of plungers, and mechanism for operating the indicator-shaft from the shaft carrying the cam-wheels, substantially as set forth.

410,290. DEVICE FOR SETTING THE TOOL-CARRIERS OF PLANERS.

JOSEPH W. RISE, Allegheny, Pa. Filed June 24, 1889. Serial No. 315,222. (No model.)

Claim.—1. The combination of a planer cross-head, a tool-carrier mounted thereon, a reference-block adjustably mounted on the cross-head, and a gage-bar, substantially as set forth.



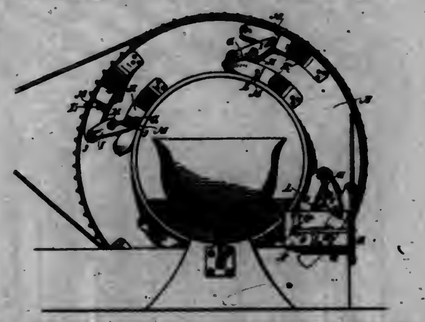
2. The combination of a planer cross-head, a tool-carrier mounted thereon, a reference-block adjustably mounted on the cross-head, a gage-bar, and supports on the tool-carrier and block for supporting the gage-bar, substantially as set forth.

3. The combination of a planer cross-head, a tool-carrier mounted thereon, a reference-block adjustably mounted on the cross-head, a gage-bar, and supports or sockets on the tool-carrier and block for supporting the gage-bar, the support or socket on the reference-block being yieldingly mounted therein, substantially as set forth.

4. The combination of a planer cross-head, a tool-carrier mounted thereon, a reference-block adjustably mounted on the cross-head, a gage-bar, supports or sockets on the tool-carrier and reference-block for supporting the gage-bar, the support or socket on the reference-block being yieldingly mounted therein, and an index-finger operated by the yielding support or socket, substantially as set forth.

410,291. APPARATUS FOR EXTRACTING GREASE FROM WATER.

HENRY PEDAR, New York, assignor of one-half to Enoch Rutzler, Brooklyn, N. Y. Filed Apr. 4, 1889. Serial No. 306,077. (No model.)



Claim.—1. The combination, with a series of tanks, one of which is provided with an inlet for waters of condensation, of coils of pipe arranged in said tanks, a supply-pipe common to all said coils for conveying cold water thereto, an outlet-pipe for said cold water communicating with all said coils, pipe communications between said tanks for conveying waters of condensation from one to the other, and a pipe communicating with all said tanks for conveying away grease therefrom, substantially as described, whereby a constant circulation of water is maintained through said coils to cool the waters of condensation in the tanks and from one of said tanks to another to convey the waters of condensation to said tanks successively.

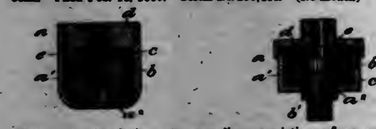
2. The combination, with a series of tanks, one of which is provided with an inlet for waters of condensation, of coils of pipe arranged in said tanks, a supply-pipe common to all said pipes for conveying water thereto, an outlet-pipe for said cold water communicating with all said coils, pipe communications between said tanks for conveying waters of condensation from one to the other, a pipe communicating with all said tanks for conveying away grease therefrom, a heating-tank, a pipe for conveying waters of condensation from the last of the tanks first named to the heating-tank, a steam-coil in said heating-tank for heating the water therein, and a pipe for conveying away the heated water from the heating-tank, substantially as described, whereby a constant circulation of water is maintained through the coils in the first-named tanks in order to cool the waters of condensation, and through all of said tanks from one to another in order to convey the waters of condensation to said tanks successively, substantially as specified.

410,292. CONCRETE-MIXING MACHINE.

ERNEST L. RAMSOME, San Francisco, Cal. Filed Nov. 16, 1888. Serial No. 291,081. (No model.)

Claim.—1. In a concrete-mixing machine, a hollow rotating drum with the hinged or swinging transverse lifting flanges or shelves on the inner surface of its periphery, in combination with lever-arms fixed to the outer ends of their fulcrum-shafts, and the pins and perforated

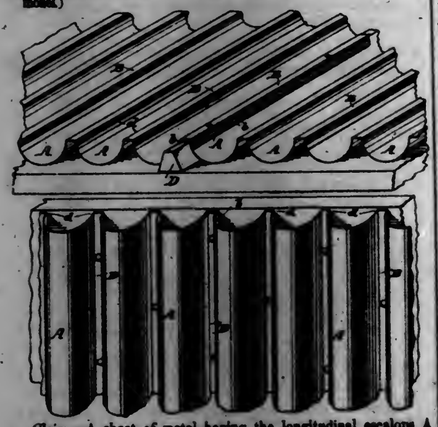
locking-springs, whereby they are held in their position, substantially as herein described.



2. In a concrete-mixing machine, a hollow rotating drum, in combination with hinged or swinging flanges or shelves upon the inner surface of its periphery, the transverse arms or levers fixed to their fulcrum-shafts, and the springs adapted to engage and hold the opposite ends of the transverse arms, and having the shoulders or stops M, substantially as and for the purpose herein described.

3. In a concrete-mixing machine, the hollow rotating drum, with the hinged or swinging transverse flanges or shelves upon the inner surface of its periphery, and the transverse arms fixed to the outer ends of their fulcrum-shafts, in combination with springs having one end fixed to the side of the drum and the other ends lying beneath the ends of the transverse arms, said springs being inclined away from the side of the drum from their point of attachment to the abrupt shoulders M, substantially as herein described.

4. In a concrete-mixing machine, the hollow rotating drum, the hinged or swinging transverse flanges or shelves upon the inner surface of the periphery, the transverse lever-arms, with locking-pins J, and fixed to the fulcrum-shafts of said flanges exterior to the drum, and the springs K, with the outward inclination from their point of attachment, in combination with the pins P and Q and the mechanism for advancing said pins alternately, whereby they move over the inclined surfaces of the springs and gradually force them out of engagement with the locking-pins J, substantially as herein described.



5. In a concrete-mixing machine, the hollow rotating drum, with the adjustable lifting shelves or flanges mounted upon fulcrum-shafts within the periphery of the drum, and the transverse levers fixed to the fulcrum-shafts exterior to the side of the drum, having locking-pins at opposite ends to engage with corresponding holes in the inclined springs K, which are fixed to the side of the drum and which have the abrupt shoulders M, as shown, in combination with a lever having pins upon opposite sides of its fulcrum, which may be advanced alternately, so as to engage the inclined surfaces of the springs and force them backward so as to release the locking-pins and allow the shelves to be turned, substantially as herein described.

410,293. PIPE-COUPLING. FREDERICK C. ROCKWELL, Hartford, Conn. Filed Feb. 11, 1889. Serial No. 299,411. (No model.)

Claim.—An insulating pipe-coupling consisting of an exterior shell *a'*, partly closed at one end, containing an integral mass of insulating composition *c*, which surrounds on all faces and firmly holds a parallel-sided nut *b* of greater diameter than the smaller opening through the shell, and a threaded cap *d*, closing the larger end of the shell, substantially as described, and for the purpose specified.

410,294. METALLIC ROOFING, SIDING, &c. LOMBLEY I. SAGENDORPH, Cincinnati, Ohio. Filed May 13, 1889. Serial No. 310,613. (No model.)

Claim.—A sheet of metal having the longitudinal escalops A formed therein, and the flat ridge-caps B, connecting said escalops, the latter lying entirely below the plane of said cap portions, the sides of each sheet terminating in a flat cap having an overlapping flange *b*, substantially as set forth.

410,295. PROCESS OF MAKING BETA-NAPHTHOL CARBONIC ACID. RUDOLF SCHMITT, Dresden, assignor to Dr. F. von Heyden Nachfolger, Radebeul, Saxony, Germany. Filed June 22, 1889. Serial No. 315,232. (No specimens.)

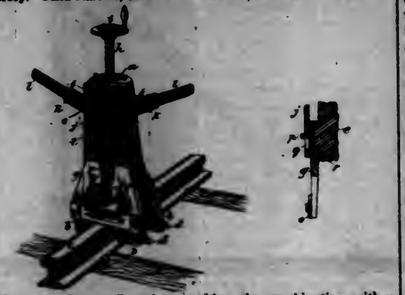
Claim.—The process of manufacturing a beta-naphthol carbonic acid of a melting-point of 216° Celsius, consisting in producing the reaction of carbonic acid upon the alkaline salts of the beta-naphthol under pressure and at a temperature of 200° to 250° Celsius, substantially as herein set forth.

410,296. BARBER'S CHAIR. HANS A. SOMMERSLOTH, New York, N. Y., assignor to Selig Litzman, same place. Filed Apr. 13, 1889. Serial No. 307,111. (No model.)

Claim.—The combination, with a supporting-frame, of a seat pivoted to the same, a pendent rod hinged to the front part of the seat-frame, a clamping-cheek applied to the front of the supporting-frame, cam-levers pivoted to lugs of the cheek, pivot-links applied to the ends of the cam-levers, a foot-lever fulcrumed to the rear part of the supporting-frame, a connecting-rod pivoted to the pivot-links and the foot-lever, and a spiral spring secured to the lug of the cheek and the front end of the connecting-rod, substantially as set forth.

410,297. TWISTING AND DOUBLING MACHINE. JAMES W. SHEPHERD, WILLIAM AYRTON, and RALPH CLEGG, Longsight, near Manchester, County of Lancaster, England. Filed Apr. 19, 1887. Serial No. 235,303. (No model.) Patented in England Jan. 30, 1886, No. 1,283, and in France Dec. 6, 1886, No. 180,102.

Brief.—The object of the invention is to improve the construction of doubling and twisting machines wherein the yarn or thread is given two turns of twist for every turn of the spindle employed.

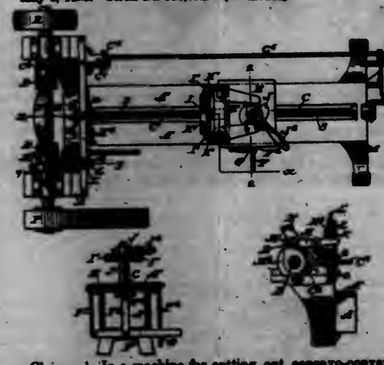


Claim.—1. The combination of parts herein described, by means of which more than one turn of twist is caused to be imparted to the sliver, yarn, or thread operated upon during each revolution of the spindle employed, which combination of parts consists in a spindle, such as *a*, provided with a tube or passage, such as *g*, a disk, such as *k*, or equivalent therefor, a tube, such as *e*, a cradle or frame, such as *f*, provided with a ring, such as f^6, and curved edge, such as f^3, all constructed, arranged, and operating substantially in the manner and for the purposes hereinbefore set forth.

2. The combination of parts herein described, by means of which more than one turn of twist is caused to be imparted to the sliver, yarn, or thread operated upon during each revolution of the spindle employed, which combination of parts consists in a spindle *a*, provided with a tube or passage, such as *g*, disk, such as *k*, or equivalents therefor, tube, such as *e*, cradle or frame, such as *f*, provided with guides *o* and *o'*, and pins or pegs, such as *m*, all constructed, arranged, and operating substantially in the manner and for the purposes hereinbefore described.

3. The combination of parts by means of which the sliver, yarn, or thread twisted or doubled, or twisted and doubled, is caused to be wound upon the spindle upon which the cop is to be wound at or about the same rate as it is delivered by the drag or draw roller employed, which combination of parts consists in faller-wire, such as 62, faller-shaft, such as 64, spindles, such as 61, counter faller-wires, such as 65, arms, such as 63, arms, such as 66, arm, such as 134, rod, such as 135, arm, such as 136, part such as 137, catches, such as 103 and 104, levers, such as 105 and 106, rod, such as 107, rod, such as 109, rod, such as 108, provided with a tooth, such as 116, rod, such as 110, provided with a tooth, such as 117, brackets, such as 111, catches or pawls, such as 114 and 115, ratchet-wheels, such as 112 and 113, shaft, such as 81, provided with screw-threads, such as 81*, a strap-guide, such as 82, a strap, such as 80, cone-drums, such as 69 and 79, bevel-wheels, such as 70 71 73, wheels, such as 74 and 75, shaft, such as 76, tin drum, such as 77, arm, such as 120, provided with a tooth, such as 126, spring, such as 127, cam, such as 124, disk, such as 129, arms, such as 131 and 133, cam, such as 132, bevel-wheels, such as 78* and 79*, shaft, such as 78*, bevel-wheel, such as 78*, wheel, such as 68*, wheel, such as 125*, wheel, such as 125, wheel, such as 124, bevel-wheel, such as 100, bevel-wheel, such as 99, worm, such as 98, and worm-wheel, such as 97, all constructed, arranged, and operating substantially in the manner and for the purposes hereinbefore described.

410,298. RAIL-SAWING MACHINE. EDWARD C. SMITH, Brooklyn, N. Y., assignor to the Smith Portable Rail Saw Company, of New Jersey. Filed June 27, 1888. Serial No. 278,264. (No model.)



Claim.—1. In a rail-sawing machine, the combination, with a supporting-frame having a sliding carriage, of an oscillating frame connected to said carriage carrying a saw adapted to have a horizontal movement, and suitable mechanism for imparting a feeding motion to said saw, as set forth.

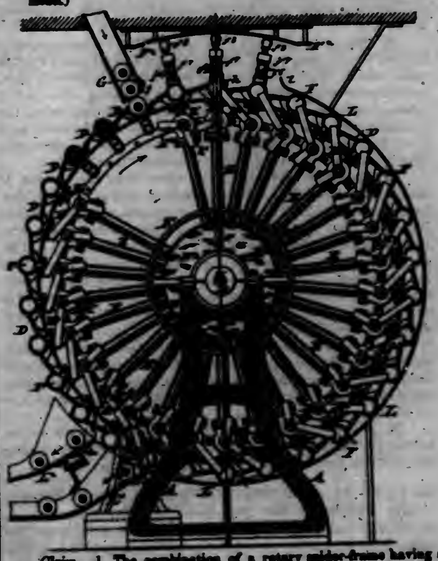
2. In a rail-sawing machine, the combination, with the stationary frame supporting a movable carriage and means for raising and lowering said carriage, of an oscillating frame pivoted to said carriage and having a pin-and-slot connection with a saw-frame arranged to move horizontally in ways formed on said sliding carriage, as set forth.

3. In a rail-sawing machine, the combination of a movable carriage, feeding mechanism, a rocking frame, saw-carrying frame connected to said rocking frame, the saw-frame being guided by horizontal ways on the carriage, as set forth.

4. In the herein-described rail-sawing machine, a rocking frame, a saw connected to the lower end of said frame and moved by said frame, and mechanism for operating said frame vertically, combined with mechanism to move said saw horizontally, as set forth.

410,299. MACHINE FOR CUTTING OUT CONCAVO-CONVEX SHELLS OR DISHES. CHARLES BROWNING, New York, N. Y., assignor to William J. Hiss and William P. Smithers, both of same place. Filed May 8, 1889. Serial No. 310,092. (No model.)

Claim.—1. In a machine for cutting out concavo-convex shells, the combination, with the curved revolving knife and with the intermittently-moving carriage by which the log to be cut is fed to the knife, of the clamping-block made to engage the front end of the log and the mechanism whereby said clamping-block is closed intermittently upon the log to bind and hold it during the cutting-stroke of the knife, substantially in the manner and for the purpose herein set forth.



2. The combination, in a machine for cutting concavo-convex shells from a log of wood, with the cutting-knife and the revolving shaft carrying said knife, of the fixed supporting-block mounted in front of the knife to form a seat for the log, the clamping-block moving to and from the fixed block in the same vertical plane to close down upon the interposed log, the pivoted lever attached to said block, a cam upon the knife-shaft, and mechanism intermediate the cam and lever, whereby the lever and block are depressed by the action of the cam to clamp the log while the knife is sweeping over its end, substantially in the manner and for the purpose herein set forth.

3. The combination, in a machine for cutting concavo-convex shells from a log of wood, with the cutting-knife and the revolving shaft carrying said knife, of the fixed supporting-block mounted in front of the knife to form a seat for the log, the clamping-block moving to and from the fixed block in the same vertical plane to close down upon the interposed log, the pivoted lever attached to said block, a spring automatically lifting the lever and block, a cam upon the knife-shaft, mechanism intermediate the cam and lever, whereby the lever and block are depressed by the action of cam to clamp the log while the knife is sweeping over its end, and mechanism for moving the log intermittently toward the knife when the clamping-block is lifted, substantially in the manner and for the purpose herein set forth.

4. The combination of the knife-shaft, the curved knife carried thereby, the log-supporting block fixed in front of the knife, the movable clamping-block mounted over the supporting-block in the same vertical plane, the cam on the knife-shaft operating mediately to depress the clamping-block during the sweep of the knife across the log held between the two blocks, the carriage moving to and from said blocks, the endless screw rotating in fixed bearings under the carriage, the detachable nut carried by the carriage to engage the screw, and the eccentric on the knife-shaft geared mediately to said screw to produce an intermittent rotation thereof at each revolution of the knife after it has completed its cutting-stroke, substantially in the manner and for the purpose herein set forth.

5. The combination, with the revolving knife, the log-supporting block fixed in front of the knife, and the carriage moving to and from the fixed block, of the endless screw under the carriage, the mechanism by which said screw is geared to the knife-shaft in manner to produce an intermittent rotation of the screw, the lever pivoted to the carriage to extend transversely under the screw, the catch carried by the carriage to uphold the free end of the lever, and the sectional nut carried by said lever into engagement with the screw when upheld by the catch, whereby the log to be cut may be adjusted in front of the knife independently of the screw and automatically fed forward by its action, substantially in the manner and for the purpose herein set forth.

410,300. MACHINE FOR TESTING TIN CANS. RICHARD SPRINGELLER, New York, N. Y. Filed Oct. 24, 1888. Serial No. 288,690. (No model.)

Claim.—1. The combination of a rotary spider-frame having a series of supporting-baskets for the cans to be tested, hollow jaws at

one side of the same, spring-actuated presser-jaws at the opposite side of the buckets, and spring-actuated pusher-rods acting on the shanks of the presser-jaws for applying or releasing the presser-jaws from the cans, substantially as set forth.

2. The combination of a rotary spider-frame having a series of supporting-buckets for the cans to be tested, hollow jaws applied to one side of the cans, radial tubular arms connecting the hollow jaws with a suction apparatus for establishing a vacuum in the cans, spring-actuated presser-jaws acting on the bottom of the cans, and spring-actuated pusher-rods acting on the shanks of said presser-jaws, substantially as set forth.

3. The combination of a series of supporting-buckets for the cans to be tested, radial tubular arms connected to a suction apparatus, hollow jaws at the outer ends of said arms, and valves in said arms for establishing, retaining, or interrupting the vacuum in the cans, substantially as set forth.

4. The combination of a series of supporting-buckets for the cans to be tested, hollow jaws at the side of the same, presser-jaws at the other side of the same, a chute for supplying the cans to the buckets, and discharge-chutes for conducting off, respectively, the leaky and sound cans, substantially as set forth.

5. The combination of a series of supporting-buckets for the cans to be tested, hollow jaws at one side, and spring-actuated presser-jaws at the opposite side of the same, spring-catches for releasing the presser-jaws from the cans, and a guard-band for conducting the bad cans to the discharge-chute, substantially as set forth.

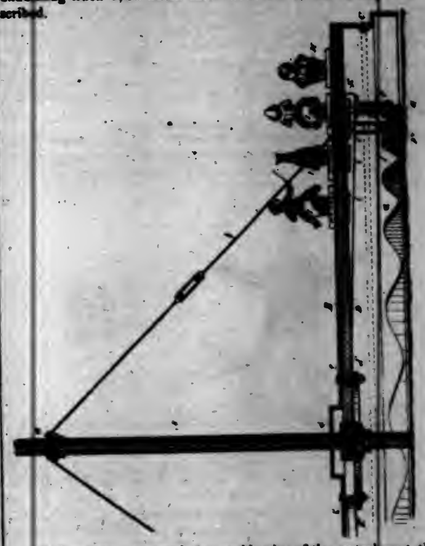
6. The combination of a supporting spider-frame provided with a series of can-supporting buckets for the cans to be tested, a second spider-frame formed of as many tubular arms as there are buckets, hollow jaws at the outer ends of said tubular arms, valves in said arms, elbow-levers attached to the spindles of said valves, and stationary pins for actuating the elbow-levers, so as to establish, retain, and discontinue the vacuum in the cans, substantially as set forth.

7. The combination of a rotary spider-frame provided with a series of buckets for the cans to be tested, spring-actuated presser-jaws supported by said spider-frame, spring-actuated pusher-rods engaging the shanks of said jaws, and a stationary cam for operating said pusher-rods and applying the presser-jaws to the cans, substantially as set forth.

8. The combination of a rotary spider-frame having can-supporting buckets, each bucket being provided with a can-releasing spring-catch, spring-actuated presser-jaws having fixed beveled catches for engaging said spring-catches, spring-actuated pusher-rods guided in brackets of the spider-frame, and a stationary cam arranged concentric to the axis of the spider-frame, substantially as set forth.

9. The combination of a rotary spider-frame having supporting-buckets for the cans, spring-actuated presser-jaws applied to the bottom of the cans, a second spider-frame formed of radial tubular arms connected to a suction apparatus, hollow jaws at the outer ends of said arms, and supply and discharge chutes for the cans, substantially as set forth.

10. The combination of a rotary spider-frame having supporting-buckets for the cans to be tested, a second spider-frame formed of radial tubular arms communicating with a hollow supporting-shaft, the latter being connected to an air-suction apparatus, valves in said tubular rods, elbow-levers applied to the spindles of said valves, and stationary pins adapted to engage the elbow-levers of the valves, so as to set the same for establishing communication with the air-suction apparatus or with the atmosphere, substantially as set forth.



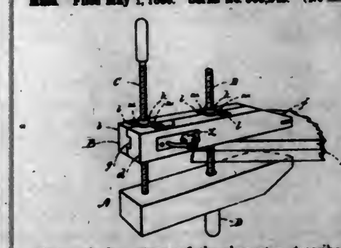
11. The combination of a rotary spider-frame having series of can-supporting buckets, a second spider-frame formed of radial tubular arms, a hollow shaft connected to an air-suction apparatus, hollow jaws at the outer ends of the tubular arms, valves in said tubular arms, elbow-levers applied to the spindles of said valves, stationary pins for setting said valves, a concentric guard-band extending around part of the spider-frames for retaining and guiding the leaky cans, a supply-chute at the upper part of the apparatus, and two inclined chutes at the lower part of the same for discharging, respectively, the leaky and good cans, substantially as set forth.

12. The combination of the presser-jaws, spring-actuated shanks secured to said jaws and provided with beveled heads, spring-actuated pusher-rods having beveled ends adjoining the heads of said shanks, and stationary cams for actuating said pusher-rods, substantially as set forth.

13. In a can testing machine, a hollow jaw provided with an elastic annular face-cheek and a central tubular screw-plug for holding the elastic cheek in position, substantially as set forth.

410,301. MERRY-GO-ROUND. WALKER C. TYLER, San Francisco, Cal. Filed Apr. 27, 1889. Serial No. 308,880. (No model.)

Claim.—1. In a merry-go-round, the rotating platform and the series of swinging radial arms carried thereby, in combination with the seats I, pivoted at one end to one of said arms and at the other end to another of said arms, the wheels carried by said arms, and the undulating track G, on which said wheels travel, substantially as described.



2. In a merry-go-round, the combination of the central mast, the rotating platform supported thereby, the radial beams of said platform, the series of swinging radial arms carried by said beams, the series of seats connected with the swinging arms, the wheels carried by the beams and the arms, and the level track and the undulating track on which said wheels travel, all arranged and adapted to operate substantially as described.

410,302. PRINTING-PRESS. FREDERICK VAN WYE, Scarsdale, N. Y. Filed June 22, 1888. Serial No. 277,900. (No model.)

Claim.—In a printing-press of the class described, having a stationary roller-frame and a moving hinged bed and revolving ink-disk, the combination, with the said bed and ink-disk, of form-rollers, as *a*, *b*, and *c*, and rider-rollers, as *a'*, *b'*, and *c'*, arranged in pairs, the former placed vertically above the latter and lifted thereby.

410,303. HAND SCREW-CLAMP. GILBERT A. WATTERSON, Quincy, Mass. Filed May 1, 1889. Serial No. 309,243. (No model.)

Claim.—1. In a clamp of the character described, a fixed jaw, fulcrum-screw, and clamping-screw, in combination with a movable jaw provided with screw-openings and divided longitudinally into two sections hinged together at one end, a clamping-lever for fastening said sections together, and a spring for separating them when released, substantially as described.

2. In a clamp of the character described, a fixed jaw, fulcrum-screw, and clamping-screw, in combination with a movable jaw having screw-openings and divided longitudinally into two sections hinged together at one end, a rod secured in one section and projecting through an opening in the opposite section, a cam-lever pivoted to the free end of said rod, and a spring for separating said sections, substantially as described.

3. In a clamp of the character described, the combination of a fixed jaw, fulcrum and clamping screws, a movable jaw having screw-openings and divided longitudinally into sections tongued and grooved on their inner faces and hinged together at one end, a coiled spring disposed in a chamber in said jaw and acting expansively to force its sections apart, a rod secured in one section and projecting through an opening in the opposite section, a cam-lever pivoted to said rod, and guide-collars for said screws provided with slotted arms working on pins in the movable jaw-sections, substantially as described.

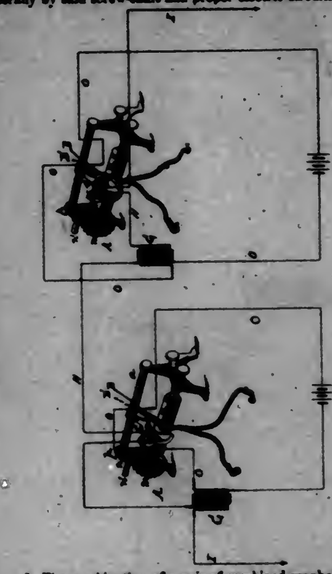
4. In a hand screw-clamp, the jaw A and screws C D, in combination with the jaw B, comprising the hinged sections *b d*, the collars *k*, having the slotted arms *l*, working on pins *m*, and mechanism, substantially as described, for locking said sections together.

5. In a hand screw-clamp, the jaw A and screws C D, in combination with the jaw B, comprising the hinged sections *b d*, tongued and grooved at *g* and provided with screw-openings *h i*, chamber *p*, and opening *v*, the spring *q* in said chamber, the rod *r*, projecting through the opening *v*, the cam-lever *x*, pivoted to said rod, and the collars *k*, having the slotted arms *l* working on pins *m*, substantially as described.

410,304. VEHICLE-CURTAIN FASTENER. JOHN WATTERS, Springfield, Ohio. Filed Aug. 24, 1888. Serial No. 283,035. (No model.)

Claim.—1. In a curtain-fastener, the combination, with the body thereof, an annular shoulder within the back thereof, and a strip of spring metal extending diametrically to the body, resting at its ends upon the said shoulder, and prevented from turning or moving around by contact with the body, of a head fitted upon the outer side of the body and having a shank which extends radially through the body and the spring and is enlarged at its inner end.

2. A curtain-fastener consisting of the following devices: a span or struck-up metallic body having integral prongs, an annular shoulder, a central hole, and depressions in the outer face of the body near said hole, a strip of spring metal extending diametrically to the body and resting at its ends upon the said shoulder and prevented from turning by contact with the body, and having a central hole, a head wide in one direction and thin in the other at its outer end, and a neck and a shouldered shank rotatably fitted to said hole, and projections on said shoulder of the shank to fit said depressions, the shank being upset at the end, for the purpose described.



410,305. TELEGRAPHOPHONE. MALONE WHELAN, Nashville, Tenn., assignor, by direct and mesne assignments, to the World Telegraphone Company, of West Virginia. Filed Sept. 12, 1888. Serial No. 285,202. (No model.)

Claim.—1. The combination of a graphophone with an additional stylus resting in the groove made by the graphophone-stylus and closely behind said stylus, and electric connections containing contacts varied by the additional stylus and extending to a suitable receiver.

2. In a combined telephone and graphophone, the combination of an impression-cylinder with a diaphragm having a stylus arranged upon one side and an electro-magnet upon the other side arranged in circuit extending from the transmitter to a distant instrument, and an additional stylus controlling the contacts in a primary circuit, the secondary of which extends to the receiver of the distant instrument.

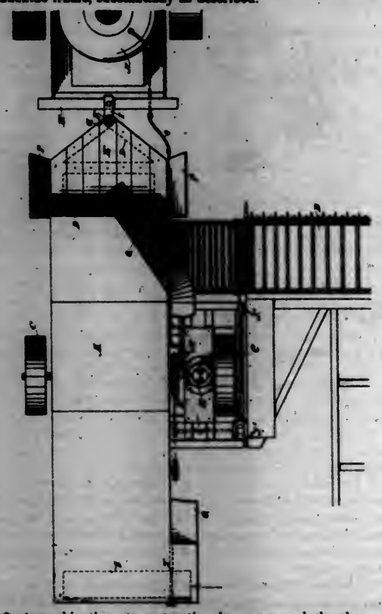
3. In a combined telephone and graphophone, the combination of a diaphragm, an impression-cylinder, and a stylus between the diaphragm and impression-cylinder, and an electro-magnet upon the other side of the diaphragm in a circuit with and controlled by the transmitter of the distant instrument, and an additional stylus varying the contact of the electrodes in a circuit extending to the receiver of the distant instrument.

4. In a combined graphophone and telephone instrument, the combination of an impression-cylinder and a suitable screw-shaft with suitable gearing for connecting said cylinder to the shaft with a diaphragm carrying one stylus and an additional stylus, both movable laterally by said screw-shaft and proper electric circuits.

5. The combination of a pair of combined graphophone and telephone instruments located at different stations, each instrument comprising an impression-cylinder, two styli laterally movable on a single screw, a diaphragm carrying one stylus and an electro-magnet upon its opposite side, suitable electric circuits, and gearing connecting the screw and cylinder.

6. The combination of two graphophones, each provided with a diaphragm having a magnet and a stylus and two arms, one above another, one arm having a stylus underneath and a contact-point on top, the other arm having a contact-point underneath and resting on the other contact-point, and a contact-point on top and a diaphragm against the bottom of which the second contact-point rests, with an electric circuit, the two arms being in circuit, as set forth.

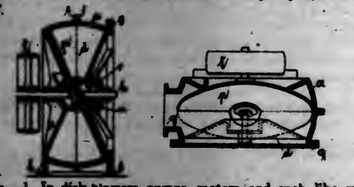
410,306. SELF-CLOSING FAUCET. GEORGE WEDELL, Denver, Colo. Filed Dec. 8, 1888. Serial No. 293,288. (No model.)



Claim.—In a self-closing faucet, the combination of the casing A, extended upwardly to form the chamber J and having an interior shoulder M, a valve-stem located entirely therein and having the rim I, with one or more notches I', a valve at the lower end thereof, the washer K, diaphragm L, collar N, the cap B, having the double-inclined oppositely-disposed cams in its interior, and the rod D, having a shoulder at its inner end with cams corresponding to and coacting with those in the cap, substantially as set forth.

410,307. COMBINED HARVESTER AND THRASHER. DANIEL BEEZ, San Leandro, Cal. Filed Nov. 22, 1888. Serial No. 291,869. (No model.)

Claim.—1. In a combined steam traction harvester and thrasher, the combination of a header with a reciprocating sickle at the front and carrying belt by which the cut straw is transferred to the thrashing-cylinder, a thrashing-machine mounted upon a frame with wheels, by which it is supported, and a hinge joint or connection whereby the



header is united to the side of the thrashing-machine frame, and an engine mounted upon a platform at one side of the thrashing-machine frame, with connections to drive the header and thresher, and a steam-supply pipe leading from it to the forward end of the thrashing-machine frame, in combination with a traction-engine with a pivoted connection, whereby the rear of the traction-engine may be connected to or disconnected from the front of the thrashing-machine frame, and a flexible pipe connecting the boiler of the traction-engine with the steam-supply pipe of the engine which is carried upon the thrashing-machine frame, substantially as described.

2. A combination steam traction harvester and thrasher comprising a cutting, thrashing, and cleaning mechanism supported upon wheels, so as to be drawn about the field, a traction-engine with a jointed connection, whereby it may be united with or disconnected from the front of the thrashing-machine, a supplemental engine mounted upon a platform at the side of the thrashing-machine, with connections therefrom to drive the heading and thrashing mechanism, and having a steam-supply pipe leading from it to the front of the thrashing-machine frame, and a flexible connection between said pipe and the boiler of the traction-engine, substantially as and for the purpose herein described.

3. A combined steam traction harvester and thrasher having an extension and receptacle at the front end of the thrashing-machine frame, a jointed connection upon the front of said frame, whereby it is connected with or disconnected from a traction engine, a carrier Q, the front end of which delivers into the receptacle at the front end of the thrashing-machine, and a supplemental carrier S, receiving straw from the main straw-carrier of the thrashing-machine and delivering it upon the carrier Q, substantially as described.

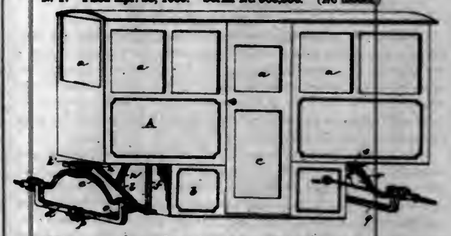
410,808. DISK-PUMP. JOHN BOWER, Sheffield, County of York, England. Filed Mar. 20, 1888. Serial No. 268,907. (No model.) Patented in England Apr. 21, 1887, No. 5,794; in Belgium Feb. 18, 1888, No. 6,000; in France Feb. 24, 1888, No. 183,943, and in Germany May 12, 1888, No. 44,317.

Claim.—1. In disk-blowers, pumps, motors, and such like machines, the collar *i*, rigidly attached to the shaft *h*, rotating in bearings coaxial with the conical cylinder ends *c* and *d* and inclined to said shaft at the angle the side of the cones form with their axis, in combination with the disk *p*, attached to hemispherical bosses *m n*, with cylindrical recesses turned into them coaxially with the disk *p*, in which recesses the collar *i* works, the spherical cylinder *e*, and partition-plate *q*.

2. In disk-blowers, pumps, motors, and such like machines operated by means of a straight shaft with an inclined collar rigidly attached thereto and rotating in recesses of the bosses of the disk, ball-bearings for reducing the friction between said collar and bosses.

410,809. STEAM-BOILER. SETH BRAGGINS, Rochester, N. Y. Filed May 9, 1888. Serial No. 310,195. (No model.)

Claim.—1. A steam-generator having hollow sections connected to form a pipe, said sections being formed with circular faces, respectively concave and convex, as shown, to allow of a rotating movement, for the purpose set forth.



2. In a steam-boiler, a central body, in combination with hollow sections arranged to form pipes at the side of said central body, and connecting-tubes for said sections and central body, substantially as shown.

3. A sectional steam-boiler having hollow sections connected to form a pipe, one section having convex ends and the adjacent section having concave ends, substantially as shown and described.

4. A steam-generator having hollow sections connected at their ends, said sections being formed with circular faces, respectively concave and convex, and having the shell or wall at the ends made thicker than at the middle parts thereof, substantially as described.

5. A steam-boiler consisting of a hollow base, hollow pedestals, a central body and side pipes, the latter being formed of sections each connected with said central body, the pedestals being placed beneath various ones of said side pipes and forming communications for water between said side pipes and base, substantially as shown.

410,810. WHEELED VEHICLE. WILLIAM H. CRAPSEY, Sherburne, N. Y. Filed Apr. 23, 1889. Serial No. 308,336. (No model.)

Claim.—1. A bar adapted to be applied to the bottom of a vehicle-body and provided with clevises, combined with a bar pivoted thereto and adapted to be connected to a spring, a draft-bar adapted to be connected to an axle, and interposed braces, substantially as described.

2. A bar adapted to be applied to a vehicle-body and provided with clevises, a bar pivoted in the upper one of said clevises and adapted to be connected to a spring, a brace attached to or formed with the said pivoted bar and pivoted in the lower clevis, and a draft-bar pivotally connected with the lower clevis and adapted to be applied to an axle, substantially as described.

3. A bar adapted to be applied to a vehicle-body and provided with clevises, a bar pivoted in the upper clevis, a brace pivoted in the lower clevis and connected to the upper bar, and a draft-bar pivotally connected with the lower clevis, combined with a spring to which the upper bar is rigidly affixed, and an axle bearing the spring, and to which the draft-bar is pivoted, substantially as described.

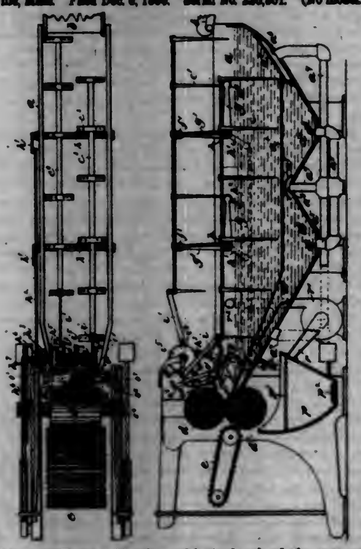
4. A wheeled vehicle having a drop-body and provided with a front running-gear composed of a bar attached to the bottom of the vehicle substantially midway between its sides and provided with clevises, a bar pivoted in one of said clevises and connected to a spring, a draft-bar connected to the axle, and a brace interposed between the upper bar and the draft-bar and pivoted to the body-bar, substantially as described.

5. The combination, with the spring and axle, of a bar *k*, rigidly affixed to the spring, a piece *m*, also rigidly affixed to the spring and

to the bar *k*, a draft-bar *o*, hinged or pivoted to the axle, a body-bar *f*, adapted to be attached to a vehicle-body, and a brace interposed between the draft-bar and the bar *k*, substantially as and for the purpose described.

6. In a drop-body vehicle, the rear running-gear composed of a spring rigidly attached to the body and side draft-irons pivoted to the axle and pivoted to the body of the vehicle, substantially as described.

7. The combination, with the axle and spring, of the draft-irons *t*, the boxes *u*, and the springs *v*, and nuts *v'*, interposed between the boxes and the draft-irons to prevent rattling of the latter, substantially as described.



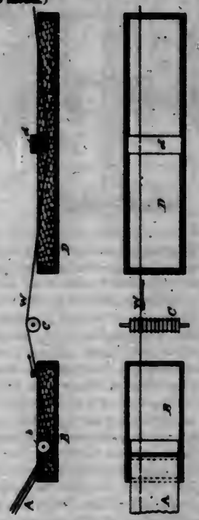
8. A wheeled vehicle having a drop-body and provided with a front running-gear composed of a bar attached to the bottom of the vehicle substantially midway between its sides and provided with clevises, a bar pivoted in one of said clevises and connected to a spring, a draft-bar connected to the axle, and a brace interposed between the upper bar and the draft-bar and pivoted to the body-bar, and a hind gear rigidly attached to the body, substantially as described.

410,811. EXPANSION-DRILL. MATTHEW T. CHAPMAN, Anvers, Ill. Filed July 11, 1887. Serial No. 244,201. (No model.)

Claim.—A drill-tube D, provided with a head C, in combination with a coupling A, slotted to receive the head C and loosely mounted on the tube D, and blades B, pivoted in the coupling A and having inclined upper ends, whereby the blades are expanded by the weight of the drill rod or tube, substantially as specified.

410,812. WOOL-WASHING MACHINE. HENRY W. CHURCH, Grafton, Mass. Filed Dec. 6, 1886. Serial No. 220,801. (No model.)

Claim.—1. The combination, with the bowl, of the two sets of agitating-forks connected with longitudinal frame-pieces, rock-shafts, and supporting-arms for said longitudinal frame-pieces, a crank and pitman for operating the said longitudinal frame-pieces, and the actuating-cam and connections for oscillating said rock-shafts, the delivering-rake, and oscillating guides therefor, and an actuating-shaft for said delivering-rake and guide, and gearing connecting said shaft with the crank-shaft that actuates the main fork proportioned to give the delivering-rake actuating-shaft double the rotary speed of the main fork-actuating shaft, substantially as described.



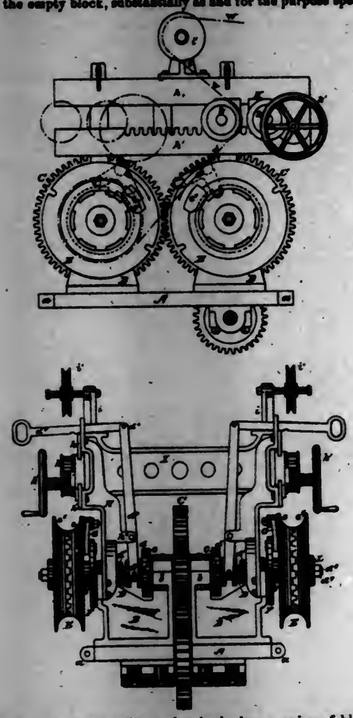
2. In a wool-washing machine, the bowl provided with a false bottom, and having depressions in the space below said false bottom and discharge-passages from said depressions, and inlet passages through the elevated part of the bottom at the side of said depressions and deflectors over the mouths of said inlet-openings, substantially as described.

3. The combination, with the bowl, of the two agitating devices operating side by side in said bowl, the rock-shafts and supporting-arms for said agitating devices, and actuating mechanism for said rock-shafts and agitating devices, whereby the former are oscillated and the latter are simultaneously reciprocated on said supporting-arms, substantially as described.

4. The combination of the delivering-rake with an oscillating guide upon which said rake is longitudinally movable, a rotating shaft provided with a cam that oscillates the said guide, and with a crank connected with said rake for producing its reciprocating movement on said guide, substantially as described.

5. In a wool-washing machine, a bowl and squeezing-rollers, through which the washed material is delivered, combined with a settling-basin into which the liquid removed from said rollers is received, said basin being provided with a screen near its top and an outlet-passage near the top of said settling-basin, and pump connected therewith having a delivery-pipe entering the main bowl near the top thereof, substantially as described.

410,813. PROCESS OF CONTINUOUSLY ANNEALING AND PLATING WIRE. JOHN GRIFFIN, Johnstown, Pa., assignor to the Cambria Iron Company, of Pennsylvania. Filed Feb. 14, 1889. Serial No. 300,281. (No model.)



Claim.—1. In the art or process of annealing and plating wire by a continuous operation, the improvement which consists in first passing the wire through a suitable red-hot annealing bath or furnace, thence through a conduit filled with non-oxidising gas, thence through a bath of water, thence through a bath of acid, and thence through a bath of molten zinc or other plating metal, substantially as specified and set forth.

2. In the art or process of annealing and plating wire by a continuous operation, the improvement consisting in the following steps: first, passing the wire through an annealing-furnace or its equivalent; second, through a bath of water; third, through a bath of cleansing-acid, and, finally, through a bath of molten plating metal, substantially as specified and set forth.

410,814. APPARATUS FOR COILING GALVANIZED WIRE. JOHN GRIFFIN, Johnstown, Pa., assignor to the Cambria Iron Company, of Pennsylvania. Filed Apr. 22, 1889. Serial No. 308,173. (No model.)

Claim.—1. In a bench for coiling galvanized wire, a series of blocks arranged in pairs, one pair for each wire, a clutch on each

block for starting and stopping the same, and a shearing and clamping mechanism attached to each block, whereby, when the coil is completed upon one block, the empty block may be started and the shearing mechanism will automatically sever the wire and clamp the end to the empty block, substantially as and for the purpose specified.

2. In a bench for coiling galvanized wire, a series of blocks on axes parallel to each other, arranged in pairs, one pair for each wire, a swinging arm pivotally attached to each block having at its swinging end a projection extending partly across the block and carrying on this projection a shear-blade, a pocket arranged in the block in which the said projection is adapted to swing, one edge of the said pocket being fitted with a shear-blade adapted to register with the before-mentioned shear-blade, and mechanism to automatically swing the before-mentioned arm simultaneously with the starting of the block for the purpose of shearing off a wire which is being coiled on the other block, and which is being led onto the other block in such direction that it will pass between the two said shear-blades, substantially as and for the purpose set forth.

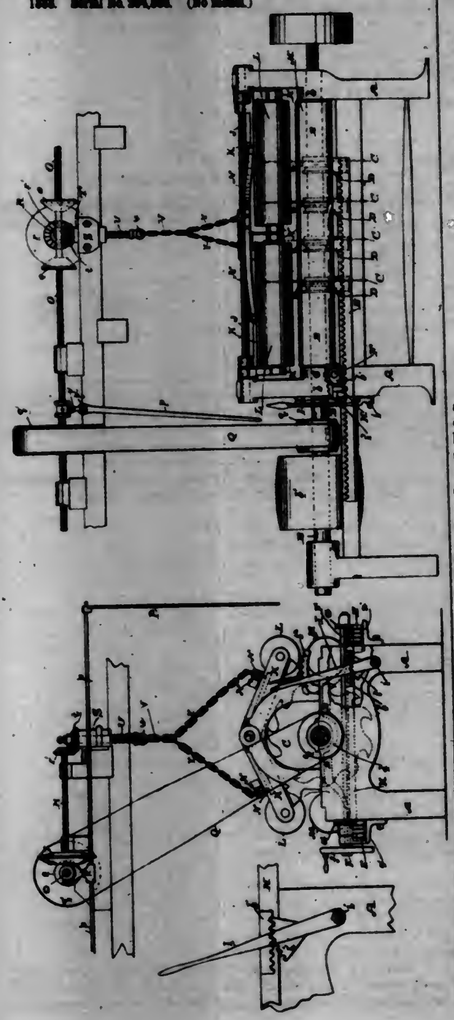
3. In a bench for coiling galvanized wire, the combination of a series of blocks arranged in pairs, one pair for each wire, a movable shear-blade carrying projection to each block adapted to move into and recede from a pocket in the block, a shear-blade attached to the edge of said projection, a shear-blade attached to the edge of said pocket adapted to register with the aforesaid shear-blade for the purpose of severing a wire which may be brought between them, the movable projection being somewhat smaller than the pocket for the purpose of allowing room for a wire between the projection and the walls of the pocket and for the purpose of clamping the end of the wire firmly between the projection and the walls of the pocket, and mechanism for moving the projection into the pocket automatically and simultaneously with the starting of the block, substantially as and for the purpose specified.

4. In a bench for coiling galvanized wire, a series of blocks arranged in pairs, one pair for each wire, a bell-crank lever pivotally connected at the outer portion of each block, one arm of the bell-crank lever carrying a projection which extends partially across the face of the block, a shear-blade fitted in this projection, a pocket located in the block adapted to receive the projection, a shear-blade fitted to the side of the pocket for the purpose of registering with the other shear-blade to sever a wire, an arm of the before-mentioned bell-crank lever extending inwardly and having fitted to its end a stud or its equivalent, a fixed disk located concentrically with the block, so that its periphery is in contact with the said stud when the bell-crank lever is in such position that its projection is closed into the said pocket, and a notch formed in the said disk adapted to receive the said stud when the bell-crank lever is in such position that its projection is opened outward from the said pocket for the purpose of severing and clamping a wire simultaneously with the starting of the block, in a manner substantially as has been specified and set forth.

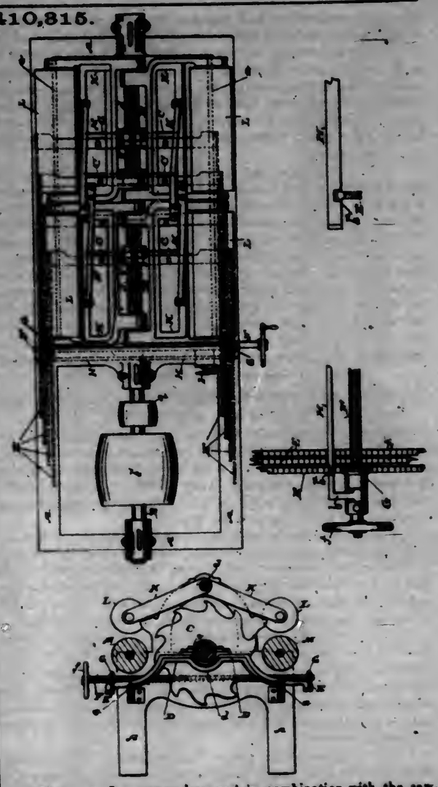
5. In a bench for coiling galvanized wire, a series of blocks arranged in pairs, one pair for each wire, each block being provided with a cutting and clamping device, whereby the wire-coiling operation may be shifted from one block to another without stopping the running wire, in combination with a device for changing the direction of the wire as it is being paid onto the blocks, consisting in a traversable wire-carrying sheave for the purpose of so directing the wire onto one of the blocks that it will be in proper position to be operated upon by the severing and clamping arrangements on the other block, substantially as and for the purpose set forth.

6. In a bench for coiling galvanized wire, a series of blocks arranged in pairs, one pair for each wire, each block being provided with a cutting and clamping device, whereby the wire-coiling operation may be shifted from one block to the other without stopping the running wire, in combination with a device for changing the direction of the wire as it is being paid onto the block, consisting in a carriage located above said blocks, free to slide in guides, and provided with wire-carrying sheaves for the purpose of so directing the wire onto one of the blocks that it will be in proper position to be operated upon by the severing and clamping arrangement of the other block, substantially as and for the purpose set forth.

7. In a bench for coiling galvanized wire, a series of blocks, each block being composed of a fixed and removable half, the removable half having a large central opening on which inwardly-projecting lands are formed, in combination with a clamp for holding said removable half, said clamp being of circular shape and having outwardly-projecting lands to reach over and bear against the inwardly-projecting lands of said removable half, the notches between the said lands being greater than the lands themselves for the purpose of allowing the removable half to be removed when the said clamp is turned so that its lands register opposite the notches of said removable half, and a stud attached to the block-shaft, extending through said clamp, and provided with a nut bearing against said clamp, by means of which said clamp may be made to bear firmly against said removable half when said removable half is in its attached position, substantially as and for the purpose specified.



8. In a bench for coiling galvanized wire, a series of blocks arranged in pairs, one pair for each wire, in combination with a pocket on each fixed half of the blocks for the purpose of receiving a movable cutting and clamping projection, said pocket extending past the center joining-line of said block, and a pocket formed in the removable half of the block of size great enough to contain the pocket of the fixed half of the block, substantially as and for the purpose set forth.



9. In a bench for coiling galvanized wire, the combination of a series of blocks arranged in pairs, one pair for each wire, driven by a series of spur-gearing meshing with each other, so that adjacent blocks will run in opposite directions, the said driving-gear having formed with it large journaled hubs, on the face of each hub being a clutch, short block-shafts entering each of the said hubs and free to turn thereon, sliding clutches splined on each of said shafts adapted to engage with the clutches on the said driving-gears, a bearing for each of said shafts outside of said splined clutch, a fixed half of a block attached to each of said block-shafts outside of said last-mentioned bearing, a circular disk attached to the frame-work of the bench on the inside of each block, its periphery being concentric with the block, a bell-crank lever pivotally connected to the outer edge of the fixed half of each block, a stud formed on one arm of said bell-crank lever adapted to pass around the periphery of the said disk or to engage in the notch cut in the periphery of said disk, an arm attached to said bell-crank lever extending in a general direction nearly tangential to said block, a projection on the end of said last-mentioned arm extending partially across the face of said block, a shear-blade fitted in the edge of said projection, a pocket formed in the fixed half of the block adapted to receive the said projection when the said bell-crank lever is in such position that its said stud will rest on the periphery of the said fixed disk, a shear-blade attached to the edge of said pocket adapted to register with the before-mentioned shear-blade for the purpose of severing a wire, the said pocket extending outward past the center line of the block, a removable half to each of said blocks, a pocket in said removable half adapted to embrace and contain the extending walls of the aforesaid pocket in the fixed half of the block, the removable half of the block being provided with a large central opening adapted to nearly fit a

concentric rib formed with the fixed half of the block, the part of the removable half of the block which nearly comes in contact with the said concentric rib of the said fixed block being formed by lands with intermediate notches, a circular clamping-piece having a bored central portion which loosely fits an externally-turned portion of the extending hub of the said fixed block, this clamping-piece being fitted at its outer edge with lands and notches for the purpose of engaging with the said removable half of the block and for the purpose of being readily disengaged by turning through a small arc, thus permitting the lands of the said clamping-piece to come opposite the notches of the said removable half of the block, a stud fastened in the end of each block-shaft, extending through each of said clamping-pieces, and having a nut on its outer end for tightening and loosening the said clamping-piece upon the removable half of the block, slides located above said blocks, carriages adapted to move on said slides in a direction longitudinal to the bench, wire-deflecting sheaves carried on studs attached to said carriages, two sheaves being attached to each carriage, and racking mechanism for moving the carriages on said slides for the purpose of changing the direction of the wire, all arranged substantially as specified, and for the purpose set forth.

410,815.

410,815. GANG-EDGER. FRANCIS W. COOK, San Francisco, Cal., assignor of one-half to H. P. Gregory & Co., same place. Filed Dec. 28, 1888. Serial No. 294,002. (No model.)

Claim.—1. In a gang-edger, and in combination with the saw-arbor and the independent saws movable thereon, the transversely-disposed brackets or shifter-bars, each engaging at its middle the collar of one of the saws, the series of independent movable racks attached to each end of the brackets or shifter-bars, and a rotary sliding shaft mounted transversely of the machine and carrying a pinion on each side, adapted by the sliding movement of the shaft to be thrown into gear with different racks of the series, whereby the saws may be independently shifted on the arbor, substantially as herein described.

2. In a gang-edger, and in combination with the saw-arbor and the independent saws movable thereon, the transversely-disposed brackets or shifter-bars, each engaging at its middle the collar of one of the saws, the series of independent movable racks attached to each end of the brackets or shifter-bars, the rotary sliding shaft having a pinion on each side, adapted by the sliding movement of the shaft to be thrown into gear with different racks of the series to shift their saws, the sliding bar connected with the shaft, and a lever for moving the bar to slide the shaft, substantially as herein described.

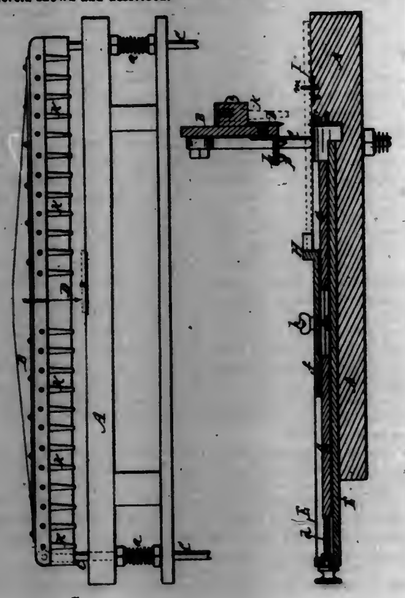
3. In a gang-edger, and in combination with a saw-arbor and the independent saws movable thereon, the transversely-disposed brackets or shifter-bars, each engaging at its middle the collar of one of the saws, the series of independent movable racks attached to each end of the brackets or shifter-bars, the rotary sliding shaft having a pinion on each side adapted by the sliding movement of the shaft to be thrown into gear with different racks of the series to shift their saws, the sliding bar connected with the shaft and having a rack, the pivoted lever having a segmental gear engaging the rack for moving the bar and shaft, and the quadrant for controlling the lever, substantially as herein described.

4. In a gang-edger, and in combination with a saw-arbor and a saw movable thereon, a transversely-disposed bracket or shifter-bar engaging the saw-collar, a movable rack on each side attached to each end of the shifter-bar, a rotary shaft having pinions engaging the racks for moving them, and a sliding bar adapted by its movement to engage and relieve the teeth of the racks, whereby they are locked and released, substantially as herein described.

5. In a gang-edger, and in combination with the saw-arbor and the independent saws movable thereon, the transversely-disposed

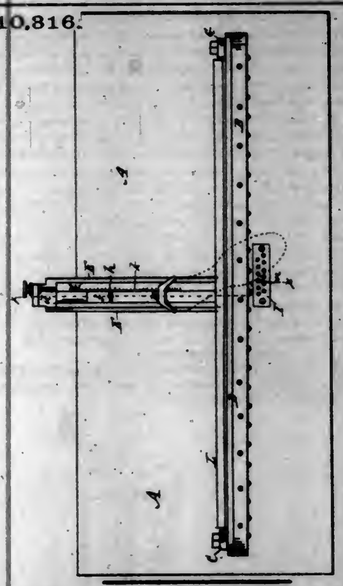
brackets or shifter-bars, each engaging the collar of one of the saws, the series of independent movable racks attached to each end of the brackets or shifter-bars, the rotary sliding shaft having a pinion on each side, adapted by the sliding movement of the shaft to be thrown into gear with different racks of the series to shift their saws, and the sliding bar engaging the teeth of the racks and locking them and grooves or ways in the bar in line with the pinions of the shaft to permit the movement of those racks engaged by the pinion, substantially as herein described.

6. In a gang-edger, and in combination with the saw-arbor and the independent saws movable thereon, the transversely-disposed brackets or shifter-bars, each engaging the collar of one of the saws and mounted and adapted to slide on fixed tracks in the frame of the machine, the series of independent movable racks attached to each end of the brackets or shifter-bars, the rotary sliding shaft having on each side a pinion adapted by the sliding movement of the shaft to be thrown into gear with different racks of the series to shift their saws, the sliding bar connected with and adapted to move the shaft, said bar engaging the teeth of the racks and having grooves or ways in line with the pinions of the shaft, and a lever and intermediate connections for moving the sliding bar, substantially as herein described.



410,816. MACHINE FOR MARKING SOLES. PATRICK COX, Rochester, N. Y. Filed Dec. 24, 1888. Serial No. 294,426. (No model.)

Claim.—1. In a sole-marking machine, the combination of the bed, the vertically-movable gate, the marking-blade attached to the gate, a heel-gage attached to the bed in rear of said gate and serving as a stop to the heel, and a side gage attached to the bed in front of said gate and serving as a stop to the side of the sole, as shown and described, and for the purpose specified.

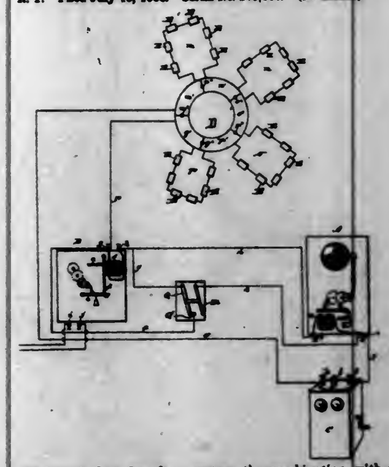


2. In a sole-marking machine, the combination of the bed, the vertically-movable gate, the marking-blade attached to the gate, the sliding gage adjustable forward and backward on the bed, the heel-gage in the sliding gage adapted to receive the heel of the sole, and the side gage adjustable to different positions to receive the side of the sole, as shown and described, and for the purpose specified.

3. In a sole-marking machine, the combination, with a vertically-movable gate carrying a marking-blade, and a series of pricking-points and stamps, of a sliding gage adjustable transversely of the bed toward and from the gate to adapt the device to different sizes of soles, and a heel-gage adjustable forward and back in the sliding gage to adapt the same to the adjustment of the sliding gage, as herein shown and described.

4. In a sole-marking machine, the combination of a bed, a vertically-movable gate, and a bar attached to the gate provided with prick-points that mark the tack-holes on the sole, and rubber pads surrounding the prick-points for throwing the sole off when pricked, as herein shown and described.

410,816.



410,817. APPARATUS FOR MOLDING SPRING-HEELS OF SOLES. PATRICK COX, Rochester, N. Y. Filed Dec. 24, 1888. Serial No. 294,426. (No model.)

Claim.—The mold for spring-heels of soles, consisting of the lower die C and upper die D, connected by spring E, and the adjustable gage G, passing into the cavity of the lower die and serving as a stop to the heel of the sole, as and for the purpose specified.

410,818. FIRE-ALARM SYSTEM. WILLIAM L. DENIS, Rochester, N. Y. Filed July 13, 1888. Serial No. 279,807. (No model.)

Claim.—1. In a fire-alarm system, the combination, with a normally-closed but uncharged main circuit and an alarm included therein rendered operative by a current, of a series of current-generators located in a shunt of the main circuit, a readily-fusible joint controlling the main circuit between the ends of the shunt, operating when melted by heat to break the main circuit, substantially as described.

2. In a fire-alarm system, the combination, with a normally-closed but uncharged main circuit, and an alarm included therein rendered operative by an electrical current, of a series of current-generators, each located in a shunt of the main circuit, a readily-fusible joint interposed in the main circuit between the ends of the shunt, operating when melted by heat to break the main circuit, substantially as described.

3. In a fire-alarm system, the combination, with a normally-closed but uncharged main circuit, and an alarm included therein rendered operative by an electrical current, of a series of magneto-generators, each located in a shunt of the main circuit, motors for operating said generators and stops for holding said motors in check, fusible joints holding said stops in position to arrest the motors, said joints being included in the main circuit, substantially as described, whereby upon the melting of the joint the generator will be allowed to operate and the main circuit between the ends of the shunt be broken, as set forth.

4. In a system such as described, the combination, with an uncharged closed main circuit, of a series of current-generators arranged to be separately and independently included therein, an alarm in said circuit rendered operative by a current, a signal-box in another circuit embodying an alarm operating to send a predetermined signal, and an electro-magnet in the main circuit for operating said signal-box, whereby upon the charging of the main line the alarm will be sounded and a signal sent by the box, substantially as described.

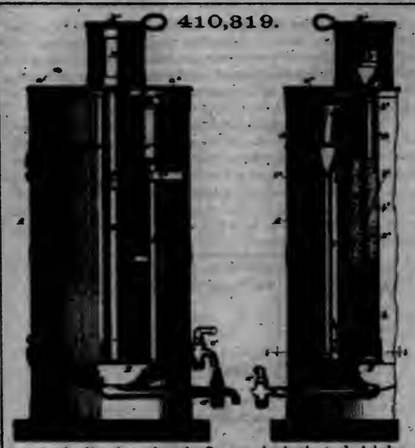
5. The combination, with a closed main circuit, of a series of current-generators adapted to be separately and independently included therein, an alarm included in said circuit, a second circuit and a signal-box arranged to send a signal over the same, an electro-magnet controlling the signal-box normally in the main circuit, a shunt around said electro-magnet, and a manually-operated switch for controlling said shunt, substantially as described.

6. In a system such as described, the combination, with an uncharged closed main circuit, of a series of current-generators adapted to be included therein, an alarm in said circuit, a second circuit, a signal-box included therein controlled by an electro-magnet, the latter normally in the main circuit, a shunt around said alarm and electro-magnet, a switch controlling said shunt, a current-generator and alarm, (such as the magneto and its bell,) and a switch for placing the latter in the main circuit, substantially as described.

7. The combination, with the closed but uncharged main circuit, of a series of current-generators adapted to be separately and independently included therein, an alarm in said circuit, a signal-box arranged in a separate circuit controlled by an electro-magnet normally in the main circuit, a shunt around said magnet, and a manually-operated switch controlling said shunt, substantially as described.

8. The combination, with the closed main circuit, of a series of devices included in the main circuit for changing its electrical condition, an alarm in the main circuit, a signal-box arranged to send a signal over another circuit and controlled by an electro-magnet, the latter normally in the main circuit, a shunt around the alarm and electro-magnet, a switch controlling said shunt, a current-generator and alarm, (such as the magneto and its bell,) and a switch for placing the latter in the main circuit, substantially as described.

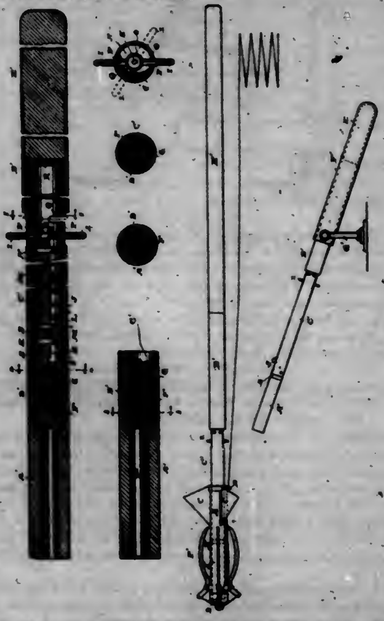
9. In a fire-alarm system, the combination, with a normally-closed but uncharged main circuit, and an alarm included therein rendered operative by an electrical current, of a series of magneto-generators with the coils of each located in a shunt of the main circuit, motors for operating said generators held in check by readily-fusible connections, said connections forming part of the main circuit, substantially as described, whereby upon the fusing of the connection the generator will be allowed to operate and the main circuit between the ends of the shunt broken, as set forth.



410,819. OIL-FILTER. DAVID R. ELLIS, Chicago, Ill. Filed Feb. 26, 1889. Serial No. 301,515. (No model.)

Claim.— 1. The combination of the tank A, filter-tube B within the tank, oil-supply tube B', and a conduit or conduits leading from the top of the tube B to the lower part of the tank A for conducting the oil which rises through the filtering material in said tube B to a point below the water-line in the tank.

2. The combination, with a tank A, filter-tube B, supply-tube B', and filtering material occupying the space between the tubes B and B', of a second tube C, its interior open-bottomed tube C', the pipe delivering from the upper end of the tube B in the top of the tube C and that leading from the top of the tube C to a point below the water-line of the tank, substantially as described.

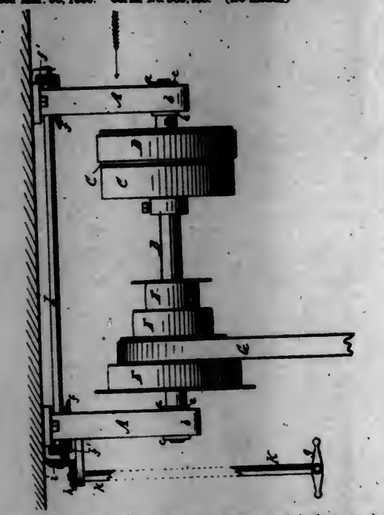


3. The combination, with the tank A, tubes B and C, the interior tubes B' and C', and the pipe leading from the tube B to the tube C', of

410,819.

the pipe leading from the tube C to a point in the tank A below the water-line thereof, and the external faucet leading respectively from the bottom of the tube B, from the bottom of the tank A, and from the tank A above the water-line, substantially as described.

410,820. GUN FOR THROWING EXTERNALLY-APPLIED PROJECTILES. STEPHEN H. EMMES, London, England. Filed Oct. 22, 1888. Serial No. 288,767. (No model.)



Claim.—1. In combination with a thimble-shaped projectile having an axial guide-bore, a gun having a short cylindrical powder-tube, a firing-device tube, and coupling devices uniting said tubes end to end, all of which are externally fitted to said guide-bore, a suitable stock to which said firing-device tube is attached, inclosed axial firing devices, and a suitable cocking and firing trigger, the latter projecting near the stock end of said firing-device tube, whereby the gun is adapted to carry an externally-applied projectile longer than the powder-tube, substantially as hereinbefore specified.

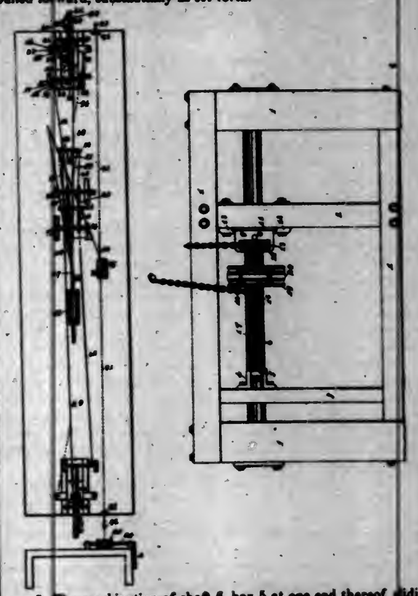
2. In combination with a powder-tube having the socket part of an interrupted screw-joint at its rear end, a breech-block provided with the plug part of such joint and having its front recessed to admit the base of the cartridge-shell, substantially as hereinbefore specified.

3. In combination with a powder-tube, a firing-device tube in line therewith, an axial hammer-rod within the latter, a detached axial firing-pin provided with a recoil-spring, a combined breech-block and coupling-piece having a shouldered axial bore at its front end, and a chambered rear end, the latter capped to form a central rear guide for the firing-pin, substantially as hereinbefore specified.

4. In combination with a breech-loading powder-tube, a breech-block, and a firing-device tube in line with each other, an axial firing-pin and a recoil-spring therefor within the breech-block, an axial hammer-rod in rear thereof having a collar fast thereon, a suitable trigger connected with its rear end, spiral striking and recoil springs behind and in front of said collar, respectively, and diaphragm-disks fast within the firing-device tube to coact with the springs last named, substantially as hereinbefore specified.

410,821. BELT-TIGHTENER. FRANK R. HYDE, Rochester, N. Y. Filed Mar. 30, 1889. Serial No. 305,495. (No model.)

Claim.—In a belt-tightener, the combination of the hangers A A, provided with ways *b b*, the boxes *a a*, resting loosely in the hangers, the counter-shaft B, resting in said boxes and provided with pulleys, the screw-shafts H H, screwing into the boxes, the longitudinal shaft I, located above the hangers, the gears *f f* and *f' f'*, connecting the longitudinal shaft and screw-shafts, the hand-shaft K, and the gears *h i*, connecting the hand-shaft and longitudinal shaft, as shown and described, and for the purpose specified.



410,822. AUTOMATIC BRAKING AND COUPLING MECHANISM FOR RAILWAY-CARS. WILLIAM KRAMP, Central City, Colo. Filed Oct. 1, 1888. Serial No. 286,922. (No model.)

Claim.—1. The combination of the main axle of a car, a band-wheel located thereon, a shaft above such axle, a pivoted box for one end of such shaft, a sliding box for the other end of such shaft, a band wheel or pulley on such shaft, an endless belt or chain passing over both pulleys and loose thereon when the said shaft is in its lower position; a chain attached to such shaft for connecting it to a brake-lever, and a connection from the shaft or its sliding box to means for raising the shaft into operative position, substantially as set forth.

2. The combination of the shaft 6, the pivoted box 5, supporting one end thereof, the sliding box 7, supporting the other end thereof, the base 11, supported and sliding in grooved ways, the box 7, attached to such base 11 and through which axle 17 passes, the axle 17, the wheel 18 thereon, the wheel 19 on shaft 6, the belt 20, passing over said wheels, the chain 16, secured to the shaft, and means for moving the sliding box 7 and the end of the shaft, substantially as set forth.

3. The combination of the shaft 6, the pivoted box 5, the sliding box 7, the axle 17, band-wheels 18 and 19, chain belt 20, chain 16, for connecting shaft 6 to a brake-lever, a spring, and a connection from the spring to the sliding journal-box, the spring acting normally to lift the sliding journal-box and throw the shaft 6 into position to set and keep set a brake mechanism, substantially as set forth.

4. The combination of the shaft 6, the box 5 at one end thereof, the sliding journal-box 7 at the other end thereof, the main axle 17, band-wheels 18 and 19, belt 20, chain 16, attached to the shaft and adapted to connect it to a brake-lever, a spring, a connection from the spring to the sliding box, the spring acting normally to lift the sliding box and throw shaft 6 into operative position to set the brakes, a reciprocating draw-bar or coupling-bar, and a connection therefrom to the spring, whereby the stress of the latter is taken from the sliding box and the brakes thrown off when the draw or coupling bar is pulled forward, substantially as set forth.

5. The combination of shaft 6, box 5 at one end thereof, sliding journal-box 7 at the other end thereof, band-wheels 18 and 19, belt 20, chain 16, for connecting shaft 6 with a brake-lever, spring 38, rod 46, with head 47, connection 15 therefrom to the sliding journal-box 7, the coupling or draw bar 26, the housing or box 28 therefor, the spring 38, and a connection 48 from the coupling or draw bar at the front of the car to the head of the rod 46, substantially as set forth.

6. The combination of the shaft 6, box 5 at one end thereof, sliding journal-box 7 at the other end thereof, band-wheels 18 and 19, belt 20, chain 16, for connecting shaft 6 with a brake-lever, spring 38, rod 46, with head 47, connection 15 therefrom to the sliding journal-box 7, a sliding coupling or draw bar 26, acted on by spring 38 in the box or housing 28, lever 50, a connection 49 from one end thereof to the draw or coupling bar at the rear of the car, and a connection 52 from the other end of the lever 50 to the spring-acted-on rod 46, substantially as set forth.

7. The combination of the shaft 6, box 5 at one end thereof, sliding journal-box 7 at the other end thereof, band-wheels 18 and 19, belt 20, chain 16, for connecting shaft 6 with a brake-lever, rod 46, acted on by spring 38, connection 15 therefrom to the sliding journal-box 7, a sliding bumper or buffer head, and rods 90 and 53, the rock-shaft 55 and lever-arms 57 58, and a connection from one lever-arm at the front of the car to the spring-acted-on rod 46, substantially as set forth.

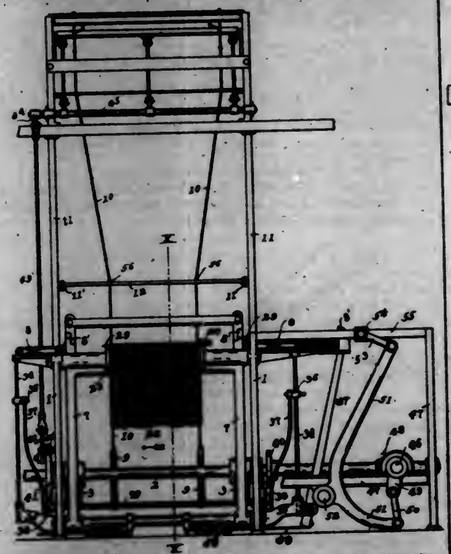
8. The combination of the shaft 6, box 5 at one end thereof, sliding journal-box 7 at the other end thereof, band-wheels 18 19, belt 20, chain 16, for connecting the shaft 6 to a brake-lever, rod 46, acted on by spring 38, connection 15 therefrom to the sliding journal-box 7, a sliding bumper or buffer rod 53, rock-shaft 55, lever-arms 57 58, a lever 64, a connection from one end thereof to the lever-arm 57 at the rear of the car, and a connection from the other end thereof to the spring-acted-on rod 46, substantially as set forth.

9. The combination of two buffer or bumper heads and bars, one at either end of a car, and each having a bar or rod 53, rock-shaft 55, and lever-arms 54 57, the sliding bar 59, with catches or lugs 69 70, the sliding bar 60 with catches or lugs 67 68, the pivoted levers 71 73, and the connections, as set forth, whereby as one bumper is pushed in the other is caused to be thrown out, substantially as set forth.

10. The combination of the draw-bar or coupling-bar 26, the spring 38 around the rear of the stem thereof, the box or housing 28, the stop-arm 39, the beveled extension-head 30 of the bar 26, and the latch-head 31, pivoted to the bar 26, substantially as set forth.

11. The combination of the draw or coupling bar 26, having the beveled side extension head 30, the bevel-headed latch 31, pivoted to or in the bar 26, the stop-arm 39, the spring 38, the box or housing 28, and the rubber bumper 36 within the box or housing, substantially as set forth.

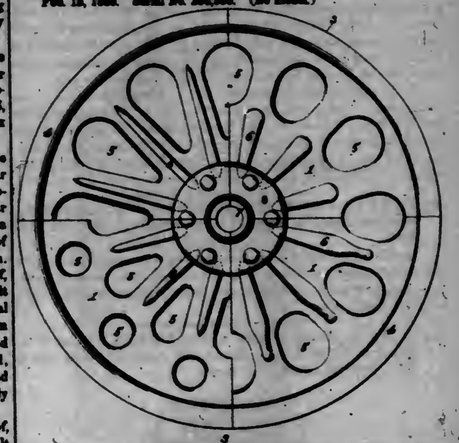
12. The combination of the draw or coupling bar 26, having the inclined side head extension 30 and the lug or washer 37 at its rear end, the bevel-headed latch 31, pivoted to or in the bar 26, the stop-arm 39, the box or housing 29, inclosing the rear portion of bar 26, and the spring 38 around such portion of the bar and within the box or housing, substantially as set forth.



13. The combination of the draw or coupling bar 26, having the inclined side head extension 30 and the lug or washer 37 at its rear end, the bevel-headed latch 31, pivoted to or in the bar 26, the stop-arm 39, the box or housing 29, inclosing the rear portion of the bar 26, the spring 38 around such portion within the box or housing, a wheel 42 on the bar 26, and a chain 43 therefrom to the spindle of an ordinary hand-brake wheel or to a lever, substantially as set forth.

14. The combination of the shaft 6, box 5 at one end thereof, sliding journal-box 7 at the other end thereof, band-wheels 18 19, belt 20, chain 16, for connecting the shaft 6 to a brake-lever, the vertical pivoted lever 76, the spring-catch 77 therefor, a connection therefrom composed of chains 80 and 81 from the opposite ends thereof, and chains 82 and 15 to the sliding journal-box 7, and the train-chain 91, supported beneath the car and having snap-hooks 92 at its ends and having a link passing over the lower end of the lever 76, substantially as set forth.

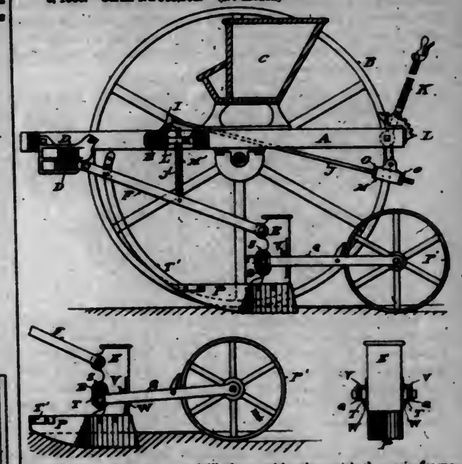
15. The combination of the shaft 6, box 5 at one end thereof, sliding journal-box 7 at the other end thereof, band-wheels 18 19, belt or chain 20, chain 16, for connecting the shaft 6 to a brake-lever, the vertical pivoted lever 76, the spring-catch 77, chains 80 81 from the opposite ends of lever 76, the chains 82 and 15, connecting them to the sliding box 7, the train-chain 91, supported beneath the car and having end connectors 92 for uniting a series of such chains and connected about its center to the lever 76, the spindle 84 on the tender or engine, the drum 83 thereon, to which the end of the series of chains 91 may be attached, and means for rotating the drum and spindle, substantially as set forth.



410,823. PILE-FABRIC LOOM. RICHARD B. LOTHE, Worcester, Mass., assignor of one-half to the Knowles Loom Works, same place. Filed Oct. 1, 1888. Serial No. 286,868. (No model.)

Brief.—By employing a fixed comber-board and a movable shuttle-box in place of a movable comber-board and a fixed shuttle-box, less power is required to shift the warp, a large portion of which is allowed to remain in the center of the shed, and at the same time the strain and friction on the warp is correspondingly reduced.

Claim.—In a loom, the combination, with the jacquard and har ness-frames, and means for operating the same, and the lay, filling, drop-box, and wire mechanisms, of a fixed comber-board, for the purpose stated, substantially as set forth.



410,824. CAR-WHEEL. HENRY F. MANN, Allegheny, Pa. Filed Feb. 15, 1888. Serial No. 263,982. (No model.)

Claim.—1. A wrought-iron or steel car-wheel having, in combination, a single web, a tread connected at its outer edge to said web, and a flange re-enforced by a fold of metal, portions of the metal of the web being removed for the purpose of lessening the weight of the wheel, substantially as set forth.

2. A wrought-iron or steel car-wheel having, in combination, a web, a tread connected at its outer edge to said web, and a flange, portions of the web being removed for the purpose of lessening the weight of the wheel, the edges of the holes formed by the removal of the metal being turned at an angle to the web, substantially as set forth.

410,825. GRAIN-DRILL. PERHAM P. MANN, Springfield, Ohio, assignor to P. P. Mast & Company, same place. Original application filed Feb. 16, 1888, Serial No. 263,131. Divided and this application filed June 8, 1889. Serial No. 313,562. (No model.)

Claim.—1. In a grain-drill, the combination, with the main frame, a hoe, and a runner upon which the hoe is mounted, a bar connecting the hoe with the said frame, and an adjustable connection for the forward end of the runner to change its inclination, of a grain and soil packing wheel and its connecting-bars, and devices to depress the wheel and the runner.

2. In a grain-drill, the combination, with a hoe and a runner upon which it is mounted, the same being connected with the frame of the machine, and devices to depress the hoe into the ground, of a grain and soil packing wheel and its connecting-bars pivotally attached

to the hoe, and a lateral projection on the hoe above and below said bars, the one to transfer the pressure on the hoe to the wheel, and the other to lift the wheel with the hoe.

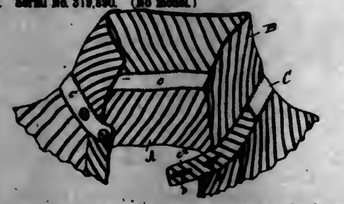
3. In a grain-drill, the combination, with a hoe and a runner upon which it is mounted, a beam connecting the hoe with said frame, and a bar adjustably connecting the forward end of the runner with said beam, of a grain and soil packing wheel and its connecting-bars pivotally attached to the hoe, and a lateral projection on each side of the hoe above and below said bars, the one to transfer the pressure on the hoe to the wheel, and the other to lift the wheel with the hoe.

4. In a grain drill, the combination, with the main frame, a hoe and a runner upon which the hoe is mounted, a bar connecting the hoe with the said frame, and an adjustable connection for the forward end of the runner to change its inclination, of a grain and a soil packing wheel and its connecting-bars pivotally attached to the hoe, and devices to depress said wheel by the depression of said hoe.

410,326. FIRE-EXTINGUISHING COMPOSITION. CHARLES MAYR, Springfield, Mass. Filed Sept. 23, 1887. Serial No. 251,260. (No specimens.)

Claim.—A charge for a fire-extinguisher, consisting of a mixture of the following ingredients: water, sulphuric acid, nitrite of soda, and an organic amide, like acetamide, in the proportions substantially as herein specified.

410,827. WATCH-BARREL. CHARLES H. METLAR, New York, N. Y., assignor to Mathey Brothers, Mathey & Co., same place. Filed June 8, 1889. Serial No. 313,545. (No model.)

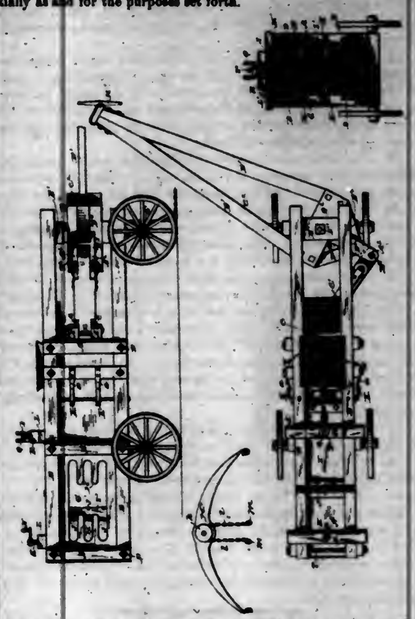


Claim.—1. The combination, with the arbor F, spring and spring-barrel A, of a secondary-spring barrel C, surrounding the arbor F, and a spring 6, within the barrel C and connected at its ends with the hub on the arbor F and with the spring-barrel, substantially as set forth.

2. The combination, with the arbor F, of the mainspring and spring barrel A, for giving motion to the time mechanism in a watch, the hub 5, surrounding the winding-arbor F, the secondary barrel C, and gear D, also surrounding the arbor F, and the spring 6, connected at one end to the hub 5 and having a projecting end that catches into notches in the interior of the secondary barrel C, substantially as set forth.

3. The combination, with the winding-arbor F, mainspring and spring-barrel A, around such arbor, of the secondary spring and spring-barrel C, also around the arbor F, a wheel H, having a central opening setting over the square end of the arbor, and a circular hub entering a hole in the watch plate or bridge, and a pawl for holding such wheel H, substantially as set forth.

410,328. SHIRT. SIMON MILLER, Philadelphia, Pa. Filed Aug. 6, 1888. Serial No. 319,890. (No model.)



Claim.—A shirt composed of woolen material, having intermediate of the upper end of the body and the collar an inelastic band C, connected at its opposite edges to said collar and body by rows of stitches, in combination with supplementary button hole tab C^3, overlying and extending outwardly beyond one end of the inelastic band, said tap being composed of the same material as the shirt, as and for the purpose intended, substantially as described.

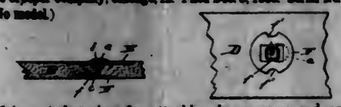
410,829. HAY-PRESS. CHARLES DE W. MCNEILL, Goliad, assignor of one-half to Francis E. Hunt, Victoria, Tex. Filed Nov. 13, 1888. Serial No. 290,768. (No model.)

Claim.—1. The combination, with the press-chamber having an adjustable top, of the block R, provided with pins bearing against different parts of the top, the cross-timber L', having apertures for the passage of the pins of the block R, the screw P, passed through said cross-timber and block, and the nut Q, applied to the end of said screw to regulate the pressure of said block and its pins, substantially as and for the purposes set forth.

2. The combination, with the adjustable top of the spring connected to and suspending said top, and the screws for adjusting the top, one of said screws being located at the discharge end of the tie-box and the other located over or adjacent to the feed-box, substantially as and for the purposes set forth.

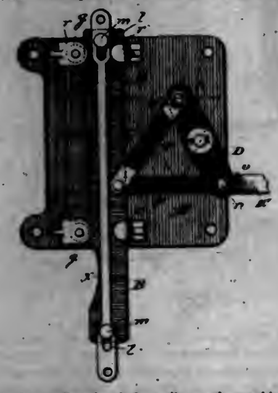
3. The combination, with the plunger formed with jaws and the main lever, of the toggle-lever connected at one end with the main lever and at the other end formed with a longitudinally-slotted tongue and shoulders above and below the tongue, said slot being of a length and said shoulders located at a point with reference to the slot to permit the end of the tongue and the shoulders to bear against the plunger at three points in the compression of the hay, and a bolt passing through the slot and securing the said lever to the plunger, substantially as and for the purposes set forth.

4. The combination, with the plunger and main lever, of the toggle-lever having a tongue formed with a slot permitting a longitudinal play of the lever, a bolt passing through the slot and connecting the toggle-lever and main lever together, friction-rollers mounted above and below the tongue, and a roller mounted between the end of the tongue and the main lever, said rollers being located, substantially as described, to form three yielding points of contact between the toggle-lever and main lever at their adjacent ends when brought together, substantially as and for the purpose set forth.



410,330. TOOL FOR APPLYING SEALING-WAX. WILLIAM A. PORTERFIELD and JOHN R. SHANNONHOUSE, Jr., Bellaire, Ohio. Filed May 9, 1888. Serial No. 310,140. (No model.)

Claim.—The herein-described tool for use in applying sealing-wax, the same consisting of the head B; having its base portion thickened in order to retain the heat, and having an extension or shank



and handle, as described, and having formed in its upper face a substantially pear-shaped chamber D, communicating with the free end of the head by means of a narrow triangular outlet-passage E, substantially as described, and for the purpose specified.

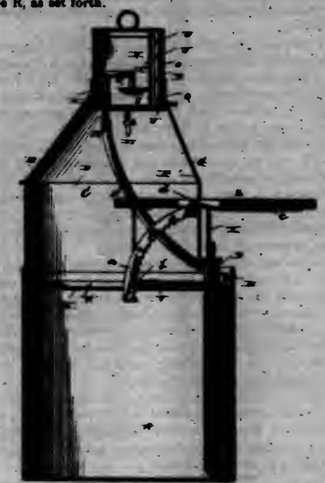
410,331. FASTENING FOR ICE-CREEPERS. WILLIAM W. PRESTON and EDWARD F. PRESTON, Bismarck, Mich., assignors to the Preston Ice Creeper Company, Chicago, Ill. Filed Dec. 3, 1888. Serial No. 292,590. (No model.)

Claim.—A fastening for attaching ice-creepers and analogous articles, consisting of a malleable nail having a large neck *b*, long enough to pass through the creeper and enter the body of the rubber, and a flat blade *c*, in combination with the washer F, having a central bar *f*, around which the nail may be clinched, said washer bearing upon the rubber immediately around the nail, substantially as set forth.

410,332. RAILROAD-SWITCH APPLIANCE. ISHAM RANDOLPH, Englewood, Ill. Filed Apr. 20, 1889. Serial No. 308,066. (No model.)

Claim.—1. In a railroad-switch appliance, the combination, with a suitable supporting-base, of a reciprocating bar B and a toggle-lever device comprising arms *p* and *p'*, pivoted to the said bar, and a pivoted bar D, joining the said arms at their free ends, substantially as and for the purpose set forth.

2. In a railroad-switch appliance, the combination of a base A, a reciprocating bar B, and a toggle-lever device comprising arms *p* and *p'*, pivoted to the said bar and having elongated openings *o* in their free ends, and a bar D, pivoted near its center and having studs near its opposite extremities extending into the elongated openings *o*, substantially as and for the purpose set forth.

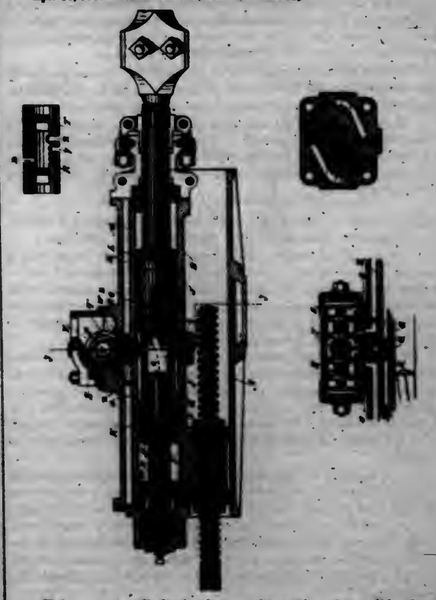


3. In a railroad-switch appliance, the combination of a base A, having guides *r* and *r'*, a reciprocating laterally-recessed bar B, confined between the guides, and a toggle-lever device comprising pivotally-connected arms *p* and *p'*, pivoted to the bar B, and a bar D, pivoted near its center and joining the said arms at their free ends, substantially as and for the purpose set forth.

4. In a railroad-switch appliance, the combination, with a suitable supporting-base, of a reciprocating bar B, a toggle-lever device comprising arms *p* and *p'*, pivoted to the said bar, and a pivoted bar D, joining the said arms at their free extremities, and a bar I, confined on the bar B and having limited longitudinal play thereon, substantially as and for the purpose set forth.

410,333. MEASURING-VESSEL. WALTER S. REYNOLDS, Clayton, Del. Filed Jan. 4, 1889. Serial No. 295,302. (No model.)

Claim.—1. The oil-tank having the perforated top and the dome C erected thereon, the measuring-vessel supported at the upper end of the dome, the pipe-connections between the measuring-vessel and the tank, the pump B within the latter, and the supporting-table Z, attached permanently to the perforated top of the tank and inclosed within the dome below the measuring-vessel, as set forth.



2. The combination, with the oil-tank and the dome therefor, of the pump, the measuring-vessel supported by the dome and having a short tube depending from its bottom, the flexible tube extending between the said short tube and the pump, the pipe R, arranged within the measuring-vessel and communicating with the tube depending from the bottom of the same, and the strainer secured on the end of the pipe R, as set forth.

3. The combination of the measuring-vessel having a slot in its side provided with a transparent cover, the vertical perforated partition arranged within the vessel adjacent to the slot, the inlet-tube and discharging-faucet in the bottom of the vessel, and the pipe R within the vessel, leading from the inlet-tube and provided with a strainer, as set forth.

4. The improved measuring device herein described and shown, comprising a tank, a pump in the tank, a supporting-table on the tank, a measuring-vessel supported by the tank above the said table, the pipe R in the measuring-vessel, having a strainer on its end, flexible connections between the pump and the measuring-vessel, the discharge-faucet L in the bottom of the measuring-vessel, and a transparent gage in the side of the measuring-vessel, as specified.

410,334. ROCK-DRILL. EDWARD A. REX, San Francisco, Cal. Filed Apr. 15, 1889. Serial No. 307,320. (No model.)

Claim.—1. A cylinder having a reciprocating piston, slides fitted into guides upon opposite sides of the cylinder, so that a line drawn

through the axis of the cylinder will pass through the center of the sides, central channels through the guides, and bolts passing through said channels and securing the heads to the cylinder, substantially as herein described.

2. In a rock-drill, the cylinder having a piston reciprocating and rotating therein, the non-rotating reciprocating sleeve fitted between the heads of the piston, said sleeve being made in a single piece and having a series of cam grooves or slots formed longitudinally in different parts of its surface, and a threaded follower for retaining the sleeve in place, substantially as herein described.

3. In a rock-drill, the reciprocating rotating piston, the non-rotating sleeve having the longitudinal cam groove or channel, in combination with the threaded follower for retaining the valve in place, the reciprocating main valve, and the intermediate supplemental claw or valve having a stem or shank which engages the cam-groove of the sleeve, whereby the valve is moved transversely to the movement of the piston, substantially as herein described.

4. In a rock-drill, the cylinder and reciprocating piston, the valve-chamber and sleeve fitted in said chamber having slots or openings corresponding with the ports which connect with the end of the cylinder, in combination with a hollow cylindrically-balanced valve reciprocating within the sleeve transversely to the movement of the piston, and an auxiliary claw or valve having a valve-stem which receives motion from the reciprocating piston and transmits it to the main valve, substantially as herein described.

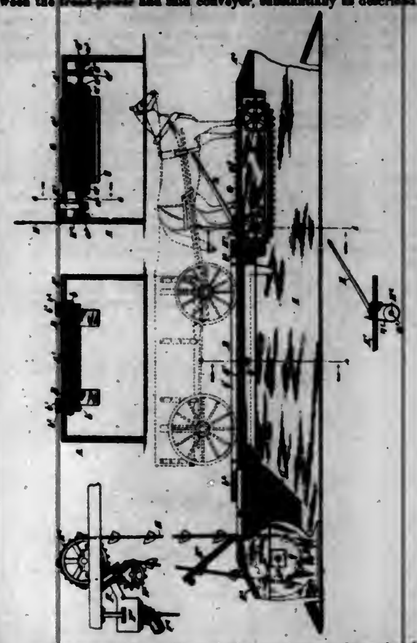
5. In a rock-drill, the reciprocating piston having a fixed head at one end, a non-rotating sleeve fitted to said piston, and a screw-threaded follower N, whereby the sleeve is retained in place and wear between the ends of the sleeve and the piston-heads may be compensated, substantially as herein described.

410,335. STEERING ATTACHMENT FOR BICYCLES. WILLIAM R. SANBORN, Boston, Mass. Filed June 8, 1889. Serial No. 313,613. (No model.)

Claim.—1. In a bicycle of the character described, the springs *f*, having one end secured at a common point on the saddle F, their opposite ends being secured to the handle-bar H, respectively, at points equidistant from the fork D, substantially as described.

2. In a bicyle provided with the post E, fork D, and handle H, the clamps *p* on said handle, and the springs *f*, having the chains *k*, connecting said posts and clamps, substantially as described.

3. In a bicyle of the character described, two coiled springs of equal tension secured at one end of the saddle and provided with chains on their opposite ends for adjustably securing them, respectively, in two clamps on the handle-bar equidistant from the fork, substantially as described.



410,336. GRAIN DUMP AND ELEVATOR. MARION P. SMILEY, Chicago, Ill. Filed May 7, 1888. Serial No. 273,094. (No model.)

Claim.—1. A dumping and elevating apparatus comprising a wagon-dump, a hopper located in position to receive material from a wagon upon the dump, an elevator adapted to receive material from the hopper, and a tread-power located in position to be operated by the horses attached to the wagon upon the dump and adapted to actuate the elevator, substantially as described.

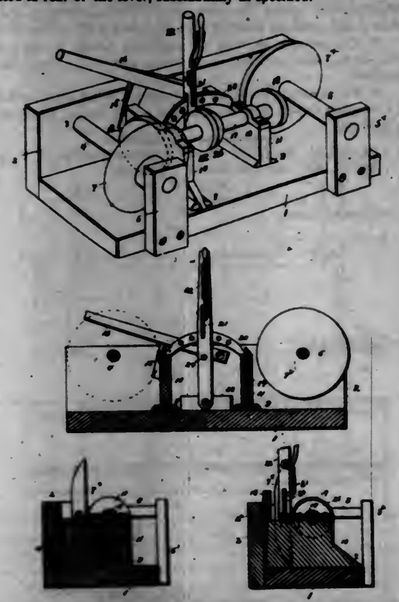
2. A dumping and elevating apparatus comprising an elevated platform, a wagon-dump therein, a hopper located beneath the floor of the platform adjacent to the dump, an elevator adapted to receive material from the hopper, and a tread-power supported upon the platform and in position to be operated by the horses attached to a wagon upon the dump and adapted to actuate the elevator, substantially as described.

3. A dumping and elevating apparatus comprising a wagon-dump, a hopper located in position to receive material from a wagon upon the dump, an elevator adapted to receive material from the hopper, a tread-power for actuating the elevator located at a point in front of and adjacent to the dump and in position to be operated by the horses attached to a wagon upon the dump, and a second or auxiliary tread-power also adapted to actuate the elevator, substantially as described.

4. The combination, with a dumping and elevating apparatus embracing a wagon-dump, a hopper, an elevator located in position to be operated by the horses attached to a wagon upon the dump, and a tread-power, of a grain-bin having a conveyer extending from the lower part of the bin to the elevator, and operative connections between the tread-power and said conveyer, substantially as described.

5. The combination, with a platform and wagon-dump therein, of an elevator, a tread-power for actuating the same mounted in the platform in position to be operated by the horses attached to the wagon upon the dump and having pivotal connection with the latter, and means attached to the thread-power for adjusting the latter and holding the same at a desired angle, substantially as described.

6. The combination, with a platform and wagon-dump therein, of an elevator, a tread-power for actuating the same pivotally supported at one end upon the platform in position to be operated by the horses attached to a wagon upon the dump, and a counterbalance-weight attached to the frame of the tread-power, substantially as described.



7. The combination, with a wagon-dump and an elevator, of a tread-power located in position to be operated by the horses attached to a wagon upon the dump, and which tread-power is pivotally supported at its forward end and provided at its rear end with a shaft provided with a sprocket-wheel, and a driving-belt trained over said wheel and the driving-pulley of the elevator, substantially as described.

8. The combination, with an elevated platform, wagon-dump therein, an elevator, and a tread-power for actuating the same located upon the platform adjacent to the wagon-dump and in position to be operated by the horses attached to a wagon upon the dump, of movable guards located at the sides of the tread-power, substantially as described.

9. The combination, with an elevated platform, a wagon-dump therein, an elevator, and a tread-power for actuating the same located adjacent to the wagon-dump and in position to be operated by the horses attached to a wagon upon the dump, of guards located at the sides of the tread-power, stationary supports for said guards, and a plurality of pivoted links connecting the said guards with the said supports, substantially as described.

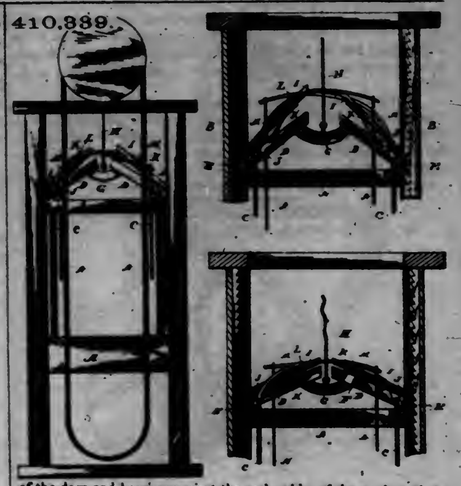
410,337. MECHANISM FOR GOVERNING THE FEED OF SAW-MILLS. HORATIO B. STRONG, Wilkesville, Ohio. Filed Apr. 19, 1889. Serial No. 307,778. (No model.)

Claim.—1. In a feed mechanism, a counter-shaft and a feed-shaft parallel therewith, each provided with friction-disks, in combination with parallel sliding blocks, a set-screw for adjusting one of the blocks, and a wedge adapted for insertion between the end of the other block and a fixed part of the frame-work, a reciprocating shaft mounted in boxes on the blocks and provided with friction-pulleys engaging the disks, and a grooved collar fixed thereon between its bearings, and a lever pivotally connected with the base and provided with an arm constructed to engage said shaft and provided with a spring-bolt, and a curved adjusting-bar having perforations engaged by the bolt and located in rear of the lever, substantially as specified.

2. The combination, with the base 1, having the wall 2, the shafts 4 and 6, and their supports 5 and 5°, the disks 7 and 7°, mounted on their respective shafts, and adjustable blocks 10 and 11, having the reciprocating shaft 17, carrying the friction-pulleys 18 and 19, and the lever 15, pivoted to the wall and provided with the wedge-shaped arm 16, adapted for insertion between the end of the block 10 and the wall 2, substantially as specified.

3. In a mechanism of the class described, opposite shafts provided with friction-disks, in combination with an intermediate reciprocating shaft at an angle to the opposite shafts provided with friction-pulleys adapted for contact with the disks, and means, substantially as described, for reciprocating said shaft, the sliding block 10, for supporting the intermediate shaft, and the lever with a wedge adapted to be inserted between the end of the block and fixed part of the frame-work, for the purpose set forth.

410,338. TOASTER. FREDERICK W. ULLRICH, Cleveland, Ohio. Filed Apr. 23, 1888. Serial No. 272,161. (No model.)



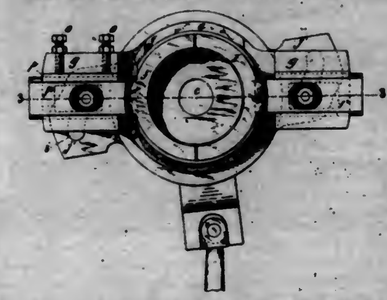
Claim.—1. In a toaster, the plate A, having one or more grooved flanges B, and a wire frame D, provided with handle H, constructed and combined, substantially as and for the purpose specified.

2. In a toaster, the combination, with plate A, having one or more grooved flanges B, and the frame D, of the cross-bar E, for supporting the frame D above the plate A, as and for the purpose specified.

410,339. SAFETY DEVICE FOR ELEVATORS. NATHAN WALKER, Norwich, Mass. Filed May 6, 1889. Serial No. 309,808. (No model.)

Claim.—As an improvement in elevators, the combination of the elevator-car, the rods C, rising therefrom, the dogs pivoted on the upper ends of said rods, the link connecting the inner ends of the said dogs, the pawls pivotally mounted on the upper sides of the dogs and having bearings L on their sides, the springs secured on the upper sides of the dogs and bearing against the under sides of the pawls, and the levers M, pivoted on the rods C and resting on the bearings L, and having cords N depending from their free ends, as specified.

410,389.

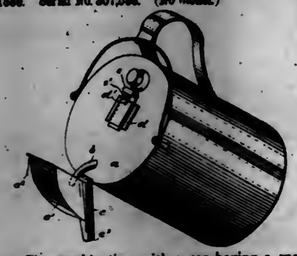


410,340. BALE-TIE BUCKLE. SAMUEL J. WEBB, Minden, La. Filed Dec. 3, 1888. Serial No. 292,553. (No model.)

Claim.—1. A bale-tie buckle formed on the arc of a circle and provided with slightly-curved side prongs and a central wedge-shaped prong having a longitudinal ridge and a recess in its under surface and arranged above the plane of the side prongs, substantially as specified.

2. The herein-described bale-tie buckle, formed in a single piece and consisting of the body portion 1, formed on the arc of a circle and provided with the opposite slightly tapered and recessed side prongs 4 and the central wedge-shaped and recessed prong 2, having the ridge 3' and terminating in a plane above the side prongs, substantially as specified.

410,341. CAN-HEADING MECHANISM. EDWIN E. ASHELL, Malden, Mass. Filed Jan. 14, 1889. Serial No. 296,945. (No model.)



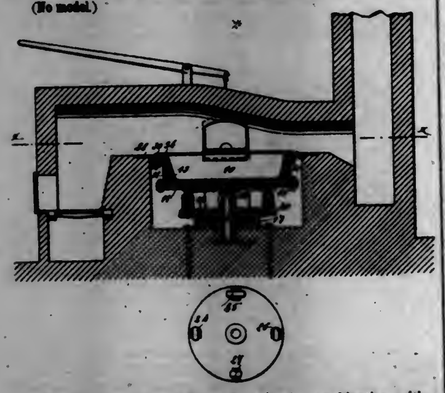
Claim.—1. A jaw-movement for can-heading mechanisms, consisting of the combination, with a head *a*, having a circular recess *b*, with an enlargement or offset *d* in its upper or outer edge, said head having also the wings *g*, provided with guideways, of the sliding jaws movable in said guideways and provided with studs or bolts, said jaws extending above or outside of said offset, and a cam-ring surrounding said head and having wings provided with cam-slots entered by said studs or bolts, substantially as described.

2. A jaw-movement for can-heading mechanisms, consisting of the combination, with a head *a*, having a circular recess *b*, with an enlargement or offset *d* at its upper or outer edge, said head having also the wings *g*, provided with guideways, of the sliding jaws movable in said guideways and provided with studs or bolts, said jaws extending above or outside of said offset, the ring or collar *k*, rigid

with said head and having wings provided with guiding-slots receiving said stud or bolts, and a cam-ring *j*, arranged between the wings of said head and the said collar and having wings provided with cam-slots, through which the said studs or bolts pass, substantially as described.

3. The combination, with the head *a*, having the circular recess *b*, provided with the offset *d*, and having also the wings provided with guideways, of the sliding jaws movable in said guideways and extending over said offset, the studs or bolts *h*, adjustably secured to the shanks of said jaws, and the cam-ring *j*, having wings provided with cam-slots receiving said bolts, substantially as described.

410,842. OIL-CAN. ALBERT A. ARNOLD, Jacksonville, Fla. Filed Apr. 17, 1889. Serial No. 307,588. (No model.)



Claim.—1. The combination, with a can having a spout, of an inverted funnel *c*, surrounding the spout and hinged to the can in front thereof, and a fastening for the funnel, substantially as set forth.

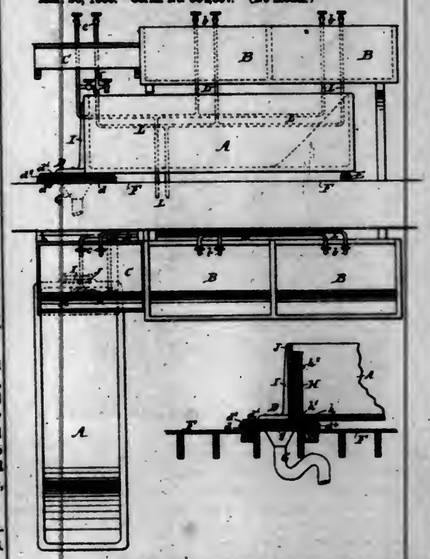
2. An oil-can provided with a concave top having an aperture *a'*, a spout *b*, and an inverted funnel *c*, surrounding the spout and hinged to the can in front thereof, and a slide for fastening the funnel, whereby the can may be used to pour from with its funnel fastened or unfastened, and the drippings from the funnel will run through aperture *a'* into the can, substantially as set forth.

3. The combination, with an oil-can having an apertured concaved top and provided with a fixed spout projecting from said concave top, of a funnel-like auxiliary spout hinged to the can adjacent to the fixed spout to be swung over the latter to form a shield therefor or away from the same to form a funnel, a keeper secured to the can-top and having an aperture in alignment with the one in said top, and a slide held by said keeper for engaging and fastening the hinged spout and having an aperture to register with the aperture in the top and keeper, substantially as described.

410,843. UNDULATING FURNACE HEARTH OR BASIN. ANTHONY BARKER, Pittsburg, Pa. Filed Dec. 19, 1888. Serial No. 294,076. (No model.)

Claim.—1. In an undulating furnace, the combination, with a basin or hearth, of a central post or standard upon which the hearth is free to turn, a revolvable disk, and wheels of unequal diameter carried thereby and arranged to bear against the under side of the hearth, substantially as described.

2. In an undulating furnace, the combination, with a hearth formed with a central boss or projection having a concave central recess, of a cam-faced flange surrounding said boss, a post or standard entering the recess of the central boss, a revolvable disk, and wheels carried by said disk and arranged to bear against the cam-faced flange, substantially as described.



3. The combination, with a hearth supported by a central standard and a means for tilting the hearth, of swinging aprons or flanges mounted to bear against the outer edge of the hearth-flange, substantially as described.

4. The combination, with a hearth, of a central supporting post or standard, a means for undulating the hearth, swinging aprons or flanges bearing against the outer face of the hearth-flange, and an asbestus fold arranged about the hearth, substantially as described.

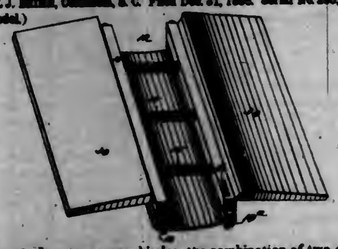
5. The combination, with an undulating hearth or basin, of a swinging fore-plate arranged in connection therewith, substantially as described.

6. The combination, with a non-revolvable tilting hearth or basin, of a swinging fore-plate resting against one edge thereof, substantially as described.

410,844. BATH-TUB. HUGO P. BRUNNER, New York, N. Y. Filed Mar. 26, 1889. Serial No. 304,997. (No model.)

Claim.—1. A bath-tub swivel-hinged at one end next its waste-outlets, the hinge of the tub having an outlet in its upper movable plate communicating with the tub, and provided in its lower plate or part with an outlet communicating with the waste-pipe, with which the tub-outlet coincides only when the tub is swung outward for use, substantially as herein set forth.

2. The combination, with a bath-tub, of a base-plate *d*, having a waste-outlet *g* and set at one end of the tub, a plate *d'* on the base-plate, a retaining-plate d^3, holding the plate *d'* to the plate *d*, said plate *d'* having a hole *h* registering with the outlet *h'* of the tub, and provided also with an upright lug, to which the end of the tub is connected, substantially as herein set forth.



3. A bath-tub swivel-hinged at one end next its waste-pipe connection and having an outlet *h'*, the hinge having a base-plate provided with a waste-outlet *g*, and a movable disk-plate held to the tub and provided with a hole *h*, registering with the tub-outlet *h'* and adapted to register with the waste-outlet *g* when the tub is swung outward for use, and an overflow-pipe fitted detachably to the outlets *h h'* in the tub and hinge-plate, substantially as herein set forth.

410,845. IMPLEMENT FOR DEHORNING CATTLE. JOHN S. BIXBY and ALBERT BLANCHARD, Rolfe, Iowa. Filed Feb. 12, 1889. Serial No. 299,619. (No model.)

Claim.—1. In a dehorning implement, the combination, with a body provided with a fixed blade at one extremity, a keeper, and a lever pivoted at or near the lower end, of a blade pivoted upon the said body, capable of moving upon the fixed blade when closed, and provided with an integral arm at the lower end, a curved guide-arm secured to the pivoted blade and blade-arm, said arm passing through the keeper upon the body, and a link connecting the extremity of the blade-arm and the lever, all combined for operation substantially as shown and described.

2. In a dehorning implement, the combination, with a body provided with a fixed blade at the upper end, a keeper, and a lever pivoted at or near the lower end, of a second blade pivoted upon the said body, adapted when closed to contact with the fixed blade, said pivoted blade having at its pivotal point a longitudinal slot and being provided with an arm integral with the lower end, a curved guide-arm integral with the pivoted blade and blade-arm, said arm passing through the keeper of the body and having straight surfaces *c* and *c'* and a circular surface *d*, and a link connecting the outer extremity of the blade-arm and the lever, substantially as described, whereby a shearing or sliding movement is imparted to the pivoted blade as it approaches the fixed blade, as set forth.

410,846. TEMPORARY BINDER. GEORGE A. BLACKBURN and DANIEL J. REESE, Columbia, S. C. Filed Dec. 31, 1888. Serial No. 295,050. (No model.)

Claim.—1. In a temporary binder, the combination of two cases having covers hinged thereto, a backing adjustably connected to the cases, and adjustable binding-strips extending from one case to the other, substantially as described.

2. In a temporary binder, the combination of cases, covers hinged thereto, rollers mounted in the cases, a back connected to the rollers, binding-strips, and a means for adjusting said binding-strips, substantially as described.

3. In a temporary binder, the combination, with cases, of shafts or rollers mounted therein, leaves hinged thereto, a flexible back connected to the rollers, binding-strips, a roller to which said strips are connected, and a means for locking the roller to place, substantially as described.

4. In a temporary binder, the combination, with cases, of covers hinged thereto, rollers mounted therein, springs arranged in connection with the rollers, a flexible back connected to the rollers, binding-strips connected at one end to one of the cases, a shaft arranged in the other case, the binding-strips being connected to this shaft, a ratchet carried by the shaft, and a pawl mounted in the case and arranged to engage the ratchet, substantially as described.

410,847. VEHICLE-WHEEL. JAMES W. BROOK, Lynchburg, Va. Filed Apr. 3, 1889. Serial No. 305,814. (No model.)

Claim.—1. The combination, with the core A, of a metallic hub formed of sections encircling said core, said sections provided with inwardly-extending projections adapted to bite into said core, metal bands adapted to be shrunk over the outer ends of said core-sections, whereby said sections are secured in place upon the core, and spokes cast integral with said hub-sections, substantially as and for the purpose described.

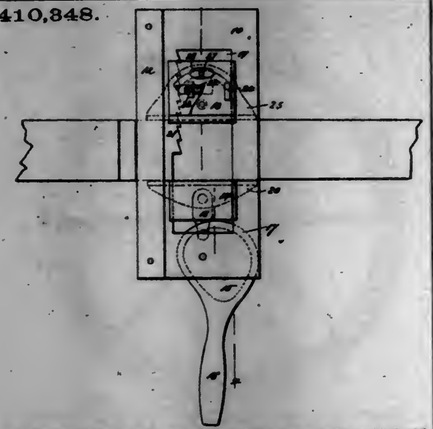
2. An improved metallic vehicle-wheel formed of sections, each section consisting of a hub portion B' and spokes D, cast integral with said hub portion, and a metal felly-section C, secured upon the ends of the spokes, substantially as shown and described.

3. An improved metallic wheel formed of sections, each section comprising a hub portion B', a felly-section C, and spokes D, connecting said felly-section and hub portion, said felly-section, hub portion, and spokes cast integral, substantially as and for the purpose described.

4. The combination, with the hub portions B' and the spokes D, cast integral therewith and provided with projecting portions *d'* *d'* at their outer ends, of the metallic felly-section C C, adapted to fit over said projections *d'*, and means for securing said sections C to the spokes, substantially as shown and described.

5. The combination, with a metallic wheel formed of sections, each section consisting of a hub portion B', spokes D, and a felly-section C, cast integral with each other, said felly-sections forming a continuous supplemental felly, of a wooden felly formed in sections, said sections adjusted on said supplemental felly, so as to break joints, and means for securing said wooden and metal felly-sections together, substantially as shown and described.

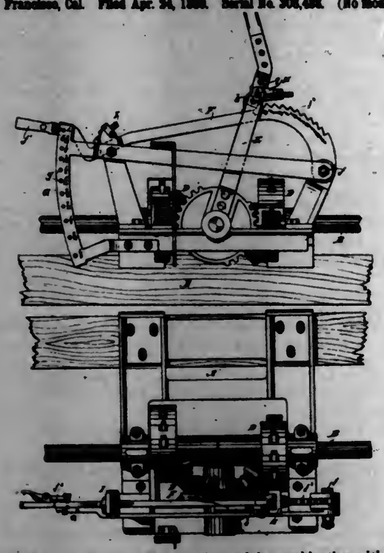
6. The hereinbefore-described improvement in vehicle-wheels, formed of sections comprising a central apertured core A, metallic sections B', each formed with a hub portion B, hollow spokes D, hub-sections C C, and projections d^3 d^3, formed integral therewith, a wooden felly formed in sections arranged about said metal felly-sections, so as to break joints, a tire, and means for holding said hub-sections together, all arranged substantially as and for the purpose described.



410,848. DADO-GUIDE. WILLIS S. CORNWOX, Binghamton, N. Y. Filed Sept. 15, 1888. Serial No. 285,502. (No model.)

Claim.—1. A dado-guide consisting in the body or frame 10, having one longitudinal edge formed or provided with a straight-edge or guide 12, an adjustable head-block 13 in said slot at one end, a sliding tail-block in the opposite end of the slot, a pivoted cam for reciprocating said tail-piece, a jaw pivoted to freely turn on the under side of the tail-piece, a jaw pivoted to turn freely on the lower face of the head-piece and provided with a segmental slot concentric with its pivot, and an adjusting-screw whereby, when the tail-jaw is set at the desired angle against the material, the head-jaw will, when forced against the material, adjust itself to said angle, substantially as set forth.

2. The combination, with the base or body having a straight-edge or guide along one longitudinal edge, of longitudinally-adjustable head and tail pieces thereon having horizontally-turning clamping-jaws the ends of which lie wholly within the plane of the outer face of said straight-edge, substantially as set forth.



3. The combination, with a frame 10, having a longitudinal slot through it from its upper to the lower face, a rack on one wall of the slot, the head-piece 13, sliding in the slot and having a transverse catch engaging the rack, the jaw 25, pivoted to the lower side of the head-block and having a curved slot, and a screw 27, extending up through

410,348.

said slot and block to the upper side of the frame and provided with a thumb-nut, of the tail-piece 14, sliding in the opposite end of the slot and provided with a stud 18 on its under side, the cam-lever pivoted to the frame and having a rib engaging the stud to positively throw the tail-block in either direction, and the jaw 20, secured to the tail-block, substantially as set forth.

410,349. SAW-MILL SET-WORKS. FREDERICK W. COOK, San Francisco, Cal. Filed Apr. 24, 1888. Serial No. 308,492. (No model.)

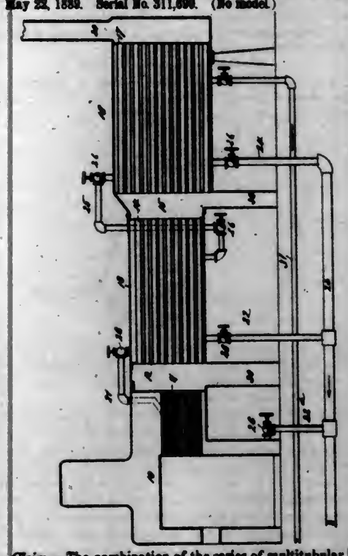
Claim.—1. In saw-mill set-works, and in combination with the vibrating set-lever, the pivoted swinging set-bar having a series of shoulders or stops, a fixed rack for limiting and defining the movement of the set-bar, and a stop on the set-lever for coming in contact with any of the shoulders or stops of the set-bar, according to the position of said bar, substantially as described.

2. In saw-mill set-works, and in combination with the vibrating set lever, the pivoted swinging set-bar having the series of shoulders or stops, the fixed rack having a series of holes corresponding with the shoulders or stops of the set-bar, a pawl on the end of the set-bar adapted to engage the holes of the fixed rack, and a stop on the set-lever for coming in contact with any of the shoulders or stops of the set-bar, according to the position of said bar, substantially as described.

3. In saw-mill set-works, and in combination with the set-lever having a forked or divided lower portion, the pivoted swinging set-bar passing through said lower portion of the set-lever and having a series of shoulders or stops, the fixed rack for limiting and defining the movement of the set-bar, and a stop-block between the members of the lower portion of the lever for coming in contact with any of the shoulders or stops of the set-bar, according to its position, substantially as described.

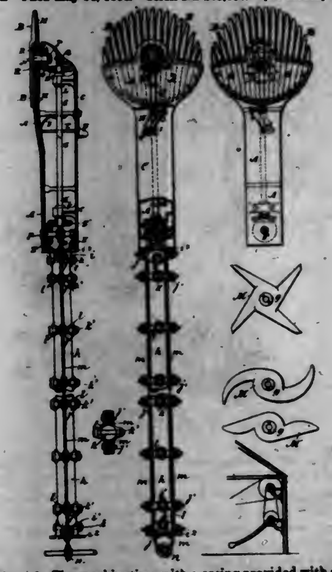
4. In saw-mill set-works, and in combination with the vibrating set-lever having a stop-block, the pivoted swinging set-bar having a series of shoulders or stops with which the stop-block of the lever is adapted to come in contact, the fixed rack for engaging the end of the set-bar and limiting and defining its movement, and the pivoted swinging stop-piece on the lever adapted to be thrown down to come in contact with the shoulders or stops of the set-bar to provide for the saw-kerf, substantially as described.

410,350. DOUGH-MACHINE. GEORGE H. CROSS, St. Johnsbury, Vt. Filed May 22, 1889. Serial No. 311,749. (No model.)



Claim.—1. The combination, with the frame 1, of the box 2, having the perforated bottom 3, the sliding frame 3 4, the lever 7, centrally pivoted to the end of the box 2, the rod 9, connecting the sliding frame and one end of the lever, and an operating-rod 11, substantially as set forth.

2. The combination, with the frame 1, of the box having a perforated bottom, the sliding frame, the centrally-pivoted lever, the rod connecting the frame and lever, an operating-rod, and the coiled spring, substantially as set forth.



3. The combination, with the frame 1, of the box having the perforated bottom and the inner side cleats, the sliding frame, the centrally-pivoted lever, the rod connecting the frame and lever, the coiled spring, a foot-pedal, and the rod connecting the lever and pedal, substantially as set forth.

410,351. BOILER. CHARLES J. DAVIDSON, Sioux City, Iowa. Filed May 22, 1889. Serial No. 311,690. (No model.)

Claim.—The combination of the series of multitubular boiler-sections 10, 13, and 16, the cross-sectional area of the second being greater than the first, and the third section greater than the second, the upper pipes 21 and 25, which connect the said sections, the lower pipes 22 22ª 24 and blow-off pipe 23, connected, as specified, and the feed-pipe 31, which leads to the third or largest boiler-section, as shown and described.

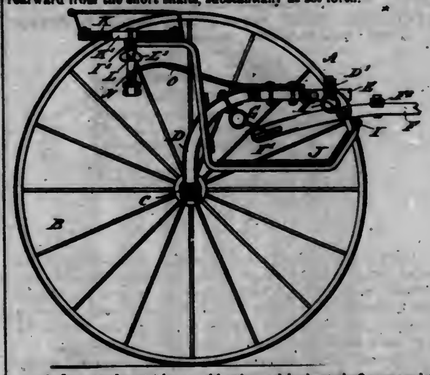
410,352. ANIMAL-SHEARS. ROBERT DIXON, Sydney, assignor to Tottenham Lee Richardson, Murrurundie, near Hyegan, New South Wales. Filed May 31, 1888. Serial No. 276,067. (No model.)

Claim.—1. The combination, with a casing provided with a comb, of a revolving cutter, a flexible arm secured to and projecting from the casing, a pulley in the casing, an endless belt traveling around the flexible arm and passing around the pulley, and intermediate mechanism between the pulley and cutter, substantially as described.

2. The combination, with a casing provided with a comb, of a revolving cutter, a grooved pulley in the casing, intermediate mechanism between the pulley and cutter, a flexible arm projecting from the casing, guide-rollers arranged on the flexible arm, and an endless belt passing around the said pulley and traveling around the flexible arm under the guide-rollers, substantially as described.

3. The combination, with a casing provided with the blades or teeth B, of the revolving cutter M, the bevel gear-wheel O on the journal of the cutter, the longitudinal shaft G, provided with the bevel gear-wheels F F', the transverse shaft F, provided with the bevel gear-wheel E and pulley D, and the belt *m*, passing around the said pulley, substantially as herein shown and described.

4. The combination, with the lower part A of the casing, the revolving cutter M, the gear-wheel O on the journal of the cutter, and the transverse shaft F, provided with the gear-wheel E, of the upper hinged part C, provided with the bearings L, and the shaft G, journaled in the said bearings and provided with the gear-wheels F F', substantially as herein shown and described.



5. The combination, with a casing provided with a comb, a revolving cutter, a pulley, and intermediate mechanism between the pulley and cutter, of a flexible arm secured to the casing, guide-rollers carried by the said arm, an endless belt passing around the pulley and traveling around the flexible arm under the guide-rollers thereof, and a flexible covering for the said arm, guide-rollers, and belt, substantially as described.

410,353. ROAD-CART. BENET W. DOOLITTLE, Garden Grove, Iowa. Filed Dec. 28, 1888. Serial No. 294,945. (No model.)

Claim.—1. In a road-cart, the combination, with the short shafts secured at their lower rear ends to the axle and curved upward and forward therefrom, of the long shafts pivoted near their rear ends to the forward upper ends of the short shafts, and a spring connecting the rear ends of said long shafts with the under sides of the short shafts, substantially as set forth.

2. In a road-cart, the combination, with the short shafts curved downward at their rear ends and secured to the shaft, a cross-piece uniting the said shafts, of the long shafts pivoted near their rear ends to the forward upward ends of the short shafts, transverse coiled springs G connecting the rear ends of the long shafts with the under sides of the short shafts at their bends, substantially as set forth.

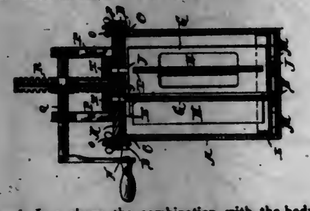
3. The combination, with the short shafts curved upward and forward from the axle, a cross-piece connecting their front ends, and the springs H, secured to the said cross-piece, of the foot-rest and seat-supporting bars I, supported at their forward lower ends by the said springs H, the upper ends of the bars being projected rearward beyond the axle, and supporting-springs for said upper ends projecting rearward from the short shafts, substantially as set forth.

4. In a road-cart, the combination, with short shafts secured to the axle and long shafts pivotally connected with the said short shafts, of rearwardly-extending springs secured to the said short shafts, a transverse spring connected with the ends of the said shaft-springs, a seat supported on the said transverse spring, bars connected with the said seat and supporting the platform, and springs connected with the said bars at their front ends and secured to the front ends of the said short shafts, substantially as shown and described.

5. In a road-cart, the combination, with short shafts secured to the axle and long shafts pivotally connected with the said short shafts, of rearwardly-extending springs secured to the said short shafts, a transverse spring connected with the ends of the said shaft-springs, a seat supported on the said transverse spring, bars connected with the said seat and supporting the platform, springs connected with the said bars at their front ends and secured to the front ends of the said short shafts, and bolts passing through longitudinal slots in the said seat for adjusting the said seat, substantially as shown and described.

410,354. SUPPORT FOR SPINNING-SPINDLES. GEORGE O. DRAPER, Hopedale, Mass., assignor to George Draper & Sons, same place. Filed June 5, 1889. Serial No. 313,178. (No model.)

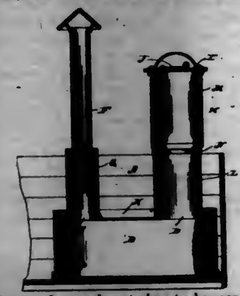
Claim.—A sleeve-whirl spindle and a supporting-case, combined with a lateral bearing having a ball-like portion located out of the line of the band-pull, and having an enlargement or stop thereon of a diameter to substantially fill the space in the said supporting-case, the said stop being located at one side of the line of band-pull opposite that where the said ball-like portion contacts with the supporting-case, substantially as described.



410,355. SUPPORT FOR SPINNING-SPINDLES. GEORGE O. DRAPER, Hopedale, Mass., assignor to George Draper & Sons, same place. Filed June 15, 1889. Serial No. 314,485. (No model.)

Claim.—The combination, with a supporting-case having a curb, a bolster-bearing, and an oil-hole, and a sleeve-whirl spindle having an extension 2 below the band-groove, the diameter of the said extension being as great as that of the sleeve-whirl at the lower end of the band-groove, of an annulus or ring *a*, adapted to be lifted verti-

cally outside the said extension up to and across the band-groove, thereby uncovering the space between the lower end of the whirl and the cover of the supporting-case, the lower end of the said annulus or ring entering the said curb, to operate substantially as described.



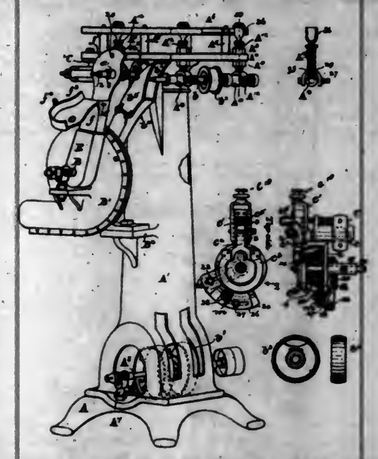
410,856. CHURN. MORVEN R. FAKES, Carbondale, Ill. Filed Apr. 10, 1889. Serial No. 306,654. (No model.)

Claim.—1. In a churn, the combination, with the body, of the parallel rotary dashers arranged therein, each consisting of the longitudinally-slotted blade G, having a post at its lower end stepped in the bottom of the body, the blade H, inserted through the slot in the blade G, and the wedge I, inserted through the slot between the end of the same and the end of the blade H, as specified.

2. In a churn, the combination of the body, the parallel rotary dashers arranged within the body, each consisting of a longitudinally-slotted blade having a post at its lower end stepped in the bottom of the body, and a solid blade detachably secured in the slotted blade, and the strainer carried by the lower ends of the dashers, as set forth.

410,857. HEATER FOR STOCK-WATERING TANKS. CHARLES FREDERICK, York, Nebr. Filed Mar. 21, 1889. Serial No. 304,212. (No model.)

Claim.—A heater for stock-watering tanks, consisting of the casing provided with a vertical flange on its upper face around the edge, and having openings D E in its upper face, the smoke-stack rising from the opening E, the cylindrical casing or reservoir arranged around the lower portion of the smoke-stack and extending above the sides of a tank, the magazine composed of the section N, rising from the opening D, and provided with a flange or bend, and the section M, resting upon the flange or bend and the damper, substantially as described.



410,858. HEEL-TRIMMING MACHINE. CHARLES W. GLIDDEN, Lynn, assignor to James W. Brooks, trustee, Cambridge, Mass. Filed Feb. 13, 1889. Serial No. 300,574. (No model.)

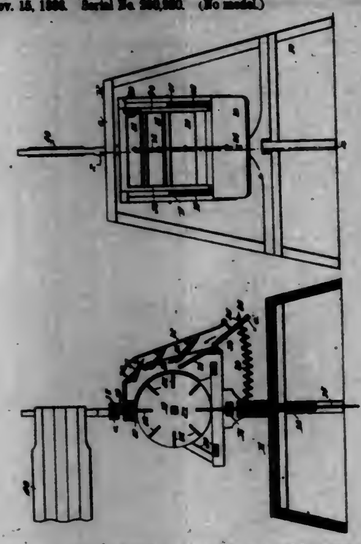
Claim.—1. In a heel-trimming machine, the block c', the carriage c^3, and its rand-guard composed of a band of thin sheet metal dished and bent around, substantially as shown and described, and attached only at its opposite ends to the said carriage, combined with the supporting-yoke, in which the said carriage slides to operate, substantially as described.

2. In a heel-trimming machine, the combination, with the heel-trimming cutter, its shaft, and the edge-rest n, of supports for the said edge-rest, whereby it may be adjusted not only radially toward and from the center of the said shaft, but also in the arc of a circle about the said shaft, substantially as described.

3. In a heel-trimming machine, the fixed arm 20 and the radially-adjustable extension 23, combined with a shoe 26, made adjustable thereon in the arc of a circle described about the center of the said cutter-shaft, and with a rest, as n, for the edge of the heel, substantially as described.

4. In a heel-trimming machine, the block c', the independent sliding yoke 4 therein, a carriage movable in the said yoke, and a rand or counter guard attached to the said carriage, combined with the spring c^4, carried by the said yoke and acting upon the said carriage to keep it normally pressed toward the said cutter, substantially as described.

5. In a heel-trimming machine, the block c', the independent sliding yoke 4 therein, a carriage movable in the said yoke, and a rand or counter guard attached to the said carriage, combined with the spring c^4, carried by the said yoke and acting upon the said carriage to keep it normally pressed toward the said cutter, and with an adjusting-screw to act upon the said yoke, substantially as described.

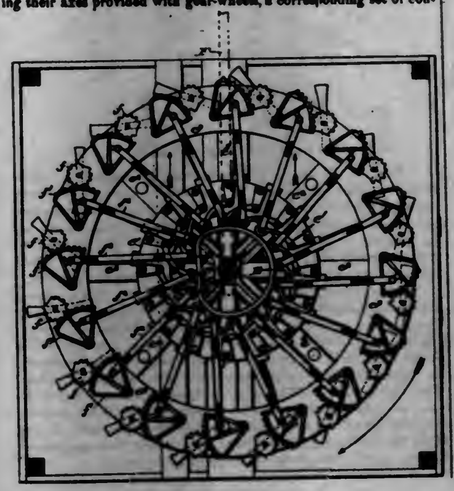


6. In a heel-trimming machine, the combination, with the column supporting the trimming mechanism, of a rotary shaft carrying a rotary cutter, bearings for the said shaft, and a work-table A^5, arranged horizontally above and parallel to the shaft carrying the cutter, substantially as described.

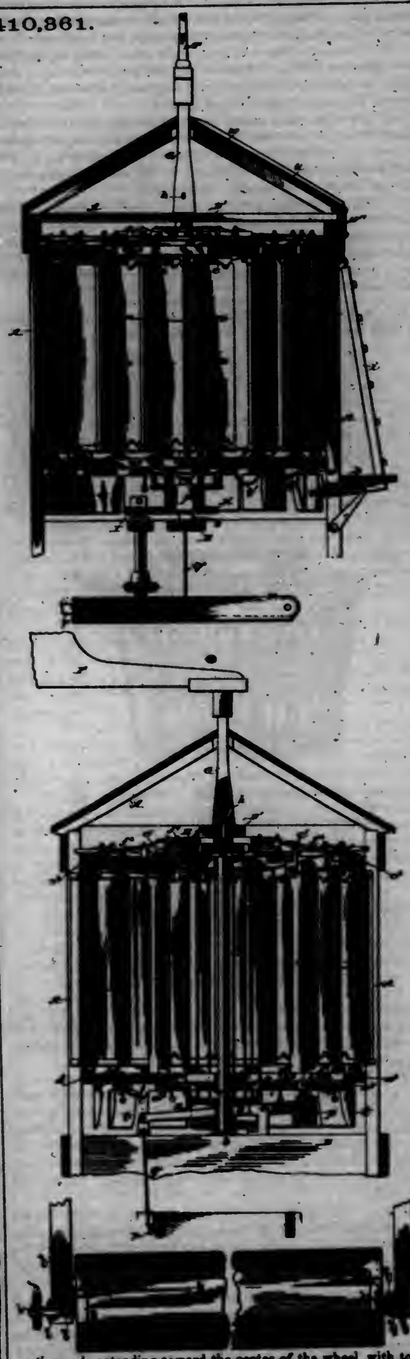
410,859. APPLIANCE FOR CONTROLLING AND PREVENTING FIRE IN BUILDINGS. ANDREW J. GOODRICH, Forville, Ill. Filed May 1, 1888. Serial No. 272,607. (No model.)

Claim.—The combination of a structure having outward-swinging closures normally held open, a spring connected to the structure at the hinged edge of each closure and connected to the closure at or near its outer or free edge, said closure opening against the tension of the springs, a separate wire or cable connected to each closure beyond its hinged edge, and guide-pulleys therefor, the cords or cables being grouped at their depending ends at a suitable point on the outside of the structure, substantially as set forth.

410,860. WINDMILL. BENJAMIN F. HAM, CHESTER, KANS. Filed Nov. 15, 1888. Serial No. 290,980. (No model.)



Claim.—1. In a windmill, the combination, with a supporting-frame, a revoluble frame mounted therein, a horizontal crank-shaft in the frame, a wind-wheel on the said shaft, and a vane carried by the revoluble frame, of a shutter-case at one side of the revoluble frame, a series of swinging shutters in said case, and a pivoted spring-pressed regulating-plate connected to the shutters, and a deflecting-plate above the regulating-plate and behind the lowermost shutter, substantially as herein shown and described.



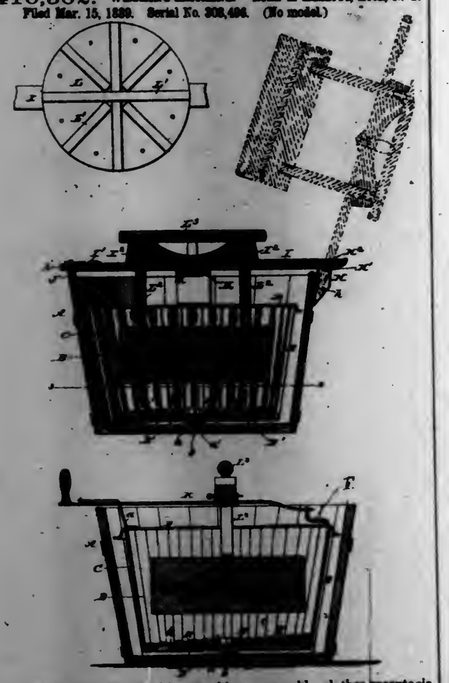
2. In a windmill, the combination, with the revoluble frame and a horizontal wind-wheel journaled in the said frame, of the shutter-case 30 at one side of the frame, the shutters 31, mounted in the case, the apertured regulating-plate 33, pivoted to the frame below the shutters, the deflecting-plate 37, the rod 32, pivoted to the shutters and to the regulating-plate, the rod 35, projecting through the regulating-plate 33, and the spring 34, surrounding the rod, substantially as herein shown and described.

410,861. WINDMILL. SOLOMON HARBAUGH, Geneva, Nebr. Filed June 15, 1888. Serial No. 277,261. (No model.)

Claim.—1. The combination, in an upright wind-wheel, of a series of vertical vanes pivoted in a circular row between the heads and having their axes provided with gear-wheels, a corresponding set of connecting-rods extending toward the center of the wheel, with toothed gears at their end engaging with the gear-wheels, friction-rollers arranged at the inner ends of the connecting-rods, a central cam resting in the horizontal plane of the connecting-rods and bearing against the

410,861.

rollers, and a guiding-tail connected to and automatically adjusting the position of the cam, substantially as shown and described.



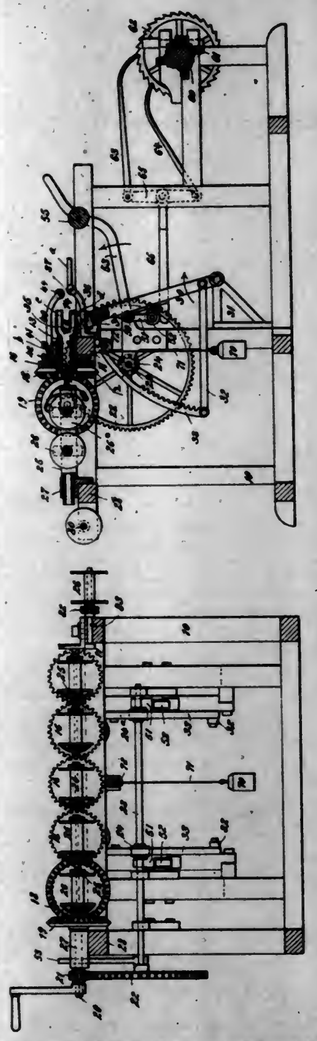
2. The combination, with the upright wheel having vertical pivoted vanes and gearing, substantially as described, for changing their angles, of a series of stops arranged to drop behind the vanes and lock them in inoperative position, as set forth.

3. In a wind-wheel having upright pivoted vanes, the combination, with said pivoted vanes, of a series of elastically-hinged deflector-blades *l*, provided with arms *l'*, adapted to bear against the edge of the vane and throw it more obliquely to the wind to automatically regulate the wheel, substantially as described.

4. The combination, with the upright wheel and its central shaft C, of the cam E, having a central bushing of wood forming a bearing for the central shaft, and a hollow hub E', the attached mast G, having oil-duct therein leading to the central shaft, and the guiding-tail rigidly attached to said mast, substantially as and for the purpose described.

410,862. WASHING-MACHINE. LUKE L. KELLOGG, Leon, N. Y.

Filed Mar. 15, 1889. Serial No. 303,496. (No model.)

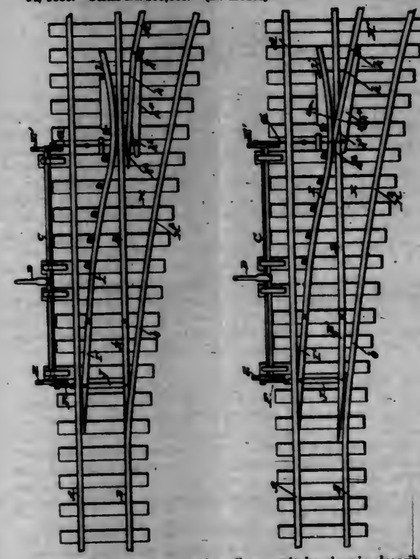


Claim.—1. In a washing machine, a movable clothes-receptacle having on its bottom a series of sections decreasing in thickness from one edge to the other and formed with the parallel grooves, substantially as set forth.

2. In a washing-machine, the combination, with an outer receptacle A, of the clothes-receptacle B, having on its bottom the series of grooved sections E, having its sides formed of the series of inclined V-shaped strips C, with the narrow spaces left between their adjacent edges, and having the inwardly-bent hook F, and the opposite handle-brace G, the cross-bar I, and the operating-handle K, centrally pivoted to the cross-bar and having the end aperture *k*, substantially as set forth.

3. In a washing-machine, the combination of an outer tub, the clothes-receptacle having the bottom stud, the V-shaped side strips, the grooved bottom sections, and the top hook and handle-brace, the cross-bar, the operating-handle pivoted to the cross-bar, and the follower, substantially as set forth.

4. The combination of the outer tub provided with the slotted bracket having the removable pin and the stop, and the opposite stud, the clothes-receptacle having the bottom stud, the V-shaped side strips, the grooved bottom sections, and the top hook and handle-brace provided with the catch, the cross-bar having the thumb-piece at its end, the pivoted operating-handle, and the ribbed follower, substantially as set forth.



410,868. FENCE-BUILDING MACHINE. JOHN B. KELLY, Sherman, Tex. Filed June 20, 1888. Serial No. 314,910. (No model.)

Claim.—1. In a fence-building machine, the combination, with a series of twisters and a means for revolving the same, of fixed jaws mounted to extend in advance of the twisters, jaws pivotally mounted above the twister-shafts, set-screws constituting stops, said screws being arranged in advance of the pivotal supports of the jaws, set-screws arranged to the rear of the pivotal supports, and elastic blocks against which said rear set-screws bear, substantially as described.

2. In a fence-building machine, the combination, with a series of twisters, of intermeshing gears carried by the twisters, a driving or crank shaft, a bevel-gear loosely mounted thereon and arranged to engage a bevel-gear carried by one of the twisters, a ratchet carried by the crank-shaft, a pawl carried by the loosely-mounted bevel-gear, said pawl being arranged to engage the ratchet, a transverse shaft 23, a gear 22, a pinion carried by the crank-shaft and arranged to engage the said gear 22, pinions 24 and 24', carried by the shaft 23, arms 30, upwardly-extending projections connected to said arms, and racks 33, also connected to the arms and arranged for engagement with the pinions 24 and 24', substantially as described.

410,864. RAILWAY-SWITCH. WALTER H. KNIGHT, Beardman, Fla., assignor of one-half to William H. Smith, same place. Filed Feb. 14, 1889. Serial No. 300,003. (No model.)

Claim.—The improvement in railway-switches herein described, consisting of the main line having section B', the side track having section A, provided with portion A^2 and shoulder A^3, the intermediate rail I, having section I' and extension *i*, the bar or beam J, the main shaft having crank-like portions, and the rods for connecting such portions with the sections to be operated, substantially as set forth.

410,865. HAND-PROPELLER FOR BOATS. JAMES S. LAMAR, Valdosta, Ga. Filed May 15, 1889. Serial No. 310,982. (No model.)

Claim.—1. A hand-propeller for boats, consisting of a vertically-disposed frame secured to the boat, provided with longitudinal extending horizontal arms, swinging bars pivotally supported from the outer ends of said longitudinal arms, and paddles secured to the lower ends of said bars, substantially as shown and described.

2. The combination, with socketed bracket-plates secured to the boat-body and projected over the sides thereof, of a vertically-extending frame supported in said socketed plates, said frames provided with forwardly-extending horizontal members, swinging bars supported at their upper ends from said horizontal members, and paddles secured to the lower ends of said bars, substantially as and for the purpose described.

3. In a hand-propeller, the combination, with the supporting-frame C, provided with horizontal members C^3, of the arms H H, pivotally supported on said arms C^3, said arms H provided with bearing-yokes H' at their upper ends, swinging bars supported at their upper ends in said yokes H', and paddle-blades secured to the lower ends of said bars, substantially as and for the purpose described.

4. In a hand-propeller, the combination, with the supporting-frame C, provided with horizontal members C^3, and adjustable clips D, secured upon said members C^3, of arms H H, pivotally supported on said clips D, provided at their outer ends with bearings or yokes H', the swinging bars G G, supported at their upper ends in said bearings H', and paddles secured to the lower ends of said bars, substantially as and for the purpose described.

5. The combination, with frames C C, formed of vertical arms C' C', provided with rack-sections C^3 C^3 and horizontal members C^3 C^3, and adjustable clips D D, secured upon the outer ends of the members C^3 C^3, of the arms H, pivotally secured near their upper ends to the said clips D, the forward ends provided with yokes or bearings H', said arms H extended downwardly and rearwardly and adapted to engage the racks C^3, swinging bars G, supported at their upper ends in the bearings H', and paddles secured to the lower ends of said bars, all arranged substantially as and for the purpose described.

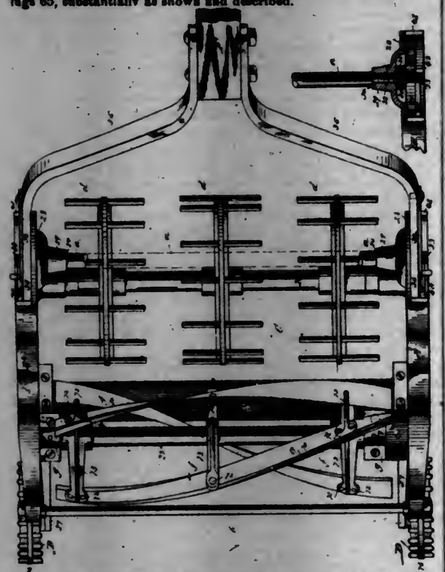
6. The combination, with the supporting-frames C C, and the arms H H, pivotally secured to the outer ends of the members C' C' of said frames C, of the swinging arms G G, journaled at their upper ends to the outer ends of the arms H, and the paddles reversibly secured to the lower ends of said bars, substantially as shown and described.

7. The combination, with the main frame and the arms H, pivoted to the horizontal members of said frame, said arms provided with stirrup-like bearings H' at their outer ends, of the swinging bars G, provided with lateral lugs at their upper ends engaging the stirrup-bearings H', and the paddles secured to the lower ends of said bars, substantially as and for the purpose described.

8. In a hand-propeller, the combination, with the paddle-bars G G, having the bearings G' G' and the spring-catches L L at their lower ends, of the rounded shafts J, carrying the paddles at their lower ends, journaled in said bearings, and having projecting handles at their upper ends engaging the latches L, substantially as and for the purpose described.

9. The combination, with the shafts journaled to the lower ends of the supporting-arms G G, formed with beveled rear edges and provided with the stops j^3, of the paddles formed each of two blades hinged at their inner ends to the shafts, substantially as shown and described.

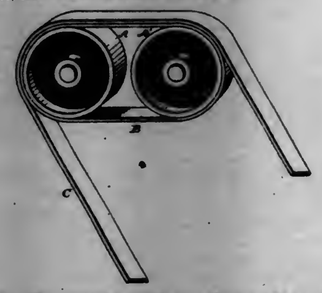
10. The combination of the shafts journaled at the lower ends of the swinging bars G G, said shafts provided at their lower ends with paddles formed each of two blades hinged at their inner ends to the shafts, the springs secured to the shafts and bearing against the blades to normally force them partially open, and the stops formed on the shafts to limit the outward movement of said blades, substantially as shown and described.



11. In a hand-propeller, the combination of the supporting-frame, the pivotal arms H, secured thereto, as shown, said arms provided with bearings H' at their outer ends, the swinging arms G G, carrying the propeller-blades at their lower ends and journaled at their upper ends in the bearings H', and provided with spring-supports O O near their lower ends, the handle-bar N, provided with flattened ends *n n*, engaging the supports, and bands P P, disposed on the ends of said bar to each side of the supports, substantially as and for the purpose described.

410,866. LAWN-MOWER. WALDO A. LOUD, Springfield, Mass. Filed Sept. 25, 1888. Serial No. 286,260. (No model.)

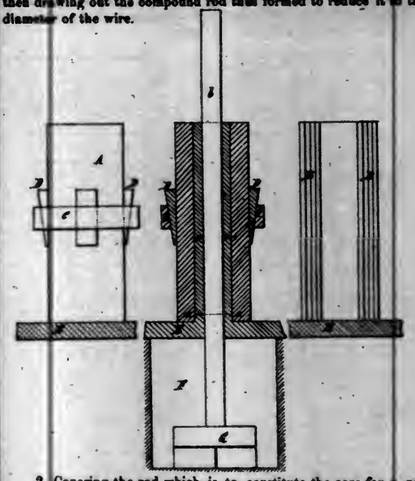
Claim.—1. The combination, with the cheek-plates A A^3, provided with the chambered faces 30 and bored hubs 29, of the brace-rod *a*, shouldered near each end, its end portions outside of said shoulders being screw-threaded, and the said brace-rod disposed between said cheek-plates abutting by its shoulders against the inner ends of said hubs, its outer ends passing outwardly through and beyond said hubs, and also the nuts which are screwed on said ends of the brace-rod and disposed within the said chambered faces of the cheek-plates, the said ends of the projecting brace-rod forming pivotal studs for the engagement of the handle-forks, substantially as shown and described.



2. In a lawn-mower having opposing cheek-plates, the combination, with the stationary cutter-bar and cutter-blade and the revolving cutter and its shaft, of the cheek-plate bearings for the revolving cutter-shaft, each consisting of the web 59, surrounding the chamber, comprising two semicircles of different areas and the opposing laterally-extending recesses 63, the semi-annular bearing-block 64, having the end lugs 65, loosely disposed in the larger semicircular portion of the said chamber and in the said recesses 63, the set-screws 67 67,

screwing through the opposing walls of one of the said recesses and against one of the legs 65, and a single set-screw 68, screwing through one wall of the other recess and against the top of the other of said legs 65, substantially as shown and described.

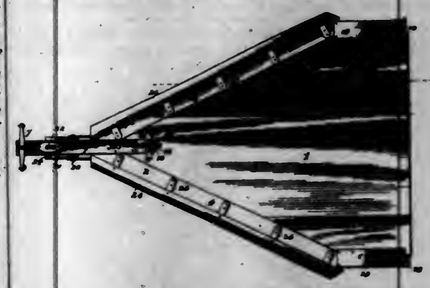
3. In a lawn-mower having opposing cheek-plates, the combination, with the truck-holder arms supported from said cheek-pieces, each provided with the hollow boss 78, of the truck having the bore of its hub of greater diameter than that of the said boss and provided with the annular oil-groove 86 and the duct 85, leading thereto from the end of the hub, the bushing-sleeve fitting on said boss and within said truck-hub, the inner and outer circular peripheries thereof being eccentric to each other, the washer covering the end of the boss, the sleeve, and truck-hub, and the bolt 83, passing through said boss and washer, resting by its head against the outer face thereof, and the nut 84, all substantially as shown, and for the purposes described.



410,367. BELT-GEARING. JOHN A. LOGAN, Chetopa, Kans. Filed July 31, 1888. Serial No. 281,545. (No model.)

Claim.—The combination, with two adjacent pulleys and the belt B, passed around said pulleys, of the main driving-belt C, passing over the belt B and in contact with it at the points where it passes around both pulleys, substantially as set forth.

410,368. MANUFACTURE OF WIRE. EDOUARD MARTIN, Paris, France. Filed July 30, 1889. Serial No. 319,137. (No model.) Patented in France Apr. 7, 1885, No. 168,133; in Belgium Oct. 30, 1885, No. 70,866; in England Nov. 2, 1885, No. 13,307; in Italy Dec. 17, 1885, XIX. 19,074, VIII, 51; in Spain Mar. 6, 1886, No. 5,431, and in Austria-Hungary July 2, 1886, No. 9,804 and No. 32,977.



Claim.—1. Covering the rod which is to constitute the core for a part only of its length with an envelope of more ductile metal, and then drawing out the compound rod thus formed to reduce it to the diameter of the wire.

2. Covering the rod which is to constitute the core for a part only of its length with an envelope of more ductile metal, and then drawing out the compound rod thus formed by passing it in alternately opposite directions through successive drawing-rolls to reduce it to the diameter of the wire.

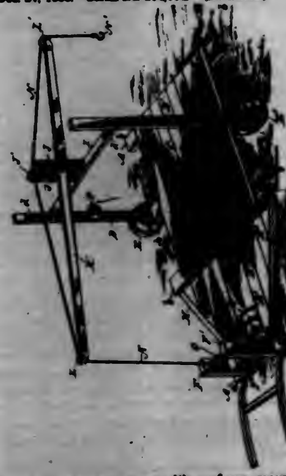
3. Casting on the rod which is to constitute the core for a part only of its length an envelope of more ductile metal, and then drawing out the compound rod thus formed to reduce it to the diameter of the wire.

410,369. CORNSTALK-CUTTER. JAMES D. MERRIS, Ottawa, Ohio. Filed Apr. 20, 1889. Serial No. 308,087. (No model.)

Claim.—1. A machine for cutting cornstalks, consisting of a triangular frame having a horizontal platform secured thereto, a single transverse axle secured to the rear end of said triangular frame and having at its ends the rear carrying-wheels, the knife-bars fixed to the inclined sides of said triangular frame, a draft-bar fixed to the apex of said triangular frame and arranged in line with the longitudinal center of the machine, and a single depending caster-wheel swiveled to the draft-bar in the line of the draft of the machine and being free to turn in any direction on the draft-bar, whereby the machine is maintained in proper relation to the line or row of cornstalks when cutting against a single row by the swiveled caster-wheel, as herein described.

2. A machine for cutting cornstalks, comprising a triangular frame having a horizontal platform secured thereto, a series of plates fixed to the inclined sides of said frame, the knife-bars removably bolted to said plates, a single transverse axle secured to the rear end of the machine and having the rear carrying-wheels at its ends, a single draft-bar secured to the apex of said frame in line with the longitudinal center of the machine, and provided with a vertical central slot, a vertically-adjustable bar fitted in said slot and having means for rigidly securing itself to the draft-bar, and a caster-wheel swiveled on the bar in line of the draft of the machine and being free to turn in a horizontal direction on said bar, substantially as and for the purpose described.

410,370. WATCH-MOVEMENT BOX. GERHARD A. MOESSER and ALBERT G. MOESSER, Allegheny, assignors of one-half to Augustus H. Estey, Pittsburg, Pa. Filed Aug. 24, 1888. Serial No. 283,614. (No model.)



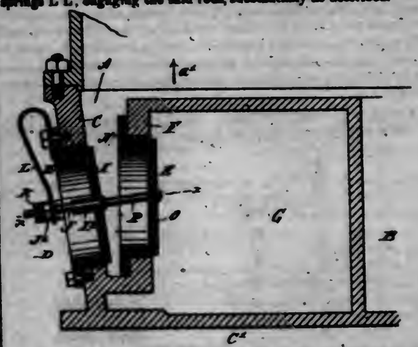
Claim.—1. An improvement in cases for watch works or movements, which consists in a glass case made of two parts which are adapted to be fitted together, the interior of the case being shaped conformably to the shape and size of the works to be contained therein, substantially as and for the purposes described.

2. An improvement in cases for watch works or movements, which consists in a glass case made of two parts which are adapted to be fitted together, the interior of the case being shaped conformably to the shape and size of the works to be contained therein, the top and bottom of the case being flat and transparent and the periphery being circular, substantially as and for the purposes described.

3. An improvement in cases for containing the works or movements of watches, which consists in a glass case made of two parts provided with screw-threads, whereby they may be fitted together, the interior of the case being shaped conformably to the size and shape of the works to be contained therein, substantially as and for the purposes described.

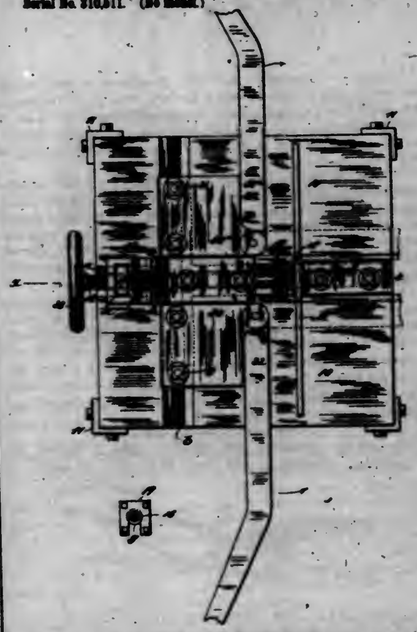
4. An improvement in cases for containing the works or movements of watches, which consists in a glass case made of two parts provided with screw-threads, whereby they may be fitted together, the interior of the case being shaped conformably to the size and shape of the works to be contained therein, and a gasket interposed between the parts at the bases of the screw-thread, substantially as and for the purposes described.

410,371. CORN-CUTTER. BENJAMIN F. MOORE, Ivanhoe, Kans. Filed Dec. 27, 1888. Serial No. 294,604. (No model.)



Claim.—1. A corn-cutter comprising a frame mounted on wheels and provided with two platforms, the front platform being triangular and in a different plane from the rear one, knives secured to the sides of the forward triangular platform, standards projecting from the frame, an adjustable beam connecting the standards, a lever pivoted on the beam and provided with guide-pulleys, a windlass at the front of the frame, and a rope secured to the windlass and passing over the guide-pulleys of the lever, substantially as described.

2. In a corn-cutter, the combination, with a frame mounted on wheels and provided with oblique cutters at its forward end and a windlass at the forward end of the frame, of the standards D D', secured to the frame, the beam I, adjustably secured to the standards and provided with the posts J, carrying guide-rollers J', the lever K, pivoted between the said posts and provided with the guide-rollers L L', and the rope N, secured to the windlass and passing over the said guide-pulleys, substantially as herein shown and described.

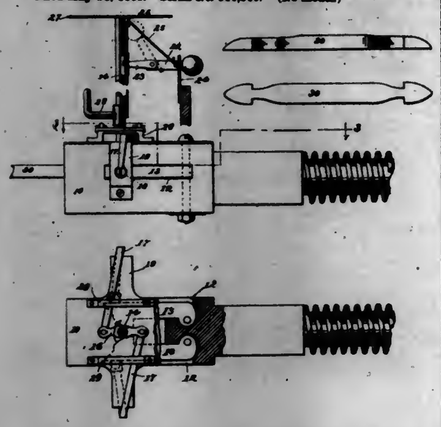


410,372. VALVE-HEAD FOR BLOWING-ENGINES. CALVIN L. HOOSE, Lebanon, Pa. Filed Oct. 15, 1888. Serial No. 288,102. (No model.)

Claim.—1. In a valve-head for blowing-engines, the combination, with the casing B and the discharge-box G, of the inlet-valve I, provided with the rods J, the discharge-valve O, provided with the rod P, the bridge K, through which the rods J and P project, and the springs L L', engaging the said rods, substantially as described.

2. In a valve-head for blowing-engines, the combination, with the casing B, the discharge-box G, and the valve-seats H N, fitted in the rims of the said casing and box respectively, of the inlet-valve I, provided with hub I', and the rods J, having nuts J', the discharge-valve O, provided with the rod P, having nut P', the bridge K, secured to the valve-seat H, and the springs L L', engaging the rods J and P, substantially as herein shown and described.

410,373. MACHINE FOR FORMING BEAM-STRAPS. HENRY McDOWALL and ROBERT POTTER, New York, N. Y. Filed May 13, 1889. Serial No. 310,511. (No model.)



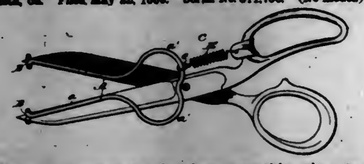
Claim.—1. In an apparatus for forming beam-straps, the combination, with a base-plate formed with a longitudinal and a transverse groove, of a forming-block 12, a block 14, a clamping-screw which passes through said block 14 and engages a nut arranged in a recess formed in the block, a clamping block or head 18, connected to the screw 16, and pivotally-mounted bending-levers, substantially as described.

2. In an apparatus for forming beam-straps, the combination, with a base-plate, of an adjustably-mounted block 12, a clamping block or head 18, an adjustably-mounted clamping-screw, and bending-levers, substantially as described.

3. In an apparatus for forming beam-straps, the combination, with an adjustable forming-block 12, of a clamping-block and adjustably-mounted bending-levers, substantially as described.

4. In an apparatus for forming beam-straps, the combination, with a bed-plate, of a forming-block 12, held thereto, adjustably-mounted bending-levers, a block 14, formed with a central bore, bolts 15, formed with apertures *f*, a clamping-screw 16, which passes through the bore of the block 14 and through the apertures of the bolts 15, and a clamping-block connected to the clamping-screw, substantially as described.

410,874. CAR-COUPLING. JONAS P. MCDOWELL, Peoria, Iowa. Filed May 21, 1889. Serial No. 311,509. (No model.)



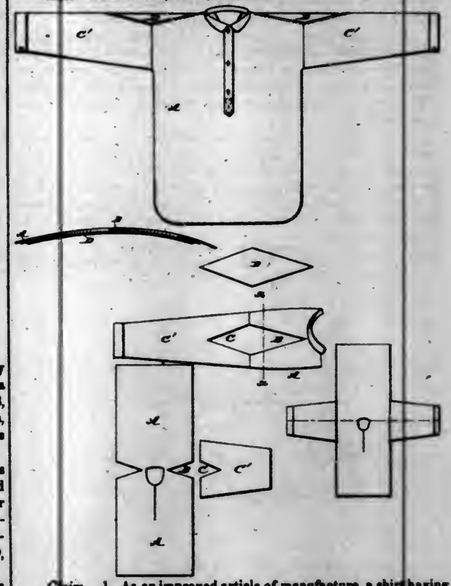
Claim.—1. The combination, with a draw-head, of jaws pivotally mounted therein, a shaft extending upward from the draw-head, a lever carried by the shaft, rods 17, connected to the lever, links 18, to which the rods are connected, said links being connected to the jaws, and springs 20, arranged in connection with the jaws, substantially as described.

2. In a car-coupler, the combination, with a draw-head, of jaws pivotally mounted therein, a shaft stepped upon the draw-head and extending upward therefrom, a latch carried by the shaft, a keeper with which the latch engages, a lever carried by the shaft, rods connected to the lever, links to which the rods are connected, connections between the links and the jaws, brackets 19, and springs 20, substantially as described.

3. In a car-coupler, the combination, with a draw-head, of jaws pivotally mounted therein, a shaft extending upward from the draw-head, a lever carried by the shaft, rods connected to the lever, links to which the rods are connected, connection between the links and the jaws, springs arranged in connection with the jaws, a latch carried by the shaft, a keeper which the latch engages, a cord or chain connected to the latch, and a lever-arm 28, arranged at the lower end of the shaft, substantially as described.

410,875. SCISSORS ATTACHMENT. JAMES H. NORRELL, Augusta, Ga. Filed May 22, 1889. Serial No. 311,738. (No model.)

Claim.—1. An attachment for scissors, comprising a bow the arms of which are adapted to extend in use alongside the scissor-blades, and having the free ends of its arms provided with openings adapted to receive the points of the scissor-blades, substantially as set forth.



2. The combination, with scissors, of the bow which is arranged alongside the same and has its free ends provided with openings to receive the points of the scissor-blade, and whose rear portion is provided with seats *a' a'*, a hook for attachment to the ring of the scissor-handle, and a connection between said hook and bow, such connection engaging one of the seats *a' a'*, substantially as shown and described.

3. The herein-described attachment for scissors, which is adapted for use alongside the latter, and consists of the bow A, the arms of which extend alongside of and close to the edges of the blades, and a fastening for securing it to the handle-ring of the scissors, substantially as shown and described.

4. The attachment for scissors, consisting of the following parts: the bow adapted to be used alongside the scissors, as described, a hook for engaging the handle-ring of the scissors, and a spring forming an elastic connection between said bow and hook, as specified.

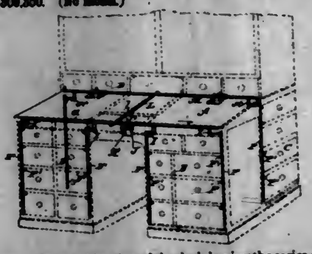
5. The combination, with scissors, of the bow which is arranged alongside thereof, with its arms extended close to the edges of the blades, and has the free ends of its arms provided with openings and its rear portion provided with seats *a' a'*, the hook for engaging the handle-ring of the scissors, and the spring connecting said hook and bow, substantially as shown and described.

410,876. SHIRT. ELI OPPENHEIM, Baltimore, Md. Filed July 12, 1889. Serial No. 317,260. (No model.)

Claim.—1. As an improved article of manufacture, a shirt having openings of greater length than width extending from opposite sides of the neck-opening into the sleeves and similarly-shaped gussets or pieces stitched to the edges of said openings, substantially as set forth.

2. As an improved article of manufacture, a shirt the body of which at the shoulders is formed with V-shaped shoulder openings, similar openings in the sleeves registering therewith at their wider ends and forming together diamond-shaped openings, and diamond-shaped pieces or gussets stitched to the edges of said openings, substantially as set forth.

410,877. GRAIN-GRADER. GEORGE H. RICH, Geneva, Ill. Filed Mar. 14, 1888. Serial No. 267,162. (No model.)



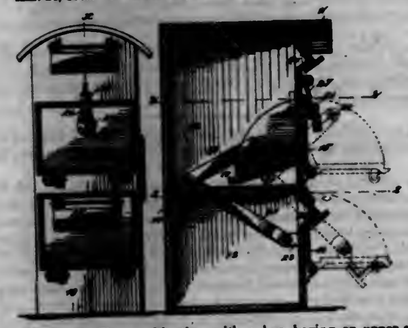
Claim.—1. The grading-cylinder E, composed of separate rings spaced apart at suitable distances and provided with internal flanges having hubs supported thereon inside of the inner portion of the rings proper, and the rods L, passing through said hubs, whereby a clear space for the passage of the grain is formed between the said rods and the internal surface of the cylinder, substantially as and for the purpose specified.

2. The grading cylinder E, composed of separate rings provided with internal flanges having hubs supported on their inner edges, the rods L, passing through said hubs, the rings being spaced on the rods L at varying distances apart, and separate hoppers Q, as and for the purpose specified and shown.

3. The combination, with the grading-cylinder E, composed of separate rings having intermediate spaces, of the shaft O, arranged parallel to said cylinder, and the roller N, mounted on said shaft and composed of separate sections having openings for said shaft of greater diameter than the diameter of the shaft, substantially as and for the purpose specified.

410,878. DEVICE FOR LOCKING A SERIES OF DRAWERS. JARED H. ROSSHEAVER, TUTS, ALTA, W. Va. Filed May 3, 1889. Serial No. 309,350. (No model.)

Claim.—1. The combination of the desk having the series of drawers B, formed with the locking-recesses E, the locking-rods F, having the projections F', the horizontal rod G, adapted to be slid to each side, and the connecting centrally-pivoted levers I, substantially as set forth.



2. The combination of the desk having the series of drawers B, formed with the locking-recesses E, the locking-rods F, having the projections F', and the horizontally-sliding rod G, having the recessed casting J, substantially as set forth.

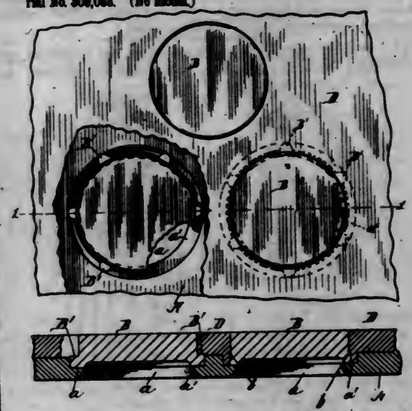
3. The combination of the desk having the series of lower front drawers B and side drawers C, formed, respectively, with the locking-recesses E and O, the front and side locking-rods F and P, having the projections F' and P', respectively, the lower horizontally-sliding rod G, the upper horizontally-sliding rod M, the centrally-pivoted lever L, pivotally connecting the upper and lower horizontal rods G M, and the centrally-pivoted levers I, substantially as set forth.

4. The combination of the desk having the series of lower drawers B, side drawers C, and top drawers D, formed, respectively, with the locking-recesses E, O, and D', the front and side locking-rods F and P, having the projections F' and P', respectively, the lower horizontally-sliding rod G, the upper horizontally-sliding rod M, having the projections M', the centrally-pivoted lever L, pivotally connecting the upper and lower horizontal rods G M, and the centrally-pivoted levers I, connecting the horizontal and the locking rods, substantially as set forth.

5. The combination, with a desk having a hinged top provided with the staple, and drawers formed with the locking-recesses, of the locking-rods having the projections, and the horizontal rod having the recessed casting and the locking-hook, substantially as set forth.

410,879. LETTER-BOX. DAVID ROSENTHAL, Hudson, N. Y. Filed Mar. 26, 1889. Serial No. 304,820. (No model.)

Claim.—1. The combination, with a box having an upper and lower compartment each provided with an opening in its side, of hinged doors closing the said openings, and rods pivoted together and to the said doors, whereby both doors will be simultaneously opened or closed, substantially as described.

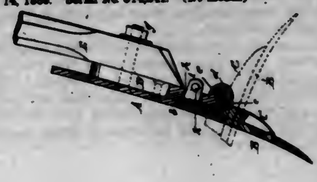


2. In a letter-box, the combination, with a body divided into compartments, each compartment provided with an opening covered by a hinged door, of panels secured to the inner face of the upper door, and a link-connection between one panel of the upper door and the inner face of the lower door, substantially as shown and described, whereby the movement of the upper door will control the movement of the lower door, as set forth.

3. In a letter-box, the combination, with a body divided into compartments by a partition provided with a slot at one side, and each compartment having an opening covered by a hinged door, of panels secured to the inner face of the upper door, links or connecting-rods pivoted to each other and to the panel of the upper door and the inner face of the lower door, the lower link extending upward in the box through the slot in the partition, all combined for operation, substantially as shown and described.

4. In a letter-box, the combination, with a body divided into compartments by a transverse partition having a slot in one side, each compartment provided with an opening covered by a hinged door, of panels secured to the upper door and provided with stop-lugs at one end, a link or connecting-bar pivoted to one of the panels of the upper door, a second link or connecting-rod pivoted to the upper link and to the inner face of the lower door, said lower link provided with a weighted lower extremity and extending upward through the slot in the partition, all combined for operation, substantially as shown and described.

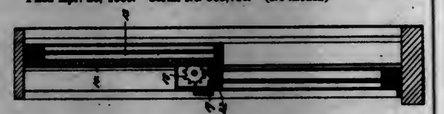
5. A letter-box divided into two compartments, each compartment provided with an opening covered by a hinged door, and a connection between the upper and the lower door, whereby the upper door controls the movement of the lower one, substantially as and for the purpose specified.



410,880. VAULT-LIGHT. CHRISTIAN H. ROSS, Chicago, Ill., assignor to the Detroit Iron Works, same place. Filed Apr. 30, 1889. Serial No. 308,966. (No model.)

Claim.—1. The combination, with the bed-plate A, having light-hole *a*, provided with circular ledge or flange *a'* of the glass B, having a body portion of less diameter than the main diameter of the light-hole, but greater than its contracted diameter, said glass being provided at its margin with radial projections to bear against the side wall of the light-hole, substantially as and for the purposes specified.

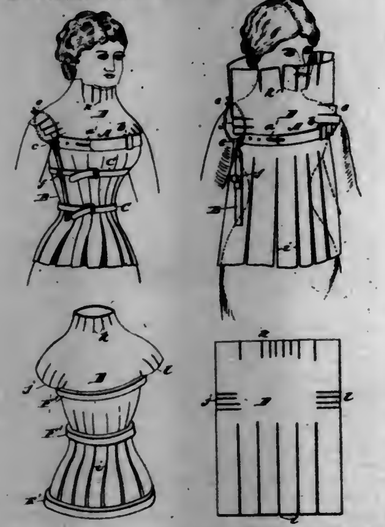
2. The combination, with the bed-plate A, having light-hole *a*, with flange or ledge *a'*, of the glass B, having a body portion of a diameter less than the main diameter of the light-hole *a*, but greater than its reduced diameter, said body portion being provided with radial projections B', to bear against the side wall of the light-hole, and shoulder *b*, and the filling D, of cement or the like, substantially as and for the purposes specified.



410,881. SHOVEL FOR PLOWS. WILLIAM L. SEXTON, Scranton City, assignor of one-half to Daniel Barrow, Grahm County, Iowa. Filed June 14, 1889. Serial No. 314,341. (No model.)

Claim.—1. In shovels for plows or cultivators, the shovel-blade constructed of upper and lower divided sections hinged together and held in position by a break-pin, as set forth.

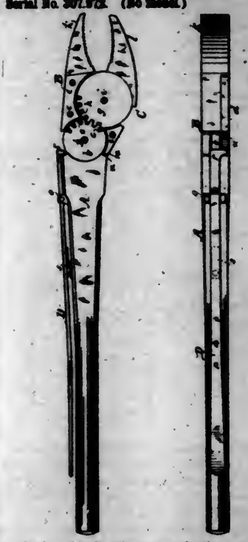
2. In shovels for plows or cultivators, the shovel constructed of upper and lower sections A B, in combination with the re-enforcing hinge-pieces C D, secured to the backs of said sections and constructed to form a hinge at the back of the lower one B of said sections, having its axis in transverse relation with the length of the shovel, also a locking attachment above the hinge adapted to receive a transverse break-pin through it, substantially as shown and described.



410,882. SASH-FASTENER. HARRISON STAGER, Valencia, Kans. Filed Apr. 26, 1889. Serial No. 308,710. (No model.)

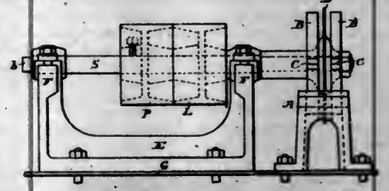
Claim.—1. In a window-sash fastener, the combination, with the rack 14, of a spur-wheel 18, traveling upon said rack, a rock-shaft 19, journaled within a bearing provided with a slot 21, a pin or dog 22, carried upon said rock-shaft and working in the slot, the end of the shaft being provided with a suitable handle 20, whereby the rock-shaft may be turned to bring the pin or dog into engagement with the teeth of the spur-wheel, substantially as shown and described.

2. The combination, with the upper and lower sash of a window-frame and a rack vertically secured to the upper sash, of a casing secured to the lower sash, a spur-wheel journaled in the said casing in front of the said rack, and a rock-shaft or rod capable of lateral movement and of sufficient length to contact with the teeth of the rack journaled below the spur-wheel and provided with an integral stop-pin or dog, said dog being adapted to contact with the teeth of the wheel, substantially as shown and described.



410,883. METHOD OF PRODUCING GARMENT PATTERNS AND MODELS. EDWARD STAHL, Prescott, Ariz. Filed Mar. 22, 1889. Serial No. 304,326. (No model.)

Claim.—1. The process herein described of forming a basque to be used as a pattern for cutting garments, which process consists in applying stiffened pattern material, slashed at its edges, to the figure, shaping the strips to the figure, and securing the same by stiffening material, and then cutting the basque to remove it from the body, substantially as described.

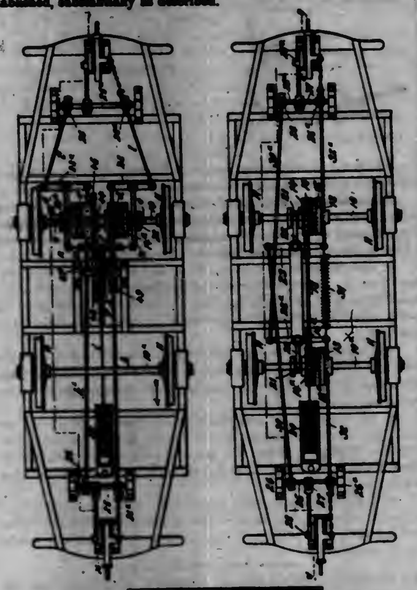


2. The process herein described of forming a basque and model from the same, which process consists in applying pattern material, slashed at its edges, to the body, shaping the strips and stiffening and securing the same, then cutting the basque from the figure, staying the same with surrounding supports shaped to fit the basque, and finally molding plastic material in the interior of the basque, substantially as described.

410,884. WRENCH. CHARLES A. SWANSON, Marshall, Minn., assignor to himself and Charles Lundenberger, same place. Filed Apr. 20, 1889. Serial No. 307,972. (No model.)

Claim.—In a self-adjusting wrench, the combination, with the pivoted handle A and its attached circular rack *b*, of the stationary jaw B, connected with said handle by its pivot *f* and provided with a rack-like or serrated portion *u*, the movable jaw C, having a mutilated pinion *g* arranged to engage with said circular rack, the pivot *i*, connecting the pinion portion of the movable jaw with the jaw B, and the lever D, fulcrumed on the handle provided with a tooth *r*, arranged to engage with the rack-like or serrated portion *u* of the jaw B, and the spring *s*, controlling said lever, essentially as and for the purposes herein set forth.

410,885. MACHINE FOR CUTTING COCOANUT-SHELLS. JOHN H. VAVASSEUR, Uxbridge, County of Middlesex, England. Filed Feb. 22, 1889. Serial No. 301,491. (No model.) Patented in England Aug. 3, 1888, No. 11,354.



Claim.—In a sawing or cutting machine, the combination of a saw or cutter and a rest and guard provided with a notch, as C, whereby the depth of cut of such tool is governed and varied, substantially as set forth.

410,886. CAR BRAKE AND STARTER. ANNE M. VERNON and STEPHEN M. YEATES, Dublin, Ireland. Filed May 8, 1889. Serial No. 310,014. (No model.)

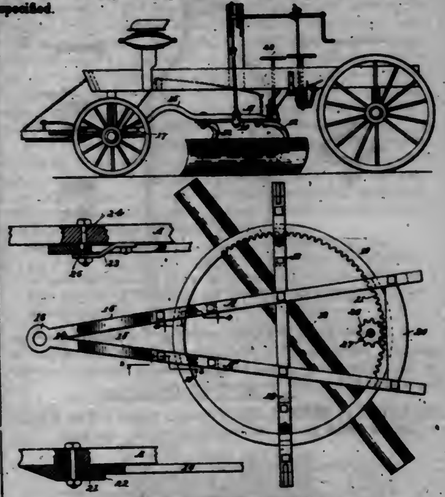
Claim.—1. In a car brake and starter, the combination, with the car-platform and truck-axles 10 10ª, and the ratchet clutch-sections 12 12ª and 14 14ª, mounted, respectively, fast and loose on said axles, of the chains 16 and 16ª, wound on the loose sections, the spring 30, connected with one of said chains, the pivoted horizontal levers 28 28ª, having yokes that connect them with said sliding sections, the spring 31, connecting said levers, the hand-levers 26 26ª, pivoted and working in a vertical plane through the car-platform, and means for locking them, the connecting-rods 30 32 30ª 32ª 25 25ª, and shafts 27 27ª, arranged intermediate of said hand and horizontal levers, all substantially as shown and described, and operating as specified.

2. In a car brake and starter, the combination, with the axles, of clutch-sections rigidly mounted thereon, other clutch-sections held to slide and to turn upon the axles, levers carrying yokes which engage

the sliding clutch-sections, a spring which acts to throw the clutch-sections into engagement, a spring 30, connections between the spring 30 and the sliding clutch-sections, a transverse shaft provided with arms, connections between the yoke-carrying levers and said arms, levers which extend to within reach of the driver, and draw-bars, connection between the levers, draw-bars, and the transverse shaft being established, substantially as described.

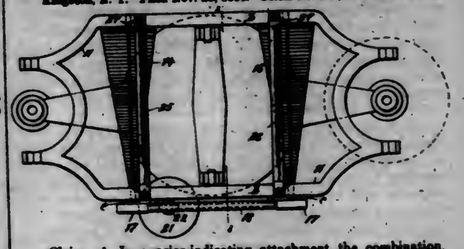
410,887. COVERING FOR COTTON-BALES. ROBERT M. WALSH, New Orleans, La. Filed May 14, 1889. Serial No. 310,736. (No model.)

Claim.—1. A cotton-bale covering consisting of metallic sheets having marginal wooden strips attached thereto on the inside of the sheets, so as to lie against the cotton, the edge of one sheet being secured to the wooden re-enforced edge of the other sheet by nails driven through and anchored in the wood, substantially as shown and described.



2. A cotton-bale covering consisting of an upper metal sheet and a lower metal sheet, both extending beyond the sides and ends of the bale, one of them being provided with wooden strips at its edges on the inner side thereof, and removable intermediate metal sheets having wooden strips at one edge, the said sheets being connected about the bale by nails driven through the metal edge of one sheet into the wood re-enforced edge of the other sheet, substantially as shown and described.

410,888. ROAD-GRADER. HERBERT H. WALWORTH, Hillsdale, Mich. Filed June 15, 1889. Serial No. 314,262. (No model.)



Claim.—1. A support for the scrapers of road-graders, consisting of a bifurcated draw-bar, one or more supporting-beams attached to the members of the draw-bar, brackets secured to the under surface of each of the said beams, and a ring supported by the said brackets, substantially as shown and described.

2. In a support for the scrapers of road-graders, the combination, with a bifurcated draw-bar, one or more beams projected from the members of the said draw-bar, and brackets attached to the under side of each beam, of a ring supported by the said brackets and held to turn thereon, substantially as shown and described.

3. In a support for the scrapers of road-graders, the combination, with a bifurcated draw-bar, a beam or beams extending from the members of the said draw-bar, and brackets attached to the under face of each beam, of a ring provided with an inner toothed peripheral surface supported by the said brackets and held to turn thereon, curved arms projected from the under face of the ring, and a scraper-blade attached to the said arms, and means, substantially as shown and described, for turning the ring in its bearings, as and for the purpose specified.

410,889. PRICE-INDICATING ATTACHMENT FOR WEIGHING SCALES. LOUIS I. WARD, West Shokan, assignor to Hewitt Brice, Kingston, N. Y. Filed Nov. 28, 1888. Serial No. 291,662. (No model.)

Claim.—1. In a price-indicating attachment, the combination, with a revolvable indicator divided longitudinally into a number of sections, said sections being proportionately divided, of a strip divided into numbered sections, a counterbalancing-weight, and connections, substantially as described, between the indicator and weight, whereby when the weight is moved the indicator will be turned, as and for the purpose stated.

2. The combination, with indicators divided, substantially as described, of numbered strips arranged in connection with said indicators, pulleys carried by the indicator-journals, a belt carried by the pulleys, a weight, and a beam, the weight being connected to one length of the belt, substantially as described.

3. In a price-indicating attachment, the combination, with indicators divided longitudinally into sections, the sections of one indicator being divided proportionately from 1 to 99 and the sections of the other indicator being divided proportionately from 2 to 100, strips divided into sections which correspond with the indicator-sections, the sections of one of the strips being numbered from 1 to 99 and the sections of the other strip from 2 to 100, pulleys carried by the indicator-journals, a belt carried by the pulleys, and a weight connected to the belt and suspended from a beam, substantially as described.

4. In a price-indicating attachment, the combination, with indicators 14 and 15, of strips 25 and 26, wires 27, pulleys 17, carried by the indicator-journals, a belt 18, arranged in connection with the pulleys, a beam 20, a weight suspended from said beam, and connections between one length of the belt and the weight, substantially as described.

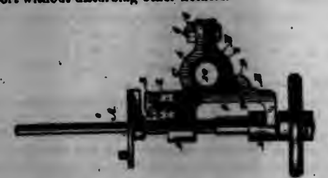
410,890. POISON-GUARD. HENRY B. WEAVER, Burlington, N. J. Filed Dec. 11, 1888. Serial No. 293,365. (No model.)

Claim.—1. A poison-guard for a bottle, having horizontal prongs extending beyond the stopper of the bottle, and depending spurs adapted

to engage with the stopper to keep the said guard in place, substantially as described.

2. A poison-guard for a bottle, consisting of a plate having prongs and spurs, and the piece D, of suitable flexible material, adapted to be clinched by said spurs, and having an adhesive coating on its under face, substantially as and for the purpose set forth.

410,891. STOVE OR FURNACE DOOR. SIMEON L. WEBB, Wilmington, Del. Filed Feb. 11, 1889. Serial No. 299,353. (No model.)

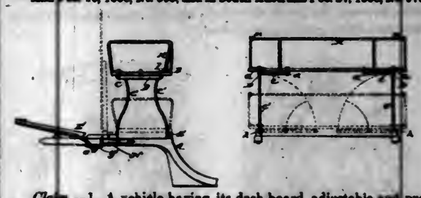


Claim.—1. A stove-door provided with a chamber open front and back and of substantially the full size of the doorway, in combination with a wire screen extending across the front of said chamber, and a series of connected butterfly-valves behind said screen and within said chamber and opening and closing the same, whereby when said valves are closed an air-space is left between said valves and said wire screen, and when said valves are open the chamber is open throughout its entire width, substantially as described.

2. A stove-door provided with an air-passage extending therethrough, with a valve opening and closing said passage, with a sliding bar operating said valve, with a front plate having a slot, and with an operating device exterior to the front plate having a rotating stem connected with said sliding bar through said slot, said stem being elliptical or cam-shaped in cross-section and having its greatest diameter longer than the width of said slot, substantially as set forth.

410,892. SPINDLE-HOLDER FOR SPINNING-MACHINES, &c. ALONZO W. ALLEN, Philadelphia, Pa. Filed Feb. 1, 1889. Serial No. 298,385. (No model.)

Brief.—The object of the invention is to provide a spindle-holder of improved construction, whereby the holder may be removed from its support without disturbing other holders.



Claim.—1. A spindle-holder having its frame, consisting of the bearings 1, ears 2, upright 4, arm C, with recessed under face, and foot D, formed in one piece, and the removable arm E, said foot D and arm E forming in connection with a screw or bolt in said arm C a clamp for sustaining the holder on the beam or support, substantially as described.

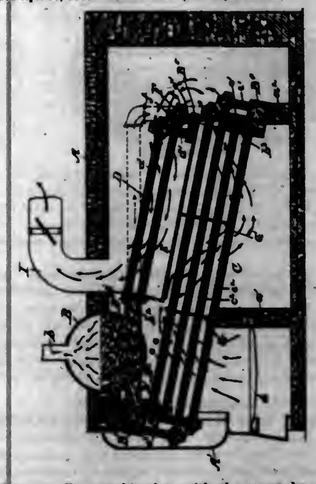
2. A spindle-holder having an arm which is removably fitted to the frame of said holder and a stationary arm opposite to said removable arm, the two arms embracing the beam or support and being clamped thereon by the screw or bolt, substantially as described.

3. The frame of a spindle-holder, having an arm, such as C, and a foot D, in combination with a removable arm E, which is connected with said foot by means of a lip 7, and with said arm by means of a screw or bolt 6, substantially as described.

410,893. CONVERTIBLE SEAT FOR VEHICLES. WILLIAM T. ARMIT and WILLIAM ARMIT, Sydney, New South Wales. Filed Dec. 4, 1886. Serial No. 282,082. (No model.) Patented in New South Wales Dec. 21, 1887, No. 401; in Victoria Feb. 15, 1888, No. 5,637; in Queensland Feb. 16, 1888, No. 388, and in South Australia Feb. 27, 1888, No. 976.

Claim.—1. A vehicle having its dash-board adjustable and provided with a vertically-adjustable seat, substantially as described.

2. A vehicle having its dash-board hinged and provided with a vertically-adjustable seat, substantially as described, whereby the dash-board is made to serve as a foot-board when the seat is elevated and a back to the seat when the latter is lowered, as set forth.



3. The combination, with the body of a vehicle, of a seat connected to the body just in rear of the dash-board by collapsible knuckle-joints, whereby the seat may be raised or lowered and held in the same vertical plane, whether raised or lowered, substantially as described.

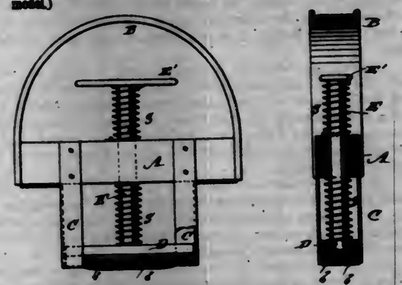
4. The combination, with the body of a vehicle, of a seat, the arm *c*, pivoted to the seat, the limb *c'*, pivoted to the body, and the transverse bar D, pivoted to the arm and limb, substantially as herein shown and described.

5. The combination, with the body of a vehicle, of a seat, the arm *c*, pivoted to the seat, the limb *c'*, pivoted to the body, the transverse bar D, pivoted to the said arm and limb, and a catch-bolt secured to the said bar and engaging the seat, substantially as herein shown and described.

6. The combination, with a vehicle-body, of a dash-board hinged to the body and a spring-catch secured to the body and engaging the dash-board to hold it in a vertical position, substantially as herein shown and described.

410,894. STEAM-BOILER. GEORGE H. ABBE, South Bend, Ind. Filed Apr. 16, 1888. Serial No. 270,881. (No model.)

Claim.—1. The combination, with the steam-drum B, of the transverse water-chambers B' and B², connected thereto, the water-chambers B³ and B⁴, arranged at the rear of the combustion-chamber, the inclined groups C and D of water-tubes, connecting, respectively, the chambers B' B³ and B² B⁴, and the circulating-pipes F and H, connecting the rear water-chambers with each other and with the steam-drum, substantially as and for the purposes specified.



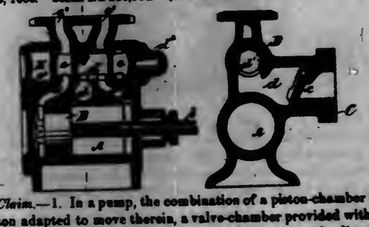
2. The combination, with the water-chamber B', having water-leg B⁵, and the water-chamber B³, having water-leg b^5, of the water-tubes *c*, connected to the water-leg B⁵, the short tubes *c'*, arranged at right angles thereto and connected to the water-chamber B³, the water-tube c^3, connected to the chamber B³ and its water-leg b^5, and the short tubes c^4, arranged at right angles thereto and connected to the water-chamber B' and its water-leg B⁵, substantially as and for the purposes specified.

3. The combination, with the upper and lower water-chambers, of the water-tubes connecting the two, and each consisting of a long inclined tube and a short tube arranged at right angles thereto, the horizontal series of said tubes being alternately arranged, as described, so that each tube extends clear through to the front or rear, substantially as and for the purposes specified.

4. The combination, with the steam-drum, of the lower group C of water-tubes, above the front portion of which the steam-drum is arranged, the upper or auxiliary group extending rearward from the steam-drum, a baffle-plate arranged between the two groups and extending from the front water-chamber to the rear water-chamber of the upper group, and a second baffle-plate closing the space between the front water-chamber of the upper group and the casing, substantially as and for the purposes specified.

5. The combination, with the water-tubes, each composed of two sections arranged at right angles to each other, said tubes being arranged in alternate horizontal series, so that each tube extends clear through to the front or rear, of the four-way unions or couplings connecting the two sections of each tube and provided with screw-plugs to close the apertures opposite the ends thereof, substantially as and for the purposes specified.

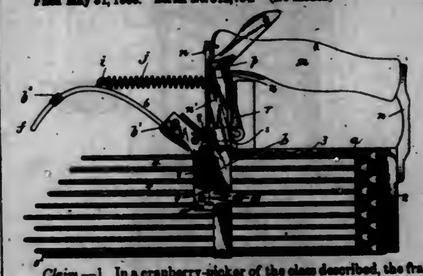
410,895. MAILING DEVICE FOR NEWSPAPERS, &c. LORIAN P. BARDWELL, Pratt, Kans. Filed July 17, 1888. Serial No. 280,126. (No model.)



Claim.—1. In a device for applying addressed slips to newspapers and the like, the combination of an apertured bar, slip-holders projecting downwardly from the bar and having recessed inner faces and closed ends, a rod working in the aperture of the said bar, a follower on the lower end of the said rod and working in the recesses of the holders and a spring for pressing the follower downward, substantially as described.

2. The herein-described device for applying addressed slips to newspapers and the like, consisting of the apertured bar A, provided with the handle B, the slip-holders C, secured to the bar and having recessed inner faces and closed ends, the rod E, working in the aperture of the bar and provided with the handle E' on its upper end and the follower D on its lower end, and the springs S, surrounding the rod between the handle E' and bar and said bar and follower, as specified.

3. The within-described hand mailing device, consisting of a cross-piece or body A, the attached slip holders and guides C C, recessed on their inner faces and having closed outer or lower ends, the follower D, with its guide-rod E, one or more springs S, operating to force said follower outward, and the handle B, for use substantially as specified.



410,896. PUMP. FERDINAND RAUBE, Brooklyn, N. Y. Filed July 19, 1888. Serial No. 280,364. (No model.)

Claim.—1. In a pump, the combination of a piston-chamber with a piston adapted to move therein, a valve-chamber provided with two outlet or discharge openings and corresponding passages leading from said piston-chamber, and a cup-valve, also provided with two discharge-openings and adapted to move in said valve-chamber and connect one or the other of the discharge-openings therein with corresponding passages leading from said piston-chamber, said cup-valve being further provided with a cavity having an opening adapted to connect successively with a port through which the oil or other liquid is supplied and the passage leading to piston-chamber and not connected with an outlet-opening, said valve and piston-chamber being further connected by channels at each end, whereby the cup-valve is given a reciprocating motion by means of the pressure of the oil forced through said channels under successive strokes of said piston, and the passages leading to and from said valve-chamber are opened and sealed and equal quantities of oil discharged, substantially as described.

2. In a pump, the combination of the piston-chamber A, with piston adapted to move therein, valve-chamber with port *d*, having discharge-openings d^2 d^3, channels d^4 d^5, and passages *d'* *d'*, and cup-valve D, provided with passages *e e*, cavity *d'*, having an opening therein, and guiding-stem d^6, adapted to move in socket in head of valve-chamber, arranged and operating substantially as described.

410,897. CRANBERRY-PICKER. BENJAMIN F. BEE, Harwich, Mass., assignor, by direct and mesne assignments, to Erastus Small, same place, and Abel D. Makepeace and George F. Baker, Barnstable, Mass. Filed May 31, 1889. Serial No. 312,704. (No model.)

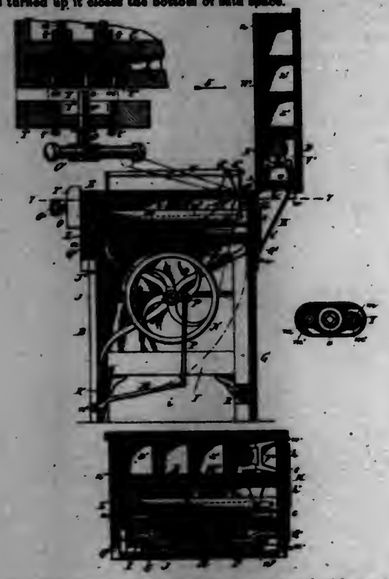
Claim.—1. In a cranberry-picker of the class described, the frame or receptacle composed of the back piece, the side and bottom rods attached at their rear ends to said back piece and free or unattached at their forward ends, and the transverse ligature engaged with said rods at a point intermediate of their attached and free ends, as set forth.

2. In a cranberry-picker, the combination, with a series of wire rods or teeth and a rigid piece, to which the rear ends of said rods or teeth are attached, of a transverse ligature connecting said rods or teeth at a point intermediate of their attached and free ends, as set forth.

3. The combination of the back piece 2, the top piece 3, the parallel side and bottom rods attached to said back piece, and the continuous ligature engaged with all of said rods and attached at its ends to the top piece, as set forth.

4. The combination, with the parallel rods, of the ligature composed of the sheet-metal strip perforated to receive said rods and bent to embrace the sides of said rods, as set forth.

5. The combination, with the frame or receptacle having the side rods 4 and bottom rods 5, of the rake or comb composed of the teeth 6 and head 7, the downwardly-projecting lugs 8 8, attached to the ends of the head and projecting downwardly into the space inclosed by the rods 4 5, and the blocks 9 9, secured to the side rods 4 and connected by pivots 14 with the lugs 8, as set forth.



6. The combination of the frame or receptacle having the side rods and the connecting-ligature, the blocks 9, perforated to receive one or more of said rods, means for engaging said blocks with the rods and ligature, and the rake or comb-head having downwardly-projecting lugs pivoted to said blocks, as set forth.

7. The combination of the frame or receptacle having the handle *m*, the rock-shaft *p*, journaled in ears or brackets attached to said receptacle, and provided with a thumb-lever *q*, arranged in suitable proximity to said handle, the rake or comb pivoted to said frame, the downwardly-projecting arm *r*, affixed to the rock-shaft, and the link *s*, connecting the lower end of said arm with the comb-head.

410,898. COMBINED WORK-BENCH AND TOOL-CABINET. HUDSON BOGARDUS, Newark, N. J., assignor to the Bogardus New Art Company, same place. Filed Sept. 12, 1887. Serial No. 249,579. (No model.)

Claim.—1. The combination, with a chest C, constructed with a space or cavity F beneath it, of a folding base B, consisting of a single back board, two opposite end boards, and a pair of front boards, all hinged to the chest with their pivotal axes in different horizontal planes, and adapted to be turned up into said space and to occupy different superposed planes therein.

2. The combination, with a chest C, constructed with a space F beneath it, of a folding base B, consisting of front boards hinged at their tops to the chest and adapted to be turned up into said space, end boards hinged at their tops and adapted to be turned up into said space in a plane beneath that occupied by the front board, and a back board hinged to said chest on a pivotal axis in a lower plane than that of the front and end boards, and adapted to be turned up in a plane beneath that occupied by the end boards, and having a length and height equal to the length and breadth of the space F, whereby when thus turned up it closes the bottom of said space.

3. The combination, with a chest C, constructed with a space F beneath it, of a folding base B, consisting of front boards hinged at their tops and adapted to be turned up into said space, a vertically-sliding board L, entering said chest and to which said front boards are hinged, end boards hinged at their tops and adapted to be turned up beneath the front boards, and a back board hinged to said chest and adapted to be turned up beneath the end boards and to close the bottom of said space.

4. The combination, with a chest C, constructed with a space F beneath it, of a folding base B, consisting of front boards, end boards, and back board hinged at their tops and adapted to be turned up into different superposed planes, and a bracket Q, pivoted to said chest, standing normally in a vertical transverse plane between said end boards, and adapted to be turned up into said space F, and a fastening for uniting the free end of said bracket to one of said front boards when it is turned down.

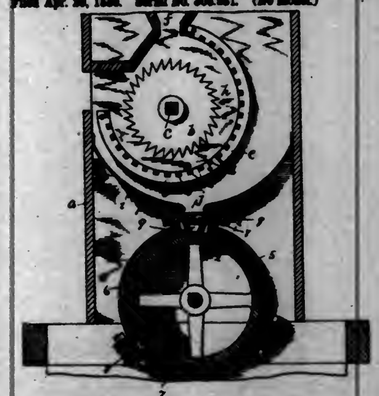
5. The combination, with a chest C, constructed with a space F beneath it, of a folding base B, consisting of front boards, end boards, and a back board hinged at their tops and adapted to be turned up into different superposed planes, a bracket Q, pivoted to said chest, standing normally in a vertical transverse plane, and adapted to be turned up into said space F, a belt-wheel N, mounted on said bracket, a treadle M, pivoted in the space between the front boards and the pitman P, the said treadle being adapted to be turned into the plane of the front boards in the opening between them.

6. The combination, with the chest C, constructed with a space F beneath it, of a folding base B, consisting of front boards J J, having a space K between them, end boards, and a back board hinged at their tops and adapted to be turned up into different superposed planes, with the front boards in the upper plane, a bracket Q, pivoted to said chest on a transverse axis within the width of said opening, standing normally in a vertical transverse plane, and adapted to be turned up into said space F, and of a length not exceeding the width of the opening, and the belt-wheel N, mounted on said bracket, whereby when said bracket and front boards are turned up they may occupy the same plane, the bracket entering said opening between the front boards.

7. The combination, with a chest C, of a folding base B, consisting of front boards, end boards, and a back board hinged at their tops and adapted to be turned up into different superposed planes, and fastening devices applied to the respective boards at their junction with one another in the right angle formed at their junction, and consisting each of a rotary hook R, pivoted to the part which comes edgewise against the other, and an escutcheon R', let into the other part and receiving said hook when the latter is turned to project beyond the edge of the part to which it is pivoted.

8. The combination of two chests C and D, hinged together, with a handle-bar S, mounted on two posts, one of them swiveled to one chest and the other entering a lock in the other chest, and the said lock adapted to engage said post, whereby the two chests are held closed together through the medium of said handle-bar, which forms a tie bridging over the joist between them.

9. The combination of two chests C and D, hinged together, with a handle-bar S, mounted on two posts, one of said posts swiveled to one chest and the other entering a socket in the other chest, and a lock applied to the latter chest and consisting of levers pivoted to the lock-case and adapted to engage shoulders on said post, a spring for drawing said levers into engagement with said post, and the lock-case provided with a key-hole arranged for the insertion of a key to displace said levers, and thereby release said post.



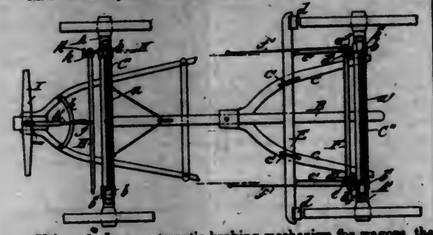
10. The combination, with two chests hinged together, of a handle-bar mounted at one end on a swiveled post, connected to the upper chest, and adapted to be turned from a vertical to a horizontal position, and having a post at its other end adapted to enter sockets in the chest in either position, and the said sockets formed in the respective chests, whereby the handle may be turned to one position to fasten together the two chests and as a handle for lifting them and to the other position to form a handle for turning up the upper chest.

11. The combination of two chests C and D, hinged together, with a lid E between them, a lathe V, having projecting feet at one end, and sockets having overhanging plates let into the said lid and into a compartment in one of said chests and adapted to engage said feet when the lathe is mounted on said lid for use or stowed away in said compartment, and screws for fastening the opposite end of the lathe in either position.

12. The combination of chest C, its hinged lid E, base B, belt-wheel N, sheaves c' c', mounted behind the hinges of said lid, and a lathe V, adapted to be fastened to said lid with its cone-pulleys in line with said sheaves, whereby a belt from said wheel N may be carried over said sheaves to said cone-pulleys.

13. The combination of two chests C and D, hinged together, with a lid E between them, the upper chest adapted to be turned back to a vertical position and formed with pigeon-holes for receiving drawers or boxes, a board W', fitting into said chest and adapted to close the fronts of said pigeon-holes, and fastenings for holding said board in place.

410,399. CORN SHELLER AND GRINDER. NICHOLAS DRESSMAN, Boston, Mass., assignor of one-half to Leroy P. Lawrence, same place. Filed Apr. 20, 1888. Serial No. 271,231. (No model.)



Claim.—1. The grinding-cylinder having peripheral ribs which are transversely slotted to form double-ended teeth, each tooth having two operative ends, whereby the cylinder is adapted to operate while rotating in either direction, combined with the concave having correspondingly-slotted ribs alternating with the ribs of the cylinder, as set forth.

2. The combination, with the cylinder, of the concave composed of the detachably-connected sections, each provided with ribs, which are transversely slotted to form double-ended teeth, each tooth having two operative ends, the detachable connection of the sections enabling either section to be reversed and make either of the ends of its teeth the acting ends, as set forth.

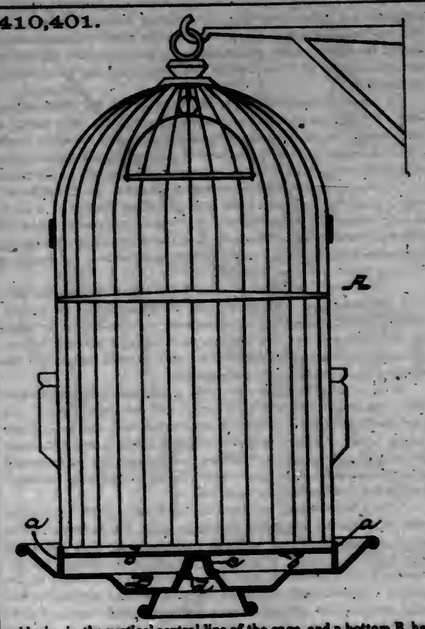
3. The combination of the grinding-cylinder, the adjustable concave composed of sections 5 6 7 and having the receiving-opening 9 and the discharge-opening v, and means for simultaneously adjusting the diameter of the concave and the width of the opening 9, said means consisting in the bolts q, connecting the sections at opposite sides of the opening 9, and the springs s, interposed between the sections in said opening.

4. The combination of the casing a, the shelling devices consisting of the saws b, a shaft c, journaled in the casing supporting the saws, and the concave grating attached to the casing under the saws, the grinding-cylinder, a shaft A, supporting said cylinder and journaled in the casing below the shaft c, the concave inclosing the said cylinder and having a receiving-opening 9 in its upper portion, and a discharge-opening v in its lower portion, means, substantially as described, for simultaneously rotating the shafts c and A, and the partitions i i under the grating of the sheller separated by an opening j, which is located over the receiving-opening of the concave, as set forth.

410,400. AUTOMATIC WAGON-BRAKE. JAMES W. ESTEP, Alth, Ohio. Filed May 20, 1889. Serial No. 312,092. (No model.)

Claim.—1. In an automatic braking mechanism for wagons, the combination of the body mounted upon rollers exteeding nearly the whole length of and traveling upon the upper surfaces of both front and rear bolsters, the rock-shaft carried by the body and its connections with the brake-shoes and doubletree, all the parts being constructed and arranged as shown and described, so that a forward movement of the body applies the brakes and a light movement of the doubletree forces back the body and releases them.

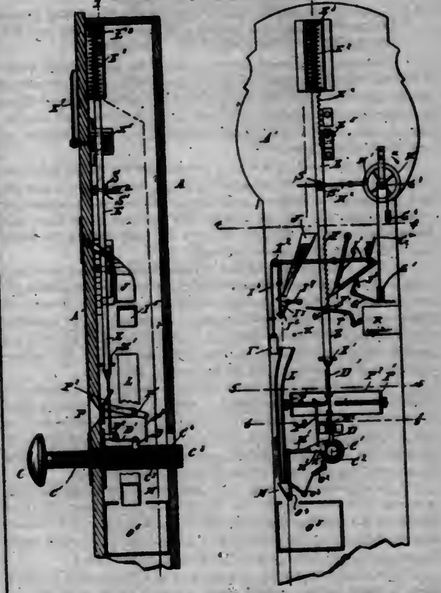
2. In an automatic braking mechanism for wagons, the shaft H, levers K and k, the arms g, the bar g', and the cross-piece h, in combination with the body of a wagon sliding longitudinally on its running-gear, all arranged and operating substantially as shown and described, and for the purpose specified.



3. In an automatic brake for vehicles, the combination of the bolster, the wear-plates C', turned up at each end and secured to the top of said bolsters, the roll a, its ends bearing against the turned-up part of said plates, and the bifurcated standards b, secured to the bolster and forming a stop to prevent the roll from leaving the wearing-plate, substantially as shown and described.

410,401. BIRD-CAGE. CHARLES H. GRIFFIN, Rockdale, Tex. Filed May 1, 1889. Serial No. 309,186. (No model.)

Claim.—As a new and improved article of manufacture, a bird-cage having the base-band a, to which the lower ends of the cage-wires are secured, a diametrically-bracing wire b, secured at its ends to the said band a, an inverted interiorly screw-threaded cap c, secured to



410,401.

said wire in the vertical central line of the cage, and a bottom B, having a screw d, adapted to enter the cap c, as specified.

410,402. COIN-OPERATIVE BLOW-TESTING MACHINE. HENRY COOPER, Brooklyn, and JAMES P. O'BRIEN, New York, assignors, by direct and mesne assignments, of one-half to Bernard Van Leer, New York, N.Y. Filed Apr. 13, 1888. Serial No. 270,511. (No model.)

Claim.—1. In a coin-controlled blow-testing machine, the combination, with a tubular guide having a cross-slot, a sliding shank having a punching-head and a cross-slot to register with that in the tubu-

lar guide, and shank retracting and indicating devices, as stated, of a balance-lever, a locking-bolt operated thereby to enter the registering slots in the tubular guide and shank, and a coin-receptacle carried by the balance-lever to withdraw the bolt when weighted, substantially as described.

2. In a coin-controlled blow-testing machine, the combination, with a fixed guide and sliding punching-head shank, each having a locking-shoulder, of a pivotal balance-lever, one arm of which forms a bolt to engage the locking-shoulders of the guide and shank, and a coin-receptacle carried by the balance-lever, substantially as described.

3. In a coin-controlled blow-testing machine, the combination, with a punching-head, its guide, and retracting device, of a head-locking device, a balance-lever, and a coin-receptacle supported thereby to release the said locking device, said coin-receptacle having a movable bottom and means for moving said bottom and dumping the coin, substantially as described.

4. In a coin-controlled blow-testing machine, the combination, with a punching-head, its guide, and retracting device, of a head-locking device, a balancing coin-receptacle, and connections to release the said locking device, said coin-receptacle having a movable bottom, and operating connections between the said movable bottom and the punching-head, substantially as described.

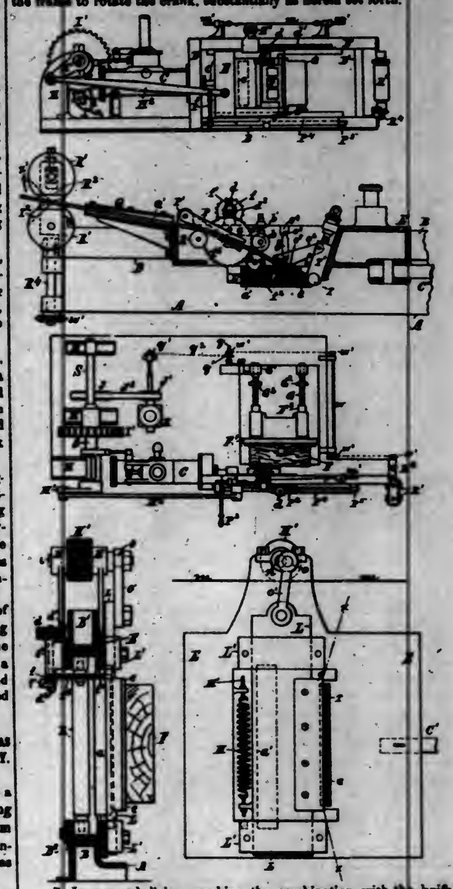
5. In a coin-controlled blow-testing machine, the combination, with a punching-head shank, its guide, and retracting device, of a shank-locking device, a balancing coin-receptacle to operate the said locking device, a tripper carried by the said shank, a movable arm in the path of said tripper, and connections between the said arm and the coin-receptacle, whereby the receptacle is dumped when the shank is retracted, substantially as described.

6. In a blow-testing machine, the combination, with a punching-head, its guide, and retracting device, an index, and an index-operating mechanism connected with the punching-head, of a self-acting index-restraining catch, a catch-tripping device consisting of a fly-wheel and drum revolving together, cables winding reversely on the drum, a weighted catch-tripper on one cable end and a greater or less weight on the other cable end, and a striker operated from the punching-head to spin the fly-wheel, substantially as described.

7. In a coin-operative blow-testing machine, the combination of a closed case having a signal-window, a movable double sign, bearing both a warning and a signal, arranged to appear alternately at the window, a punching-head, its retracting-spring, a hand-locking bolt, a balancing coin-receptacle in operative connection with the bolt, and a connection between the double sign and the bolt, the whole adjusted and arranged to operate substantially as described.

410,408. MACHINE FOR CUTTING BOARDS FROM LOGS. THOMAS S. CRANE, East Orange, N. J., assignor to Edward Bradley, New York, N.Y. Filed Apr. 20, 1888. Serial No. 307,941. (No model.)

Claim.—1. In a wood-slicing machine, the combination, with a knife-carriage reciprocated to cut intermittingly, of a reciprocating steam piston-rod attached directly to such carriage, a knife-beam movable upon the carriage transverse to the piston-rod, and mechanism movable with the carriage for reciprocating the knife-beam, as and for the purpose set forth.



2. In a wood-slicing machine, the combination, with a knife-carriage reciprocated to cut intermittingly, of a reciprocating steam piston-rod attached directly to such carriage, an adjustable presser-roll sustained upon the carriage parallel with the edge of the knife, and mechanism movable with the carriage for reciprocating the knife-beam, as and for the purpose set forth.

3. In a wood-slicing machine, the combination, with a knife-carriage reciprocated to cut intermittingly, of a reciprocating steam piston-rod attached directly to such carriage, an adjustable presser-roll sustained upon the carriage transversely to the path of the carriage, a knife and knife-beam movable upon the carriage parallel with the presser-roll, and mechanism movable with the carriage for reciprocating the knife-beam, as and for the purpose set forth.

4. In a wood-slicing machine having a reciprocating knife-carriage with the edge of the knife in a vertical position, the combination, with a presser-roll upon the carriage sustained transversely to the path of the carriage, of a knife and knife-beam movable vertically parallel with the presser-roll, and a spring to counterbalance the weight of the knife-beam, substantially as herein set forth.

5. In a machine having a reciprocating knife-carriage, the combination, with the carriage, of a knife and knife-beam movable thereon and a rotating shaft journaled in bearings upon the knife-carriage and provided with a crank and connections to the knife-beam to reciprocate the latter, as and for the purpose set forth.

6. In a machine having a reciprocating knife-carriage movable upon a frame having parallel ways, the combination, with the carriage, of a knife and knife-beam movable thereon, a rotating shaft journaled in bearings upon the carriage, a crank upon the shaft, and connections to the knife-beam to reciprocate the same, and a wheel upon the shaft making a rolling contact with a stationary fixture upon the frame to rotate the crank, substantially as herein set forth.

7. In a wood-slicing machine, the combination, with the knife and an adjustable presser sustained adjacent to the same, of straightening rolls or devices upon the carriage and delivery-rolls *a* and *b*, rotated upon the carriage for drawing the board from the grip of the knife and presser and propelling it through the straightening devices, substantially as herein set forth.

8. In a wood-slicing machine, the combination, with the knife and an adjustable presser sustained adjacent to the same, of straightening rolls or devices upon the carriage and delivery-rolls *a* and *b*, arranged between the straightening devices and the edge of the knife and rotated upon the carriage for drawing the board from the grip of the knife and presser and propelling it through the straightening devices, substantially as herein set forth.

9. In a wood-slicing machine having a reciprocating knife-carriage, the combination, with the knife, of delivery-rolls mounted upon the knife-carriage for drawing the board from the knife, a discharge-channel to direct the board from the carriage in a given path, and a movable plate upon the knife-carriage adapted to throw the board from the carriage or into such discharge-channel, as and for the purpose set forth.

10. In a wood-slicing machine having a reciprocating knife-carriage, the combination, with the knife, of delivery-rolls mounted upon the knife-carriage for drawing the board from the knife, a discharge-channel to direct the board from the carriage in a given path, and rolls upon the frame adjacent to the carriage at the end of its stroke to draw the board from such discharge-channel by their rotation, substantially as herein set forth.

11. In a wood-slicing machine having a reciprocating knife-carriage, the combination, with the knife, of delivery-rolls mounted upon the knife-carriage for drawing the board from the knife, discharge mechanism, as the trough Q, to discharge the board from the carriage in a given path, and rolls upon the frame to take the board from such discharge mechanism, one or more of such rolls being segmental in form to clear the board in a given position and rotated an even number of times for each stroke of the knife, substantially as herein set forth.

12. In a wood-slicing machine, the combination, with the knife and the stay-log, of a feed-screw, a locking-cam rotated with the same and held in a fixed position during the cut of the knife, a bolt or latch for holding the same from rotating, and a dog operated to retract the bolt at each movement of the knife, substantially as herein set forth.

13. In a wood-slicing machine, the combination, with the knife and the stay-log, of a feed-screw, a feed-spindle adjacent to the same, change-wheels for connecting the screw and spindle, and a locking-cam rotated with the same and held in a fixed position during the cut of the knife, and a spring-bolt applied to the cam and actuated substantially as herein set forth.

14. In a wood-slicing machine, the combination, with the knife and the stay-log, of a feed-screw, a locking-cam rotated with the same, a bolt or latch for holding the same from rotating, a friction-clutch having one part rotated continuously, another part connected by suitable gearing with the locking-cam and operating to rotate the same when engaged, a clutch-lever for engaging the friction-clutch to drive the locking-cam, and means, as the cam *k'*, for actuating the clutch-lever once for each stroke of the knife, as and for the purpose set forth.

15. In a wood-slicing machine, the combination, with a reciprocating knife-carriage, of a knife, an adjustable presser sustained adjacent to the same, delivery-rolls upon the carriage for drawing the board from the grip of the knife and presser, and a wheel upon the carriage connected with such rolls and making a rolling contact with a stationary fixture upon the frame to rotate such rolls, substantially as herein set forth.

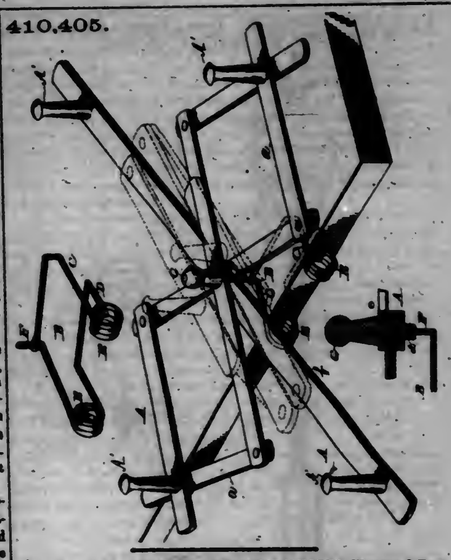
16. In a wood-slicing machine, the combination, with a reciprocating knife-carriage, of a knife, an adjustable presser sustained adjacent to the same, delivery-rolls upon the carriage for drawing the board from the grip of the knife and presser, a wheel upon the carriage making a rolling contact with a stationary fixture upon the frame, and a pawl-and-ratchet connection from such wheel to the delivery-rolls to actuate the same in one direction only, substantially as herein set forth.

17. In a wood-slicing machine, the combination, with a reciprocating knife-carriage, of a knife, an adjustable presser sustained adjacent to the same, delivery-rolls upon the carriage for drawing the board from the grip of the knife and presser, a toothed wheel upon the carriage meshing with a stationary rack upon the frame, and a pawl-and-ratchet connection from such wheel to the delivery-rolls to actuate the same in one direction only, substantially as herein set forth.

410,404. PROCESS OF DYEING ARTIFICIAL SILK. HILAIRE DE CHARDONNET, Besançon, France. Filed June 28, 1888. Serial No. 277,895. (No specimens.) Patented in France Jan. 27, 1888, No. 188,304, and in England Apr. 9, 1888, No. 5,270.

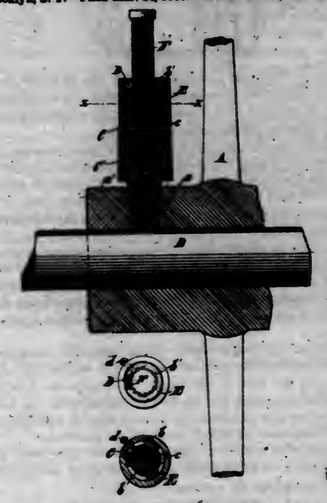
Claim.—The process of dyeing artificial silk and other pyroxyline compounds, which consists in, first, denitrating the artificial silk or pyroxyline compound by immersion for a few hours in a bath of nitric acid; second, washing the denitrated material, and, third, dipping the same in a dyeing-bath, substantially as set forth.

410,405. REEL OR SWIFT. HERMAN RIPLE, Belleville, Ill. Filed May 9, 1889. Serial No. 310,120. (No model.)



Claim.—1. The combination of a reel having a central pin with an opening therein and a clamping device with a standard adapted to fit in said opening, and provided with jaws adapted to embrace a table or support, substantially as described.

2. A reel consisting of slats pivotally connected, a screw-pin for clamping the same in position, the said pin having an opening therein, and a holder having a standard adapted to enter said opening and provided with jaws adapted to embrace or grip a table or support, said parts being combined substantially as described.

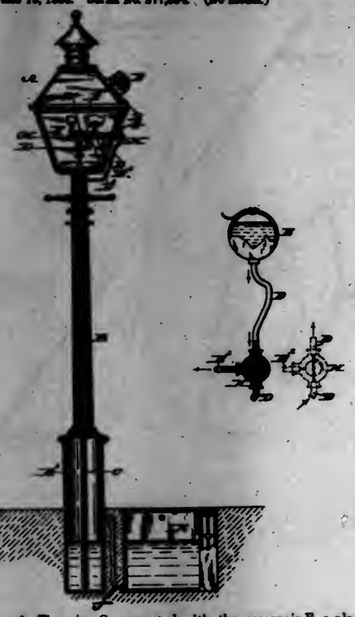


3. A reel consisting of slats pivotally connected at their ends and centers, a cross-slat, and a screw-pin with an opening therein, in combination with a holder having a standard adapted to be inserted in said opening in said screw-pin, and having jaws adapted to embrace or grip a table or support, substantially as described.

4. A reel consisting of slats pivotally connected at their ends and centers, a cross-slat, and a screw-pin with an opening therein, in combination with a clamping device having a standard adapted to fit in said opening in the screw-pin, substantially as described.

410,405.

410,406. LUBRICATOR FOR LOOSE PULLEYS. WILLIAM J. FAIR, Brooklyn, N. Y. Filed Mar. 14, 1888. Serial No. 303,209. (No model.)



Claim.—1. In a lubricator for loose pulleys, the combination, with a case in which is contained a stick of lubricating material, of a weight surrounding said case and provided internally with a rack, a pinion on said case engaging said rack, and a follower bearing upon said stick of lubricating material and provided with a rack also engaging said pinion, substantially as specified.

2. In a lubricator for loose pulleys, the combination, with a case for containing a stick of lubricating material, of a weight surrounding said case and provided internally with a rack, a pinion on said case engaging said rack, a follower provided with a rack also engaging said pinion, and a stop on said case for engaging the rack on the weight, substantially as specified.

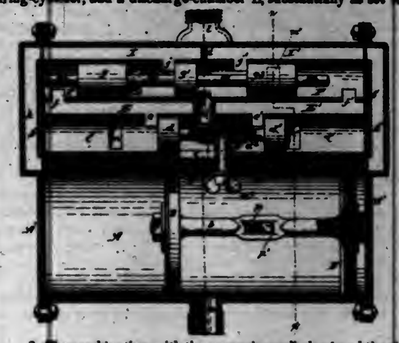
3. In a lubricator for loose pulleys, the combination, with a case for containing a stick of lubricating material, of a weight surrounding said case and provided internally with a rack, a pinion on said case engaging said rack, a follower also provided with a rack engaging said pinion, a stop on said case, and a pin or projection on said weight adapted to contact with said stop to prevent a too extended outward movement of said weight, substantially as specified.

410,407. VAPOR-LAMP. PETER J. FITZGERALD, Sharon Hill, Pa. Filed June 19, 1888. Serial No. 277,554. (No model.)

Claim.—1. The pipe C, connected with the reservoir E, a place of supply of fluid under pressure, and a chamber connected therewith, the branch D, with the cock H, and the pipe E', with the cock G, combined and operating substantially as described.

2. A supply-tank adapted to contain liquid under pressure, a chamber connected by a pipe with said supply-tank, a supply-pipe leading from said chamber and having a two-way cock therein, a reservoir connected with said supply-pipe, and a pipe leading from said cock and having a cock and burner, said parts being combined substantially as described.

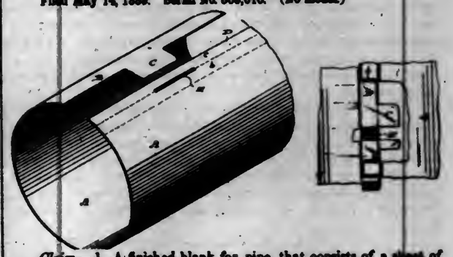
3. The tank K, adapted to contain liquid under pressure, a chamber connected with said tank, the pipe C, leading from said chamber and having the branch pipe D, with the two-way cock therein, the reservoir E, communicating with the said branch pipe D, and the pipe E', with cock H and burner F, said parts being combined substantially as described.



4. The tank K, in combination with a separate chamber, the post B, the pipe C, leading from said chamber and to said post, the branch pipe D, having the cock H, the reservoir E, supported by a frame connected with the post B, and the pipe E', leading from the two-way cock H and provided with the cock G and burner F, said parts being combined substantially as and for the purpose described.

5. A lamp with a reservoir above the flame of the same, the said reservoir having a coating of asbestus on the upper surface thereof, substantially as and for the purpose set forth.

410,408. PISTON METER. WILLIAM T. FOX, Rochester, N. Y. Filed Feb. 21, 1888. Serial No. 264,757. (No model.)



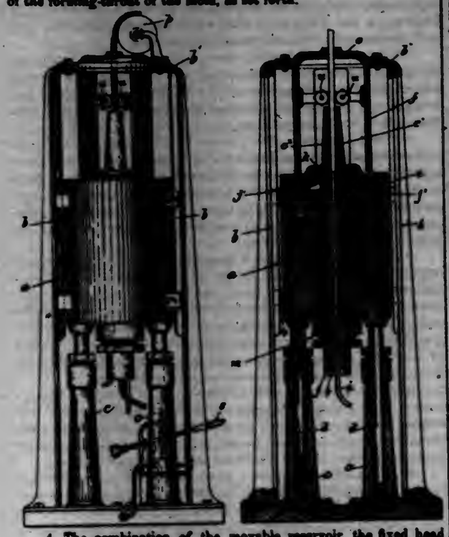
1. The combination, with the measuring-cylinder A and pistons B B', of a primary-valve chamber C, connected with the measuring-cylinder, sliding valves d d', arranged in the valve-chamber C and having arms d^3 projecting into the measuring-cylinder and actuated by the pistons B B', chambers or passages E E', communicating with the primary-valve chamber C, a secondary-valve chamber F, communicating with the primary-valve chamber C and the passages E E', sliding valves g g' g^3, arranged in the secondary-valve chamber F and operated by the pressure of the liquid, chambers I I', communicating with said secondary-valve chamber, ports k k', connecting said channels with opposite ends of the measuring-cylinder, and a discharge-chamber L, communicating with the secondary-valve chamber F, substantially as set forth.

2. The combination, with the measuring-cylinder A and the duplex pistons B B', of a primary-valve chamber C, connected with the measuring-cylinder and provided with relief-openings n n', sliding valves d d^3, arranged in the valve-chamber C and having arms d^3, actuated by the pistons B B', chambers or passages E E', communicating with the primary-valve chamber C, a secondary-valve chamber F, communicating with the primary-valve chamber C and the passages E E' and having liquid-escape openings m m', sliding valves g g' g^3, arranged in the secondary-valve chamber F and operated by the pressure of the liquid, channels I I', communicating with said secondary-valve chamber, ports k k', connecting said channels with opposite ends of the measuring-cylinder, and a discharge-chamber L, substantially as set forth.

3. The combination, with the measuring-cylinder A and the pistons B B', of the valve-chamber C, provided with detachable end walls S and communicating with the cylinder A by an opening c, sliding valves d d', arranged in the valve-chamber C and connected by a valve-rod d^2, and arms or projections d^3, arranged in the cylinder A and attached to a shank projecting through the opening c and detachably secured to the valve-rod, substantially as set forth.

410,409. SHEET-METAL PIPE. HENRY L. GATES, Milwaukee, Wis. Filed May 14, 1889. Serial No. 309,610. (No model.)

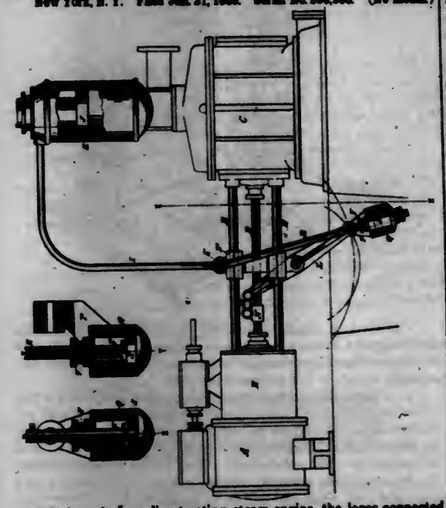
Claim.—1. A finished blank for pipe, that consists of a sheet of metal having one longitudinal edge thereof provided with one or more lateral tongues and the opposing edge double folded to form an outwardly-open groove throughout its length and slotted at the rear of the groove coincident with said tongue or tongues, substantially as set forth.



2. A sheet-metal pipe-joint having one longitudinal edge thereof folded to form an outwardly-open groove throughout its length, a slot or slots cut out of the metal at the rear of the groove, the opposing edge seated in said groove, and a tongue or tongues projected from the latter edge through said slot or slots and bent back, substantially as set forth.

410,410. APPARATUS FOR APPLYING SHEATHS TO ELECTRICAL CONDUCTORS. CHARLES G. GOODWIN, Malden, assignor of one-half to Peter B. Wiley, Wakefield, Mass. Filed Mar. 30, 1889. Serial No. 305,408. (No model.)

Claim.—1. The combination of the movable reservoir, fixed guides therefor, a motor whereby the reservoir may be moved upon said guides, a fixed head having a mold communicating with the interior of the reservoir, a guide for an electrical conductor below said mold, and rigid lateral supports connecting the upper end of said guide with the fixed head, whereby the upper end of the guide and an electrical conductor therein are kept at the center of said mold, as set forth.



2. The combination of the fixed supporting-frame having vertical guides b b, the reservoir a, fitted to slide on said guides, means for elevating said reservoir, the fixed head c, fitted in said reservoir and having the mold c', and the tube j, having the guide j' within the reservoir, said guide being formed and arranged to keep a conductor passing therethrough at the center of the forming-throat of the mold, as set forth.

3. The combination of the fixed supporting-frame having vertical guides b b, the reservoir a, fitted to slide on said guides, a stuffing-box in the bottom of said reservoir, means for elevating said reservoir, the fixed head c, fitted in said reservoir and having the mold c', and the tube j, having the guide j' within the reservoir and passing through the stuffing-box in the bottom of the reservoir, said guide being formed and arranged to keep a conductor passing therethrough at the center of the forming-throat of the mold, as set forth.

4. The combination of the movable reservoir, the fixed head having the mold c', the tube j, having the guide j' within the reservoir, and means for circulating water in said tube, as set forth.

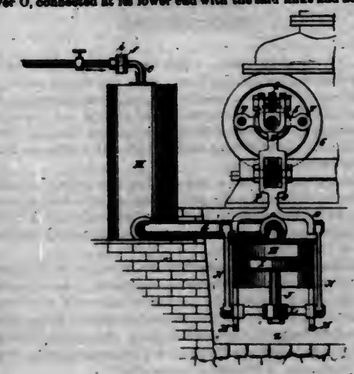
410,411. DIRECT-ACTING STEAM-ENGINE. JOHN A. GRONDIN, New York, N. Y. Filed Jan. 21, 1889. Serial No. 296,963. (No model.)

Claim.—1. In a direct-acting steam-engine, the lever connected at one end with the main piston-rod and pivotally supported, so that its other end may be moved in the arc of a circle, combined with the hollow lever pivotally secured at one end, so that its other end may be moved on a different arc of a different circle from that described by the first-mentioned lever, a piston secured on said end, and a pipe leading from a source of pressure to said hollow lever, the said arcs of the circles crossing each other at each side of a given point, substantially as set forth.

2. In a direct-acting steam-engine, the lever connected at one end with the main piston-rod and pivotally supported, so that its other end may be moved in the arc of a circle, the hollow lever pivotally secured at one end, so that its other end may be moved on a different arc of a different circle from that described by the first-mentioned lever, and the piston on said last-mentioned end, combined with a pressure-box receiving the piston on the end of said hollow lever and in pivotal connection with the first-mentioned lever connected with the piston-rod, the hollow lever being connected with a source of pressure and having outlets within said pressure-box, substantially as and for the purposes set forth.

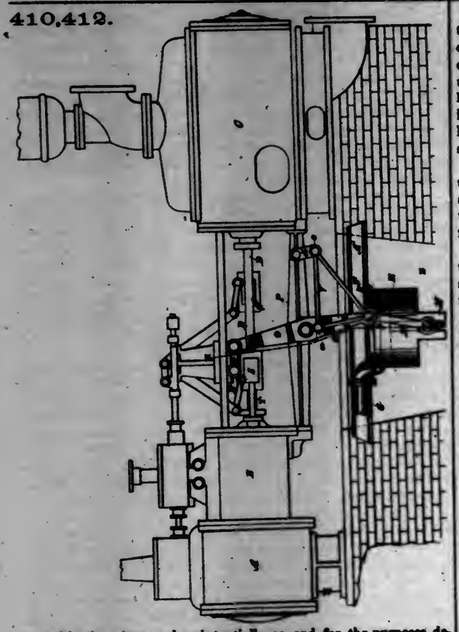
3. In a direct-acting steam-engine, the lever connected at one end with the main piston-rod and pivotally supported, so that its other end may be moved in the arc of a circle, combined with the hollow lever pivotally secured at one end, so that its other end may be moved in a different arc of a different circle, and carrying a piston, the pressure-box in pivotal connection with the first-mentioned lever and receiving the said piston, and the pipe leading from the accumulator to the hollow lever, the end of the hollow lever having openings within said pressure-box, and the said arcs of said circles crossing each other at each side of a definite point, substantially as set forth.

4. In a direct-acting steam-engine, the lever L, connected at one end with the piston-rod and pivotally supported, so that its other end may be moved in the arc of a circle, combined with the hollow lever R, fulcrumed at one end eccentrically to the lever L, so as to move in a different arc of a different circle, and being in communication with a source of pressure, the piston on the end of said hollow lever, and the pressure-box receiving said piston, the hollow lever having outlets within said pressure-box, and said arcs of said circles crossing each other at each side of a definite point, substantially as set forth.



5. In a direct-acting steam-engine, the pivotally-secured lever connected at one end with the piston-rod by the link, combined with a lever carrying a piston on its free end and fulcrumed to move simultaneously with but on a different line from the first-mentioned lever, the pressure-box to receive said piston, and a source of pressure communicating with said pressure-box, the lines of movement of said levers crossing each other at each side of a definite point in the stroke of said piston-rod, substantially as and for the purposes set forth.

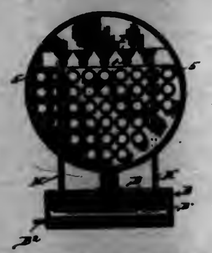
6. In a direct-acting steam-engine, the pivotally-secured lever connected at one end with the main piston-rod, combined with the pivotally-secured lever moving on its pivot simultaneously with the first-mentioned lever, but describing at its end a different line of movement, and carrying a piston, the pressure-box receiving said piston and connected to move with said levers, and a source of pressure in communication with the interior of said pressure-box, substantially as set forth.



7. The accumulator K, formed in the air-chamber above the water-cylinders C of the pump and provided with differential pistons, combined with a pipe leading to means for resisting the movement of the piston-rod during one portion of its stroke and assisting said movement during the latter portion of its stroke, said pipe containing a column of water through which the pressure of the pistons is transmitted, substantially as set forth.

410,412. STEAM-ENGINE. JOHN A. GRONDIN, New York, N. Y. Filed Feb. 8, 1888. Renewed May 16, 1889. Serial No. 310,993. (No model.)

Claim.—1. In combination with a direct-acting steam-engine, the auxiliary cylinder E, open to the atmosphere at one end and closed at the other end, and there forming a vacuum, the piston and piston-rod for the auxiliary cylinder, cross-head L, links N, and the rocking lever O, connected at its lower end with the said links and at its upper



410,412.

end with the piston-rod, substantially as and for the purposes described.

2. In combination with a direct-acting steam-engine, the auxiliary cylinder E, open to the atmosphere at one end and closed at the other end, and there forming a vacuum, the piston I, rod J, cross-head L, guides M, links N, and the rocking lever O, pivoted at its lower end to said links and at its upper end connected with the piston-rod of the engine, substantially as and for the purposes described.

410,418. FEED-WATER PURIFIER FOR STEAM-BOILERS. HENRY HAGUEY, Topeka, Kans., assignor to the Hackney Steam Boiler Improvement Company, of Illinois. Filed Apr. 2, 1889. Serial No. 305,765. (No model.)

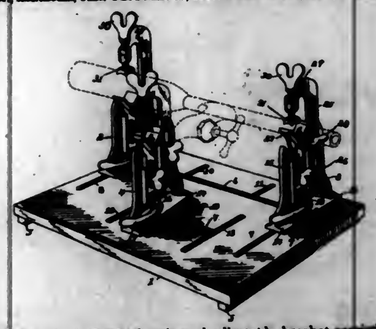
Claim.—1. The combination, with a steam-boiler, of a series of open sediment-troughs extending from end to end of said boiler, a delivery-chamber connected to said troughs and communicating therewith, a discharge-chamber connected to said troughs and communicating therewith, a feed-water-delivery pipe leading into said delivery-chamber, and a blow-off pipe leading from said discharge-chamber, substantially as described.

2. The combination, with a steam-boiler, of a series of troughs having upwardly-expanded walls, and having sediment-pockets communicating with the contracted portions of said walls, and suitable means for delivering the feed-water into said troughs, substantially as described.

3. The combination, with a steam-boiler, of a series of sediment-troughs having upwardly-expanded walls, and having sediment-pockets connected with the contracted portions of said walls, a delivery-chamber at one end of said troughs, a discharge-chamber at the opposite end of said troughs, a feed-water-delivery pipe communicating with said delivery-chamber, and a blow-off pipe communicating with the discharge-chamber, substantially as described.

4. The combination, with a steam-boiler, of a series of sediment-troughs having expanded upper walls, and having sediment-pockets connected to the contracted bottoms of said walls, a delivery-chamber connected to the front ends of said troughs and having openings communicating with the upper portion of said troughs, a discharge-chamber connected with the opposite ends of said troughs and having openings communicating with the sediment-pockets, a feed-water pipe leading into said delivery-chamber, and a blow-off pipe leading from said discharge-chamber, substantially as described.

5. The combination, with a steam-boiler, of a series of sediment-troughs, a delivery-chamber connected with the ends of said troughs, and a discharge-chamber connected with the opposite ends of said troughs, said delivery and discharge chambers being provided with flanges E for sustaining said troughs, substantially as described.



6. The combination, with a steam-boiler, of a series of sediment-troughs extending from end to end of said boiler in its upper portions, suitable means for delivering the feed-water into said troughs, suitable means for removing the sediment from said troughs, a mud-drum communicating with the boiler at its lower portion, and suitable circulating-pipes connecting said mud-drum with the upper portion of the boiler, substantially as described.

7. The combination, with a steam-boiler, of a series of sediment-troughs extending from end to end thereof in its upper portion, a delivery-chamber connected to said troughs and having openings communicating therewith, a discharge-chamber connected to the opposite ends of said troughs and having openings communicating therewith, a mud-drum, a pipe connecting said mud-drum with the lower portion of the boiler, and suitable circulating-pipes leading from said mud-drum to the delivery-chamber, substantially as described.

8. The combination, with a steam-boiler, of a sediment-trough having upwardly-expanded walls, and having a sediment-pocket connected with said walls at their contracted portions, and suitable means for delivering the feed-water to said trough, and suitable means for withdrawing the sediment therefrom, substantially as described.

9. The combination, with a steam-boiler, of a sediment-trough having upwardly-expanded walls, and having a sediment-pocket communicating with the lower contracted portion of said walls, and having also a V-shaped false bottom, and suitable means for delivering the feed-water into said trough, and suitable means for withdrawing the sediment therefrom, substantially as described.

410,414. PLUMBER'S ADJUSTABLE BRACKET. PERRY B. HALL, Sr., Ashtabula, Ohio. Filed June 19, 1889. Serial No. 314,802. (No model.)

Claim.—1. A plumber's universal adjustable bracket consisting, essentially, of a common base-board and a set of brackets adjustable on said base-board both longitudinally and transversely thereof, substantially as and for the purpose described.

2. A plumber's universal adjustable bracket comprising a horizontal base-board and a set of brackets adjustable longitudinally and transversely on the base-board, each bracket having means for clamping the same in a fixed position on the base-board, and with a clamp for holding the work, substantially as and for the purpose described.

3. A plumber's universal adjustable bracket comprising a base-board and a set of brackets adjustable longitudinally and transversely thereon, each bracket having a pipe-rest and an adjustable clamp arranged to hold the work between itself and the pipe-rest, substantially as and for the purpose described.

4. A plumber's universal adjustable bracket comprising a base-board having the longitudinal and transverse slots and a set of adjustable brackets, each having a vertical bolt which passes through one of the slots, and a clamp-lever pivoted on the bolt and having a cam-surface arranged to lift the bolt when said lever is turned to one position, substantially as and for the purpose described.

5. A plumber's universal adjustable bracket comprising a slotted base-board and a set of adjustable brackets, each having a slotted base, a headed bolt passing through said base of each bracket and one of the slots in the base-board, and a clamp-lever fitted on the bolt and having a cam-surface which rides against a corresponding surface on the base of the bracket when the lever is turned into a position parallel with the base, substantially as and for the purpose described.

6. A plumber's universal adjustable bracket comprising a horizontal base-board and a set of adjustable brackets, each bracket having a vertically-adjustable pipe-rest and an adjustable clamp which overhangs the pipe-rest, substantially as and for the purpose described.

7. A plumber's universal adjustable bracket comprising a horizontal base-board and a set of adjustable brackets, each bracket having a pipe-rest formed with a rigid V-shaped jaw, and a clamp which overhangs the jaw of said pipe-rest, substantially as and for the purpose described.

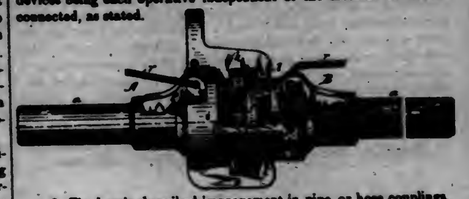
8. A plumber's universal adjustable bracket comprising a horizontal base-board and a set of adjustable brackets, each bracket having its shank or standard provided with two ways, a vertically-slotted pipe-rest fitted in one of the ways and having a rigid jaw, a vertically-slotted clamp fitted in the other way, and thumb-screws for holding the pipe-rest and clamp at any desired vertical adjustment on the bracket, substantially as and for the purpose described.

9. A plumber's universal adjustable bracket comprising a horizontal base-board and a set of adjustable brackets, each bracket having a pipe-rest provided with a rigid jaw, a clamp having an overhanging end, and an adjusting-screw fitted in the overhanging end of the clamp and carrying a binding-plate arranged to contact with the work fitted in the jaw, substantially as described.

410,415. APPARATUS FOR EXTRACTING SULPHUROUS ACID. EMIL HERMITE, Southsea, O. S., and MAX SCHRODER, Neumühl, Germany. Filed Sept. 13, 1888. Serial No. 285,712. (No model.) Patented in Germany Jan. 15, 1888, No. 36,161, and Nov. 23, 1883, No. 27,531, and in England May 30, 1883, No. 2,621.

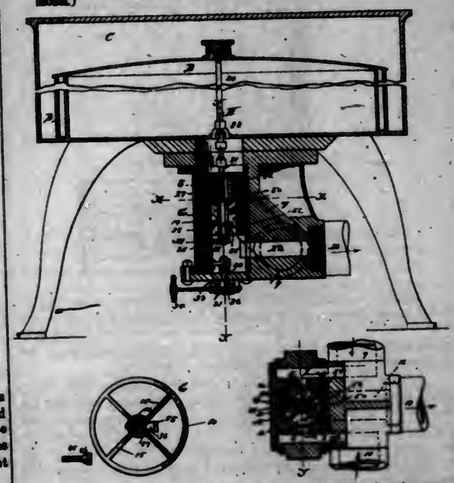
Claim.—1. In an apparatus for separating sulphurous acid from furnace and other gases, a heater for the acidulated water composed of a series of horizontal chambers connected alternately at opposite ends, and a series of intermediate chambers divided by leaden beams into channels, through which the hot fluid passes in a counter-current to the flow of the acidulated water, substantially as set forth.

2. In an apparatus for separating sulphurous acid from furnace and other gases, the preliminary heater composed of a series of horizontal compartments or chambers connected alternately at opposite ends, and a series of intermediate spaces or chambers divided by transverse lead beams into channels which are also connected alternately at opposite ends, and inlet and outlet pipes at the ends of both sets of chambers, so that the acidulated water ascends through one series of chambers, while the hot water descends through the intermediate chambers in a direction at right angles to the flow of acidulated water, substantially as set forth.



410,416. GARMENT-PROTECTOR. PETER B. HAMBURY, Philadelphia, Pa., assignor to HENRY S. HAMBURY, same place. Filed June 10, 1889. Serial No. 313,702. (No model.)

Claim.—A garment-protector consisting of a piece of soft rubber, having at its bottom a bead solid with said piece, and a core in said bead, substantially as described.



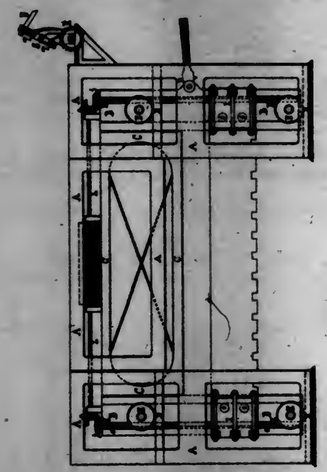
410,417. COUPLING FOR HOSE OR PIPE. OLIVER P. HIX, Rockland, Me. Filed Nov. 12, 1888. Serial No. 290,502. (No model.)

Claim.—1. The herein-described improvement in pipe or hose couplings, comprising the two members having inclined or wedge-shaped meeting ends, the collars secured on said members at their ends, the gaskets or packing-rings, the rings or bushings for securing said gaskets to said collars, and the locking devices connected to each of said members, and constructed and arranged to engage and become locked with the other member, substantially as set forth, said locking devices being each operative independent of the member to which connected, as stated.

2. The herein-described improvement in pipe or hose couplings, comprising the members having overlapping wedge-shaped ends, and provided with shoulders or collars, the collars *c*, bearing against said shoulders or collars, the gasket secured to the ends of said collars *c*, the rings *i*, having the projecting arms engaging said collars *c*, the apertured lugs formed on the pipe, and the cords connected to said arms, substantially as set forth.

410,418. GAS AND AIR MIXER AND GOVERNOR. CHARLES F. HOYT, Springfield, Mass. Filed Mar. 19, 1888. Serial No. 267,502. (No model.)

Claim.—1. The combination, with a circular vertical casing provided with lateral inlet-ports in communication with gas and air supply conduits, and having an outlet-port leading therefrom, a vertically-movable gas-receiver in communication therewith, and an inclosing-tank, of a valve-stem hung from said movable gas-receiver and vertically movable therewith, and a tubular valve secured thereto, provided in its walls with ports arranged to register with said casing-ports, a forked radial arm secured to said valve-stem, an arbor having a bearing in the bottom of the casing provided at its inner end with a radial arm having a vertical post engaging the said forked arm, and at its outer end provided with a sector-gear, and a worm having bearings on said casing, engaging with said sector, all substantially as and for the purpose described.



2. The combination, with a circular vertical casing provided with lateral inlet-ports in communication with gas and air supply conduits and having an outlet-port leading therefrom, a vertically-movable gas-receiver in communication therewith, and an inclosing-tank, of a valve-stem made in sections and connected by a universal joint hung from said movable gas-receiver and vertically movable therewith, a tubular valve secured thereto, provided in its walls with ports arranged to register with said casing-ports, a forked radial arm secured to said valve-stem, an arbor having a bearing in the bottom of the casing, provided at its inner end with a radial arm having a vertical post engaging the said forked arm, and at its outer end provided with a sector-gear, and a worm having bearings on said casing engaging with said sector, all substantially as and for the purpose described.

3. In a device for mixing gas and air, the valve herein described, comprising a tubular outer portion provided with ports, an axial hub, and intermediate arms, and having a longitudinal kerf through the outer wall and said hub and provided in said hub with screw-holes

with flaring ends, and one or more screws provided inside their heads with taper portions, substantially as and for the purpose described.

4. In a device for mixing gas and air, the valve herein described, comprising a tubular outer portion provided with ports, an axial hub, and intermediate arms, and having a longitudinal kerf through the outer wall and said hub, and provided in said hub with screw-holes with flaring ends and in its outer wall with one or more apertures in radial alignment with said screw-holes, and one or more screws provided inside their heads with taper portions, substantially as and for the purpose described.

410,419. STONE-SAWING MACHINE. THADDEUS A. JACKSON, New York, N. Y. Filed Sept. 6, 1888. Serial No. 284,911. (No model.)

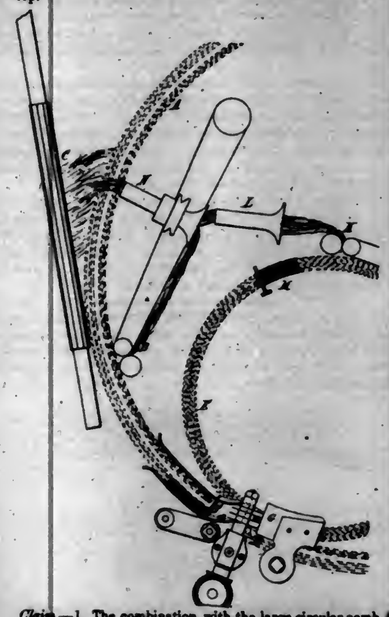
Claim.—1. In a stone-sawing machine, a saw-sash constructed of three parts—namely, two rectangular hollow uprights or heads connected at the top by a single deep brace, and combined with a saw-blade carried on one side of the sash and movable therefrom, in the manner and for the purpose substantially as specified.

2. In a stone-sawing machine, a saw-sash, together with a saw-blade carrier consisting of a single right-angled plate embracing the back outer corner of the sash-upright, having suitable recesses and lugs for saw-buckles, and provided with anti-friction rollers or equivalent means to prevent friction in movement up and down against the uprights, in combination with a stone-saw, all constructed and operated substantially as specified.

3. A stone-sawing machine consisting of a saw-sash composed of two single rectangular uprights or heads opposite each other and connected between their tops by a single deep brace, in combination with a stone-saw buckled in saw-blade carriers each consisting of a single right-angled plate embracing the back outer corner of the sash upright or head, and having anti-friction rollers between such contact, together with means for raising and lowering such blade-carriers and saw-blade, all supported in suitable outside frame-work and constructed and operated substantially as specified.

4. In a stone-sawing machine, a saw-sash constructed with hollow uprights or heads, each provided with projecting shoulder or corner and abutting recess, in combination with a saw-blade on one side of said sash, substantially as specified.

5. In a stone-sawing machine, a saw-sash adjustable horizontally and transversely to its length by means of shouldered axles supporting the sash and provided with reciprocally-adjustable nuts on each side of such sash, as and for the purpose substantially as specified.



6. In a stone-sawing machine, for raising and lowering the blade on the sash, and in combination with each upright or head of such sash, a perpendicular revolving feed-shaft provided with suitable key-way and loose worm, with a key or feather working in such keyway, such worm meshing with a perpendicular rack on the sash-upright, as and for the purpose substantially as specified.

7. In a stone-sawing machine, in combination with and for operating the upright feed-shafts by bevel-gears, a horizontal shaft provided with a gear as broad as the length of the stroke of the saw, in sliding contact and meshing with a pinion on another horizontal shaft parallel with the first and operated through bevel-gears and a ratchet-wheel by a rock-arm and two pawls connected to the crank-shaft, all combined and co-operating in the manner and for the purpose substantially as specified.

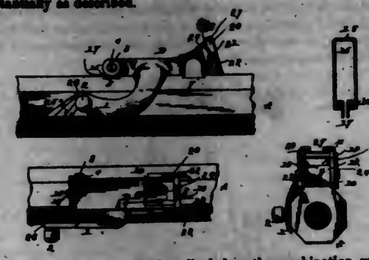
8. In a stone-sawing machine, an upright saw-sash, combined with the saw-blade carried on one side thereof and movable perpendicularly thereupon, substantially as specified.

410,420. MACHINE FOR COMBING WOOL, &c. FREDERIC G. LAMER, St. Acheul-lez-Amiens, France. Filed May 3, 1888. Serial No. 90,946. (No model.) Patented in France Mar. 7, 1881, No. 141,322, and in England Mar. 16, 1881, No. 1,126.

Brief.—The object of the invention is to increase the production of "top."

Claim.—1. The combination, with the large circular comb A and the small circular comb E, of the horizontal drawing-off rollers C, the vertical drawing-off rollers D-K, and the tweedlers L N, substantially as described.

2. The combination of the large circular comb A, the small circular comb E, the oblique trough F, sun-wheels H, knives R, and dabbing-brush G, located at the junction of said combs, the horizontal drawing-off rollers C, the vertical drawing-off rollers D K, the tweedlers L N, and the knives M, substantially as described.

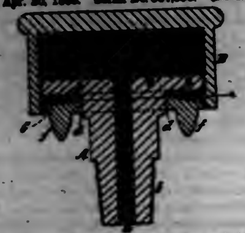


410,421. BOTTLE-STOPPER. HENRY LIEBTWARDT, Jr., and CHRISTIAN F. RACHLER, Philadelphia, Pa. Filed June 20, 1889. Serial No. 314,922. (No model.)

Claim.—In a bottle-stopper, the combination of a central stem, a rigid lower end section on the end of the stem, a movable upper non-flexible section, an interposed elastic expansible section, means, substantially as described, on the upper end of the stem to force the upper section down on the elastic section to expand the same, said upper end section having a recess in its upper face around the stem, an expansible elastic section filling and projecting above the recess and embracing the stem, and a metallic washer interposed between said section and said means for expanding the stopper, for the purpose set forth.

410,422. GUN-SIGHT. BENJAMIN LOSS, Boulder, Colo. Filed Feb. 15, 1889. Serial No. 300,084. (No model.)

Claim.—1. In a gun-sight, the combination of the sight-carrier, a sight-piece pivoted therein and provided with a forwardly-curved reduced portion, and a spring exerting a downward pressure on the sight-piece, and having the rear portion thereof seated in the angle formed between the forward reduced portion and the rear enlarged portion of the sight-piece, whereby when the sight-carrier is raised the sight-piece will be forced out and raised simultaneously therewith, substantially as described.

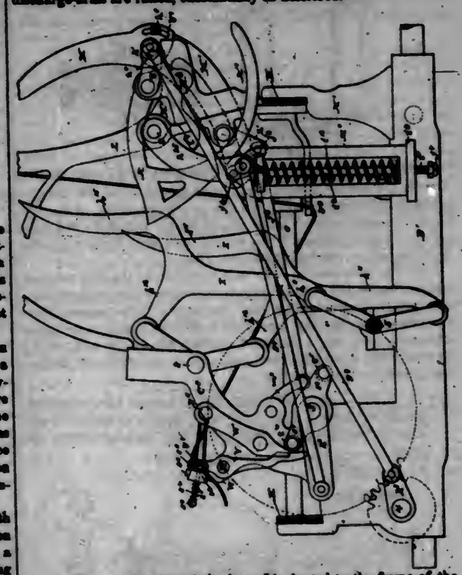


2. In a gun-sight of the described class, the combination, with the hinged sight-carrier provided with a rear opening and having a suitable operating-lever, of the movable or tilting slide disposed beneath the sight-carrier in the recess thereof and having a sight-notch on its outer end, and the vertically-adjustable horizontal wires passing transversely through the opening in the sight-carrier, substantially as set forth.

3. The combination of a gun-barrel having a graduated scale on the side thereof, a sight-carrier lever pivoted on the said barrel, a sight-piece pivoted within the carrier and provided with a forwardly-curved reduced portion, a spring for exerting a downward pressure on the sight-piece, and having the rear portion thereof seated in the angle formed between the forward reduced and rear enlarged portions of the sight-piece, whereby when the carrier is raised the sight-piece will be forced out and raised simultaneously therewith, and a lever on the carrier having an indicator moving over the said scale, substantially as described.

4. In a gun-sight of the described class, the combination, with the carrier having a rear opening, of the slotted plates located upon each side of the rear portion of sight-carrier and provided with a series of perforations equidistances apart, the set-screws working within the slots of the adjustable slides or plates, and the horizontal wires passing through the perforations across the rear opening formed in the carrier, said wires having their ends secured to the set-screws, substantially as set forth.

410,423. GREASE-CUP. RICHARD LOEWENHERZ, Cincinnati, Ohio, assignor to the Lambertstown Brass Manufacturing Company, same place. Filed Apr. 20, 1889. Serial No. 307,990. (No model.)



Claim.—The grease-cup herein described, consisting, essentially, of the interiorly-threaded cup B, the hollow standard or stem A, having the exteriorly-threaded disk *c*, the expansible packing *c*, and the adjustable screw-connected washer C, for forcing the expansible packing outward into the threads of the cup B, whereby to enable the screw-joint between the cup and the standard-disk to be kept tight without disturbing the relative positions of said parts and without disconnecting the cup as a whole, substantially as described.

410,424. GRAIN-BINDER. SAMUEL D. MASON, Mississaugy, Ohio, assignor to Mary Maddin, Barrie, Ontario, Canada. Filed July 16, 1888. Serial No. 171,282. (No model.)

Claim.—1. The combination of the needle, the swinging link on the needle-shaft, the compressor adjustable on the link, a toggle-brace for supporting the compressor in its elevated position, a set-off mechanism operated by the accumulated gavel, and a positively-operated ejector having a projection which contacts with the said toggle-brace and breaks the same to permit the descent of the compressor, substantially as set forth.

2. The combination, with the compressor carried by an arm or link suspended from a shaft, of a movable support for holding the arm or link in its elevated position, and an ejector carrying a projection in line with said support, arranged to make contact therewith to displace the same as the ejector is raised, substantially as described.

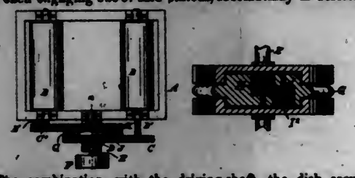
3. The combination, with the compressor carried by an arm swinging upon the shaft, of toggle-levers arranged to support the arm or link in its elevated position, and ejector-arms provided with a projecting finger arranged to make contact with one of said levers as the discharge-arms are raised, substantially as described.

4. The combination of the lever L', pivoted to the frame of the binder, the longitudinally-slotted compressor-arm connected therewith, a stopping and starting mechanism also connected therewith and including a spring-clutch device, and a spring connected with the lever and with a fixed part of the binder and arranged to resist by its tension the movement of the compressor beyond a certain point, substantially as set forth.

5. The combination, with a compressor having a longitudinally-slotted arm and the stopping and starting mechanism, of the lever L', pivoted to the binder-frame and engaging with the slotted arm of the compressor and connected with the stopping and starting mechanism, the frame M^3, hung from the said lever, provided with a cross-bar, a headed rod supported in a bearing on the binder-frame and extending into the frame M^3, and a spring arranged between the head of the said rod and the cross-bar of the frame M^3, and arranged to resist by its tension the movement of the compressor beyond a certain point, the said headed rod having a limited sliding movement in its bearing prior to the compression of the spring, substantially as described.

6. The combination of the compressor having the slotted arm M', the lever L', the frame suspended from said lever, a headed rod $5'$, passing through a fixed lug P, and provided with a stop j^3 beyond said lug to permit a limited amount of lost motion, and a spring interposed between the head of the rod and the frame, and the tripping mechanism connected with the lever L', substantially as described.

7. The combination of the ejector, the shaft supporting the same, a mutilated gear-pinion driving said shaft having two series of gear-teeth separated by intervening delay-sheet, and the wheel J, having two series of gear-teeth j j', and intervening delay-surfaces, whereby the ejector is first raised to discharge the bundle, is then held in its elevated position, and is then returned to its normal position below the binder-table, substantially as and for the purpose set forth.

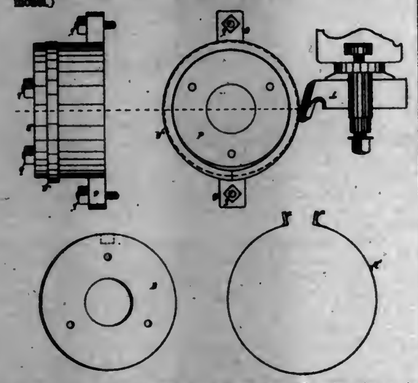


8. The combination, in a tension device of a grain-binder, of the cord-clamp, the vibrating cord-drawing lever arranged in proximity to the clamp, and an arm which vibrates the lever to draw the cord and which subsequently opens the clamp, substantially as set forth.

9. The combination of the stationary cord-clamping jaw, movable jaw, pivoted lever V, carrying the movable jaw, spring arranged to close the jaws, cord-drawing lever W', and revolving arm arranged to strike first the lever W', and the lever V, substantially as set forth.

410,425. COMPENSATING GEARING. ROBERT S. MATTHEWS, Rochester, N. Y., assignor of one-half to James Shellington, same place. Filed Mar. 14, 1889. Serial No. 303,260. (No model.)

Claim.—1. The combination, with the driving-shaft, the disk secured thereto, and the two intermeshing pinions carried by the disk,

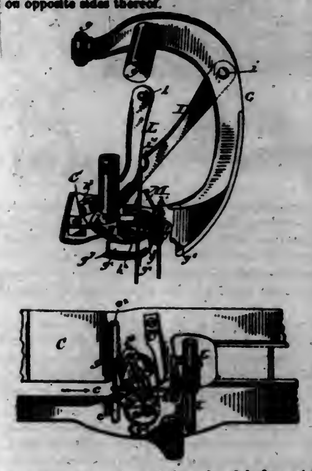


with their outer ends projecting in different planes, of the two gears mounted loosely on the shaft on opposite sides of the disk, with the teeth of each engaging one of said pinions, substantially as described.

2. The combination, with the driving-shaft, the disk secured thereto, and the two intermeshing pinions carried by the disk and projecting from the periphery of the disk in different planes, of the two gears mounted loosely on the shaft, one on each side of the disk, having the recessed sides and the internal gear-teeth for co-operating with the pinions, substantially as described.

3. The combination, with the driving-shaft, the disk secured thereto, having the recesses in opposite sides near the periphery communicating with each other, and the pinions in the recesses intermeshing and having their outer ends in different planes, of the gears mounted loosely on the shaft, one on each side of the disk, having recessed sides, and the internal gear-teeth co-operating with the pinions, substantially as described.

410,426. MODE OF CONSTRUCTING SPRING PACKING-RINGS. FOSTER M. METCALF, Battle Creek, Mich., assignor of one-half to William Andrus, same place. Filed June 19, 1889. Serial No. 314,874. (No model.)



Claim.—1. In the manufacture of spring packing-rings for use in engines, pumps, and analogous machines, the flexible compression-clasp A', provided with projecting end portions *a a*, whereby the ring is closed and held, while its annular substance is left free to find such irregular form as its normal diameter and differing degrees of expansibility and elasticity of its substance shall determine, irrespective of the flexible clasp, and so held while being clamped in the lathe-chuck, for the purpose of turning the outer surface of said ring to a true circle concentric with the bore of the cylinder in which it is to be used, thereby correcting said irregularities, substantially as and for the purposes set forth, illustrated, and described.

2. In the manufacture of spring packing-rings for use in the cylinders of pumps, engines, and analogous machines, a clasp or means for forcibly bringing the ends of the expansible ring together, whereby its annular substance is free to assume such oval or irregular form as the larger normal diameter or differing degrees of elasticity thereof shall seek or determine, and so held and clamped in the lathe-chuck, while the said irregularities shall be corrected by turning the outside surface of said ring to a true circle, exactly concentric with the bore of the cylinder, substantially as set forth.

410,427. GRAIN-BINDER. LEWIS MILLER, Akron, Ohio. Filed July 17, 1888. Serial No. 280,169. (No model.)

Claim.—1. The combination, substantially as hereinbefore set forth, of the knotter-shield having a cord-receiving slot therein, a fixed cord-guiding finger projecting athwart said slot, a frame mounted on the shield, a tying-bill rotating spindle in front of and above said slot, a driving-shaft mounted in bearings in said frame, a cam and gear wheel rotated by said shaft, gearing actuating the tying-bill intermittently, an elbow-lever vibratable laterally by the cam and gear wheel, the pivot on which said lever rocks, a cord-guiding foot carried by the elbow-lever, the sliding jaw of the cord-holder vibratable athwart the plane of the cord-slot and pivoted on the elbow-lever, and the cord-clamp pivoted on the frame and vibratable with the sliding jaw, whereby the cord is carried laterally past or in advance of the tying-bill on opposite sides thereof.

2. The combination, substantially as hereinbefore set forth, of a knotter-shield having a cord-slot therein, a frame mounted on the shield, the elbow-lever pivoted outside (or on the stubble side of) the knotter, a cord-guiding foot mounted on the said elbow-lever projecting underneath the knotter and vibratable intermittently across the plane of the cord-slot, a sliding jaw pivoted on the elbow-lever and vibratable transversely athwart the plane of the cord-slot, a cord-clamp pivoted on the frame and vibratable in contact with and in the same plane as the sliding jaw, and a guide-horn on the frame over which the sliding jaw traverses to carry the cord laterally toward the knotter-spindle.

3. The combination, substantially as hereinbefore set forth, of a knotter-shield having a cord-receiving slot therein, a knotter-frame, an elbow-lever pivoted thereon outside or on the stubble side of the knotter-shaft, a cord-guiding foot on said elbow-lever extending under the knotter and vibratable intermittently across the cord-slot, a cord-holder sliding jaw pivoted upon and moving intermittently and coincidently with the elbow-lever, a cord-clamp pivoted on the frame bearing on the sliding jaw and vibratable coincidently therewith, a spring pressing the clamp against the sliding jaw, and mechanism actuating the knotter and elbow-lever.

4. The combination, substantially as hereinbefore set forth, of a knotter-shield having a cord-receiving slot therein, a knotter-frame, a tying-bill rotating on a spindle at one side of and above said slot, a driving-shaft mounted in bearings in said frame, a cam rotated by said shaft, gearing actuating the tying-bill intermittently, an elbow-lever vibratable laterally and intermittently across the cord-receiving slot, a pivot on which the elbow-lever vibrates, a cord-guiding foot carried by the elbow-lever, a cord-holding sliding jaw movable coincidently with the cord-guiding foot, the pivot on which the sliding jaw rocks carried by the elbow-lever, the cord-clamp, the pivot on which the cord-clamp rocks, and a spring insuring the engagement of the sliding jaw and cord-clamp during all their vibrations, as specified.

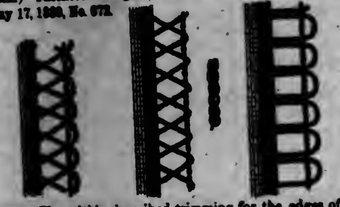
5. The combination, substantially as hereinbefore described, of a knotter-shield having a cord-receiving slot therein, a fixed guide-finger projecting across the slot, a cord-guiding foot, a cord-supporting finger vibratable across the slot and over the guide-finger, a knotter rotating over the foot, a yielding or elastic guide-bar behind and within the circuit of the knotter over which the cord is laid by the cord-holder to insure its entrance between the jaws of the knotter, and the sliding jaw and clamp moving parallel with the guide-bar.

6. The combination, substantially as hereinbefore set forth, of a knotter-shield having a cord-receiving slot therein, a fixed guide-finger therein, a cord-supporting foot vibratable across the slot in advance of the knotter, a knotter rotating over the foot, a cord-holder consisting of a sliding jaw and clamp vibratable with the foot but behind the knotter, a binder-arm which lays the cord in the holder, and the actuating mechanism.

7. The combination, substantially as hereinbefore set forth, of the vibratable elbow-lever, its foot, the recess g^3 therein, the cord-holder sliding jaw, its pivot on the elbow-lever, the clamp, its pivot, and the spring pressing it against the lever.

8. The cord-carrier herein described, consisting of the combination of the elbow-lever, the sliding jaw pivoted thereon, its cord-holding notch *i'*, the support over which it slides mounted on the knotter-frame, the cord-clamp and its actuating-spring pivoted on the frame, the trough-shaped foot of the clamp fitting over the sliding jaw, and the cord-holding offset *P* on the clamp, whereby the cord is clamped and carried toward the knotter-spindle.

9. The combination, substantially as hereinbefore set forth, of the elbow-lever, the cord-guiding foot, the knife fixed thereon, the sliding jaw pivoted on the elbow-lever, and the spring-clamp on the frame, the foot, the knife, the sliding jaw, and clamp all vibratable in parallel planes, whereby the knife is caused to slide past the cord as it is carried toward the knotter and to sever it on the back-stroke after its strands have been seized by the tying-bill.



10. The combination, substantially as hereinbefore set forth, of a knotter, a cord guide and support vibratable laterally athwart the cord-slot in advance of the knotter, and a sliding jaw and clamp constituting a laterally-vibratable cord-carrier in rear of the knotter, whereby the cord is positively forced toward the knotter on both sides thereof.

11. The combination, substantially as hereinbefore set forth, of the pivoted vibratable cord guiding and supporting foot, the sliding jaw of the holder pivoted thereon, and the clamp pivoted on the frame and bearing on the sliding jaw, and all three vibrating in parallel planes athwart that of the cord-slot.

12. The combination, substantially as hereinbefore set forth, of a knotter-shield having a cord-slot terminating in an enlarged opening, a knotter revolving thereover, and a yielding or elastic overhung cord-guide in rear of the enlarged opening (supported at one end only traversed by the open jaws of the knotter and adapted to yield to the strain on the cord.

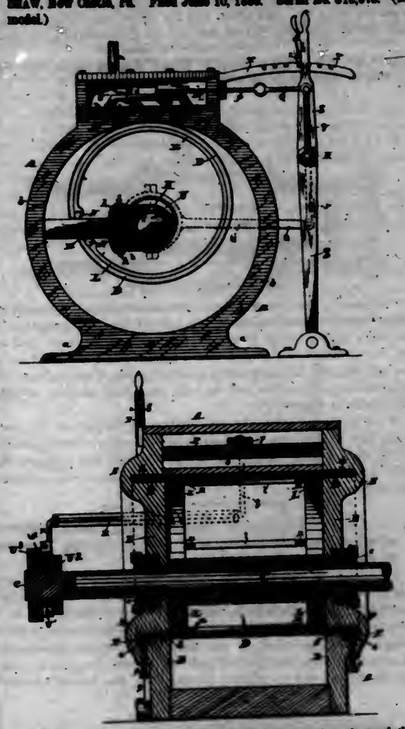
13. The combination, substantially as hereinbefore set forth, of the knotter, the laterally-vibratable cord-holder, and the interposed bridge or cord-guide in rear of the enlarged opening over which the strands are laid by the holder and from which they are swept by the knotter-jaws.

410,428. TRIMMING FOR THE EDGES OF FABRICS. JOSEPH D. MOSLEY, Philadelphia, Pa. Filed Aug. 24, 1888. Serial No. 283,611. (No specimens.) Patented in England Jan. 1, 1889, No. 43, and in Switzerland May 17, 1889, No. 672.

Claim.—1. The within-described trimming for the edges of fabrics, said trimming consisting of a row of stitches formed on the fabric adjacent to the edge of the same, a row of stitches beyond the edge of the fabric, and a thread carried back and forth between the two rows of stitches and incorporated with each, substantially as specified.

2. The within-described trimming for the edges of fabrics, said trimming consisting of a row of stitches formed on the fabric adjacent to the edge of the same, a second row of stitches parallel therewith, but some distance beyond the edge of the fabric, and one or more threads carried back and forth between the two rows of stitches and incorporated with each of the same, but looped beyond the outer row of stitches so as to form a scalloped edge on the trimming, all substantially as specified.

410,429. TRANSPORTING-PACKAGE FOR FRUIT. JOSEPH T. MOTT, Brooklyn, N. Y. Filed Apr. 20, 1889. Serial No. 307,891. (No model.)



Claim.—1. The herein-described transporting-package for fruit, consisting of a case C, having inclined sides and ends and a cover, a series of boxes A of equal dimensions, each having inclined sides and ends and arranged in two tiers in said case, with a removable partition interposed between the tiers, the boxes in the upper tier lying transversely to those in the lower tier and breaking joints therewith, and the walls of the boxes in each tier adjacent to the walls of the case being parallel thereto, as set forth.

2. The herein-described transporting-package for fruit, consisting of a case C, having inclined sides and ends and a cover, its walls being provided with ventilating-apertures, a series of boxes A of equal dimensions, each having inclined sides and ends and arranged in two tiers in said case, with a removable partition interposed between the tiers, the boxes in the upper tier lying transversely to those in the lower tier and breaking joints therewith, and the walls of the boxes in each tier adjacent to the walls of the case being parallel thereto, as set forth.

410,430. PROCESS OF MAKING STEEL DIRECT FROM THE ORE BY THE USE OF NATURAL GAS. WILLIAM F. M. MCCARTY, Hagerstown, Md., assignor of part to Sarah C. Ashton and Herman Dudley Walbridge, Washington, D. C. Filed May 31, 1889. Serial No. 311,993. (No specimens.)

Claim.—The process which consists in first introducing powdered ores, combined with a basic flux, into the upper portion of a shaft-furnace, and there subjecting them to the action of a flame of natural gas; second, passing them downward into the bosh of the furnace and there subjecting them to the action of a blast of natural gas; third, passing the fused ore into the crucible of the furnace and there subjecting it to the action of jets of natural gas and hydrocarbon oil, and finally, conveying the reduced metal into a vacuum-chamber, whereby the gases are removed from the metal, substantially as described.

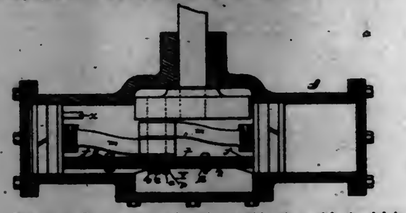
410,431. ROTARY ENGINE. JOHN MCCAMEY and CHARLES P. SHAW, New Castle, Pa. Filed June 10, 1889. Serial No. 313,675. (No model.)

Claim.—1. The combination of the casing having channeled side plates, the main shaft and piston, and the sleeve resting in the channels of said side plates with the adjustable shoes supporting said sleeve, substantially as described.

2. In a rotary engine, the combination of the casing and the rotating sleeve eccentrically mounted therein with the packing-rings in said sleeve and the rods and springs separating said rings, all substantially as and for the purpose specified.

3. The combination, in a rotary engine, of the casing, the piston therein, and the inlet and outlet ports leading thereinto with the valve-chest, the slide-valve therein, the rock-shaft R, connected to said valve, and the adjustable lever S, supporting said rock-shaft, all substantially as specified.

4. The combination of the casing, the rotatable sleeve therein eccentric to the shaft, the piston hung on said shaft and projecting through a slot in said sleeve, with the packing-rollers for said piston carried in said sleeve, and the packing-rings L L, all substantially as specified.



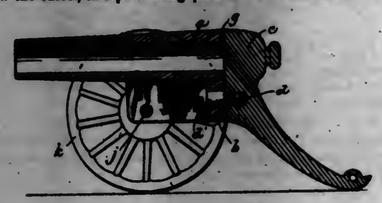
5. The combination of the casing, the main shaft, the rotatable slotted sleeve in said casing eccentric to said shaft, with the packing-rings in said sleeve, the springs and rods for separating the same, the piston hung on said shaft and projecting through the slot in said sleeve, and the packing-rollers for said piston within said sleeve, all substantially as described.

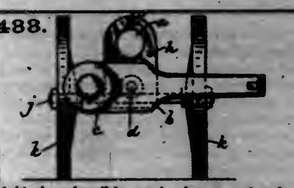
6. The combination of the casing, the rotatable sleeve therein eccentric thereto, and the concentric piston, substantially as described, and the inlet and outlet ports with the valve-chest, the valve therein, the rock-shaft R, connected to and operating said valve, the eccentric loosely mounted on the main shaft operating said rock-shaft, and the adjustable pivoted lever S, supporting said rock-shaft, all substantially as described.

7. The combination of the casing, the rotating sleeve eccentrically mounted therein, and the packing-rings in said sleeve with the adjustable shoes supporting said sleeve and the piston projecting through said sleeve, all substantially as and for the purpose described.

8. The combination, in a rotary engine, of the casing, the inlet and outlet ports, the rotatable sleeve eccentrically mounted in said casing, the packing-rings in said sleeve, and the piston and main shaft with the valve-chest, the slide-valve therein, the rock-shaft connected to said valve, the eccentric on the main shaft and the connections between the same and rock-shaft, and the lever supporting said rock-shaft and the adjusting devices therefor, all substantially as set forth.

410,482. STEAM-ENGINE. ROBT T. MCKAIN, Racine, Wis. Filed May 6, 1889. Serial No. 309,980. (No model.)

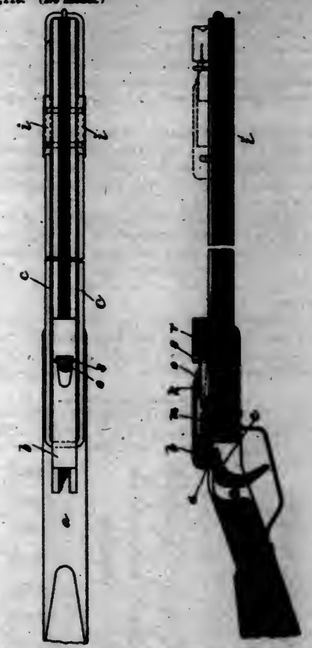




Claim.—1. In a steam-engine, the combination, with the driving eccentric and arms having segmental racks, of the pistons engaged by said racks having wings or guides, the overlapping piston rods or bars, one of which is provided with a lug and the other a slot to receive said lug, the adjusting-screw carried by one of the rods and engaging the lug of the other, and the bolts connecting said bars or rods, substantially as described.

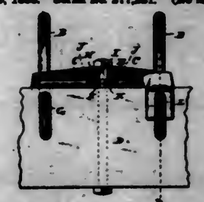
2. In a steam-engine, the combination of the pistons, the overlapping bars or rods, one having a lug and the other a slot to receive said lug, the set-screw carried by one of the bars and engaging the lug on the other, and the bolts connecting said rods or bars, substantially as described.

410,483. TOY CANNON. GEORGE W. HAM, Chelsea, assignor of one-half to E. H. Hunt, Reading, Mass. Filed Jan. 22, 1889. Serial No. 297,113. (No model.)



Claim.—In an improved toy cannon, the combination, with the barrel provided with a vent and having at its rear end a downwardly-projecting flange which is flush with the rear end of the barrel, of a breech-block and trail formed in a single piece, said piece having a close bearing on said flange and on the rear end of the barrel, and the screw or pivot connecting the breech-block and trail to the flange at a point below the barrel, said pivot being parallel with the barrel, whereby

the breech-block and trail is permitted to move in a lateral direction or at right angles to the barrel, substantially as shown and described.

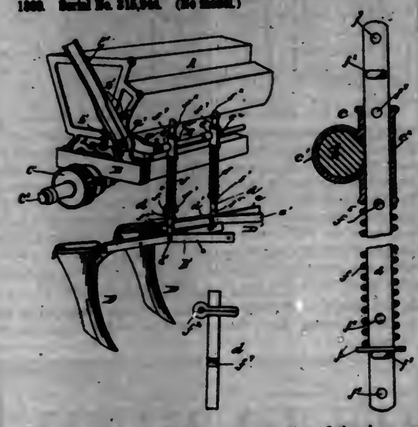


410,484. TOY GUN. GEORGE W. HAM, Chelsea, assignor of one-half to E. H. Hunt, Reading, Mass. Filed Jan. 22, 1889. Serial No. 297,119. (No model.)

Claim.—1. In a toy gun of the class described, the combination of the stock, the spring-impelled carrier supported by the stock and having a longitudinal cavity and a cap-supporting anvil, and a hammer sliding loosely longitudinally in said cavity, and a stop to arrest said carrier on its forward throw, substantially as and for the purpose specified.

2. In a toy gun, the combination of the stock, the carrier having a cap-supporting anvil, the impelling-spring connecting the carrier with the stock, a stop or stops on the stock, whereby the carrier is arrested, and a loose hammer located in a cavity in the carrier, as set forth.

410,485. RIGHT-ANGLE TOOTH-HOLDER. LEONARD W. O'BRIEN, Bellevue, Ohio, assignor to the Fremont Cultivator Company, same place. Filed June 18, 1888. Serial No. 277,261. (No model.)



Claim.—1. A tooth-holder provided with a longitudinal recess communicating with an opening at an angle thereto, in combination with a perforated rake-head to which said holder is secured, said holder provided with guard-lugs extending down along the sides of the perforation in the rake-head, for the purposes specified.

2. The combination of a head provided with a perforation for the tooth, said perforation being large at one end and small at the other end, a tooth provided with a swooping curved portion located between said perforation and the tooth-holder, and a tooth-holder rigidly secured to the head and holding the tooth in place, substantially as and for the purposes specified.

3. The combination of the head having a perforation large at one end and small at the other end, with a tooth having a curved portion between said perforation and its fixed end and having a portion at its upper end bent to engage with a tooth-holder, and a tooth-holder having vertically-extending flanges or lugs forming a friction-bearing for the sides of the tooth and secured to the head at the large end of the perforation in the head, substantially as and for the purpose specified.

410,486. GRAIN-DRILL. FRANK B. PARKHAM, Springfield, Ohio, assignor to the Superior Drill Company, same place. Filed June 20, 1888. Serial No. 278,044. (No model.)

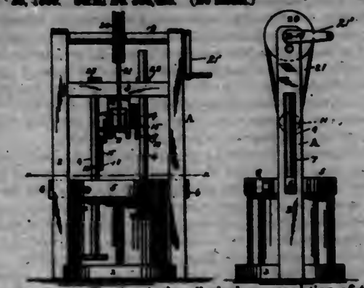
Claim.—1. In a grain-drill, the combination of the shoes and the pressure-bar, bearing-supports on said pressure-bar, links passing through said bearing-supports and attached to said hoes, and springs between said bearing-supports and hoes, substantially as specified.

2. The combination of the hoes and pressure-bar, the links attached to said hoes, springs on said links, and an adjustable collar below said springs on said links, and bearing-support journaled on said pressure-bar, through which said links pass, substantially as specified.

3. In a lifting device for grain-drills, the combination, with a lifting-bar, of a bearing-support journaled on said lifting-bar and a vertical sleeve for the lifting-links, and adjustable stops on said links above and below said bearing-support, substantially as specified.

4. In a grain-drill, lifting-links attached to the shoes or hoes, a lifting-bar adapted to be raised and lowered on the supporting-frame, bearing-supports on said lifting-bar adapted to form a variable connection between said bar and links, substantially as specified.

5. In a grain-drill, the lifting-links attached to the shoes or hoes, a lifting-bar adapted to be raised or lowered on the supporting-frame, and bearing-supports on said lifting-bar to form a variable connection between said links and bar, said bearing-supports being each provided with vertical and longitudinal sleeves to form bearings for the links and bar, respectively, said links and sleeves being joined together in close proximity, so as to bring the strain as close as possible to the centers of said bar and links, substantially as specified.



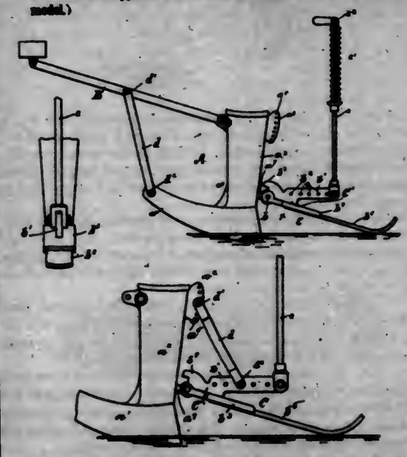
6. In a grain-drill, the combination of the hoes or shoes and their drag-bars and a movable bar arranged transversely across and above said drag-bars, lifting-links pivotally secured to said drag-bars, bearing-supports on said lifting-bar and connected to said links, springs on said links, and adjustable stops above and below said bearing-supports, substantially as specified.

7. The combination, in a grain-drill, of the shoes or hoes and their drag-bars, said drag-bars being attached at different points to the main frame to provide for a zigzag adjustment thereof, lifting-links pivotally secured to said drag-bars, a lifting-bar above said drag-bars, bearing-supports journaled on said lifting-bar, and lifting-links forming a connection between the same, substantially as set forth.

8. The combination, in a grain-drill, of the shoes or hoes and their drag-bars, lifting-links pivoted to said drag-bars, adjustable collars on said links, springs above said collars, a lifting-bar above said drag-bars, bearing-supports journaled on said lifting-bar and having a sleeve portion for said links above said springs, and adjustable stops on said links above said bearing-supports, substantially as specified.

9. The combination, in a grain-drill, of the shoes or hoes and their drag-bars, lifting-links pivoted to said drag-bars, adjustable collars on said links, springs above said collars, a lifting-bar above said drag-bars, bearing-supports connecting said links and lifting-bar, rocking arms attached to said bar, and a lifting-lever adapted to operate said lifting-bar, substantially as specified.

410,487. CHURN. JOHN W. PARKER, Milton, W. Va. Filed Mar. 26, 1889. Serial No. 304,633. (No model.)



Claim.—1. The herein-described churn, consisting of the base, the uprights rising therefrom, having the slots in the sides thereof, the sectional cover, one of the sections thereof having wings fitting in said slots, the cross-piece having the dovetailed recesses therein, the dovetailed bearings fitting in said recesses, the dasher-shafts fitting in said bearings, the plates connected to said shafts, the double cranks connected to said plates, the shaft and pulley for operating the cranks, the hanger for the pulley-shaft, and the driving-band pulley and shaft, all arranged and adapted to operate substantially as and for the purpose described.

2. In a churn, the combination of the uprights having slots therein, the cover having wings fitting in said slots, the dasher-shafts, plates, and double crank for operating the same, the cross-piece having dovetailed recesses to receive the dasher-shafts, and the dovetailed bearings fitting in said recesses, substantially as described.

3. In a churn, the combination of the driving-shaft and driving-pulley, the driving-cord, the pulley and double cranks, the plates, the dasher-shafts connected to the plates, the cover having wings, and the uprights having slots to receive the wings, substantially as described.

410,488. GRAIN-DRILL. CHARLES R. PARKER and FRANK B. PARKHAM, Springfield, Ohio, assignors to the Superior Drill Company, same place. (Original application filed Oct. 30, 1888. Serial No. 289,638. Divided and this application filed May 6, 1889. Serial No. 309,986. (No model.)

Claim.—1. In a grain-drill, a presser-foot pivoted to the shoe or hoe and provided with a lower runner and an upper bearing-support, and a connection from said bearing-support to the lifting mechanism, substantially as described.

2. In a grain-drill, a presser-foot having a lower flexible runner,

an upper bearing-support, and a stop projection to limit the upward movement of said bearing-support, substantially as specified.

3. The combination, with a grain-drill, of a presser-foot pivoted to a shoe or hoe and having a flexible runner and an upper bearing-support, a connection from said bearing-support to the raising and lowering mechanism, and means for adjusting said connection along said bearing-support, substantially as specified.

4. The combination, in a grain-drill and with the shoes or hoes, of a series of presser-feet—one for each shoe or hoe pivoted thereto—said presser-feet each being provided with a lower flexible runner and an upper bearing-support, a connection from each of said presser-feet to the raising and lowering mechanism, and means for connecting said presser-feet rigidly to the shoes or hoes, substantially as specified.

5. The combination, with a grain-drill shoe, of a presser-foot having a flexible runner and an upper bearing-support, a series of openings in said bearing-support to connect the raising and lowering mechanism, a stop on said presser-foot, and means, substantially as described, for connecting said presser-foot rigidly to the said hoe or shoe in different positions of adjustment, substantially as specified.

6. The combination, with a grain-drill shoe having a backwardly-extending flange with a series of openings therein and a boss or projection on the same side with said flange, of a presser attachment pivoted to said boss or projection having a lower flexible runner and upper bearing-support, said bearing-support being provided with a series of openings adapted to be connected by a link-connection to the respective openings in said flange, substantially as specified.

7. The combination, with a grain-drill shoe or hoe, of a presser-foot pivoted thereto, said presser-foot being provided with a lower flexible runner and an upper bearing-support, a connection from said bearing-support to the raising and lowering mechanism, said connection being provided with an elastic or yielding portion adapted to exert a pressure on said presser-foot, substantially as specified.

8. The combination, with a grain-drill hoe having a backwardly-extending flange with a series of openings therein, of a presser-foot pivoted to said hoe and provided with a lower flexible runner, and an upper bearing-support having a series of openings adapted to be connected by a link to the openings in said flange, a stop on said presser-foot, and a yielding connection from said bearing-support to the raising and lowering mechanism, substantially as specified.

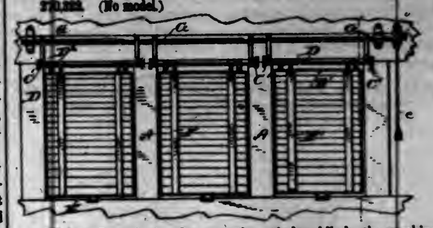
9. The combination, with a grain-drill shoe or hoe, of a pressing attachment having a bearing-support pivoted to said shoe and a flexible runner connected to said bearing-support, said runner being convex in cross-section on its bottom surface, substantially as specified.

410,439. COAT-HOLDER. WILLIAM D. G. PATTISON, Boston, Mass., assignor to Charles H. Lowell, trustee, same place. Filed Feb. 13, 1888. Serial No. 263,760. (No model.)

Claim.—1. A coat-holder composed of separable jaws at the outer ends of pivoted levers *b b'*, and a plate with which one of said levers is pivotally engaged and on which the other lever is movable, the arrangement being such that the jaws are automatically closed by their own weight and opened by an outward and upward pull on the upper jaw, as set forth.

2. In a coat-holder, the combination of separable jaws, pivotally-connected levers supporting said jaws, a plate with which one of said levers is pivotally connected and on which the other lever is movable, and means for supporting the lever of the upper jaw at different heights, as and for the purpose specified.

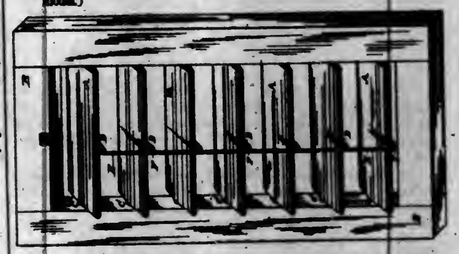
3. In a coat-holder, the combination of the upper and lower jaws, the levers *b b'*, carrying said jaws, said levers being crossed and pivoted together at *c*, and the plate *e*, to which the lever *b'* is pivotally connected, and on which the lever *b'* is movable, as set forth.



4. In a coat-holder, the combination of the upper and lower jaws, the levers *b b'*, carrying said jaws, said levers being crossed and pivoted together at *c*, and the plate *e*, to which the lever *b'* is pivotally connected, and on which the lever *b'* is movable, and an adjustable rest *g* to support the lever *b'* at different heights, as set forth.

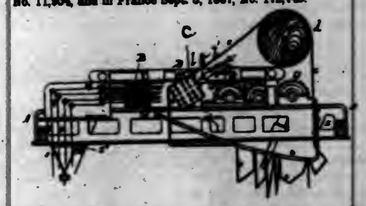
5. The combination, with the jaws *a a'* and crossed pivoted levers *b b'*, of the plate *e*, to which the lever *b* is pivoted, the rest *g*, hinged to said plate, and the bar or stop *i*, adapted to support said rest in different positions, as set forth.

6. The combination of the elongated jaws *a a'*, having concave inner edges, the levers *b b'*, to which said jaws are affixed, and the supporting-plate, to which one of said levers is pivotally secured and on which the other lever is movable, as set forth.



7. In a coat-holder, the combination of the jaws *a a'*, the pivotally-connected levers *b b'*, supporting said jaws, and the plate *e*, having ears to which the lever *b* is pivotally connected, the lever *b'* bearing on said plate without engagement therewith, whereby the levers and jaws may be turned upwardly out of the way, as set forth.

410,440. DEVICE FOR OPERATING WINDOW-BLINDS, &c. WILLIAM H. PAULDING, Peekskill, N. Y. Filed Apr. 11, 1888. Serial No. 270,222. (No model.)



Claim.—In a device for operating window-blinds, the combination of a spring-actuated roller located adjacent to the upper part of the window, a series of independent auxiliary rollers parallel with the main roller, bands for connecting the auxiliary with the main roller, whereby motion may be imparted to each of the auxiliary rollers by the rotation of the main roller, window-shades or blinds below the auxiliary rollers, hoisting-cords connected at their lower ends to the cross-bar of the blinds and at their upper ends to the auxiliary rollers, tapes secured to the supporting-slats and passing around the auxiliary rollers, and means, substantially as described, for releasing the spring-roller to cause it to raise the blind, substantially as described.

410,441. WINDOW BLIND OR SHUTTER. WILLIAM H. PERKINS, Cleveland, Ohio. Filed Oct. 18, 1886. Serial No. 215,909. (No model.)

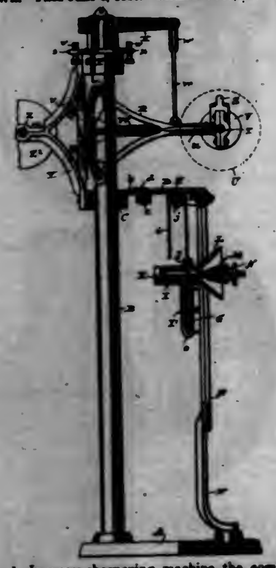
Claim.—In a window-blind, the combination, with pivoted slats A, having staples D arranged in a line at right angles to the slats, of the wire E, formed with loops F, formed all on one side of the wire, substantially as and for the purpose described.

410,442. SHEDDING MECHANISM FOR LOOMS. EDUARDO PONT, Barcelona, Spain. Filed Mar. 6, 1888. Serial No. 266,288. (No model.) Patented in Spain May 3, 1887, No. 10,739; in England Sept. 3, 1887, No. 11,954, and in France Sept. 5, 1887, No. 179,749.

Claim.—1. The combination, with a perforated movable needle-guide bar, bar C, and devices for operating said bars, of needles passing through the guide-bar, rods Q, over which the needles pass at the rear, rods Q', located to the rear of and below rods Q, and cords O, secured to rear ends of the needles and passed around bars Q and Q', in the manner and for the purpose set forth.

2. The combination, with a reciprocating card-bar having squared faces, spring-actuated pawls at the ends thereof, the one at one end being mounted on one side of the bar and the one at the other end being mounted on the opposite side of the bar, and cords for withdrawing each pawl from engagement with the bar, of needles, a perforated movable needle-guide bar through which the needles pass, rod Q, over which the needles pass at the rear, rods Q', located to the rear of and below rods Q, and cords O, secured to the rear of the needles and passed around bars Q and Q', in the manner and for the purpose set forth.

410,443. TRUNK FOR COTTON-CLEANING APPARATUS AND THE LIKE. JAMES G. POTTER, Pawtucket, R. I. Filed June 17, 1888. Serial No. 314,888. (No model.)



Claim.—1. A trunk for cleaning cotton or the like, consisting of a passage for the material to be cleaned, a grated bottom for said passage, and a dust-chamber below said grated bottom divided into a series of separate dust-receptacles by partitions movable so as to convert at will the series of separate receptacles into a continuous chamber or passage, substantially as and for the purpose hereinbefore set forth.

2. A trunk for cleaning cotton or the like, consisting of a passage for the material to be cleaned, a grated bottom for said passage, a dust chamber or passage below said grated bottom, and hinged partitions or gates which when dropped divide said dust chamber or passage into separate dust-receptacles, and which when raised close up toward or against the grated bottom, substantially as and for the purposes hereinbefore set forth.

3. A trunk for cleaning cotton and the like, comprising a passage for the material to be cleaned, a grated bottom for said passage, a dust chamber or passage below said grated bottom, movable partitions in said dust-chamber, whereby the chamber can be converted into a series of separate dust-receptacles at will, an air-supply opening above the grated bottom, and a door or gate for closing the outlet end of the passage for the material to be cleaned, substantially as and for the purposes hereinbefore set forth.

4. A trunk for cleaning cotton and the like, comprising a passage for the material to be cleaned, a grated bottom for said passage, a dust chamber or passage below the grated bottom, hinged partitions for converting said chamber into a series of separate dust-receptacles, and partition actuating devices outside of the trunk, substantially as and for the purposes hereinbefore set forth.

410,444. SAW-SHARPENING MACHINE. ARGOST F. RADANT Wausau, Wis. Filed June 6, 1889. Serial No. 313,247. (No model.)

Claim.—1. In a saw-sharpening machine, the combination of a pivoted frame, a transverse track-bar vertically adjustable on the frame, and a saw-carriage laterally adjustable on the track-bar, substantially as set forth.

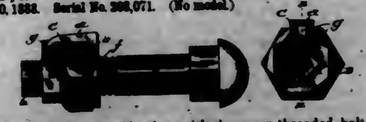
2. In a saw-sharpening machine, the combination of a pivoted frame having vertical sides provided with guides, bolts arranged in the guides, a transverse track-bar supported on the bolts, set-nuts arranged on said bolts to impinge against the track-bar, a crank-shaft journaled in the frame, sprocket-wheels carried by the shaft and chains passed over the sprocket-wheels and connected to the track-bar, and a saw-carriage laterally adjustable on said track-bar, substantially as set forth.

3. In a saw-sharpening machine, the combination of a rectangular frame having a depending goose-neck pivoted to a suitable base, a segmental plate connected to the upper side of the frame, a guide for this plate, a transverse track-bar vertically adjustable on said frame, and a saw-carriage laterally adjustable on the track-bar, substantially as set forth.

4. In a saw-sharpening machine, the combination of a pivoted frame having the greater portion thereof on one side of its pivot-point, a counter-balance for the frame, a track-bar vertically adjustable on said frame, and a saw-carriage laterally adjustable on the track-bar, substantially as set forth.

5. In a saw-sharpening machine, the combination of a pivoted lever, a yoke having rearwardly-extended arms linked to the lever, a revoluble shaft having its bearings in the yoke, a grinding-wheel carried by the shaft, segments connected to said yoke to center on the shaft, and tracks for the segments, substantially as set forth.

6. In a saw-sharpening machine, the combination of a pivoted lever, a yoke having rearwardly-extended arms linked to the lever, a revoluble shaft having its bearings in the yoke, a grinding-wheel carried by the shaft, segments connected to said yoke to center on the shaft, tracks for the segments, and anti-friction rollers arranged on said yoke-arms to travel on said segment-tracks, substantially as set forth.

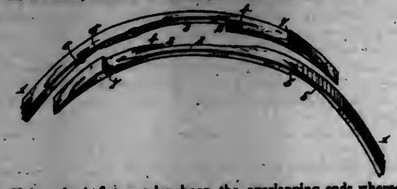


7. In a saw-sharpening machine, the combination of a pivoted lever, a yoke having rearwardly-extended arms linked to the lever, a revoluble shaft having its bearings in the yoke, a grinding-wheel carried by the shaft, toothed segments connected to said yoke to center on the shaft, and racks arranged to engage the segments, substantially as set forth.

8. In a saw-sharpening machine, the combination of a pivoted lever, adjustable stops for the lever, a yoke having rearwardly-extended arms linked to the lever, a revoluble shaft having its bearings in the yoke, a grinding-wheel carried by the shaft, segments connected to said yoke to center on the shaft, and tracks for the segments, substantially as set forth.

9. In a saw-sharpening machine, the combination of a pivoted lever, a yoke having rearwardly-extended arms linked to the lever, a shaft having its bearings in the yoke, a grinding-wheel and a pulley carried by the shaft, segments connected to said yoke to center on the shaft, tracks for the segments, suitably-arranged brackets, a drive-shaft having its bearings in the brackets, and a pulley arranged on the drive-shaft for belt-connection with the pulley on the shaft that carries said grinding-wheel, substantially as set forth.

10. In a saw-sharpening machine, the combination of a base, a standard connected to the base, a collar arranged on the standard and provided with a flange having a segmental guide, a frame having a depending goose-neck pivoted to said base and a top plate arranged to work in the segmental guide, a track-bar vertically adjustable on the frame, a saw-carriage laterally adjustable on the track-bar, a pivoted lever supported on said standard, a yoke having rearwardly-extended arms linked to the lever, a revoluble shaft having its bearings in the yoke, a grinding-wheel carried by the shaft in line with the goose-neck pivot, segments connected to said yoke to center on the shaft, and tracks for the segments, substantially as set forth.



410,445. NUT-LOCK. ANDREW KERR, Lawrence, Kans. Filed Dec. 10, 1888. Serial No. 293,071. (No model.)

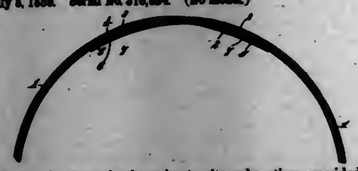
Claim.—1. The combination, with the screw-threaded bolt having angularly-reduced end and a nut, of a wrench-shaped locking-bar C, consisting of two jaws *c c*, with right-angular shank *d*, the said jaws being adapted to embrace the angular end of the bolt and provided with a locking tooth or dog *g*, as and for the purpose described.

2. The combination, with the screw-threaded bolt A, having angularly-reduced end *a*, and a nut B, with recess *f*, of the wrench-shaped locking-bar C, having jaws *c c*, with tooth or dog *g*, and the right-angular shank *d*, with flange or lip *e*, substantially as shown and described.

410,446. FLAT WOODEN HOOP. JOHN F. RICH, Summertown, assignor of two-thirds to Luther L. Frierson, Mount Pleasant, Tenn. Filed Feb. 11, 1889. Serial No. 299,431. (No model.)

Claim.—1. A flat wooden hoop, the overlapping ends whereof are provided with lapping notches extending partly across the width of the hoop, forming transverse edges, each of which has a chamfer upon its external face, substantially as described.

2. A wooden hoop having its overlapping ends notched, and provided upon one or both ends with shoulders on the inner face of the hoop, said shoulders engaging the oppositely-formed shoulders near the ends of the lapped portions and upon the outer faces thereof, said shoulders being so located that when engaged the transverse edges of the lapping notches are held out of contact or engagement with each other, substantially as described.



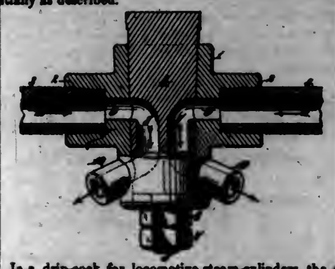
3. A wooden hoop having the lapping notches 2, each provided with a chamfer 4 on its back or external face, and provided with transverse locking-shoulders upon the inner face of said hoop, engaging with oppositely-formed transverse shoulders upon the outer faces of the engaging ends, said shoulders being so located that the radial or bursting strain shall be substantially removed from the lapping notches 2, substantially as described.

4. A wooden hoop for barrels, casks, and similar purposes, the same having lapping notches 2, the wood being chamfered off upon the external faces of the lapping portions adjacent to said notches, said lapping portions being provided upon their inner faces with transverse shoulders extending entirely across the inner face of the hoop and adapted to engage with opposite shoulders on the external face of the lapping ends, the latter being tapered to lie in the recesses 6 beyond the transverse shoulders, substantially as described.

5. A flat wooden hoop having notches 2, the wood being beveled or chamfered on the exterior faces 4, the lapping portions being provided with interior locking-notches 5 and exterior notches 7, the wood of the extremities of the hoop being cut away to lie in recesses 6, adjacent to the shoulders 5, and the wood of the outer faces of the lapping ends being removed adjacent to the exterior shoulders to permit the engagement thereof with the interior shoulder without increase of thickness, substantially as described.

6. A wooden hoop having notches 2, edges 3, interior shoulders 5, exterior shoulders 7, recesses 6, and tapered extremities lying in said recesses, substantially as described.

410,447. FLAT WOODEN HOOP. JOHN F. RICH, Summertown, assignor of two-thirds to Luther L. Frierson, Mount Pleasant, Tenn. Filed July 8, 1889. Serial No. 316,894. (No model.)

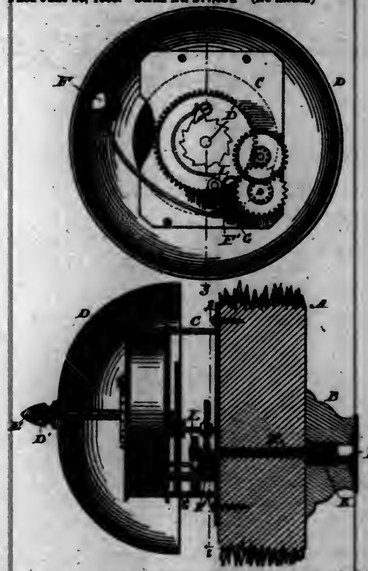


Claim.—1. A wooden hoop having its end portions provided with lapping notches cut in the edges and provided upon one or both lapped portions with an angular shoulder, the recess adjacent to the same being provided with notches or corrugations, while the engaging extremity of the hoop has an opposite shoulder and a tapered or beveled end provided with notches or corrugations engaging those in the said recess, substantially as described.

2. A wooden hoop having a lap-notch 2 in each extremity and provided with a shoulder 3 in each lapping portion, formed by a recess having notches or corrugations 4, the ends of the hoop being provided with opposite shoulders 7 and tapered or beveled extremities having notches or corrugations 6, substantially as described.

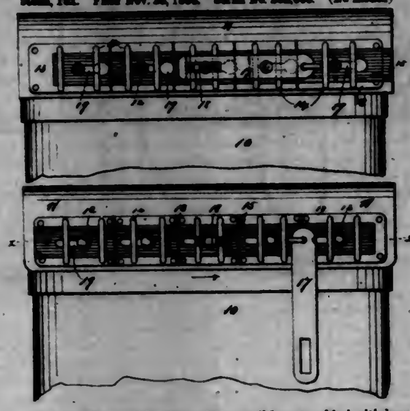
410,448. DRIP-COCK FOR LOCOMOTIVE-CYLINDERS. HENRY H. ROGUE, Wilmington, Del. Filed Apr. 11, 1889. Serial No. 306,854. (No model.)

Claim.—1. In a drip-cock for locomotive steam-cylinders, the combination, with the drip-pipes leading from opposite ends of said cylinders, of a centrally-located drip-cock having two separate and easily-distinguished outlets and a valve by which communication between both drip-pipes and both outlets may be simultaneously made, substantially as described.



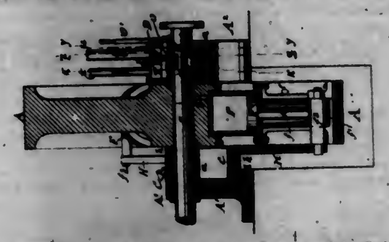
2. In a drip-cock for locomotive steam-cylinders, the combination, with the drip-pipes entering opposite ends of the steam-cylinder, of a drip-cock having two separate and divergent outlets, a valve of slightly-tapering form having a stem passing the bottom of the valve-casing and receiving a draft or set nut and a jam-nut, and means for operating the valve to open the discharge from both ends of the steam-cylinder simultaneously, substantially as described.

3. In a drip-cock for locomotive steam-cylinders, the combination, with the pipes leading from the ends of the steam-cylinder, of a valve having two downwardly-directed outlets, a valve by which both outlets are opened at the same time, and a lever operating the valve and having a stop-pin running in a recess in the valve-casing to control the throw of the lever, substantially as described.



4. In a drip-cock for locomotive steam-cylinders, the combination, with a valve-casing having opposite wings, of pipes tapped into said wings and entering the ends of the steam-cylinder, a tapered valve or plug lying in said casing and having a threaded stem passing through its end, and receiving-nuts, one to set the valve and the other to lock the set-nut, a lever mounted upon the valve and provided with a stop-pin running in a way in the valve-casing, and means for operating said lever, whereby discharge is given to both ends of the steam-cylinder at the same time, the valve-casing being provided with two downwardly-turned diverging outlets, which in one position of the valve register with passages therein communicating at their other ends with the drip-pipes entering the opposite ends of the steam-cylinder, substantially as described.

410,449. DOOR-BELL. ALBERT F. ROCKWELL, Jacksonville, Fla. Filed June 20, 1888. Serial No. 277,894. (No model.)

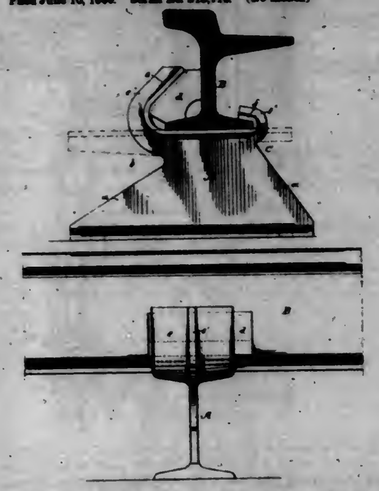


Claim.—In a door-bell mechanism secured within a building, the combination of a spring push-button to be operated from the outside, a bell-wire and bell-crank levers connecting the spring push-button with the alarm-bell mechanism, a push-rod provided with a retracting-spring and connected with the bell-wire, and a stop upon the inner end of the push-rod for engagement or disengagement with the tappet of the alarm mechanism, all arranged substantially as set forth.

410,450. MAIL-BAG FASTENING. JAMES A. ROOSEVELT, Hempstead, Tex. Filed Nov. 26, 1888. Serial No. 292,066. (No model.)

Claim.—The combination, with a mail-bag provided with headed studs and apertures adapted to receive said studs, of a closing-flap, also apertured to receive the studs, a slide provided with key-hole slots adapted to receive the studs and protected by metallic plates, staples or loops secured to the flap overlapping the slide and serving as a guide for the same, a hasp pivotally secured to the slide between two adjacent staples, whereby the motion of the slide is limited, and a staple or bow 18, carried by two of the staples and adapted to engage with the hasp 17, substantially as and for the purpose described.

410,451. STEAM-ENGINE. FERDINAND S. ROTHMAN, Plainfield, N. J. Filed Oct. 12, 1888. Serial No. 287,916. (No model.)



Claim.—1. The combination of a central shaft, radial cylinders mounted on said shaft, a fly-wheel concentric to said shaft, guide-rails connecting the cylinders and fly-wheel, cross-heads connected to the piston-rods of the cylinders, a stationary eccentric surrounding the shaft, and strap-rods applied to the stationary eccentric outside of the plane of the fly-wheel and pivoted to the cross-heads, substantially as set forth.

2. The combination of supporting-standards having bearings, a central shaft supported on said bearings, a stationary eccentric surrounding said shaft and forming a part of one of the standards, radial cylinders mounted on said shaft, a fly-wheel concentric to said shaft, guide-rails connecting the cylinder and fly-wheel, cross-heads connected to the piston-rods of the cylinders, and strap-rods applied to the stationary eccentric and pivoted to the cross-heads outside of the plane of the fly-wheel, substantially as set forth.

3. The combination, with a central shaft having longitudinal channels and ports, of cylinders mounted radially on said shaft, a fly-wheel extending around said cylinders, guide-rails connecting the cylinders and fly-wheel, cross-heads for the piston-rods, a stationary eccentric surrounding said shaft, strap-rods pivoted to the cross-heads and applied to said eccentric, a steam-chest having a transverse partition forming a live-steam and an exhaust chamber, annular steam-channels around the shaft, abutments in said channels, and a cylindrical reversing-valve having ports at right angles to each other, substantially as set forth.

4. The combination of a central shaft having longitudinal channels and ports, cylinders mounted on said shaft, a fly-wheel concentric to said shaft, guide-rails connecting the cylinders with the fly-wheel, cross-heads for the piston-rods guided in said rails, a stationary eccentric located outside of the fly-wheel and surrounding the central shaft, strap-rods pivoted to the cross-heads and applied to the eccentric, a steam-chest having a transverse partition forming a live-steam and exhaust chamber, annular steam-supply and exhaust channels communicating with the ports and channels in the shaft, a cylindrical reversing-valve having steam-supply and exhaust ports at right angles to each other, abutments located in the annular supply-channel at the upper and lower part of the same, a cut-off valve having longitudinal bars located in the steam-supply channel, and mechanism for setting said cut-off valve, substantially as set forth.

410,452. RAIL-CHAIR. EDWARD SAWER, Philadelphia, Pa., assignor to William Wharton, Jr., and Company, (Incorporated,) same place. Filed June 10, 1889. Serial No. 313,716. (No model.)

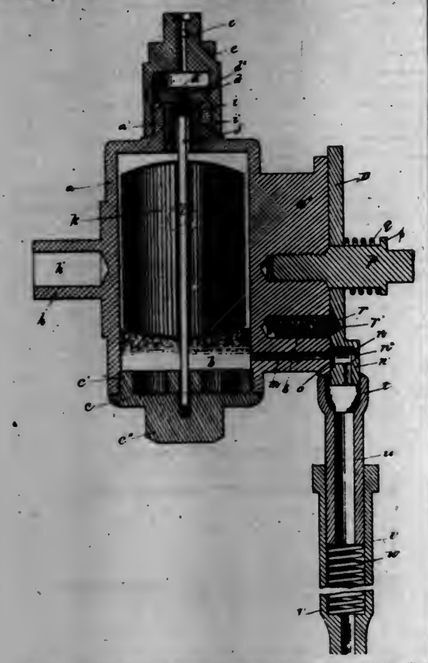
Claim.—1. A rail-chair made from a beam or shape, having a web and a top plate or flange, and having the web partly severed and that portion of the top plate or flange thus freed bent so as to form a rail-retaining lip, substantially as specified.

2. A rail-chair made from a beam or shape, having a web and top plate or flange, and having the web partly severed and that portion of the top flange thus freed bent over in the direction of the length of the beam, so as to form a rail-retaining lip, substantially as set forth.

3. A rail-chair made from a beam or shape, having a web and base and top plate or flange, and having the web partly severed and that portion of the top plate thus freed bent so as to form a rail-retaining lip, substantially as specified.

4. A rail-chair made from a beam or shape, having a web and top plate or flange, and having the web severed at a point some distance below the top flange and the portion of the top flange with adhering web thus freed bent to form a rail-retaining lip with outer strengthening-rib, substantially as specified.

5. A rail-chair made from a beam or shape, the outer portions of the top plate and portions of the web being bent upward to form ribbed retaining-lugs for the rail, substantially as described.



6. A rail-chair made from a beam or shape, having a web and top plate or flange, and having the web partly severed and that portion of the top flange thus freed bent to form a rail-retaining lip, the web extending diagonally outward from said lug toward the base, substantially as set forth.

7. The combination of a rail-chair made from a beam or shape and having lips or lugs *e* and *f*, the lug *e* extending a certain distance above the foot of the rail, with a wedge *d* bearing against the web and flange of the rail and against the inner face of the retaining-lug *e*, substantially as specified.

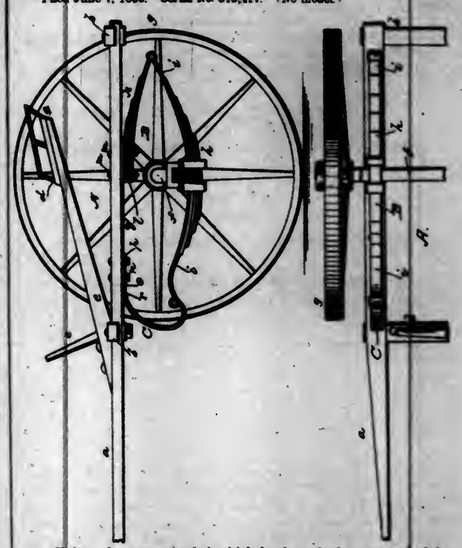
410,453. AUTOMATIC OIL-FEEDER FOR OIL-STOVES. ABNER G. BARNEBY, Titan, assignor of one-half to the Lacasta Car Company, Lacasta, N. H. Filed Mar. 14, 1889. Serial No. 303,294. (No model.)

Claim.—1. In an automatic oil-feeder, the combination of an oil-chamber having inlet and outlet passages, a valve for said inlet-pas-

sage, a float within the chamber controlling said valve, and a movable plate having a plurality of outlet-passages adapted to coincide interchangeably with the outlet-passage, as set forth.

2. In an automatic oil-feeder, the combination of an oil-chamber having inlet and outlet passages, an automatic valve to control the admission of oil to said chamber, a rotary plate or dial properly connected to said chamber and provided with a plurality of outlet-passages, and a latch or detent, whereby said plate may be held with either of its passages in register with the outlet-passage of the chamber, as set forth.

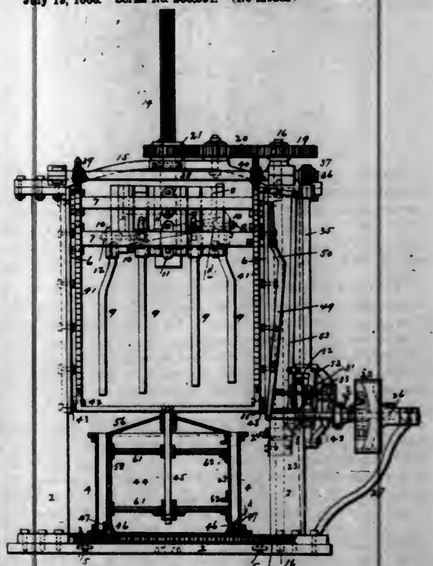
3. In an automatic oil-feeder, the combination of an oil-chamber having inlet and outlet passages, an automatic valve controlling the admission of oil to said chamber, a movable plate having a plurality of outlet-passages adapted to coincide interchangeably with the outlet-passage of the oil-chamber, and disks removably inserted in the outlet-passages of said plate and provided with apertures of different sizes, said apertures regulating the outflow of oil from the chamber, as set forth.



4. The oil-chamber having the inlet and outlet passages, the float-supported inlet-controlling valve, and the pipe or conduit arranged above the outlet-passage, whereby air is admitted to the chamber and an undue accumulation of oil therein is prevented, as set forth.

5. The oil-chamber having the oil-inlet, the float-supported valve, and the boss or projection in which is formed the oil-outlet, combined with the plate or dial pivotally connected to said boss and having a plurality of outlet-passages adapted to register interchangeably with the outlet-passage of the chamber, and a series of notches corresponding in number and arrangement with said outlet-passages, and a spring-pressed bolt or latch in said boss adapted to engage either of said orifices, as set forth.

6. The oil-chamber having the oil-inlet, the float-supported valve, and the boss or projection in which is formed the oil-outlet, combined with the plate or dial pivotally connected to said boss and having a plurality of outlet-passages adapted to register interchangeably with the outlet-passage of the chamber, each of said passages having a removable apertured disk inserted in a countersunk seat in the inner side of said plate, and a spring whereby said plate is pressed against said boss, as set forth.



7. The combination, with the oil-chamber having the inlet and outlet passages and the automatic inlet-controlling valve, of the cup located on a spring-supported tube or conduit, forming a part of the conduit that conducts the oil from the chamber to the lamp, said cup being adapted to be depressed to show the feeding of the oil, as set forth.

410,454. TWO-WHEELED VEHICLE. EDWARD P. SETTLES, BENJAMIN F. SETTLES, and WILLIAM H. SETTLES, Jr., Mount Sterling, Ky. Filed June 7, 1889. Serial No. 313,417. (No model.)

Claim.—In a two-wheeled vehicle having a body composed of the shafts *a a*, united by cross-bars both front and rear, the inclined seat-bars *c*, and also a cranked axle *f*, the combination of the side springs B, each composed of a lower compound semi-elliptic spring clipped directly to said axle, the upper compound leaf-spring *k*, pivoted to the rear spring *k* and bolted rigidly to the shaft directly over the axle, and the single-leaf C-spring also bolted to the shaft and pivoted to the front curved extension *i* of the lower spring *k*, all constructed and adapted to operate as shown and described.

410,455. TILE-MACHINE. WILLIS D. SHERMAN, Omaha, Nebr., assignor to the Union Hydraulic Drain Tile Company, same place. Filed July 19, 1888. Serial No. 280,391. (No model.)

Claim.—1. In a tile or pipe machine, the combination, with a base-piece, of hollow columns secured thereto, a revoluble table upon the base, a cross-piece secured to the tops of the columns, a vertical shaft within one of the columns, tamping mechanism between the columns, gear-wheels on the vertical shaft for operating the tamping mechanism and table, and a driving-pulley for operating the vertical shaft.

2. In a tile or pipe machine, the combination, with a base-piece, of vertical columns secured thereto, a table upon the base, a shaft across the top of the machine, a sprocket-wheel upon each end of the shaft, a cross-piece between the columns, a core suspended from the cross-piece, and two chains from the cross-piece over the sprocket-wheel.

3. In a tile or pipe machine, the combination, with a base piece, of vertical columns secured thereto, a table upon the base, tamping mechanism above the table, a vertical shaft, and mechanism connecting the shaft and tamping mechanism, a bevel-wheel upon the shaft, a hollow shaft journaled in one of the columns having a bevel-wheel at one end and a clutch at the other, a shaft within the hub, and a drive-pulley upon the shaft.

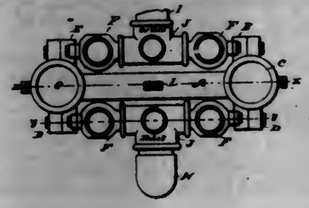
4. In a tile or pipe machine, the combination, with a base-piece, of a table journaled thereon, tamping mechanism above the table, two clutches, one of which controls the rotary movement of the tamping mechanism and the table, and the other one controls the vertical movement of the tamping mechanism, and two systems of levers for operating the clutches.

5. In a tile or pipe machine, the combination, with a base-piece, of vertical columns secured thereto, a table upon the base, a cross-piece between the columns, a core suspended from the cross-piece, a shaft at the tops of the columns, two sprocket-wheels, and a spiral gear upon the shaft, a vertical shaft at the side of one of the columns, the upper end of which is provided with a worm-gear, a bevel-wheel upon the lower end of the vertical shaft, two clutch bevel-wheels engaging with the bevel-wheel upon the end of the shaft, a clutch-wheel engaging with said two bevel-wheels, and a handle for operating the clutch-wheel.

6. In a tile or pipe machine, the combination, with a base-piece, of vertical columns secured thereto, a table upon the base, tamping mechanism above the table, a clutch at the side of the machine, a bell-crank lever pivotally secured to the side of the column above the clutch, a rod at the side of the column, the lower portion of which is pivotally connected with one arm of the lever, and two stops or levers secured to the ends of the rod.

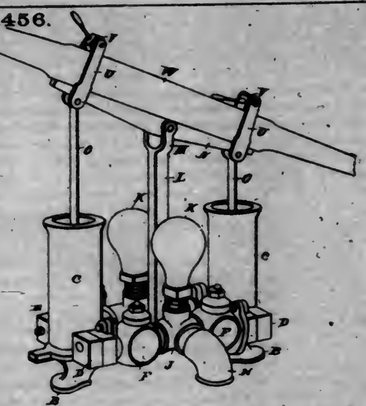
7. In a tile or pipe machine, the combination, with a base-piece, of vertical columns secured thereto, a table upon the base, tamping mechanism above the table, a clutch at the side of the machine, a slide-bar, one end of which engages with the clutch and the other end projects beyond the inner face of the column at that side, a lever pivoted to the side of the column, the lower end of which engages with the slide-bar and the upper end is bent or inclined, and a stop upon the tamping mechanism.

8. In a tile or pipe machine, the combination, with a table, of a core, the adjoining edges of the shell of which are inclined, a wedge-shaped block, two cross-pieces secured to the block, two pairs of stops secured to the inner side of the shell opposite the inclined edges, and a rod passed up through the cross-pieces and through the top of the core.



9. In a shell for tile or pipe machines, the combination, with the body of the shell, of rings secured thereto, the middle one of which is provided with a groove upon its under side.

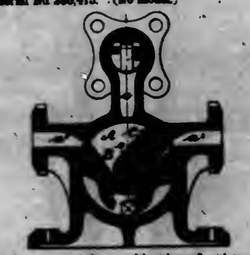
10. The combination, with a shell for tile or pipe machines, of pins or legs at one end.



410,456. PUMP. FREDERICK W. SEVILL, Galion, Ohio. Filed Apr. 20, 1889. Serial No. 307,961. (No model.)

Claim.—1. In a pump, the combination of the base, the cylinders mounted upon the same and having lateral extensions provided with entrance and exit channels, the valve-chambers connecting said channels, respectively, with the suction and exit pipes, and the air-chambers extending upwardly from the T-couplings, which connect the suction and exit pipes with the valve chambers or casings, substantially as and for the purpose herein set forth.

2. In a double-acting force-pump, the standard L, having the



410,456.

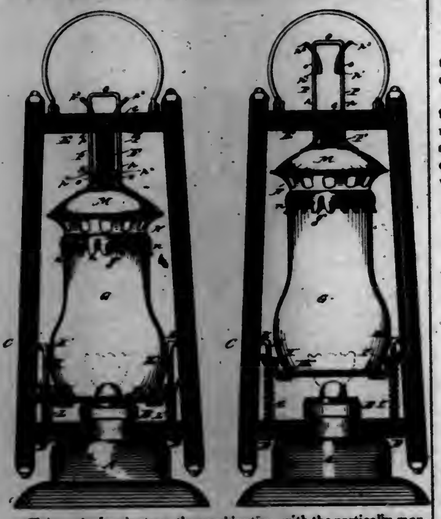
walking-beam N pivoted thereto, combined with the handle W, the cylinders C C, the piston O, and the cam-levers V, carried by the rods of the pistons to clamp against the handle W and bind not only the handle and walking-beam together, but also connect the pistons thereto, as set forth.

410,457. PUMP. ALFRED SIEBERT, New York, N. Y. Filed July 19, 1888. Serial No. 280,413. (No model.)

Claim.—1. In a pump, the combination of a piston-chamber having two discharge-passages leading therefrom, and an intermediary port through which the oil or other liquid is admitted, a valve within said chamber provided with outer rounded sides bearing against the inner sides thereof and adapted to receive an oscillating motion and open and seal said discharge-passages, a wing-piston bearing upon said valve and against the inner wall of said chamber, and a piston-rod adapted to operate said piston, whereby an oscillating motion is given said valve and the liquid discharged, substantially as described.

2. In a pump, the combination of a piston-chamber having two discharge-openings leading therefrom, and an intermediary port through which the oil or other liquid is admitted, a valve mounted upon trunnions and provided with outer rounded sides, and end pieces having bearings against the inner wall of said chamber, said valve being adapted to receive an oscillating motion and open and seal said discharge-passages, a wing-piston bearing upon said valve and against the inner surface of said chamber, and a piston-rod adapted to operate said piston, whereby an oscillating motion is given said valve and the oil discharged, substantially as described.

410,458. PUMP. ALFRED SIEBERT, New York, N. Y. Filed July 19, 1888. Serial No. 280,414. (No model.)



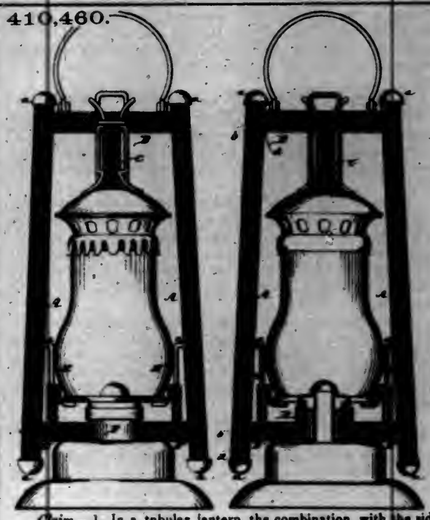
Claim.—1. In a pump, the combination of a piston-chamber provided with two discharge-passages and intermediary inlet port or ports, a cylinder having openings in its sides and adapted to move

back and forth within said chamber and connect said openings with the discharge-passages and inlet-ports, and a piston provided with a rod adapted to operate the same within said cylinder, whereby both piston and cylinder are given a reciprocating motion and the oil or other liquid admitted and discharged, substantially as described.

2. In a pump, the combination of a piston-chamber provided with two discharge-passages and intermediary inlet port or ports, a cylinder having openings in its sides and adapted to move back and forth within said chamber and connect said openings with the discharge-passages and inlet-ports, and a piston provided with a rod adapted to operate the same within said cylinder, said chamber being further provided with channels and connections between said discharge-passages and inlet port or ports and adapted to render said pump single-acting, substantially as described.

3. In a pump, the combination of a piston-chamber provided with two discharge-passages and intermediary inlet port or ports, a cylinder having openings in its sides and adapted to move back and forth within said chamber and connect said openings with the discharge-passages and inlet-ports, a piston provided with a rod adapted to operate the same within said cylinder, and an equalizing-pipe connecting the ends of said chamber, whereby the oil admitted therein and without said cylinder is allowed to flow back and forth, substantially as and for the purpose set forth.

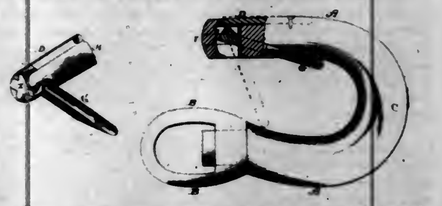
410,459. TUBULAR LANTERN. Orrin M. Smith, Philadelphia, Pa., assignor to William Grange, same place. Filed Mar. 17, 1888. Serial No. 267,544. (No model.)



Claim.—1. In a lantern, the combination, with the vertically-movable air-plate H and the globe G, of the dome M, having a depending flange N, with spring-fingers *n n*, grasping bead *g* on said globe, substantially as described.

2. In a lantern, the combination, with the dome M, spring-catches P P, the horizontal tube E, and the staples *e e*, with which said catches engage, of the depending flange N, the spring-fingers *n n* on said flange, and the globe G, having bead *g* engaging with said fingers, substantially as described.

410,460. TUBULAR LANTERN. Orrin M. Smith, Philadelphia, Pa., assignor to William Grange, same place. Filed Mar. 19, 1888. Serial No. 267,732. (No model.)



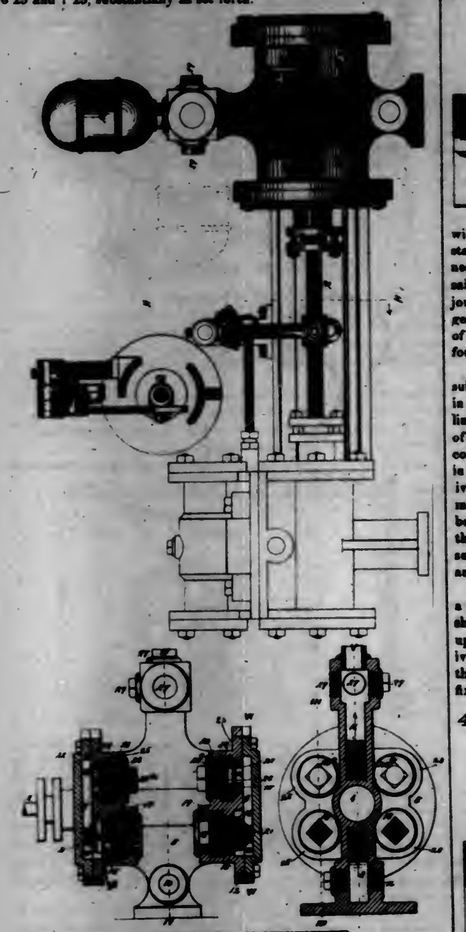
Claim.—1. In a tubular lantern, the combination, with the side tubes A A, having notches *d d*, of the horizontal tubes having their ends beveled and projected into said notches, substantially as described.

2. In a tubular lantern, the combination, with the vertical or side tubes A A and the horizontal tubes secured thereto, of the bracing-rods B E, the lower ends of which project through the walls of the said horizontal tubes and are soldered thereto, and which have laterally-bent upper ends which project through and are soldered to the walls of the said vertical or side tubes, substantially as described.

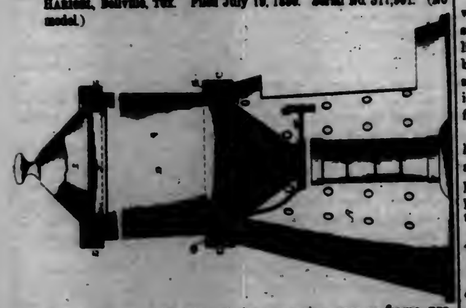
410,461. HOOK. Ferdinand Splittstoser, North Branch, Minn. Filed Apr. 29, 1889. Serial No. 309,000. (No model.)

Claim.—1. The combination of a hook having a recess formed in its top and a recess formed in its end, and the casting placed in the recess in the end of the hook, with the spring placed in the top of the hook, and the latch provided with a projection upon one end, against which the free end of the spring bears, whereby the spring serves to hold the latch either in an open or closed position, substantially as described.

2. The combination of the hook having a longitudinal recess formed in its top and a horizontal and vertical recess formed in its end, with the casting shaped to fit and placed in the end recesses, the spring placed in the top recess with its rear end rigidly secured therein, and the latch placed in the horizontal recess and provided with a projection upon its upper end, against which the free end of the spring bears, substantially as shown and described.



410,462. PUMP. Frank Steinmann, St. Louis, Mo. Filed Dec. 15, 1888. Serial No. 293,693. (No model.)



Claim.—1. In a pump, the combination, with the cylinder 4 and piston 3, of the flange 12, having ports therethrough, chambers 6 7 at the ends of said cylinder communicating therewith and with said ports, the inlet and outlet chambers 8 9, the chambers or heads 25, connecting said chambers 8 9 at both ends with the chambers 6 7, removable plugs having valve-stems secured in the rear of said heads or chambers 25, and the valves 13 14, situated on said stems and guarding the ports in said flanges 12, substantially as set forth.

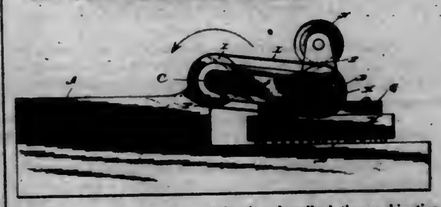
2. In a pump, the combination, with the cylinder 4 and piston 3, of the chambers 6 7 at the ends of said cylinder, the inwardly-projecting heads or chambers 25, the flanges 12, dividing said chambers 25 from the chambers 6 7 and having ports forming communication between said chambers 6 and 25 and 7 and 25, the inlet and outlet

chambers 8 9, extending between the heads or chambers 25 and each communicating with said heads at its opposite ends, removable screw-plugs in the inner ends of said heads 25, the stems 17 and 24, projecting from said plugs, the rings 15, secured in the flanges 12 and having arms 16, connected to stems 17, and spring-actuated valves on said stems 17 24, adapted to close the ports between said chambers 6 25 and 7 25, substantially as set forth.

410,463. GUNPOWDER-CANISTER. John J. Stopple and Emil Harsem, Bellville, Tex. Filed July 19, 1889. Serial No. 317,991. (No model.)

Claim.—The combination of the supporting case or frame provided with an opening through one side and a supporting-flange at its top, with a powder-can supported by such flange and provided with a conical lower end closed by the spring-actuated perforated slide, and a cover provided with concentric flanges which seat themselves within and without the upper edge of the can-body, substantially as shown and described.

410,464. HAND-STAMP. Daniel C. Stover, Prospect, Ill. Filed Mar. 5, 1889. Serial No. 302,011. (No model.)

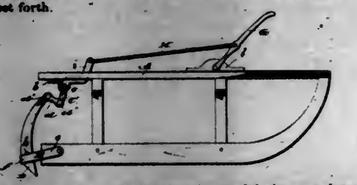


Claim.—1. In a machine of the class described, the combination, with a suitable support and an inking-surface, and a paper-support stationary with reference thereto, of a type-carrying block, links connecting said block with said support, two gears rigidly fastened to said block and said support, respectively, and a third gear loosely journaled to one of said links and engaging and connecting said fixed gears, said gears being adapted to automatically govern the position of said block upon its axis, substantially as and for the purpose set forth.

2. In a machine of the class described, the combination, with a suitable bed provided with inking and paper-supporting surfaces lying in parallel planes to a type-carrying block connected with said bed by links permitting oscillation of the block about the axis of connection of the links with the bed and rotation of the block about the axis of connection of the links with the block, of gears of equal diameter lying in the same plane and rigidly attached to said bed and block, respectively, and a third gear journaled to one of said links at a point intermediate between the centers of said stationary gears, said third gear being of the same diameter as the other two and in engagement with them both, whereby the successive planes of position of the working-surface of the block shall be parallel to each other, substantially as and for the purpose set forth.

3. The combination, with the bed having an inking-surface A and a paper-supporting surface A', of a shaft B, journaled in the bed, the shaft B' and links L L', connecting it with the shaft B, the plate C, hung upon the shaft B', the gears G G'', centered on the shafts B B', respectively, and rigidly fastened to the bed and the plate C, respectively, and the intermediate gear G', journaled to the link L' and connecting the fixed gears G G'', substantially as and for the purpose set forth.

410,465. HAND-STAMP. Daniel C. Stover, Prospect, Ill. Filed Mar. 6, 1889. Serial No. 302,091. (No model.)



Claim.—1. In a machine of the class described, the combination, with a stationary support and an inking-pad and paper-supporting surface stationary with reference thereto, of a type-carrying block, links connecting the block with said support and pivoted to both the block and the support, two pulleys rigidly fastened to said block and said support, respectively, a band connecting said pulleys and governing the motion of one of them with reference to the other, and means for preventing all slipping of said band upon either pulley.

2. The combination, with the base, the swinging block, and the links connecting the base and block, of pulleys lying in the same plane and rigidly fastened to said base and block, respectively, and the band passing about said pulleys and connected with each of them at one point by means adapted to prevent the slipping of the band, substantially as and for the purpose set forth.

410,466. SLED-BRAKE. John P. Tabor, Henrietta, Wis. Filed June 20, 1889. Serial No. 314,955. (No model.)

Claim.—1. The combination, in a sled-brake, of the vertically-curved dogs pivotally hung at each side and each provided with an enlarged head forming a horizontal shoulder, and a horizontal yoke pivotally connected to each runner and having a vertical perforation

for the passage of a dog-shank, and a beveled key passing through a perforation in the latter to clamp the yoke on the shoulder, substantially as set forth.

2. The combination, with the slotted top, of the hangers depending therefrom, a shaft bearing therein and provided with integral arms, vertically-curved dogs pivotally connected by links with said arms, horizontal yokes pivotally connecting the dogs and runners, and arm *i*, pivoted in the slot of the top and connected to the end of said shaft, and consisting of inclined end and central portion, located as described, and a rod connecting said arm *i* and an operating-lever, said rod and lever being adapted to be thrown on a dead-center, substantially as set forth.

410,467. FELLY-BOILER. JOHN W. TAMPLIN and BENJAMIN F. HOLT, Hanna City, Ill. Filed June 15, 1889. Serial No. 314,352. (No model.)

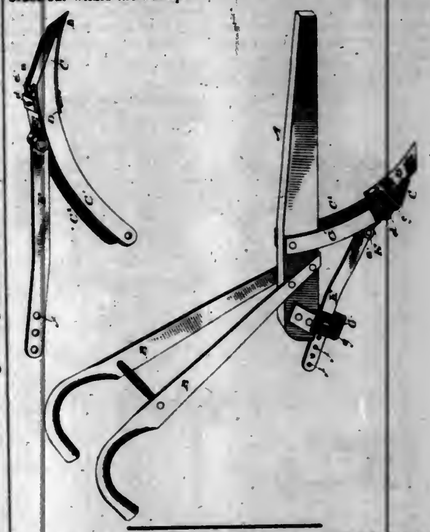
Claim.—In a device for the purpose described, the combination, with the lamp-chamber, its hinged door, and the tank above the lamp-chamber, of the guard secured to the wall of the tank above the hinges of the said door, whereby said guard forms the triple function of protecting the hinges, a stop for the door, and a shield to prevent overflowing oil from entering the lamp-chamber, substantially as shown and described.

410,468. REACTIVE AND INDUCTION COIL. ELIHU THOMSON and EDWIN W. RICE, Jr., Lynn, Mass. Filed Apr. 6, 1887. Serial No. 233,949. (No model.)

Claim.—1. An electric coil provided with an iron sheath which covers the inner side thereof closely and is divided externally into sections, between which are air-openings communicating with the space between the sheath and coil.

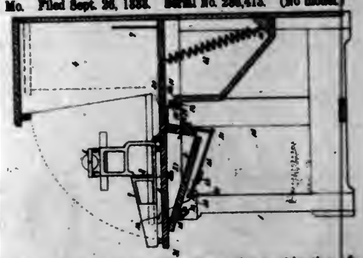
2. An electric coil provided with an iron-wire sheath divided into sections at the external portion of the coil and separated therefrom by an air-space, as and for the purposes described.

3. The combination, with an electric coil and its supporting-base, of the separating blocks or feet F F, whereby free access of air to the bottom of the coil may be permitted, as and for the purpose described.



4. The combination, with the primary or secondary conductors, of the interposed separating-blocks *e e*, as and for the purpose described.

5. The combination, with an electric coil, of an iron sheath separated from the coil by an air-space and having openings, as and for the purpose described.



6. The combination, with an electric coil, of an iron sheath wound loosely at center and divided externally, so as to partly expose the coil to air.

410,469. PLOW. JAMES O. THOMAS and BURWELL O. HILL, Greenville, Ga. Filed Feb. 13, 1889. Serial No. 300,337. (No model.)

Claim.—The combination, substantially as hereinbefore set forth, of the narrow deep plow-beam, the bifurcated curved shank embracing at its upper end the plow-beam and hinged thereto, the flat, narrow, upwardly-curved brace-bar hinged to the curved shank at its lower end, the backwardly-inclined stirrup or downhanger secured on each side of the plow-beam at its rear end and through which the curved brace-bar extends, and devices for adjustably securing the brace-bar within the stirrup.

410,470. TYPE-WRITER CABINET. CHARLES H. TYLER, St. Louis, Mo. Filed Sept. 26, 1888. Serial No. 286,413. (No model.)

Claim.—1. In a type-writer cabinet, the combination of a receptacle and a door for the receptacle which serves as a base or support for the machine when the latter is in using position, said door being on a forward incline when closed, substantially as and for the purpose set forth.

2. In a type-writer cabinet, the combination of a receptacle for receiving the machine when not in use, a door to the receptacle which serves as a base or support for the machine when the latter is in use, and a double-acting spring connecting the door to a fixed object, substantially as and for the purpose set forth.

3. In a type-writer cabinet, the combination of a receptacle for receiving the machine when not in use, a door to the receptacle which serves as a base or support for the machine when the latter is in use, a lower extension on the door, and a double-acting spring secured by one end to the extension of the door and by the other to the body of the cabinet, substantially as and for the purpose set forth.

4. In a type-writer cabinet, the combination of a receptacle for receiving the machine when not in use, a door to the receptacle, a jointed table secured to the door, arms 20 and 22, connected to the table and hinged together, and inclined ways upon which the outer ends of the arms 22 move as said door is opened and closed, substantially as and for the purpose set forth.

5. In a type-writer cabinet, the combination of a receptacle for receiving the machine when not in use, a door to the receptacle which serves as a base or support for the machine when the latter is in using position, a table secured to the door and made in two portions hinged together, arms 20 and 22, and brackets 24, forming inclined ways having horizontal extensions 25, substantially as and for the purpose set forth.

6. In a type-writer cabinet, the combination of a receptacle for receiving the machine when not in use, a door to the receptacle which forms a base or support for the machine when the latter is in using position, a table secured to the door, arms 20 and 22, inclined ways for

receiving the outer ends of the arms, springs 27, and set-screws 28, substantially as and for the purpose set forth.

7. In a type-writer cabinet, the combination of a receptacle for receiving the machine when not in use, a door to the receptacle which serves as a base or support for the machine when the latter is in using position, a jointed table secured to the door, arms 20 and 22, hinged together, connecting-bar 23, securing the bars 22 together, projections 33 on the outer ends of the arms 22, and brackets 24, forming inclined ways, substantially as and for the purpose set forth.

8. In a type-writer cabinet, the combination of the receptacle for receiving the machine when not in use, a door to the receptacle which serves as a base or support for the machine when the latter is in using position, a jointed table secured to the door, arms 20, arms 22, pivoted to the latter, brackets 24, and stops 26, fixed to the brackets, substantially as and for the purpose set forth.

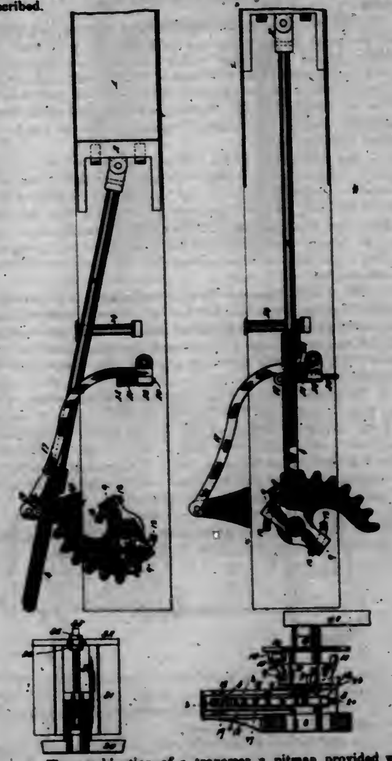
410,471. BUGGY-SPRING. JOHN D. WHIPPLE, Excelsior Springs, Mo. Filed June 20, 1889. Serial No. 315,007. (No model.)

Claim.—1. The vehicle-spring comprising the saw-horse-like disposed bars or members, the curved plates connecting said bars at one end to the side bars upon their under sides, the rod serving as a common pivoting-rod for the members or bars, and the short rods connecting said members or bars with the vehicle-bottom, substantially as specified.

2. The combination of the vehicle-bottom, the side bars, the springs comprising the crossing-bars, the pivoting-rod, the short rod connecting said bars to said bottom, the keepers guiding the upper ends of said bars, and the proximately V-shaped spring-plates connected to said bars, substantially as set forth.

410,472. RAILROAD-RAIL AND WHEEL THEREFOR. CHARLES WHITE, Washington, D. C. Filed Apr. 24, 1889. Serial No. 308,379. (No model.)

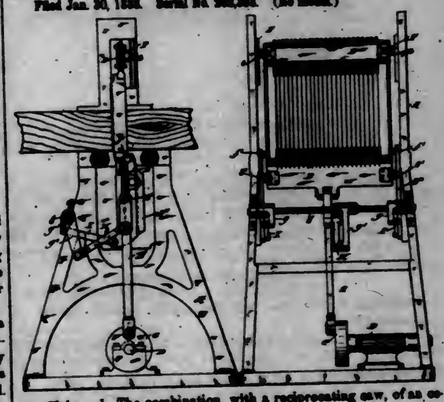
Claim.—1. A flanged car-wheel having a compound flange adjacent to its tread, said flange consisting of a solid annular shoulder *b*, and rounded teeth or cogs D, forming, with the shoulder *b*, the flange of the wheel, substantially as set forth.



2. The combination, with the flanged car-wheel constructed as described, of the grooved rail provided with a flat or smooth face and longitudinal groove adapted to receive the flange of the wheel, said groove having equidistant transverse ribs adapted to engage the flange-teeth of the wheel, substantially as and for the purpose set forth.

410,473. RAILING-FRAME. HENRY L. WHITMAN, St. Louis, Mo. Filed Feb. 5, 1889. Serial No. 298,708. (No model.)

Claim.—1. The combination of a traverser, a pitman provided with a rack, a power-shaft, an oscillating rack-segment loosely mounted on the shaft and meshing with the pitman-rack and having a projection, a pivoted lever engaging the segment projection at one end, and a press projection against which the other end of the lever impinges, substantially as described.



2. The combination of a traverser, a pitman provided with a rack, a power-shaft having a cross-piece rigidly secured thereto, provided with a pivoted lever, and an oscillating rack-segment loosely mounted on the shaft and meshing with the pitman-rack, having a projection with which the lever engages, substantially as described.

3. The combination of a traverser, a pitman provided with a rack, a power-shaft having a cross-piece rigidly secured thereto, provided with a pivoted lever, an oscillating rack-segment loosely mounted on the shaft and meshing with the pitman-rack, having a projection with which one end of the lever engages, and a press projection on which the other end of the lever impinges, substantially as described.

4. The combination of a traverser, a pitman provided with a rack, a power-shaft having a cross-piece rigidly secured thereto, provided with a pivoted lever formed with a lower end 12 and upper end 13, an oscillating rack-segment loosely mounted on the shaft and meshing with the pitman-rack, having a friction-roller with which the lower end of the lever engages, and a friction-roller on the press, on which the upper end of the lever impinges, substantially as described.

410,474. SAW-MILL. HENRY D. WISNER, East Saginaw, Mich. Filed Jan. 30, 1888. Serial No. 262,982. (No model.)

Claim.—1. The combination, with a reciprocating saw, of an ec-

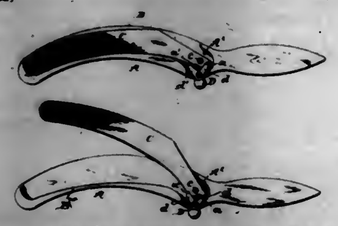
oillating mechanism whose parts are connected or adjusted, in the manner described, to move the lower portion of the saw to a position in advance of the upper portion, and to maintain it in such position or increase the advance, as described, during the whole time that the saw is in engagement on the downstroke, as and for the purpose described.

2. The combination, in a saw-mill, of a reciprocating gate or sash moving at its upper end in a fixed slide and at its lower in a movable slide, in combination with an oscillating mechanism, substantially such as described, connected to the lower slide and adjusted or proportioned in proper manner to cause the lower portion of the saw to be in advance of the upper portion during its whole time of engagement on the downstroke of the sash or gate, as and for the purpose described.

3. The combination, with a reciprocating gate or sash in a saw-mill, of a vibrating or oscillating lower gang-slide, and an oscillating mechanism connected therewith and proportioned or adjusted so as to move the lower gang-slide in a forward direction after the reciprocating mechanism passes the quarter on the downstroke, and to continue the forward movement of the lower portion of the saw against the feed of the material during substantially the entire downstroke of the sash or gate.

4. The combination, with the oscillating gang-slide in a saw-mill, of a link H, connected at one end with a crank-arm upon the rock-shaft which oscillates the slide, and at the other end joined with the pitman E at a point above the horizontal line passing through the point of connection with the crank-arm when the pitman is at the quarter or its downstroke.

5. The combination, with the reciprocating gate or sash, of an upper slide located, as set forth, to cause the saws to stand in vertical line at the moment of engagement of the downstroke, a lower oscillating slide, a rock-shaft, a main pitman, and a pitman H, connected to the rock-shaft and to the main pitman in the manner described, so as to maintain the lower part of the saw in an advanced position after the pitman passes the quarter on the downstroke.

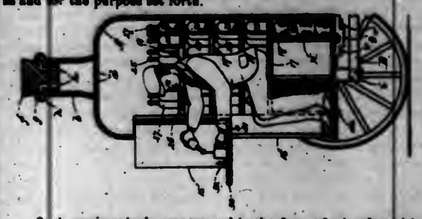


410,475. STRIKING APPARATUS. FRANK A. WIDGER, Lynn, Mass. Filed Apr. 9, 1889. Serial No. 306,695. (No model.)

Claim.—1. In a striking apparatus, the combination of a hollow bag of yielding material, an elastic or resilient standard supporting said bag, and a base or pedestal having a socket in which said standard is vertically adjustable, as set forth.

2. The combination of the flexible bag, the resilient supporting-standard, and a base having re-enforcing springs bearing on said standard, as set forth.

410,476. COMBINED CRUMB-BRUSH AND SCRAPER. BRIDGET M. WOODARD, Manchester, N. H. Filed May 4, 1885. Serial No. 164,320. (Model.)



Claim.—A crumb-brush provided with a recess in its back, in combination with a scraper pivoted within said recess and provided with recesses *a a'*, and a pivoted locking-catch having projections which engage said notches, whereby the scraper is projected from and closed within the recess in the brush, all substantially as described, and for the purposes specified.

410,477. CARRIAGE-BODY. FREEMAN H. YOUNG and FRANK R. THOMPSON, Lowell, Mass. Filed May 9, 1889. Serial No. 310,126. (No model.)

Claim.—1. A carriage-body constructed in the shape of a bottle and provided in its wall with hinged doors, substantially as and for the purpose set forth.

2. A carriage-body constructed in the form of a bottle, provided with a neck and stopple having ventilated ducts therethrough, and two sets of hinged doors in the rear wall of said body, substantially as and for the purpose set forth.

3. A carriage-body constructed in the form of a bottle and having doors in its walls, in combination with an ice-chest in said body provided with an elongated detachable cover forming a seat and provided with air-openings, substantially as described.

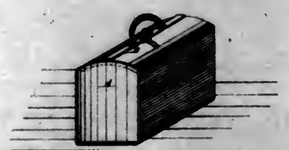
4. A carriage-body constructed in the form of a bottle having a neck and stopple provided with ventilation-ducts, two sets of hinged doors in the wall of said body, a counter adjustable on said doors, and an ice-chest formed in said body and provided with an elongated detachable cover, substantially as described.

5. A carriage-body constructed in the form of a bottle and provided interiorly with an ice-chest and bottle-shelves having openings and two sets of hinged doors in its rear wall, said body being suspended by hangers from springs on the axle of a wheel-truck, substantially as described.

6. In a device of the character described, a body constructed in the shape of a bottle having a neck and stopple, openings from the body into said neck, ducts through said stopple and neck, hinged doors in said body, a counter detachably secured thereto, an ice-chest within the body provided with a detachable elongated cover having air-openings, and a series of shelves having openings registering with those in said cover, substantially as described.

7. The body A, having the openings *d*, neck *b*, stopple *f*, and ducts *h*, in combination with the hinged doors 15 and 16 and the counter 30, detachably secured thereto, substantially as described.

8. The body A, provided with the doors 15 and 16, in combination with the chest H, having the cover 17, provided with openings 18, and the shelves 19, provided with the openings 20, substantially as described.

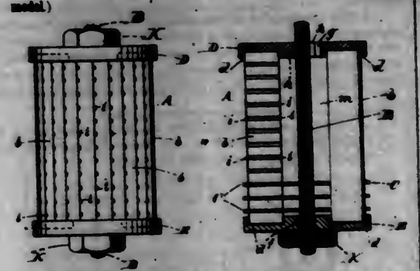


9. The body A, provided with the doors 15 and 16, in combination with the wheels B, axles *i q*, brace D, and springs *k*, and the hangers *l*, secured to said body and springs, substantially as described.

10. The wheels B and axles *i q*, connected by the brace D, in combination with the springs *k r*, bottle-shaped body A, suspended from the springs *k* by hangers *l*, and the seat C, secured to said body and spring *r* by the frame *t*, substantially as described.

11. In a device of the character described, the combination of the body A, provided with doors 15 and 16 and counter 30, the chest H, having the cover 17, the shelves 19, provided with openings 20, and the hangers *l*, for suspending said body on the springs of a wheel-truck, substantially as described.

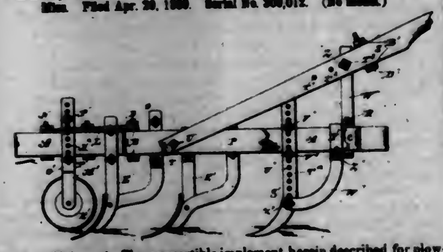
12. The carriage-body A, constructed in the shape of a bottle, having neck *b* and stopple *f*, provided with the openings *d h*, the doors 15 and 16, the counter 30, detachably secured thereto by hooks 31 and 32, the chest H and cover 17, having openings 18, and the shelves 19, having the openings 20, substantially as and for the purpose set forth.



410,478. FRAME FOR TRAVELING-BAGS. OTTO ESSER, Jersey City, N. J. Filed May 20, 1889. Serial No. 312,540. (No model.)

Claim.—1. A frame for traveling-bags having single jaws, the whole of one jaw being entirely flat while the side parts of the other jaw are also flat, and the outer part of the latter having only a slight upward bend for the purpose of overlapping the outer part of the first jaw, substantially as set forth.

2. The combination, with the body of a traveling-bag, of single jaws, one of which is entirely flat, the second jaw having its side parts also entirely flat, and the outer part with only a slight upward bend to overlap the outer part of the first jaw, the jaws being hinged to the end braces of the frame by means of transverse hinge-rods, substantially as set forth.



410,479. PROCESS OF MAKING METALLIC BRUSHES. DANIEL J. ARMS, Boston, Mass. Filed Dec. 6, 1888. Serial No. 292,972. (No model.)

Claim.—1. The improved process of making metallic brushes, which consists in constructing a mold from separable plates provided with slots, inserting metallic bristles through said slots so that they project into the interior of the mold, filling said mold with molten metal, which hardens around the inner ends of said bristles and forms the body of the brush, and then removing said plates, whereby the bristles are left projecting from said body, substantially as described.

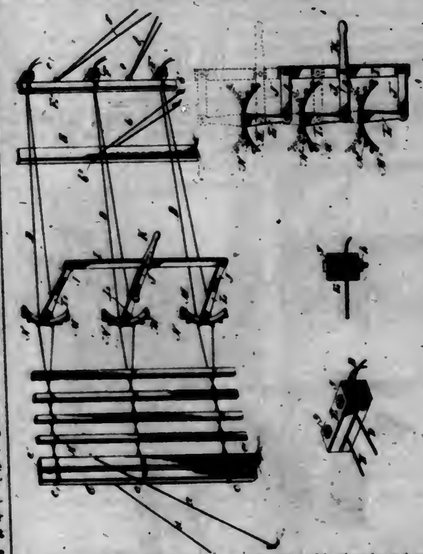
2. The improvement in the art of constructing metallic brushes, which consists in inserting metallic bristles through slots formed in a mold composed of separable pieces and filling the mold with molten metal, wherein said bristles are secured when the metal has cooled and the mold is removed.

410,480. PLOW OR CULTIVATOR. HUGH G. ANDERSON, Duncan, Miss. Filed Apr. 20, 1889. Serial No. 308,012. (No model.)

Claim.—1. The convertible implement herein described for plowing, harrowing, and the like, comprising the central beam A, the cross-bars, the pivotal bolts D E, connecting the centers of the cross-bars to the beam A, the semicircular bars having the similarly-shaped slots and having their ends pivoted to the front cross-bar, the parallel beams P K, having their ends pivotally bolted to the cross-bars, the handles adapted to be attached to the center or outer bars, the brace-arms having their inner ends lapped and adjusted on cross-bars and handles, and the bar A', having its ends pivotally attached to the handles, substantially as described.

2. In a convertible implement for plowing, harrowing, and the like, the combination of the pivoted handles having the adjusting-openings T' T' T' and the openings T' T' at right angles thereto, the bar A', to connect the handles, having the pairs of extended arms B' at its ends, provided with the openings C, to register with the openings T' T', for the purpose set forth, and the brace-arms having their upper ends vertical and plane, adapted thereby to lie flush against either the inner or outer sides of the handles, and provided with the adjusting-openings T, to register with the openings T' T' T', substantially as described.

410,481. PACKING AND REFRIGERATING VESSEL. JAMES BARKER, Columbia, assignor of one-half to LUTHER L. FREEMAN, Mount Pleasant, Tenn. Filed Feb. 7, 1889. Serial No. 299,068. (No model.)



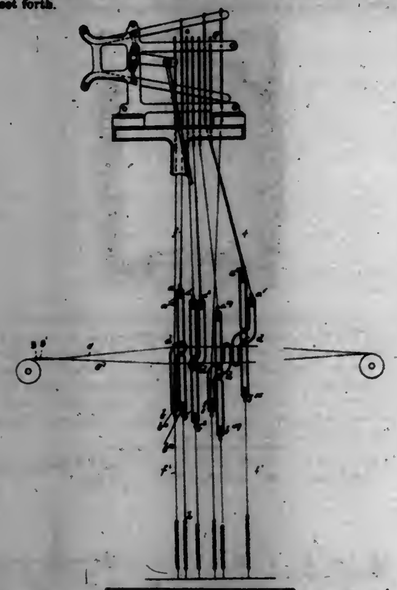
Claim.—1. In a package-receptacle, the containing-vessel having an inclined top wall portion, and a neck rising therefrom and provided with a movable cover, said vessel having a rigidly-attached and outwardly-projecting perforated flange, which, in connection with the inclined top of the vessel, constitutes an annular water-trough below the neck, in combination with the surrounding envelope having a tight cover, and an antiseptic material packed between the vessel and envelope, and on the top of which packing the rigidly-attached inclined flange bears, substantially as described.

2. A packing-refrigerator consisting of a containing-vessel having a perforated trough at its upper portion and a stationary neck located above the trough and provided with a cover, an envelope surrounding the vessel and having a tight cover, a foraminous screen closely fitting the body of the vessel below the trough, and an antiseptic substance placed under the vessel and between the sides of the envelope and the foraminous screen, substantially as described.

3. In a packing-receptacle, the combination, with a containing-vessel having an annular trough at its top portion, of a surrounding envelope having an antiseptic material packed in the space intervening between it and the vessel, a perforated turret-shaped ventilator on the perforated bottom of the can, and an annulus inclosing the perforations in the vessel's bottom, the floor of the envelope having ventilating-openings within said annulus and drip-openings outside the same, substantially as described.

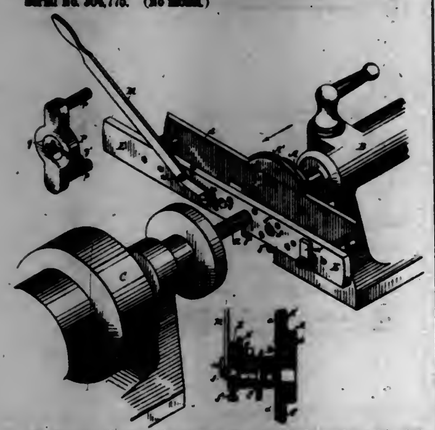
410,482. FENCE-MACHINE. WILLIAM S. BARKER, Troy, Ohio. Filed July 15, 1889. Serial No. 317,697. (No model.)

Claim.—1. The twister-frame combined with the pivoted arms and the segmental heads at the outer ends of said arms provided with holding-jaws, substantially as described.



2. The combination, with the twister-frame and the pivoted arms thereon, of the segmental heads on the outer ends of said arms, and provided with a plurality of holding-jaws extending in opposite directions from the center of the heads, substantially as and for the purpose specified.

410,483. HEDDLE FOR WEAVING GAUZES. JOHN H. BENTLEY and THOMAS W. BENTLEY, Paterson, N. J. Filed Aug. 14, 1888. Serial No. 174,397. (No model.)



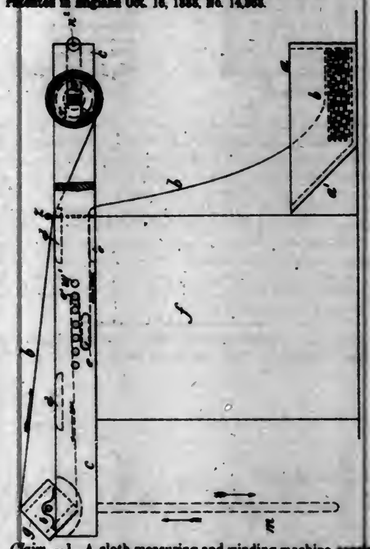
Brief.—By this arrangement of heddles the crossing of the warps is brought to the rear of all the heddles instead of between the deep heddles and the ordinary heddles, as is the case with the customary arrangement.

Claim.—In a loom for weaving gauze, the combination of four full heddles and four half-heddles for one pair of warp-threads, wherein,

as described, the first and third sets of full and half heddles work in unison in connection with one thread, and the third and fourth sets work in unison in connection with the other; substantially as shown and set forth.

410,484. MACHINE FOR CUTTING SCREW-BLANKS AND SCREWS. JOHN P. BERKHOLS, Philadelphia, Pa. Filed Mar. 26, 1889. Serial No. 304,776. (No model.)

Claim.—1. The combination, in a screw-blank-cutting tool, of the base portion and a slide adapted to slide thereon and carrying a plate on which are mounted cutting-tools, substantially as and for the purpose described.



2. The combination of the base portion and a slide adapted thereto, said slide carrying a plate having a series of orifices for the insertion of the rod to be cut, with posts secured to the rear of the plate and carrying cutting-tools for reducing portions of the blank, substantially as described.

3. The combination of the base portion having undercut ways with a slide adapted to said ways and having a plate carrying the screw-cutting tool, with a series of orifices in said slide, and a pin carried by the base portion and adapted to one or other of said orifices, substantially as described.

4. The combination of the tail-stock of the lathe, the base-plate carried thereby and having a plate provided with the screw-blank cutters, the head-stock carrying the rod from which the screw-blanks are to be formed, and a handled lever pivoted to the cutter-carrying plate and carrying a cutting-tool for severing the rod, substantially as specified.

5. The combination of the tail-stock, the plate carried thereby and provided with screw-blank cutters, a screw-threading die, a carrier therefor, having arms which engage with the edges of the plate and hold the die-carrier in position thereon, and the head-stock of the lathe carrying the rod to be formed into screws, substantially as specified.

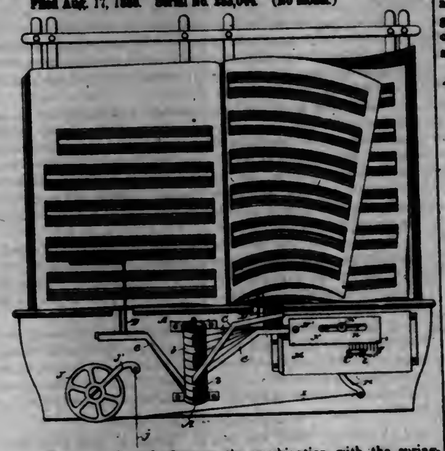
410,485. CLOTH-MEASURING MACHINE. BENJAMIN B. BOSS, London, England. Filed Mar. 11, 1889. Serial No. 302,902. (No model.) Patented in England Oct. 16, 1888, No. 14,963.

Claim.—1. A cloth measuring and winding machine consisting of a cloth-roll box, side bars connected by an upper pair and a lower pair of transverse cloth-supporting boards, a polygonal measuring frame or box having an axle provided with a flattened extension, and a measuring-chain passing around and moved by such flattened extension, substantially as described.

2. A cloth measuring and winding machine consisting of side bars, upper and lower cloth-supporting boards connecting the side bars, a polygonal measuring-frame having an axle provided with a flat extension, and the measuring-chain passing around and moved by the flat extension, substantially as described.

3. A cloth measuring and winding machine consisting of the side bars *c*, having upper and lower cloth-supporting guide-boards *d d'* and *e e*, a tension-bar *d'*, adjustable along the length of the side bars between the upper and lower guide-boards, a polygonal measuring-frame *g*, and the winding-axle *n*, substantially as described.

4. A cloth measuring and winding machine consisting of the cloth-roll box *a*, the side bars *c*, having upper and lower transverse cloth-supporting guide-boards *d d'* and *e e* and a series of sockets between the upper and lower guide-boards, a tension-bar *d'*, capable of adjustment to any of the sockets, a polygonal measuring frame or box *g*, having an axle provided with an extension *h'*, the measuring-chain *m* on the extension, and the winding-axle *n*, substantially as described.

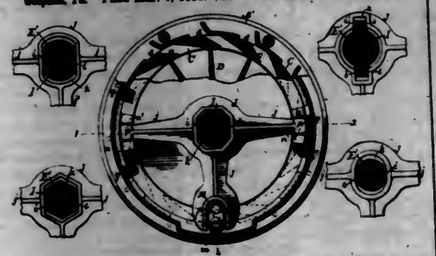


5. The combination, with the flattened continuous axle *n*, provided with two sliding clamps x^2, of the two wedges *x*, laid lengthwise on the flattened axle and clamped at their ends thereupon by the sliding clamps, substantially as described.

6. The combination, with the side bars *c* and the flattened axle *n*, journaled in the side bars and continuous from one to the other of said bars, of two wedges *x*, extending along and supported by the flattened axle, and means for detachably clamping the ends of the wedges upon the axle, substantially as described.

7. The combination, with the frame *c* and measuring-box *g*, of the flat winding-axle *n* and bearings for the ends of the axle, each bearing consisting of a sectional plate *r r*, having a slot *o* and a circular seat *r'*, and a disk *p*, fitted to and revolving on said circular seat and provided with a diametrical recess or slot *o'*, receiving the flat axle, substantially as described.

8. The combination, in a cloth-measuring machine, of the side bars *c*, the revolving plate-bearings *p*, mounted in said side bars and having slots *o'*, and the flattened winding-axle *n*, having clamps x^2, slidable along the axle, substantially as described.



410,486. LEAF-TURNER. MARIANO BOTELLA, Mexico, Mexico. Filed Aug. 17, 1888. Serial No. 283,044. (No model.)

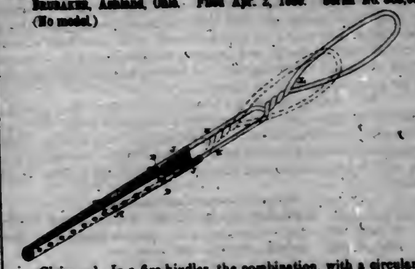
Claim.—1. In a leaf-turner, the combination, with the spring-actuated arms having fingers to turn the leaves, of the block having a recess to receive the projecting ends of said arms—the projections thereof extending beyond the fingers—and the sliding rack resting partly over said recess and said ends of the arms, the propelling-pawl engaging said rack and itself actuated by suitable means, a spring pressing upon said rack, and a retaining-pawl for said rack, the same being arranged for operation, substantially as set forth.

2. In a leaf-turner, the combination, with the leaf-turning arms, of a slide provided with a rack, a pivoted lever for actuating the rack, a pawl for preventing the retrograde movement of the slide, and an actuating device for temporarily depressing said pawl to permit the setting of the device, substantially as set forth.

410,487. TURBINE WATER-WHEEL. HENRY BROOMELL, Philadelphia, Pa. Filed Mar. 7, 1889. Serial No. 302,264. (No model.)

Claim.—1. The combination, in a turbine water-wheel, of a gate-ring, with an operating-yoke therefor, having arms acting on said ring, said yoke being pivoted at the center, but being free to move transversely in respect to the axis of the pivot, substantially as and for the purpose set forth.

2. The combination, in a turbine water-wheel, of the gate-ring, an octagonal pivot-block, a gate-operating yoke having arms acting on said gate-ring, and having a central octagonal opening larger in one direction than the pivot-block, and mechanism for turning said yoke, substantially as specified.

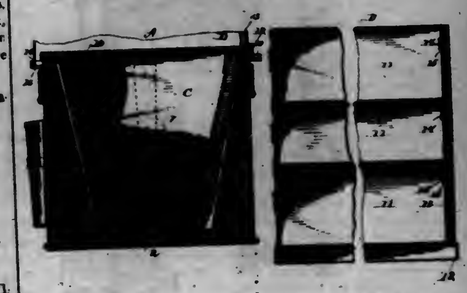


3. The combination, in a turbine water-wheel, of the gate-ring, the octagonal pivot-block, the operating-yoke having arms acting on the ring, and an octagonal opening receiving the block, but larger in one direction than the latter, and a yoke-operating shaft having an arm acting upon an arm of the yoke, substantially as specified.

4. The combination, in a turbine water-wheel, of a gate-ring having lugs or bearings, with an operating-yoke having arms fitting loosely between said lugs or bearings, said yoke being pivoted at the center, but free to move transversely in respect to the axis of the pivot, substantially as and for the purpose set forth.

5. The combination, in a turbine water-wheel, of the base and curb, the cap having a depending sleeve, the wheel-shaft passing through said sleeve, the gate-ring, and the gate-operating yoke loosely pivoted to the sleeve and having arms acting on the gate-ring, and an arm by which it is operated, substantially as specified.

6. The combination, in a turbine water-wheel, of the cap having a depending sleeve, with a collar mounted thereon, the gate-ring, the gate-operating yoke loosely pivoted on the collar and having an operating-arm, and arms for acting on the gate-ring, substantially as and for the purpose set forth.



410,488. FIRE-KINDLER. ANDREW BEHRAKER and WILLIAM H. BEHRAKER, Ashland, Ohio. Filed Apr. 2, 1889. Serial No. 305,667. (No model.)

Claim.—1. In a fire-kindler, the combination, with a circular or tubular body for holding an absorbent material, having its inner end formed into a holder or a guide, of a handle which has its inner end fitting and freely sliding within the guide and its end beyond the guide provided with a stop, whereby the device is extensible and the movement of the handle limited, substantially as described.

2. In a fire-kindler, the combination of the tubular body A, in which the absorbent is placed, and which is provided with the turned-in parts or corners D, and with a circular portion at its inner end having its edges formed into holders or guides, with the handle, substantially as described.

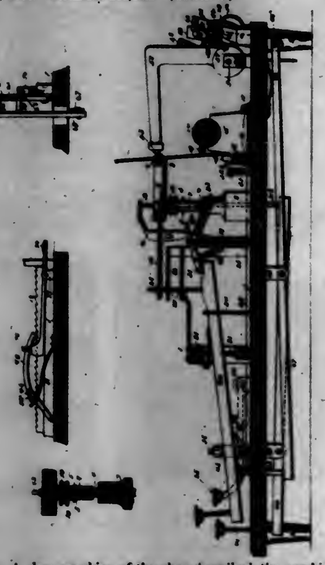
410,489. CULINARY UTENSIL. WILLIAM J. BURNETT, Huron, Dak. Filed Aug. 13, 1888. Serial No. 282,560. (No model.)

Claim.—1. The combination, with a culinary utensil, of a superheating-chamber, a feed-pipe of uniform diameter leading thereto, and an exhaust-pipe leading therefrom, the latter pipe being of decreasing diameter from the bottom to the top and terminating in a jet-orifice, substantially as described.

2. In a cooking utensil, the combination of the casing, a hopper-shaped receptacle fitting therein, having a fixed and a false bottom forming a superheating-chamber, a pipe of uniform diameter for conveying steam from the said receptacle to the superheating-chamber, and a pipe of diminishing diameter for conveying steam from the superheating-chamber, the upper end of the said pipe terminating in a jet-orifice, substantially as and for the purpose specified.

3. In a cooking utensil, the combination of the casing, a hopper-shaped receptacle fitting therein, having a fixed and a false bottom forming a superheating-chamber, an oven on the casing, and a pipe of uniform diameter leading from the hopper-shaped receptacle to the superheating-chamber, and a pipe of diminishing diameter, having its upper end terminating in a jet-orifice, leading from the said chamber and connecting with the oven, substantially as described.

4. In a cooking utensil, the combination of the casing, a hopper-shaped receptacle fitting therein, having a fixed and a false bottom forming a superheating-chamber, an oven on the casing, a pipe of uniform diameter leading from the hopper-shaped receptacle to the superheating-chamber, a pipe of diminishing diameter leading from the said chamber and connecting with the oven, and a filling-pipe



extending through the casing and hopper-shaped receptacle, substantially as described.

5. In a cooking utensil, the combination of the casing, a hopper-shaped receptacle fitting therein, having a fixed and a false bottom forming a superheating-chamber, an oven on the casing provided with a series of compartments, a pipe secured within the oven and connecting with said compartments, and a pipe of diminishing diameter, having its upper end terminating in a jet-orifice, leading from the superheating-chamber and connecting with the pipe in the oven, substantially as and for the purpose specified.

6. In a cooking utensil, the combination of the casing, a hopper-shaped receptacle fitting therein, having a fixed and a false bottom, an oven on the casing provided with a series of compartments having openings at their rear ends, a pipe secured within the oven, a series of nozzles secured thereto and engaging the openings in the compartments, and a pipe connecting with the false bottom and with the pipe in the oven, substantially as described

7. In a cooking utensil, the combination of the casing having a flange on its upper end, a hopper-shaped receptacle fitting therein, a filling-pipe connecting with the receptacle, an oven resting on the flange and provided with a series of compartments, a cover fitting over the said oven, and an escape-pipe in the cover, substantially as described.

410,490. TYPE-WRITING MACHINE. WILLIAM CABOON, Jr., Little Rock, Ark., assignor of one-half to E. L. Lefèvre, same place. Filed July 27, 1888. Serial No. 281,212. (No model.)

Claim.—1. In a machine of the class described, the combination of a standard mounted on the base and centrally bored, a spindle loosely mounted in the same, a type-segment provided with a sleeve mounted upon the spindle and adapted to rotate therewith, and a spring-arm having a pin bearing upon the top of said spindle, substantially as specified.

2. In a machine of the class described, a type-segment mounted upon a spindle and a curved arm projecting from the spindle, in combination with a slotted arm, a rock-shaft connected with the curved arm, and a key-lever for operating said rock-shaft, substantially as specified.

3. In a machine of the class described, a type-segment provided with a projecting arm and mounted upon a spindle having a projecting curved inclined arm, in combination with a rock-arm having a slot adapted to operate the curved arm, and a key-lever adapted to operate the rock-arm, and a stop to be projected in the path of the arm of the segment, substantially as specified.

4. In a machine of the class described, a pivoted platen provided with an impression end, an impelling-spring, and with cams, in combination with a spring-pressed pawl having a finger for locking over one of said cams, and a releasing-arm, and a key-lever for operating said arm, substantially as specified.

5. In a machine of the class described, a pivoted platen having a spring arranged in rear thereof and provided with cams, in combination with a locking-pawl having a finger adapted to take over one of said cams and provided with curved portions at each side of its finger, and a releasing-arm pivoted at one side of the locking-pawl and provided with a pin adapted to ride in the curved portion of the locking-pawl and release the same from the platen, substantially as specified.

6. In a machine of the class described, a pivoted platen provided with cams, a locking-pawl for the same, and a releasing-arm arranged at one side of the pawl, in combination with a releasing-arm lever and a ball for operating said lever provided with a key, substantially as specified.

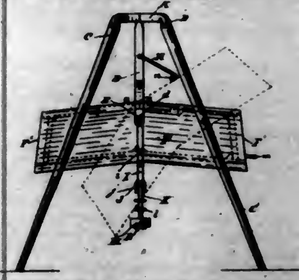
7. In a machine of the class described, a pivoted spring-pressed platen provided with a pin and rearwardly-projecting cams, a spring-pressed locking-pawl provided with curved faces, and an intermediate finger for taking over one of the cams, in combination with a releasing-arm having pins, one for liberating the platen from connection with the locking-pawl and one for contact with the rearwardly-projecting pin of the platen, whereby the latter is returned to a locked position, substantially as specified.

8. In a machine of the class described, the standard 3, centrally bored, having the spindle 4 mounted therein, provided with the arm 35, in combination with the bail 31, rock-shaft 30, the rock-arm 33, slotted, as at 34, and connected to said arm, and the key-lever 20, substantially as specified.

9. In a machine of the class described, the platen 52, mounted in standards 55, notched, as at 57, having the spring 56, arms 73, and cams 58 and 59, in combination with the locking-pawl 60, having the spring 64, curved faces 60 and 63, and finger 61, and the releasing-arm 69, having the pins 70 and 71 for operating the same, substantially as specified.

410,491. BODY FOR DRAYS. HOMER W. CASE, South Bend, Ind. Filed July 11, 1889. Serial No. 317,153. (No model.)

Claim.—1. The herein-described dray-body composed of metallic and wooden bars arranged alternately in the longitudinal plane of the body, for the purpose and substantially as specified.



2. A dray-body composed of metallic flanged bars and wooden bars laid alternately and united, substantially as and for the purpose specified.

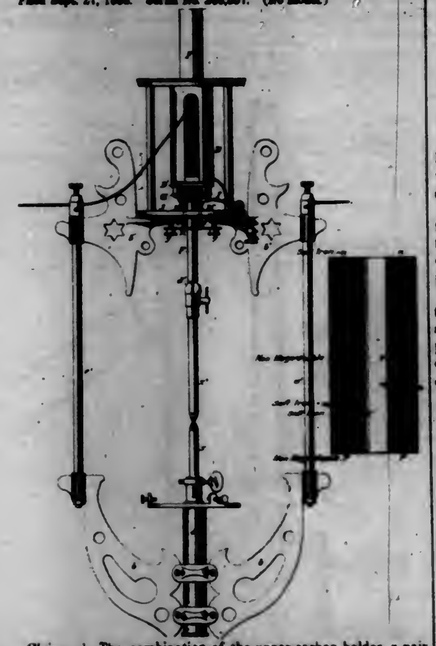
3. In a dray-body, the combination of longitudinal metallic I-bars and longitudinal wooden bars arranged alternately, with the devices for binding the same together laterally, all substantially as specified.

4. The combination of the wooden bars, the metallic bars laid alternately therewith and projecting at rear beyond the ends of the wooden bars, and the rod or bolt passing through the projecting ends of the metallic bars, substantially as and for the purpose specified.

5. The herein-described dray-body, composed of wooden bars and metallic I-shaped bars arranged alternately and parallel with the length of the body, said metallic bars projecting at rear beyond the wooden bars, with the devices for binding said bars together laterally, and the bolt passing through the projecting ends of said metallic bars, for the purpose and all substantially as set forth.

410,492. CHURN. SAMUEL D. CHERRY, Seneca, S. C. Filed May 4, 1889. Serial No. 309,622. (No model.)

Claim.—1. The combination, with a hanger having depending arms embracing the churn-body and the body having top and bottom inclined downwardly from center to ends and inwardly-inclined ends and the transverse angular ribs therein of the pendulum-rod removably connected to the body and having adjustable weights, substantially as specified.

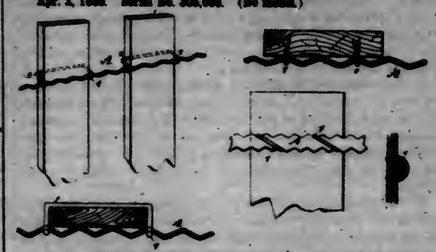


2. The combination of the body having its top and bottom inclined upwardly from both ends to the center and inwardly-inclined ends, the transverse angular ribs at the corners thereof, the central angular rib on its bottom, and the two angular ribs on its top at each side of the door-opening, with the pendulum removably connected to the bottom of the body having bottom and intermediate weight-catches and the weights thereon, all substantially as specified.

3. The combination of the body F, having its bottom and top inclined upwardly from ends to center, the transverse ribs *c*, A, and H therein, and the door thereof, with the U-shaped iron I secured thereto, the pendulum-rod connected to said iron, the weights thereon, and the hanger D, having arms *d d*, provided with key-slots, all substantially as described.

4. The combination of the folding support A and hanger D, suspended therefrom, with the body F, having inclined top and bottom, the angular ribs A A and H H, secured transversely therein, the iron I, embracing the body and having trunnions on its ends engaging the hanger, and a depending loop, and the pendulum loosely engaging said loop, all substantially as and for the purpose specified.

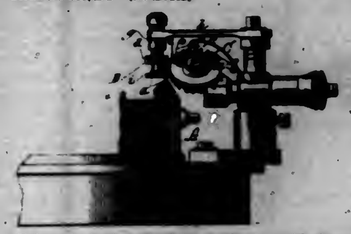
5. The combination of the support A, composed of arms B and hinged legs C, and the hanger D, suspended therefrom, having arms *d d*, provided with key-slots *e e*, and the body F, having its top and bottom inclined upwardly from ends to center, the transverse angular ribs *c* A A H H therein, and inclined ends F', with the iron I, embracing the body, having trunnions *i*, depending loop J, the pendulum-rod K, engaging said loop and having weight-catches L and *l*, and the weights on said rod, all substantially as and for the purpose specified.



410,493. ELECTRIC-ARC LAMP. ROBERT L. COUSE, Camden, N. J., assignor of one-half to William P. Anderson, Philadelphia, Pa. Filed Sept. 27, 1888. Serial No. 286,567. (No model.)

Claim.—1. The combination of the upper-carbon holder, a pair of gripping-levers therefor, the upper arms of said levers having gripping-jaws for engaging with the rod and having inclined or flaring outer faces, a magnet having an armature with closing-plate for engaging with said inclined outer faces of the levers, a carrier for said levers, and stops for engaging with the lower arms of the levers and limiting the descent of the same, substantially as specified.

2. The regulating-magnet consisting of an inner tubular shell, an outer shell having openings in opposite sides, so that it forms a horse-shoe-magnet, a piece of magnetizable metal connecting the inner and outer shells at the top, and the wire wrapping interposed between the inner and outer shells, substantially as specified.

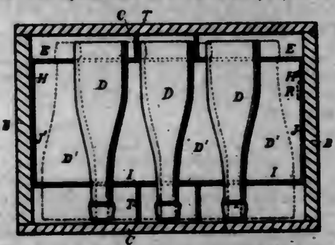


410,494. FENCE. JAMES H. CRANE, Mounds Junction, Ill. Filed Apr. 2, 1889. Serial No. 305,993. (No model.)

Claim.—1. In a fence, the combination, with a cable transversely crimped or corrugated throughout its length and pickets, of a series of loops for securing each picket to the cable, the said loops embracing the cable in the depressions thereof, substantially as set forth.

2. In a fence, the combination, with a wire transversely crimped or corrugated throughout its length, of removable staples or loops embracing the cable at the depressions thereof and passing around the pickets, substantially as set forth.

410,495. KNITTING-MACHINE. JOHN H. CRANE, Lake Village, N. H., assignor to J. H. Crane & Co., same place. Filed Jan. 28, 1887. Serial No. 225,454. (No model.)

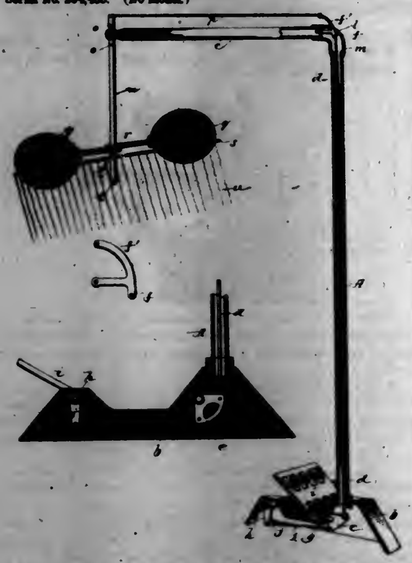


Claim.—1. A wing-wheel in combination with the needles of a knitting-machine, and an oppositely arranged or counter-feeding-in wheel or burr, substantially in the manner and for the purpose herein specified.

2. The combination of the needles *a a* of a knitting-machine, a feeding-in wheel C, having plates *c c* in pairs, substantially as specified, and a wing-wheel D, having wings *d d*, meshing with the plates of the said feeding-in wheel or burr, substantially as and for the purpose herein specified.

3. The combination of the needles *a a* of a knitting-machine, a feeding-in wheel C, having plates *c c*, in pairs or groups, substantially as specified, a wing-wheel D, having wings *d d*, meshing with the plates of the said feeding-in wheel, and the gear-wheel *i* on the spindle of the wing-wheel and meshing with the needles of the needle-cylinder, substantially as and for the purpose herein specified.

410,496. PACKING-CASE FOR BOTTLES. SIMEON G. CURTISS, Rochester, N. Y., assignor to the Curtiss Brothers Company, of New York. Filed Apr. 26, 1889. Serial No. 308,503. (No model.)



Claim.—1. The combination, with the packing-case, of the perforated partition E, formed in one piece with the flanges F F' H H', and the perforated partition I, formed in one piece with the flanges J J' L L', the said partitions being arranged parallel with each other at suitable distances from the top and bottom of the case, and one set of the flanges extending inward on opposite sides of the case until they meet, and the other set outward to the top and bottom of the case respectively, substantially as described.

2. The combination, with the packing-case, of the perforated partitions E I, arranged parallel to each other at suitable distances from the top and bottom of the box and having bent flanges extending along opposite sides of the case until they meet, and the centrally-located supports T, adapted to prevent the partitions from bending outward, substantially as described.

3. The combination, with the packing-case, of the removable partitions E I, extending parallel to each other at suitable distances from the top and bottom of the case, and having perforations adapted to support the bottles in reversed positions, and provided with integral flanges at their opposite extremities extending in opposite directions along the sides of the case until they meet, substantially as described.

4. The combination, with the packing-case, of the removable partitions E I, extending parallel to each other at suitable distances from the top and bottom of the case and having perforations adapted to support the bottles in reversed positions, and provided with integral flanges at their opposite extremities extending in opposite directions and interlocking at their meeting edges, substantially as described.

410,497. PORTABLE FAN. WILLIAM H. CURTICE, Louisville, Ky., assignor to the Portable Fan Company, same place. Filed Dec. 24, 1888. Serial No. 294,485. (No model.)

Claim.—1. The combination, with a hollow base, a hollow standard, and an arm projecting from the upper end of said standard, of a foot-treadle mounted on the base, a link and lever located within the base and connected to the treadle, a rod located within the standard, and a fan supported by the projecting arm and connected to the rod, substantially as set forth.

2. The combination, with a base, a hollow standard detachably connected thereto, and a laterally-projecting arm detachably secured to the standard, of a treadle, a rod located within the hollow standard and operated by the treadle, and a fan actuated by said rod, substantially as set forth.

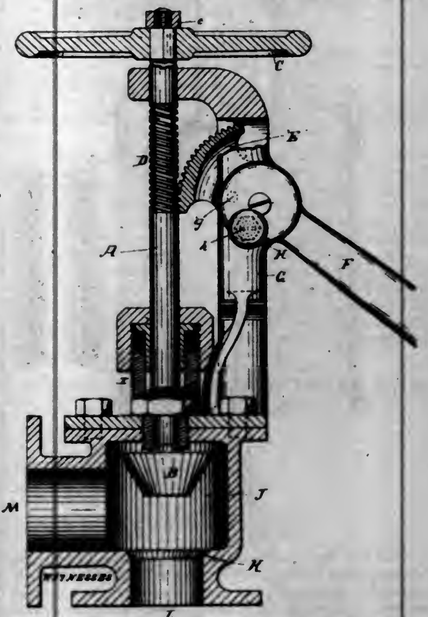
3. The combination, with a hollow base, a hollow standard secured thereto, and an arm projecting from said standard, of a treadle mounted in the base, motion-transmitting devices consisting of a crank, link, and lever, located within the base, a lever located within the laterally-projecting arm and provided with a projecting portion extending through a slot in said arm, a rod located within the standard and connected to the motion-transmitting devices in the base and to the lever in the laterally-projecting arm, a fan pivoted to the free end of said arm, and a link connecting the lever and fan, substantially as set forth.

410,498. TUBULAR CONDUCTOR FOR ELECTRIC RAILWAYS. LEO DAFT, Plainfield, N. J. Filed Jan. 7, 1886. Renewed May 4, 1889. Serial No. 272,264. (No model.)

Claim.—1. An electrical conductor consisting of a tube, composed of two sections having projections on one side clamped together and separated at the opposite edges to form a longitudinal slot, substantially as set forth.

2. An electrical conductor consisting of two flanged sections, with the flanges clamped together and the opposite edges separated and adapted to receive and retain a traveling contact-piece, substantially as set forth.

3. A tubular electrical conductor provided at one side with a longitudinal slot and at the other with a longitudinal rib for attachment to the support, substantially as set forth.



4. A conductor consisting of two sections having flanges *f f e e*, substantially as and for the purpose set forth.

5. The combination, with a tubular electrical conductor, of a support provided with clamping-jaws engaging between them a rib or projection upon the conductor and clamping devices which permit them to be opened without being disconnected from each other, substantially as set forth.

6. The combination, with the conductor, of a traveler provided with a cylindrical body, lateral shank, and curved supporting contact-springs arranged longitudinally and secured to the said body at or near their centers only, and having their ends free so as to be in constant contact with the conductor, substantially as and for the purpose set forth.

7. The combination, with the tubular conductor having a slot at one side, of a traveler or contact-piece within the conductor provided with a lateral shank and springs connected thereto at or near the center and free at the ends, and forming a yielding support for the traveler and of a length greater than twice the diameter of the conductor, whereby the traveler is prevented from cramping and conforms to inequalities of the interior of the conductor, substantially as described.

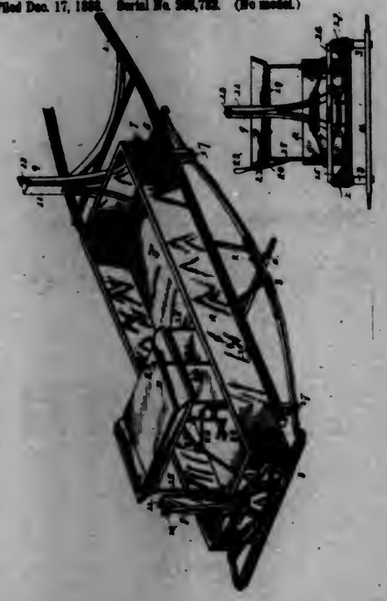
410,499. SCREW AND SLIDE VALVE. DE LEON DAVIS, San Antonio, Tex. Filed Apr. 27, 1889. Serial No. 308,806. (No model.)

Claim.—1. In a valve, the main casing provided with a valve-seat and having a vertical arm rigidly secured thereto, in combination with a geared sector operated by a hand-lever and a valve-stem and valve, all constructed and combined to operate substantially as and for the purpose specified.

2. In a combination slide and screw valve, the valve-casing and valve-seat and vertical perforated arm having a geared sector provided with a stop for holding it rigidly in place when used as a nut, in combination with a valve-stem screw-threaded between its ends and provided with a valve, substantially as and for the purpose specified.

3. In a valve of the character described, the combination of a valve-casing and a pivoted lever-arm and geared sector and a vertical arm perforated at the top with a screw-threaded valve-stem extending through the perforation in the arm and provided with a stuffing-box outside the valve-casing, substantially as and for the purpose specified.

410,500. CORN-HARVESTER. LEWIS A. DAVIS, Delaware, Ohio, assignor to the Delaware Corn Harvester Company, same place. Filed Dec. 28, 1888. Serial No. 294,672. (No model.)



Claim.—1. The combination, with the platform and the swinging jib, of the pivoted levers, the operating-lever, and the toggle-levers connecting the operating-lever with the said jib, substantially as described.

2. The combination, with the platform, the swinging jib, and the bars G and G', of the operating-lever connected with the jib, and the rod I, connecting the said lever with one of the said bars, substantially as shown.

3. The combination of the platform, the swinging jib, the bars connecting the jib with the platform, the operating-lever, the toggle-levers connecting the operating-lever with the said jib, the slotted rod connected with the operating-lever, and the pin projecting from one of the bars and working in the slot of the said rod, substantially as set forth.

4. The herein-described corn-harvester, composed of the platform having knives on its front end arranged obliquely to the line of draft of the machine, the runners, the vertically-adjustable wheels, the swinging jib, the operating-lever, the toggle-levers connecting the jib with the said lever, the slotted rod connected with the lever, and the pin projecting from one of the jib-supports and working in the slot of said bar, substantially as described.

410,501. ROAD-CART. WILLIAM R. DUNN, Stuart's Draft, Va. Filed Dec. 17, 1888. Serial No. 293,732. (No model.)

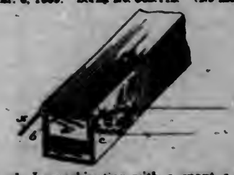
Claim.—1. In a road-cart, the combination of the body, the body-springs, standards secured to the body-springs and extending above the body, and standards secured to the body and having a pivotal connection with the standards on the body-springs, substantially as described.

2. In a road-cart, the combination of the body-springs, the standards secured thereto, and the body pivotally connected to the said standards, substantially as described.

3. In a road-cart, the combination of the body-springs, the standards secured thereto, the body, and the standards secured to the body and pivotally secured to the standards on the body-springs, substantially as described.

4. The combination, with the shafts, of a U-shaped brace secured thereto, bow-shaped springs secured to the said brace and to the axle, and cross-pieces secured to the ends of the bow-shaped springs for carrying the body-springs, substantially as described.

5. In a road-cart, the combination of the body-springs, the A-shaped standards secured thereto, provided with openings at their upper ends, the body, and standards secured to the body and having arms at their upper ends for engaging the openings in the A-shaped standards, substantially as described.



6. In a road-cart, the combination of the axle, the bow-shaped springs secured thereto, the cross-pieces secured to the said springs, the body-springs on the cross-pieces, the standards on the body-springs, and the body pivotally connected to the said standards, substantially as described.

7. In a road-cart, the combination of the axle, the bow-shaped springs secured thereto, the cross-pieces secured to the said springs, the body-springs on the cross-pieces, the standards on the body-springs, the body pivotally connected to the said standards, and the coiled springs secured to the shafts and body, substantially as described.

8. In a road-cart, the combination of the axle, the bow-shaped springs secured thereto, the shafts above the said springs, and the stops secured to the shafts and passing around the bow-shaped springs, substantially as and for the purpose specified.

9. In a road-cart, the combination of the seat, a rack-plate secured thereto, a locking-arm the lower end of which is provided with a crank, a jointed rod secured to the seat and to the body of the cart, and a rod connecting the said jointed rod and crank on the locking-arm, whereby when the locking-arm is moved the seat will be elevated or depressed, substantially as described.

410,502. SIGNAL FOR MILLS. WILL H. DONNER, Columbus, Ind. Filed Mar. 6, 1889. Serial No. 302,112. (No model.)

Claim.—1. In combination with a spout, a plate pivoted within the same, an arm *f*, extending to the outside connected to or forming a part of said plate, and an electric circuit including an alarm, the movement of said arm *f* being adapted to close the said circuit and sound the alarm, substantially as described.

2. In combination with a spout, a plate pivoted within the same, an arm *f*, extending to the outside, an electric circuit including an alarm, the said circuit being closed by the movement of said arm, and an extension *x* outside the spout and in connection with the pivotal plate, whereby the position of said plate is indicated by the position of the said extension, substantially as described.

410,503. BLOW-PIPE. LORENZO DOBE, Gloversville, N. Y. Filed July 11, 1888. Serial No. 279,611. (No model.)

Claim.—1. In a burner, the combination of the reservoir provided with a suitable inlet-tube and the independent combustion-tube provided with air-supply openings G G, and communicating with the

reservoir through small apertures arranged out of the plane of the said air-supply openings, substantially as specified.

2. In a burner, the combination of the reservoir, the independent combustion-tube provided with air-supply openings G G and communicating with the reservoir through the perforations M M, which are arranged out of the plane of the openings G, and the air-pipe tip passing longitudinally through the combustion-tube between the said perforations M M, and extending to the end of said tube, substantially as specified.

3. In a burner, the combination of the reservoir, the combustion-tube communicating with the reservoir through the perforations M M, which are arranged, respectively, above and below the center of the said combustion-tube and provided on opposite sides with air-supply openings G G, the air-pipe affixed to the reservoir and provided with a tip which passes through the upper end of the reservoir, passes between the perforations M M, and extends concentrically through the combustion-tube nearly to its outer end, and the flexible tube connected to the blow-pipe and provided with a suitable mouth-piece, substantially as specified.

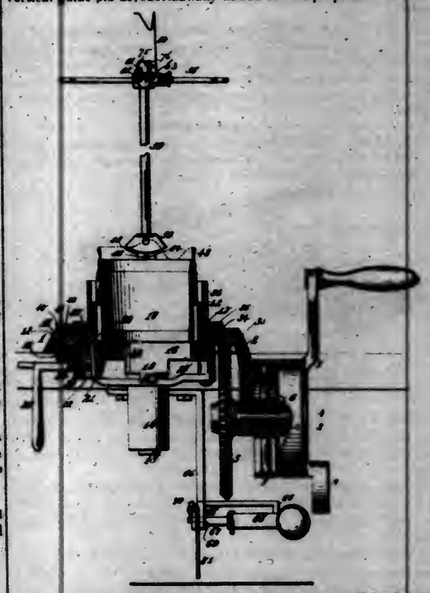
4. In a burner, the combination, with a suitable base or support A, provided on its upper side with the registering bearings B B, of the horizontal inlet-tube mounted in the said bearings, the reservoir arranged perpendicular to the inlet-tube, the combustion-tube communicating with the upper end of the reservoir and having an air-pipe tip arranged longitudinally therein, and the sprag bearing against the under side of the inlet-tube and adapted to hold the same in the desired position, substantially as specified.

5. The base A, provided with bearings B B, combined with a transverse tube C, mounted in the said bearings, the combustion-tube communicating with the reservoir, and the blow-pipe connected to the combustion-tube, substantially as specified.

410,504. ATTACHMENT FOR GAS-STOVES. BENTON G. DOSCH and FRANK C. SAWHILL, Allegheny, Pa. Filed Aug. 10, 1887. Renewed Feb. 19, 1889. Serial No. 300,466. (No model.)

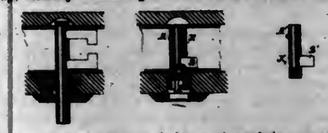
Claim.—The combination, with an attachment for gas-stoves, consisting of an inverted box or hood, of a longitudinal damper hinged at its upper edge to the back of the top plate of the attachment, and a handle in the back of the top plate, the lower end of which is provided with a horizontal arm adapted to engage with the damper when the upper end of the handle is operated.

410,505. CIRCULAR-KNITTING MACHINE. JAMES I. BOX, Kutztown, Pa. Filed Dec. 22, 1887. Serial No. 258,716. (No model.)



Brief.—The objects of the invention are to provide improved means for securing and vertically adjusting the needle-cylinder to vary the length of the stitch without stopping the machine, and to provide a novel thread-carrier.

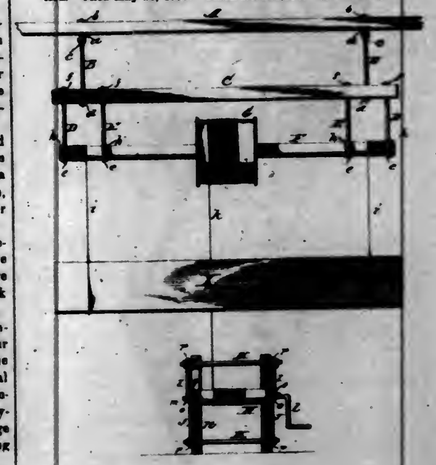
Claim.—1. The combination of the frame or bed having a depending guide-pin, a needle-cylinder, a horizontal arm or bar having a cam on its under surface and provided at one end with a sleeve for engaging said guide-pin, and at its other end with a solid unsplit ring for supporting the needle-cylinder, and a lever acting on said cam to raise and lower the needle-cylinder and its support, substantially as described.



2. The combination, with the needle-cylinder, cam-cylinder, and loose cam-cylinder gear, of an adjustable thread-carrier mounted on said gear, said thread-carrier comprising an arm 53, provided with a perforation 54, and an indentation 55 on each side of said perforation, the pivoted plate 51 having a stud 56 to engage said perforation or indentations, and the spring 57, substantially as described.

3. The combination of the frame 1, the cam-cylinder 35, the needle-cylinder 18, the solid vertically-movable ring 16, for supporting the needle-cylinder, said ring being provided with recessed annular flange 17, slot 22, and lug 26, the sliding segmental clamp 20, having shank 21, the spring 23, and the thrust-pin 24, substantially as described

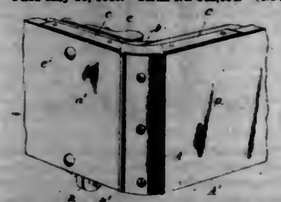
4. The combination of the main frame 1, provided with concentric flanges and an annular chamber between the flanges, an annular gear running in said chamber, a cam-cylinder bearing on the frame and loosely connected with the gear, a vertically-movable horizontal bar 15, having a ring 16, and provided on its under side with the cam-surface 27, the needle-cylinder 18, resting on the ring, a horizontally-swinging lever 28, pivoted at one end to the main frame to engage the cam-surface for raising and lowering the horizontal bar, its ring and the needle-cylinder, and provided at or near its other end with a vertical guide-pin 29, substantially as and for the purposes set forth.



410,506. KEY-HOLE GUARD. FRIEDRICH RICHE, Sebnitz, Saxony, Germany. Filed Aug. 8, 1888. Serial No. 282,263. (No model.)

Claim.—A removable key-hole guard consisting, essentially, of a sleeve having a pair of peripheral slots extending partially around the same, and a core loosely located and adapted to rotate in said sleeve and provided with a pin extending through one of said slots and with a key-bit extending through the other slot, the outer end of the core being formed to receive a key to turn the same, substantially as described.

410,507. HOISTING APPARATUS. WILLIAM T. FAIN, Lead Hill, Ark. Filed May 21, 1889. Serial No. 311,557. (No model.)



Claim.—1. In a hoisting apparatus, the combination, with a suitable windlass, of a beam C, connected to a support by hanger-rods B and the eyebolts *e*, and the roller F, suspended from the beam and carrying drum G, and the hoisting-ropes passing around the roller and drum, substantially as and for the purpose set forth.

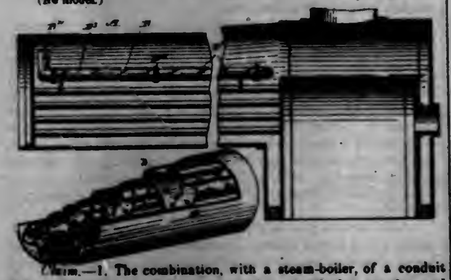
2. In a hoisting apparatus, the beam C and means for suspending it from a suitable object, in combination with the hangers D E, connected to the beam and provided with rings *e*, to serve as bearings, the roller F, having its ends supported by the rings of the hangers and carrying drum G, the ropes extending around the roller and drum, and a suitable windlass to which the rope of the drum is connected, substantially as and for the purpose specified.

3. In a hoisting apparatus, the combination, with a suitable windlass, of the frame for supporting the same, consisting of the supporting-rods I J, having eyes on their ends, and the horizontal brace-rods K, having their ends passing through the eyes of the supporting-rods, substantially as and for the purpose specified.

4. In a hoisting apparatus, the hanger-rods B and eyebolts *e*, as a means for supporting the beam C, the hangers D E, having the rings *e*, and the roller F, carrying drum G, in combination with the windlass H and the frame for supporting same, consisting of the horizontal brace-rods K and the supporting-rods I J, having eyes at their ends, substantially as and for the purpose set forth.

410,508. WAGON-BODY CORNER. HORACE S. FAIRBANKS, Racine, Wis. Filed May 29, 1889. Serial No. 312,651. (No model.)

Claim.—1. The wagon body or box and corner iron or piece having a rounded or convex outer surface and connected to a cleat or post adapted to be fitted at the corner-joint of the body or box, substantially as set forth.



2. The corner piece or iron having a rounded or convex outer surface and an inner curved or concave surface and its securing-cleat, substantially as set forth.

3. The corner piece or iron having an outer rounded or convex surface and an inner concave surface and the post or cleat having one side edge beveled or chamfered and the opposite side edge rabbeted, substantially as set forth.

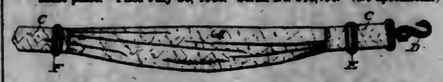
4. The combination, with the corner-piece, the end gate, and panel of the vehicle-body, of the bracket secured to the cleat of the said corner-piece and having at each end an offset or plate, one plate or offset entering a recess or gain in the edge of the bottom frame and having a hinge-connection with said frame, the offset or plate at the other end of the bracket having a hook-and-eye connection with the end-gate, substantially as set forth.

5. The combination of the corner piece or iron having an outer rounded or convex surface, the post or cleat having one side edge beveled and the opposite side edge rabbeted, and the square or bevel ended panels fitting the cleat or post, one of said panels entering the rabbet of said post or cleat and the corner iron or piece, substantially as set forth.

410,509. WATER-PURIFIER AND SCALE-ARRESTER. BENJAMIN F. FIELD, Chicago, Ill. Filed Mar. 28, 1889. Serial No. 305,123. (No model.)

Claim.—1. The combination, with a steam-boiler, of a conduit B, located within the boiler, connected to the feed-water pipe, and having a discharge pipe or orifice within the boiler, said conduit being provided with a series of tubes arranged within and extending longitudinally thereof, substantially as described.

2. The combination, with a steam-boiler and a conduit B, horizontally disposed within the boiler and connected to the feed-pipe at one end and provided with a discharge-pipe at the opposite end above the water-line, of a series of corrugated tubes open at both ends and contained one within another, said tubes being longitudinally disposed within the conduit B, substantially as described.

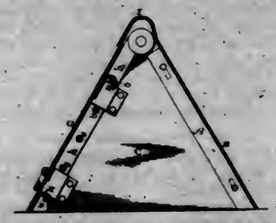


3. In combination with a steam-boiler and the feed-pipe thereof, a conduit B, connected to the feed-pipe and provided with a discharge above the water-line, said conduit being composed of a series of separate pipes or sections detachably secured together, and one or more of said sections provided with a series of open-ended corrugated tubes held in position within and longitudinally of the section by a transverse bolt, with spacing devices for holding the several tubes separated, substantially as and for the purpose set forth.

4. The combination, substantially as described, with the boiler and feed-pipe, of the sectional conduit B, composed of a series of outer pipes or sections provided with non-scaling surfaces and a series of removable internal tubes or plates composed of materials, such as iron or steel, for which the scale-forming materials contained in the water manifest an affinity, as and for the purpose set forth.

5. The combination, with a steam-boiler and with the feed-water pipe, of a conduit B, provided with a discharge-pipe, opening within the boiler, said conduit being composed of an outer tube and a series of inner tubes arranged one within another and disposed longitudinally of the outer tube, said inner tubes being open at both ends and perforated, as and for the purpose set forth.

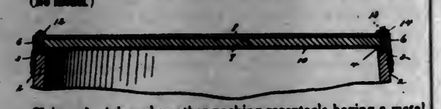
6. In a conduit for conveying and heating the water and delivering the latter into a boiler, an outer tube and a series of inner tubes arranged one within another, said inner tubes being composed of corrugated and perforated plates open at both ends and held in place within the outer tube, a transverse bolt passing through all of the tubes, with devices interposed between the inner tubes to hold them apart, substantially as and for the purpose set forth



410,510. COMBINED SASH AND BELT. THOMAS J. FLAGG, New York, N. Y., assignor to himself, Henry C. Flat, and Thomas R. Clark, same place. Filed July 26, 1889. Serial No. 318,750. (No specimens.)

Claim.—1. As a new article of manufacture, the combined sash and belt constructed substantially as described, of a central sash gathered and secured at its ends to comparatively narrow strips, serving as a continuation thereof and having suitable detachable fastening devices to unite them.

2. The combination, with the end belt-pieces C C, formed of comparatively narrow strips and provided with detachable devices for uniting them, of the interposed wide sash-piece A, left free and full in the middle and gathered in folds at each end for attachment to said narrower belt-pieces C C, substantially in the manner and for the purpose herein set forth.

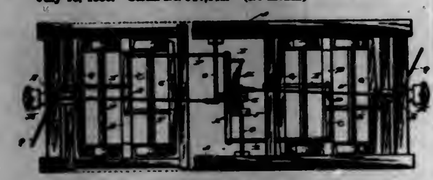


410,511. FOLDING COOP. PATRICK FOGARTY, Oxford, Ohio, assignor of one-half to Owen McCoy, same place. Filed May 13, 1889. Serial No. 310,522. (No model.)

Claim.—1. In a folding coop, the combination of the hinged end pieces, the back secured thereto having its upper end curved over the top of the coop and left open at the ends for ventilation, with the triangular end pieces, and the rods or slats connecting the front end pieces and forming the front of the coop, substantially as described.

2. In a folding coop, the combination of the end pieces hinged together at their upper ends, the back secured thereto having its upper end curved over the top of the coop and left open at the ends, the triangular end pieces, the rods or slats connecting the front end pieces, and the removable metallic plate provided with hooks for catching over the rods, and which closes the front of the coop at night, substantially as described.

410,512. COVER FOR PACKING-VESSELS. LUTHER I. FRIERSON, Mount Pleasant, Tenn. Filed Feb. 5, 1889. Serial No. 298,760. (No model.)



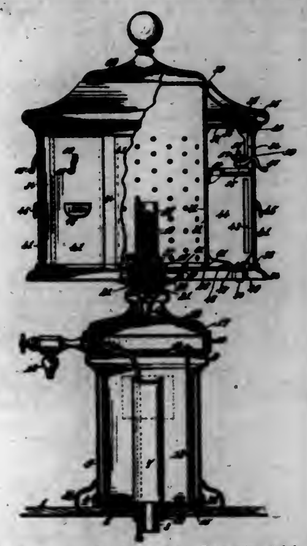
Claim.—1. A barrel or other packing-receptacle having a metal hoop or binding flush, or nearly so, with its edge, metallic plates fastened to said hoop and bent inward over the same to lie in recesses in the edge, said plates receiving headed bolts, and a cover having apertures and bolts extending through the same, and means engaging said bolts for forcing the cover against the edge of the receptacle, substantially as described.

2. A barrel or other receptacle having a metallic hoop or binding flush, or nearly so, with its upper edge, metallic plates riveted to said hoop, bent over the same and lying in recesses in the edge, a cover having a packing-annulus and provided with a metallic frame or spider which receives the heads of the bolts lying under the metallic plates on the hoop, said bolts passing up through the plates and openings in the cover and frame or spider, and means engaging the bolts for forcing the cover against the edge, substantially as described.

3. The combination, with a barrel or other packing-receptacle having a metallic hoop riveted to the upper edge, said hoop provided with metallic plates bent inward over its edge and lying in recesses in the edge of the vessel, of a cover having a spider fastened to its upper face and provided with apertures in the ends of the arms of the spider, which receive bolts whose heads lie under the inwardly-bent plates and which pass through holes in the plates and the cover, and nuts turned on said bolts, substantially as described.

410,513. CAR-BRAKE. HENRY GALLAGER, Savannah, Ga. Filed July 10, 1889. Serial No. 317,012. (No model.)

Claim.—1. The combination, with a car, a brake mounted thereon, a spring adapted to force the brake against the wheels, and a sliding draw-bar connected with the brake to overcome the force of the spring and carry the brake from the wheels, of draw-bar locking mechanism, a cord passing from end to end of the car through the upper part thereof, and a lock-actuating rope connecting said locking mechanism with said cord, substantially as and for the purpose set forth.



2. The combination, with the car and truck frames and the swinging brakes G, of the transverse bar B, the lever pivoted thereon, a spring connected to said lever to draw the brakes against the wheels, and a sliding draw-bar connected with said lever to draw it in the opposite direction, substantially as set forth.

3. The combination, with the car, of the swinging brake suspended to swing against the car-wheels, the lever H, pivotally suspended between the brakes and having its ends connected with them, respectively, the spring K, fixed alongside the lever, the link L, connecting the free end of the spring to one end of said lever, and the sliding draw-bars connected, respectively, to the ends of the lever to overcome the force of the spring, substantially as and for the purpose set forth

410,514. APPARATUS FOR DISPENSING EFFERVESCING DRINKS. WILLIAM GEE, New York, N. Y. Filed May 23, 1889. Serial No. 311,848. (No model.)

Claim.—1. In apparatus for dispensing effervescing drinks, the combination, with a container having an ice-chamber in which the coils are arranged, of a supporting cap or cover having a seat, a stem or spindle, and a cup-flange, all formed in one casting, and a rotating siruping apparatus contained in a casing pivotally mounted upon said seat and stem, substantially as described.

2. In an apparatus for dispensing effervescing drinks, the combination, with an ice-container in which the pipe-coils are arranged, of a cap or cover having a seat, a stem or spindle, and a flange, all formed of a single integral casting, a siruping apparatus contained in a casing pivotally mounted upon said stem and seat and having openings in its base discharging into the cup-flange, and thence through openings in the seat into or upon a diverting-plate which conducts the drip to the inner face of the container, substantially as described.

3. In an apparatus for discharging effervescing drinks, a siruping apparatus contained within a casing or chamber inclosed in front by a series of panels resting at their lower ends within a circumferential rib or flange, and upon the inner faces of which the sirup-jars are detachably mounted, substantially as described.

4. In an apparatus for dispensing effervescing drinks, the combination, with the casing, of a series of separate panels resting at their lower ends within a channel on the base of the casing, each panel being provided on its interior face with flanges or tangs, and sirup-jars having grooves terminating at a short distance from their inverted bottoms, and in which the flanges lie, substantially as described.

5. In apparatus for dispensing effervescing drinks, the combination, with a casing, of a series of separate panels inclosing its front, each panel having its lower edge lying in a channel in the base of the casing, a series of inverted sirup-jars detachably mounted upon the inner faces of said panels and having valves carried by stems projecting through their inverted bottoms, and weights adjustably mounted on the projecting ends of the valve-stems, and actuating-levers inserted through openings in the panels and engaging the valve-stems beneath said weights, substantially as described.

6. In apparatus for dispensing effervescing drinks, the combination, with a casing, of a series of separate panels inclosing its front, a series of inverted sirup-jars detachably mounted on the inner faces of said panels, their necks projecting through openings in the base or floor of said chamber, a series of valves carried by stems which lie within and project above the inverted bottoms of the jars, each bottom being formed of two removable parts, each part having a half socket or bearing for the valve-stem, weights screwed upon the threaded projecting ends of the valve-stems, and a series of levers inserted through openings in the panels and resting upon the edges of said openings, said levers engaging the valve-stems beneath the weights, substantially as described.

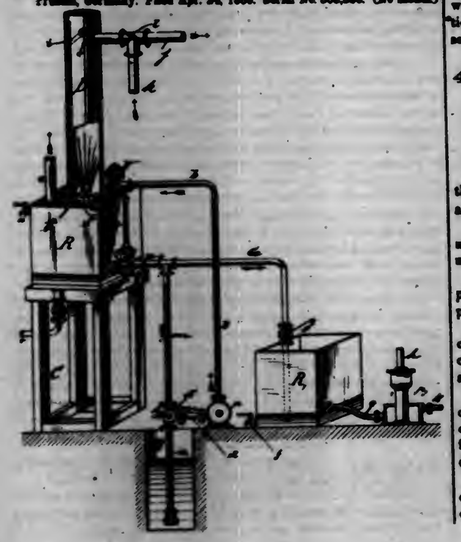
7. In an apparatus for dispensing effervescing drinks, the combination, with a casing, of a panel inclosing its front and resting at its lower end in a channel in the base of the casing, a sirup-jar having grooves in its body engaging flanges on the inner face of said panel, by which the jar is entirely supported, a screw-cap containing a valve-seat and turned upon the inverted neck of the jar, which projects through an opening in the base of the casing, a rubber-faced valve engaging said seat and mounted on a stem passing through the removable two-part bottom of the inverted jar, a weight turned upon the threaded projecting end of said stem, and a lever inserted in an opening in the panel and engaging the stem below the weight, substantially as described.

8. In an apparatus for dispensing effervescing drinks, the combination, with a pivotal support, of a casing for the siruping apparatus having a circular base provided with a peripheral channel and having at intervals a series of columns or brackets arranged within said channel and connected by screws or rivets to the base and to a sectional flange above, and a series of panels having their lower ends resting in said channel and their vertical edges overlying the outer faces of the columns, substantially as described.

9. In an apparatus for dispensing effervescing drinks, the combination, with a container having a suitable ice-chamber within which the pipes are coiled and provided with a support or cover having a stem or pivot, of a siruping apparatus contained within a casing pivotally mounted upon said stem and supported by the container, substantially as described.

410,515. REVOLVING COAL-SCREEN. WINFIELD O. SIMMONS, Terre Haute, Ind. Filed Jan. 22, 1889. Serial No. 297,097. (No model.)

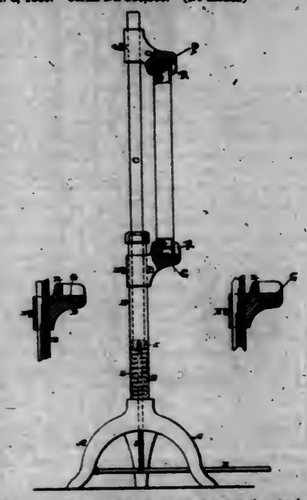
Claim.—1. The combination of the cylindrical wire screen, the flat bands secured to the ends of the screen, the middle driving-band of larger diameter than the end bands, the driving-shafts situated below the screen, one on each side of it, the flat-faced wheels supporting the ends of the screen, and the driving-wheels engaging with the said middle driving-band, substantially as and for the purpose set forth.



2. The combination of the inclined cylindrical wire screen, the flat bands secured to the ends of the screen, the middle driving-band of larger diameter than the end bands, and provided with the circumferential V-shaped projection, the longitudinal bars uniting the middle and end bands, the driving-shafts situated below the screen, one on each side of it, the flat-faced wheels supporting the ends of the screen, and the grooved driving-wheels engaging with the said projection on the middle driving-band, substantially as and for the purpose set forth.

3. The combination of two parallel driving-shafts, three wheels secured upon each shaft, and a cylindrical screen provided with middle and end bands, supported upon the said wheels and bearing hardest upon the middle wheels, whereby the screen is driven from the middle, substantially as set forth.

410,516. INCRUSTATION PREVENTIVE. THOMAS HARRIS and CHARLES DAY, Xenia, Ohio. Filed Oct. 22, 1888. Serial No. 288,541. (No specimens.)



Claim.—The herein-described composition for removing scale from steam-boilers, consisting of one gallon of coal-oil, one pint of black oil, one ounce of wheat-flour, and one ounce of lard, as and for the purpose set forth.

410,517. FEED-WATER HEATER. MAX HENKING, Dortmund, Prussia, Germany. Filed Apr. 24, 1889. Serial No. 308,286. (No model.)

Claim.—The herein-described apparatus for heating and purifying the feed-water for steam-boilers, consisting of the following combined and co-operative parts, viz: tank R, having pipes c and v and faucet u, heating-dome D, having valve i and branched pipe j k, provided with the valve l, water-pipe b b', having air-chamber W and rose or spraying nozzle b^2, discharge-pipe E G, having gage-chamber O, provided with the gage-glass F and valve g, secondary or sediment tank K', connecting-pipe e, feed-pump p', suction-pipe a, valve d', having three-way cock d^2, connecting-pipe d, pump p, and branch pipe m, all constructed and combined to operate substantially in the manner and for the purpose herein set forth.

410,518. MACHINE FOR CRIMPING THE ENDS OF PAPER TUBES. ROBERT K. HILL and HERBERT C. FOSTER, Woodbury, N. J. Filed Apr. 3, 1889. Serial No. 305,969. (No model.)

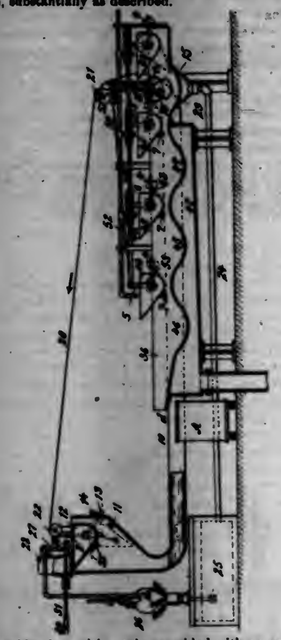
Claim.—1. The combination of the tubular body B, mounted upon a suitable stand or support, and a lower support or table which is attached thereto, with the upper portion of the frame, the upper support placed thereon, and a spring-actuated treadle mechanism for depressing the upper die upon the lower one, substantially as shown.

2. In a machine for crimping the ends of paper tubes, the combination of the two supports secured to a suitable frame and made vertically movable in relation to each other, each one being provided with a circular flange for the purpose of centering the tube in position, with the dies for crimping the ends of the tubes, substantially as set forth.

410,519. SCOURING AND WASHING MACHINE. SAMUEL HOSKIN, Medway, Mass., assignor to himself, and Frank R. Anderson, Orange, N. J. Filed Nov. 1, 1888. Serial No. 289,707. (No model.) Patented in England Nov. 27, 1888, No. 17,271; in France Nov. 30, 1888, No. 194,668; in Germany Dec. 7, 1888; in Belgium Mar. 2, 1889, No. 85,234, and in Cape of Good Hope Mar. 20, 1889, No. 56.

Claim.—1. The combination, with a substantially horizontal tube that is normally filled with liquid, of a staple-supplying mechanism and a tube-flushing mechanism, as and for the purpose stated.

2. The combination, with a tube normally filled with liquid, of a means for delivering a constant supply of liquid to the tube and a means for delivering an intermittent supply of liquid thereto.



3. The combination, with a tube provided with an upturned and perforated delivery end, of a tube-flushing mechanism, as and for the purpose stated.

4. The combination, with a tube having an upturned delivery end, of a receiving-tray arranged in advance of said delivery end, a staple-compressing mechanism, and a tube-flushing mechanism, substantially as described.

5. The combination, with a tube having an upturned delivery end, of a receiving-tray arranged in advance of said delivery end, a staple-compressing mechanism, a flushing-tank, and connections between the flushing-tank and the staple-compressing mechanism, substantially as described.

6. The combination, with a tube having an upturned delivery end, of a receiving-tray arranged in advance of said delivery end, a staple-compressing mechanism, a vertically-movable and tilting flushing-tank,

and connections between said flushing-tank and the staple-compressing mechanism, substantially as described.

7. The combination, with a tube provided with an upturned delivery end and with a receiving-hopper, of a tilting flushing-tank mounted in said hopper, a staple-receiving hopper, and a staple-delivery mechanism, substantially as described.

8. The combination, with a tube provided with a hopper and an upturned and perforated delivery end, of a tube-flushing attachment and a slide, said slide being arranged in connection with the perforated delivery end, substantially as described.

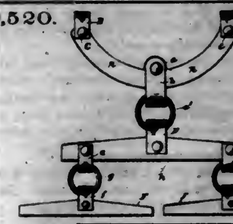
9. The combination, with a hopper and a flushing mechanism, of a tube connected thereto and formed with an upturned delivery end, the tube gradually increasing in diameter from the hopper to its delivery end, substantially as described.

10. The combination, with a tube or conduit having its main portion lying in a plane below its inlet and outlet, of an intermittent staple-feeding mechanism and an intermittent flushing mechanism, as and for the purpose stated.

11. The combination, with a series of basins, of a series of flushing-tanks and connections between said tanks, as and for the purpose stated.

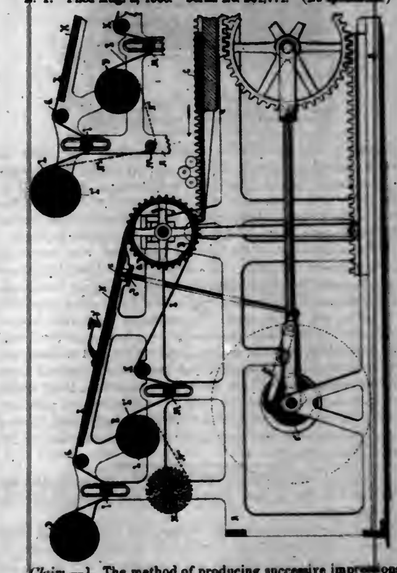
12. The combination, with a series of basins, of a series of pivotally mounted tanks provided with lever-arms, and slotted arms pivotally connected to the tank lever-arms, and extending to the rear to engage with pins carried by the lever-arms of the tanks to the rear, said pins passing through the rod-slots, substantially as described.

13. The combination, with a tube provided with a hopper and an upturned delivery end, of a staple-feeding mechanism, a tube-flushing mechanism, a staple-compressing mechanism, and a staple-washing mechanism, substantially as described.



14. The combination, with a tube or conduit normally filled with liquid, of a liquid-supply attachment and a means for imparting an intermittent impulse to the liquid within the tube, as and for the purpose stated.

410,520. WHIFFLETREE. JACOB B. HOWELL, Veteran, N. Y.



Filed June 5, 1888. Serial No. 313,119. (No model.)

Claim.—The whiffletree consisting of the segmental casting or plate A, having at its ends pivoted loops B B, the loop *b*, having its ends connected to a central enlargement or knob *a* of the segmental plate A upon its rear or concave side, the doubletree A, having a central loop D, connected by a ring *d* to the loop *b* of the segmental plate, and the singletrees F, having loops *f*, connected by ring *g* with loops *e* at the ends of the doubletree A, substantially as set forth.

410,521. METHOD OF PRINTING. GUSTAV L. JAEGER, New York, N. Y. Filed Aug. 3, 1888. Serial No. 281,771. (No specimens.)

Claim.—1. The method of producing successive impressions on a continuous web, which consists in drawing the web from the roller on which it has been wound by the co-operation of the impression-cylinder and of the bed during the forward stroke of the bed, holding the impression cylinder stationary during the return-stroke of the bed, and adjusting the web in the proper registering position previous to the next movement of the impression-cylinder, substantially as described.

2. The method of producing successive impressions on a continuous web, which consists in drawing the web from the roller on which it has been wound by the co-operation of the impression-cylinder and of the bed during the forward stroke of the platen, holding the impression-cylinder stationary during the return-stroke of the bed, providing the web with registering holes or perforations, and bringing these in engagement with suitable registering projections previous to the next movement of the impression-cylinder, substantially as described.

3. The method of producing successive impressions on a continuous web, which consists in drawing the web from a roller and producing the first impression by the coaction of an impression-cylinder and a bed, and then adjusting the web to bring registering marks thereon into coincidence with other registering marks prior to producing the next impression, substantially as described.

4. The method of introducing a laying-in sheet, which consists in drawing the same from a roller and winding it up upon another roller, together with the freshly-printed web, then changing the position of the compound roll containing the printed web and the laying-in sheet, and passing the web from said compound roll through the printing apparatus for a second series of impressions while the laying-in sheet is drawn from the compound roll and wound up for the second time with the web after the latter has passed for the second time through the printing apparatus, substantially as described.

410,522. BOX-STAYING MACHINE. GUSTAV L. JAEGER, New York, N. Y. Filed May 1, 1889. Serial No. 309,257. (No model.)

Claim.—1. In a machine for applying corner-stays to boxes, the combination, with the die A, of an anvil or support C, said anvil being made laterally movable upon its base, substantially as described.

2. In a machine for applying corner-stays to boxes, the combination, with the die A, of an anvil or support C, having a laterally-oscillating motion, substantially as described.

3. In a machine for applying corner-stays to boxes, the combination, with the die A, of an anvil or support C, having a longitudinally-oscillating motion, substantially as described.

4. In a machine for applying corner-stays to boxes, the combination, with the die A, of an anvil or support C, laterally movable upon its base, and a spring H, for holding said anvil in the starting position, substantially as described.

5. In a machine for applying corner-stays to boxes, the combination, with the die A, of an anvil or support C, made laterally movable upon its base and secured to said base by a pin-and-slot connection, substantially as described.

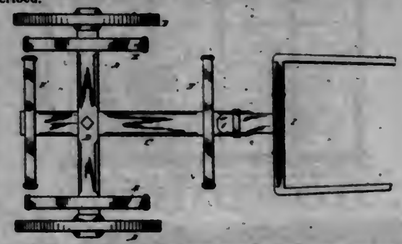
6. In a machine for attaching corner-stays to boxes, the combination, with the die A, of an anvil or support C, either said die or anvil being made laterally movable, substantially as described.

410,523. DECOY. WILLIAM H. JENNER, Clinton, Iowa. Filed Feb. 5, 1889. Serial No. 298,728. (No model.)

Claim.—1. A decoy-duck provided with an internal anchor-cord-winding reel, in combination with a set-screw adapted to bear upon the reel and lock the same in position, substantially as specified.

2. A decoy-duck provided with an internal anchor-cord-winding reel having a recess upon one of its ends, in combination with a set-screw adapted to take into the recess, whereby the reel is locked against unwinding, but may be oscillated from side to side, substantially as specified.

3. A decoy-duck provided with an internal anchor-cord-winding reel mounted upon a shaft projecting through the upper portion of the duck, in combination with the head of the decoy mounted on the shaft, adapted to be revolved for the purpose of revolving the reel, substantially as specified.



4. A decoy-duck formed with forward and rearward internal recesses, in combination with a shaft mounted in the forward recess and provided with a spool or reel, a decoy-head mounted on the shaft and adapted to revolve the same, and an anchor-cord, one end of which is made fast to and adapted to be wound upon the spool, substantially as specified.

5. The combination of the body-sections 1 and 2, secured as at 6, internally recessed, as at 4 and 5, and having the openings 7, 8, and 14, in combination with the head 3, recessed, as at 11, the shaft 9, mounted in the bearings 7 and 8 and terminating in the recess 11, the reel 12, mounted rigidly on the shaft and recessed, as at 16 and 18, and carrying the anchor-cord 13, passing through the opening 14, and the set-screw 17, for taking into the recesses 16 and 18, substantially as specified.

410,524. VEHICLE. WESLEY JOHNSON, East Enid, Pa. Filed Apr. 13, 1889. Serial No. 307,000. (No model.)

Claim.—1. The combination, with a body of a vehicle, of an axle, a supporting rod or bar secured near its center to the axle and at right angles thereto, and springs arranged on opposite points of said supporting-rod and disposed between the same and the vehicle-body, substantially as set forth.

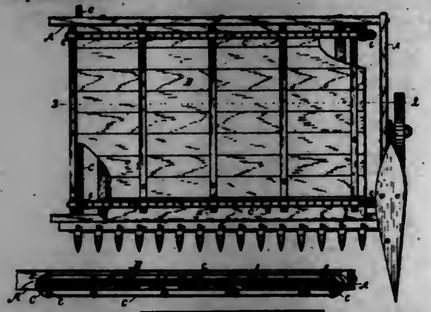
2. The combination, with the body of a two-wheel vehicle, of the running-gear, consisting of the axle, supporting rod or reach, said rod being secured near its center to the axle at right angles thereto, and of the springs interposed between the vehicle-body and the running-gear, said springs being secured to the base of the vehicle-body at the sides and ends thereof and at opposite points to the supporting-rod and axle, substantially as herein shown, and for the purpose described.

3. The herein-described running-gear for a two-wheel vehicle, consisting of the wheels, axle, longitudinally-supporting recessed rod, and of the springs interposed between the vehicle-body and the running-gear, said springs being secured to the base of the vehicle-body at the sides and ends thereof and to the outer ends of the axle and supporting-rod, substantially as herein shown and described.

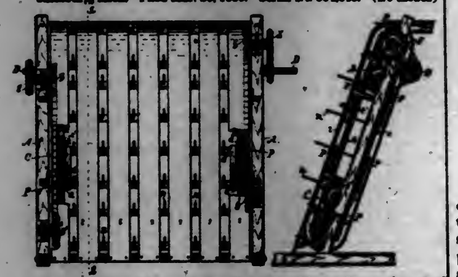
4. The herein-described running-gear for two-wheel vehicles, consisting of the wheels, axle, longitudinal supporting-rod, said rod having a central recess formed therein, into which the axle is adapted to engage, coupling-bolt for securing the axle within the recessed portion of the supporting-rod, and of the side and end springs interposed between the vehicle-body and the running-gear, said springs being secured to the base of the vehicle-body and to the outer ends of the axle and supporting-rod, substantially as set forth.

5. The herein-described running-gear for two-wheel vehicles, consisting of the centrally-enlarged longitudinal supporting-rod, said rod having a recess formed therein, of the axle adapted to fit within the recess formed in the supporting-rod, coupling-bolt for securing the axle and rod, springs interposed between the body of the vehicle, at the sides and ends thereof, and the running-gear, said springs being secured to the outer ends of the axle and supporting-rod, and of the shaft secured upon the forward end of the supporting-rod, substantially as set forth.

410,525. STEAM-ENGINE. WILLIS R. JONES, Alba, Mich. Filed Jan. 15, 1889. Serial No. 296,366. (No model.)



Claim.—The combination of the bed-plate provided with central ways or grooves having upper flanges, the three-throw crank-shaft, the pitman connected thereto, the cross-heads working in the grooves or ways and provided with steps or shoulders passing beneath the upper flanges of the ways or grooves, and also having the forward ends of the pitman secured thereto, the frame surrounding the cylinder, the inner ends of the side pieces thereof being connected to the outer sliding cross-heads, and their forward ends passing through bearings upon diametrically-opposite portions of the cylinder, the cross-heads connecting said side pieces transversely, the forward one of which connects the extreme front ends thereof, and the rear cross-head connecting said side pieces at a point somewhat removed from their rear extremity, the piston-rods extending from the cross-heads, the piston-rod upon the innermost cross-head being hollow, the central piston-rod connected to the central sliding cross-head constructed to pass through said hollow piston-rod and to be actuated in an opposite direction to the piston-rods upon the cross-heads, the steam-cylinder, the steam-pipes leading into the steam-cylinder and provided with induction and eduction openings, and the valve for alternately admitting steam into the cylinder and exhausting the same therefrom, substantially as set forth.

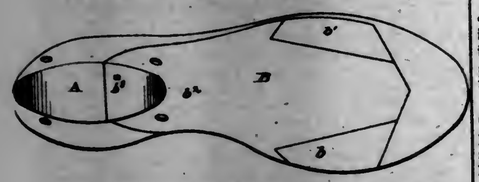


410,526. GRAIN-CARRIER. WILLIAM H. KRAFT, Galesburg, Mich. Filed Mar. 26, 1888. Serial No. 304,512. (No model.)

Claim.—The combination of a platform, sprocket-wheels at the four corners, sprocket-chains on said wheel at the sides of the platform, said wheels being recessed between the sprockets to receive the slats, and slats attached at the ends to the side of the chains which engage the wheels, whereby the slats move the grain along the upper

surface of the floor of the platform and in contact therewith, substantially as set forth.

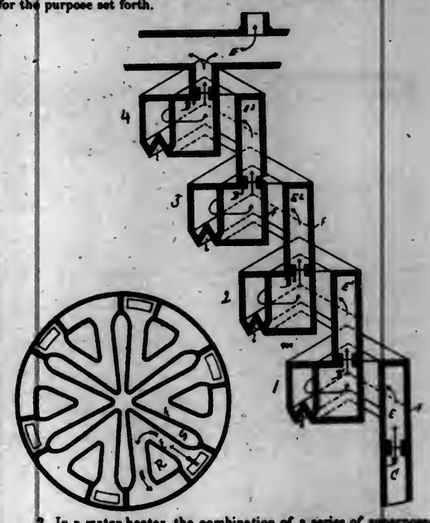
410,527. ELEVATOR FOR HARVESTERS. WILLIAM H. KNAPP, Galesburg, Mich. Filed Mar. 26, 1889. Serial No. 304,813. (No model.)



Claim.—1. An elevator or carrier comprising a frame, the set of sprocket-wheels on each side of said frame, and sprocket-chains on said wheels, one set of said wheels and chains being placed at a suitable distance above the other set, and a frame or frames bearing fingers and being pivoted at diagonally-opposite corners to said chains, substantially as set forth.

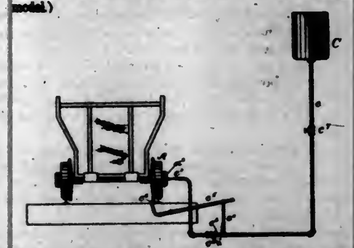
2. In an elevator or carrier, the combination of the two sets of sprocket wheels and chains, one set being placed a suitable distance above the other set, the frame bearing fingers, said frame being pivoted at diagonally-opposite corners to the chains, and guideways to steady the moving chains and frame, substantially as set forth.

3. In an elevator or carrier, the combination of two sets of sprocket wheels and chains, one set being a suitable distance above the other set, the frame bearing fingers and having a friction-roller at each of the four corners of said frame, said frame being pivoted at the two diagonal corners to the chains, and the guideways for the rollers to traverse, substantially as set forth.



410,528. LAST. BERNARD W. KOSTMAN, Terre Haute, Ind. Filed May 20, 1889. Serial No. 311,069. (No model.)

Claim.—In a last, the body portion, in combination with the last-block, said block consisting of the central part b^3, and the wedge-shaped pieces b and b' across the ball upon the inner and outer sides, respectively, of said block, substantially as described, and for the purpose set forth.

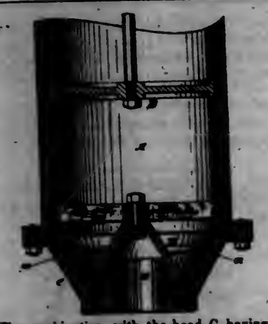


410,529. WATER-HEATER. NEWELL P. ANDERS, Brooklyn, assignor of one-half to Robert J. Hatby, New Brighton, N. Y. Filed June 19, 1888. Serial No. 314,891. (No model.)

Claim.—1. In a water-heater, the combination of a series of superposed chambers each provided with a series of irregular water-passages formed by their internal walls, said passages having separate inlets and outlets arranged equidistant around the chambers and having their respective consecutive water-connections arranged spirally, and the heat-flues R and S, formed between the external walls of said chambers and passing vertically through them, substantially as and for the purpose set forth.

2. In a water-heater, the combination of a series of superposed chambers provided with irregular water-passages formed by their internal walls and having their consecutive water-connections arranged spirally, said chambers being separated by horizontal spaces m and provided with grooves i in their under sides, and the heat-passages R and S, formed between the external walls of said chambers and passing vertically through them, substantially as and for the purpose set forth.

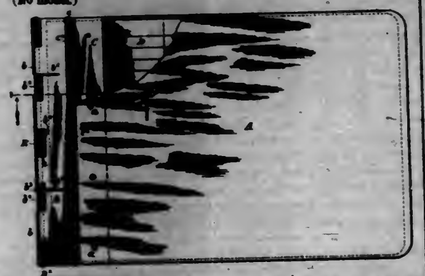
410,530. APPARATUS FOR OILING MINE-CARS. JAMES F. BEATTIE, Wheeler, Pa. Filed May 2, 1889. Serial No. 308,774. (No model.)



Claim.—1. In an apparatus for oiling cars, the combination of an oil-reservoir, a pipe connecting with the said reservoir, a valve located in said oil-pipe, a trip-lever connecting to said valve, whereby a passing wheel may open the valve, and a nozzle located at the end of said pipe and so directed that it will squirt a jet of oil into the oil-chamber of the passing wheel, substantially as specified and set forth.

2. In an apparatus for oiling the journals of car-wheels, a fixed nozzle located so as to squirt a jet of oil into the oiling-place of the passing wheel, in combination with a pipe connecting to the said nozzle, an oil-reservoir connected to said pipe, and an automatic valve located in the said pipe, for controlling the delivery of oil, substantially as specified and set forth.

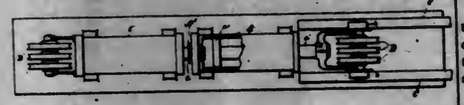
410,531. MACHINE FOR MAKING CURVED PIPE. HORACE B. CARP, Cuyahoga Falls, Ohio, assignor to Turner, Vaughn & Taylor, same place. Filed June 4, 1888. Serial No. 275,905. (No model.)



410,531.

Claim.—The combination, with the head C, having the internal recess *a*, and the mandrel D, supported centrally therein, of the detachable ring E, arranged to rest immovably in said recess and having an opening eccentric to its periphery, substantially as shown and described, and for the purpose specified.

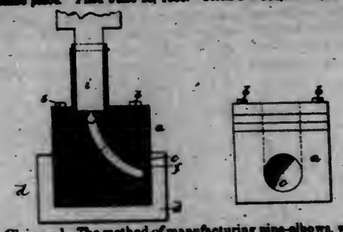
410,532. TEMPORARY BINDER. WILLIAM H. CARROLL and FRANK LEMMON, Chicago, Ill. Filed Feb. 12, 1889. Serial No. 299,664. (No model.)



Claim.—1. The temporary binder, comprising the spring-actuated clamping-leaves B B, pivotally secured to each other at one of their margins and each provided with a leaf C, to which the covers of the book may be secured, said leaves C C being pivotally joined to said clamping-leaves B B, substantially as specified.

2. The combination, with the clamping-leaves B B, hinged together at their adjacent margins, and a spring adapted to compress or hold said leaves together, of a spring-detent secured to one of said leaves, provided with a shoulder to engage a margin or part upon the other leaf when said leaves B B are opened, and to hold the latter in the opened position against the action of the said spring.

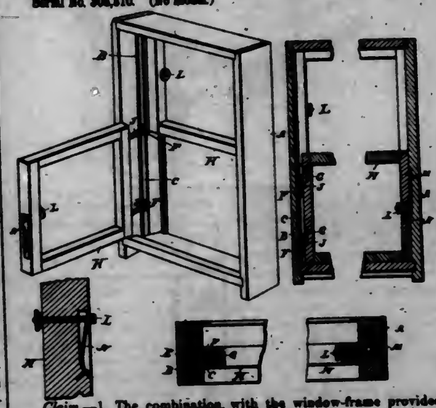
3. In a hinge-back for book-binders, the spring-actuated clamping-leaves B B, the cover-leaves C C, each pivotally attached to the outer margins of the leaves B B, the pages D, and a cushion *d*, interposed between said pages D and the clamping-leaves B B, substantially as and for the purpose specified.



410,533. HYDRAULIC ELEVATOR. GEORGE W. CLAYTON, Cleveland, Ohio. Filed Jan. 23, 1888. Serial No. 261,562. (No model.)

Claim.—1. In a hydraulic elevator, the combination, with a primary motor, a piston and piston-rod therein, and a cross-head secured to the latter, of auxiliary motor, piston therein, the latter having piston-rod secured thereto, said piston and rod running out of frictional contact with the piston of the primary motor and adapted to abet the reciprocating part of the primary motor in order to co-operate with the latter in hoisting heavy loads, substantially as set forth.

2. In a hydraulic elevator, the combination, with primary and auxiliary motors, of an independent piston in each of said motors and independent piston-rods secured to the pistons, the piston and piston-rod of the auxiliary motor being located out of frictional contact with the piston of the primary motor and adapted to abet the reciprocating part of the primary motor to co-operate with the latter, substantially as set forth.



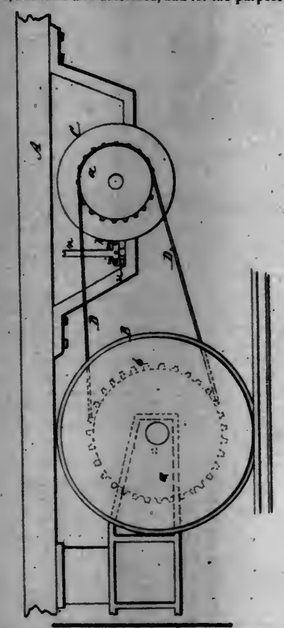
410,534. PROCESS OF MAKING PIPE-ELBOWS. CHARLES B. COOPER, New York, N. Y., assignor to W. P. Wallace and Hugh B. Cooper, same place. Filed June 15, 1889. Serial No. 314,376. (No model.)

Claim.—1. The method of manufacturing pipe-elbows, which consists in first forming a flat metal blank and bending the same into cylindrical form with its edges overlapping, then inserting said cylindrical blank into a bore or female die of the shape of the pipe-section to be produced, then inserting a hollow flexible air or fluid tight expander into said cylindrical blank, and then applying heavy pressure to the end of said expander, and thereby expanding the same laterally, for the purpose set forth.

2. The method of forming pipe-sections, which consists in placing a cylindrical sheet-metal blank in a forming-bore, the walls of which conform to the shape of pipe-section to be produced, and which is closed at one end and open at the other end, then inserting an elastic hollow air-tight cylinder loosely into said blank, and then applying sudden heavy pressure to the end of the cylinder, as set forth.

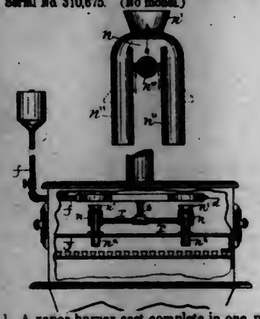
410,535. WINDOW. PATRICK D. CORRIGAN, Wellsville, N. Y., assignor of one-half to John W. Gallman, same place. Filed Apr. 27, 1889. Serial No. 308,810. (No model.)

Claim.—1. The combination, with the window-frame provided with vertical longitudinal grooves in its sides and the sash, of the guide-bars secured within the grooves and arranged out of contact with the walls of the grooves, the hinges secured to the sashes, and the slide secured to the hinges and having flanges engaging the edges of the guide-bars, as set forth.



2. The combination, with the frame and the guide-bar secured therein, of the slide engaging the guide-bar, the sash, and the hinge connecting the sash and the slide, and consisting of the leaves I K, the leaf K having a shoulder L', and the link adapted to contact with said shoulder, as set forth.

410,536. MOTOR FOR LAND-CARRIAGES. COVE. B. COWLEY, Wyoming, and LEONARD H. COWLEY, Rochester, assignors of one-third to William A. Sutherland, Rochester, N. Y. Filed Sept. 17, 1888. Serial No. 285,592. (No model.)



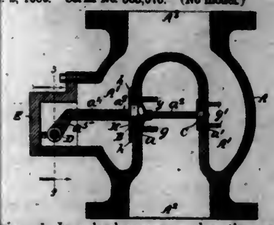
Claim.—1. In a land-carriage, the combination of the engine-shaft, the side plates turning freely thereon, the cog-ring resting loosely between the side plates, the fixed gear on the shaft, the planetary gears having their bearings in the side plates and engaging with the center gear and cog-ring, the brake consisting of a clamping-band resting around the cog-ring and capable of being clamped thereon, and a friction-gear on the shaft adapted to be engaged with and disengaged from one of the side plates, as shown and described, and for the purpose specified.

2. In a land-carriage, the combination of the engine-shaft, the side plates turning freely thereon, the cog-ring resting loosely between

the side plates, the fixed gear on the shaft, the planetary gears engaging with the fixed gear and the cog-ring, the brake-band resting around the cog-ring, the rock-lever for operating the brake-band, the friction-gear on the shaft engaging with a friction-rim on one of the side plates, and a clutch mechanism connecting the rock-lever with the friction-gear, whereby the latter is operated automatically with the brake-band, as shown and described, and for the purpose specified.

410,537. VAPOR-BURNING STOVE. JESSE R. CURL, Des Moines, Iowa, assignor of one-half to Alfred Anderson, same place. Filed May 13, 1889. Serial No. 310,675. (No model.)

Claim.—1. A vapor-burner cast complete in one piece, comprising a hollow metal case or combustion-chamber having a contracted neck and flaring open top at its center, open-ended tubes at its outside extending downward, an integral tube extending across the bottom and open at one end to be connected with an extraneous tube, a perforation in the top of said horizontal tube, and one or more perforations in the bottom of the case at the side of said horizontal tube, substantially as and for the purposes stated.

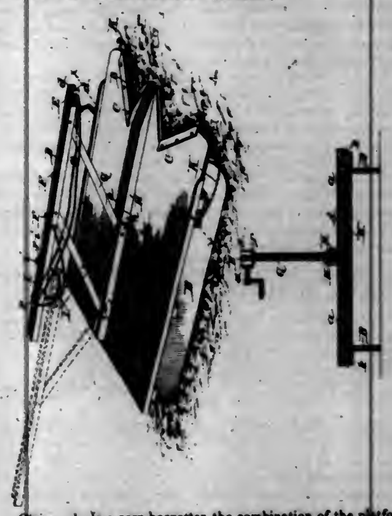


2. A vapor generator and burner coupling device cast complete in one piece and provided with two distinct chambers and two openings in each chamber to admit tubes, and an integral post adapted to support a deflector, in combination with two burners and a deflector, for the purposes stated.

3. The combination of a generator having a post adapted to support a deflector, two burners and tubes extending therefrom into distinct chambers in the generator, and a deflector extending horizontally over the tops of the burners, in the manner set forth, for the purposes stated.

4. The vapor-burners *n*, having open tops *n'*, open-ended tubes *n''*, and perforated tubes *n'''*, a generator *s*, having chambers *s'* and *s''*, and an integral post *s'''*, a deflector on said post extending horizontally over said burners, arranged and combined substantially as shown and described, for the purposes stated.

5. A burner *n*, having tubes *n''*, a plate *y*, having perforations to admit said tubes, a vapor-generator, and flame-deflector arranged and combined with a stove, in the manner set forth, for the purposes stated.



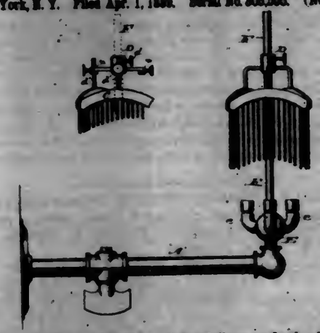
410,538. BACK-PRESSURE VALVE. GEORGE M. DAVIS and ALBERTO BEMENT, Chicago, Ill.; said Bement assignor to said Davis. Filed Apr. 2, 1889. Serial No. 305,673. (No model.)

Claim.—1. In a back-pressure valve, the combination, with a valve-chamber having two exhaust-openings of different areas, of the differential valves located in said openings and connected by a stem common to both, the spring-plate secured to the larger of said valves and cushioning the action of the same, the stud a^2, the link a^4, the crank-arm, the shaft on which said crank is mounted inside of the valve-casing, and the weighted lever mounted on the outer projecting end of said shaft, substantially as and for the purpose set forth.

2. In a back-pressure valve, the combination of the valve-casing, the differential valves chambered therein, the spring-plate cushioning the action of said valves, the chambered cap bolted to one side of said casing, the connecting-link and crank, the rock-shaft located inside of said cap, the bearing-sleeve through which said shaft passes, and the weighted lever mounted on the outer end of said shaft, substantially as and for the purpose set forth.

410,539. CORN-HARVESTER. LEWIS A. DAVIS, Delaware, Ohio, assignor to the Delaware Corn Harvester Company, same place. Filed Oct. 6, 1888. Serial No. 287,366. (No model.)

Claim.—1. In a corn-harvester, the combination of the platform, the vertically and longitudinally movable beam D, and connections, as the bars G, between the beam and platform, and having pivotal connections at their ends with the said beam and platform, respectively, substantially as described, for the purpose specified.

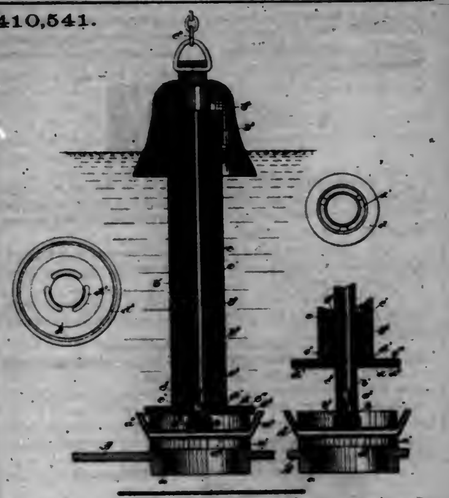


2. In a corn-harvester, the combination, with the platform and the beam D, of the bars G, pivoted to beam D at their upper ends and to the platform at their lower ends, and an adjustable stop for the bars, substantially as and for the purpose described.

3. In a corn-harvester, the combination, with the platform and the beam H, of the beam D and the bars G, pivotally connecting the beam D with the beams H and adapted to fold between the beams H, substantially as set forth.

4. In a corn-harvester, the combination, with the platform, the beam D, and the bars G, pivotally connecting beam D with the platform, of the staples F on the beam, the rope I, adapted to be hooked into said staples, and the windlass mounted on the end of the beam, the rope being connected therewith, substantially as and for the purpose described.

5. The herein-described corn-harvester, composed of the platform mounted on runners, the parallel beams H, arranged midway of the sides of the platform, the beam D, composed of two parallel bars, the bars G, pivotally connecting beam D with the beams H and adapted to fold in each, the windlass on the front end of the beam, the rope I, attached therewith and having hooks at its ends, the staples F along on the beam D, adapted to be engaged by said hooks, the pins adapted to be interposed between the beams H and the bars G, the blades C on the platform, and the draft-chain extending from one side of the platform to the other and passing over pulleys at each side of the platform, substantially as described.



410,540. INCANDESCENT GAS-BURNER. EDWARD C. DAVIDSON, New York, N. Y. Filed Apr. 1, 1889. Serial No. 305,565. (No model.)

Claim.—1. The combination, substantially as set forth, of radially-arranged independent gas-burners, a centrally-located support extending above the burners, independent groups of filaments arranged in angular relation to each other, radial arms in which the filament groups are mounted projecting from said central support above their corresponding gas-burners, and connections between each filament group and its radial arm, by which the group is independently adjustable and removable.

2. The combination, substantially as set forth, of a group of pendent filaments or pencils carried by a suitable head, a supporting-rod connected with said head, and a supporting-arm in which the supporting-rod is both vertically adjustable and rotatable.

410,541.

410,542. CAR-COUPLING. ROBERT H. DOWLING, Newark, Ohio, assignor of two-thirds to Charles Pollett and Charles H. Pollett, both of same place. Filed Apr. 8, 1889. Serial No. 306,891. (No model.)

Claim.—1. In a draw-bar, the lateral joint projection and the inner concussion-shoulder of the draw-head, in combination with the coupling-hook engaging bearings of said joint projection, and its concussion-shoulder in rear of the middle portion of the hook-head, adapted to engage the concussion-shoulder of the draw-head when the hook is closed, substantially as specified.

2. In a draw-bar, the lateral outwardly-concave joint projection having circular bearing-flanges, in combination with the hook recessed to receive the joint projection and its bearing-flanges, and having upper and lower circular flanges engaging the circular flanges of the joint projection of the draw-head, and covering in the same above and below, substantially as specified.

3. In a draw-bar, the T-form arc-shaped lateral bearing-shank or joint projection, in combination with the recessed coupling-hook and its circular flanges covering in the T-form bearing-shank above and below the pin-slot of said projection, the pin-receiving notches of the draw-head in line with said slot, the pin-receiving channels of the hook-shank, the rabbeted bearings communicating therewith, and the notched prismatic locking-pin, substantially as specified.

4. In a car-coupling, the combination, with the draw-head having a concave front including a lateral curved guide-flange and the connected coupling-hook, of the lateral concussion-shoulder H of said concave front opposite the curved guide-flange and extending across the draw-head from top to bottom, substantially as specified.

5. In a draw-bar, the combination, with the T form arc-shaped joint projection having a pin-slot extending vertically through it and the pin-receiving extensions thereof in the concave wall of said joint projection, of the circularly flanged and recessed coupling-hook shank, the pin-receiving channels thereof, and the rabbets extending from said channels, the notched prismatic locking-pin, and the stops of the shank of the coupling-hook adapted to engage the same, substantially as specified.

410,541. FLUSHING-VALVE. CHARLES H. DILLON, North Attleborough, Mass., assignor of one-half to John G. Hannigan, same place. Filed Apr. 23, 1889. Serial No. 308,336. (No model.)

Claim.—1. In a flushing-valve, the combination, with a hollow casting or shell provided with a hollow cross-bar having an outlet, of a pipe secured to said cross-bar about said outlet, a hollow spindle fitted loosely over said pipe, a valve secured to said spindle and provided with a slot, an overflow-pipe, and a cap or casting secured to said spindle and extended below and covering the mouth of the said overflow-pipe, substantially as described.

2. In a flushing-valve, the combination, with a hollow casting or shell provided with a hollow cross-bar having an outlet and provided with arms extended above said shell, of a pipe secured to said cross-bar about said outlet, a valve to control said outlet, a hollow spindle fitted loosely over said pipe, a valve secured to said spindle and provided with a slot, an overflow-pipe, and a cap or casting secured to said spindle and extended below and covering the mouth of the said overflow-pipe, substantially as described.

3. In a flushing-valve, the combination, with a hollow casting or shell provided with a hollow cross-bar having an outlet, of a pipe secured to said cross-bar about said outlet, a valve to control said pipe, a hollow spindle fitted loosely over said pipe, a valve secured to said spindle and provided with a slot, an overflow-pipe, and a cap or casting secured to said spindle and extended below and covering the mouth of the said overflow-pipe, and a chain or pull connected to said cap substantially over the center of the said valve, whereby a direct pull upon the valve is obtained, substantially as specified.

410,543. CAR-COUPLING. JOSEPH H. DOFFIN, Harrisburg, Pa., assignor of one-half to Jacob Warren Reap, same place. Filed July 2, 1888. Serial No. 310,208. (No model.)

Claim.—1. In a car-coupler, a coupling-frame, a pivoted jaw, a projection on the upper face of the same at the rear end thereof, and a spring-bar in the path of said projection and adapted to engage the same, substantially as described.

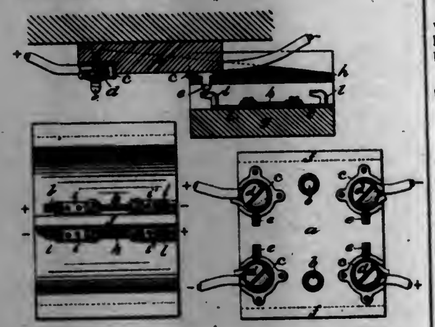
2. In combination, a coupler-frame, a pivoted jaw, a projection on the upper face of the same at the rear end thereof having an inclined face, and a spring locking-bar in the path of said projection, substantially as described.

3. In combination, a coupler-frame, a pivoted jaw, a locking projection on the rear end of said pivoted jaw, a spring locking-bar adapted to engage said projection, and a lever for lifting said locking-bar, substantially as described.

4. In combination with a pivoted jaw of a coupler, a spring locking-catch and an operating-lever extending beneath the opposite car, substantially as described.

5. In combination with the pivoted jaw of a coupler, a spring locking-catch, a bar *f*, for operating it, and an extension *f'*, substantially as described.

410,544. CAR-COUPLING. DENNIS P. EDGAR, Jackson, Mich. Filed May 9, 1889. Serial No. 310,087. (No model.)

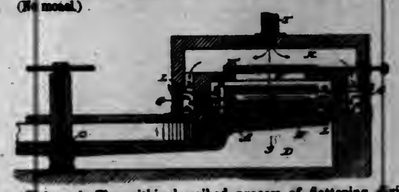


Claim.—1. The draw-bar of a car-coupling provided with two lever-jaws K K, movable in a vertical plane, said jaws having projections k^3 k^4 to press down on the link, and projections k^5 k^6, to raise the end of link above the fixed hook I on the bottom of draw-bar, as described.

2. The combination, with the lever-jaws K K, of the spring-pitman L, curved at *l l'* and having slotted end l^2, the pendent lug or post O, and the cross-shaft M', having the middle crank M and diametrically opposite thereto the end cranks m^2 m^3, as and for the purpose set forth.

3. In car-couplers, the bottom hook J, bolted detachably in a medium groove of the draw-bar, as and for the purpose specified.

410,545. CUT-OUT. LAWRENCE F. FURLONG, Hartford, Conn., assignor to Frederick C. Rockwell, same place. Filed Apr. 26, 1889. Serial No. 308,739. (No model.)



Claim.—1. In an electrical cut-out, in combination, a base two edges of which are provided with wedge-shaped tongues, contact-plates with outwardly-projecting lugs attached to the base, a cap two edges of which are provided with wedge-shaped grooves adapted to receive the tongues on the base, and outwardly-projecting lugs attached to the cap, so as to make contact with the lugs on the base when the base and cap are slid together, substantially as specified.

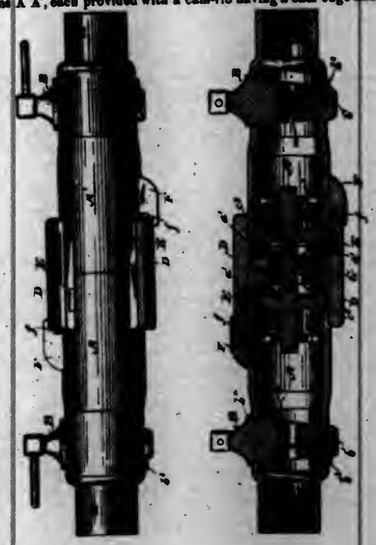
2. In an electrical cut-out, in combination, a base two edges of which are provided with tongues, contact-plates with hook-shaped lugs attached to the base, a cap two edges of which are provided with grooves adapted to receive the tongues on the base, and plates having hook-shaped lugs attached to the cap, one or more of said plates on the cap being joined by an electric fuse, said lugs on the base being adapted to interlock and make contact with the lugs on the cap when the tongues on the base are slid into the grooves in the cap, substantially as specified.

3. In an electrical cut-out of the within-described class, in combination, a rectangular base two edges of which are provided with a wedge-shaped tongue, and a rectangular trough-shaped cap, two edges of which are provided with wedge-shaped grooves adapted to receive the tongues on the base, substantially as described, and for the purpose specified.

410,546. MANUFACTURE OF WINDOW-GLASS. HERBERT W. GRISWOLD, Ridgewood, N. J. Filed Jan. 26, 1889. Serial No. 297,702. (No model.)

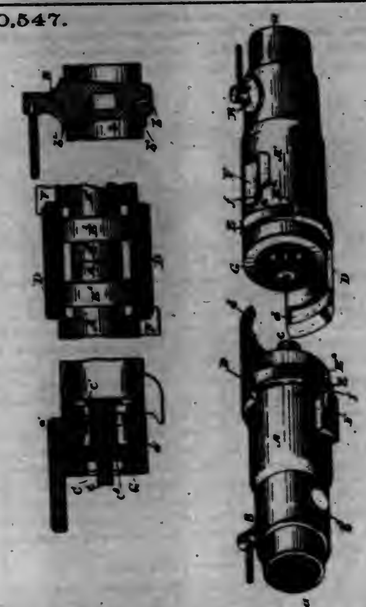
Claim.—1. The within-described process of flattening divided glass cylinders, which consists in subjecting them when ductile to a blast of air, gas, or steam introduced into the cylinder, substantially in the manner specified.

2. The within-described process of flattening divided glass cylinders, which consists in subjecting them to a sufficient degree of heat to make them plastic and then submitting them to a blast of air or gas forced into the cylinder under a pressure sufficient to produce a separation or divergence of the opposite sides of the ductile cylinder.



3. The process of softening the inner concave surface of a divided glass cylinder, which consists in heating the same by means of a blast of air, gas, or dry steam applied directly thereto with power sufficient to produce a separation and divergence of the opposite sides of the ductile cylinder, substantially in the manner and for the purpose herein set forth.

410,547. STEAM-PIPE COUPLING. FREEMAN HARMON, Bar Mills, assignor of three-fourths to Charles B. Harmon, Biddeford, and George H. Bird and Herbert G. Briggs, both of Portland, Me. Filed Jan. 14, 1888. Serial No. 260,894. (No model.)



Claim.—1. A pipe-coupling composed of two similar sections adapted to be locked together by turning, and each provided with a cam-rib extending circumferentially about one-quarter of the periphery of the section, and provided with an inner cam-edge *c*, a longitudinal projection D, as wide as the cam-rib is long on the side opposite said rib, and provided with the cam-groove *d* in its inner surface, and a fixed keeper-block F inward from the cam-rib, substantially as specified.

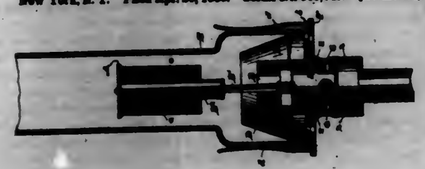
2. A pipe-coupling composed of the two sections A A', each provided with the cam-rib E, having the cam-edge *c*, the stop-rib E^3, the longitudinal projection D, having the cam-groove *d*, and the keeper-block F, having the lip *f*, substantially as specified.

3. In a pipe-coupling, as described, the combination of the sections A A', each provided with a cam-rib having a cam-edge and stop-

410,547.

rib and a projection internally cam-grooved, and block F, having lip *f*, with the perforated valves C, having the stems *c*, projecting from each side, the perforated diaphragms secured at proper points within the sections, and the coiled springs c^2 between said diaphragms and the disk c^3 of the valves, substantially as specified.

4. In a pipe-coupling, as described, composed of two parts, each part similarly constructed and having one-quarter of its periphery plain, a cam-rib, and a projection D, as wide as the cam-rib is long, and having a cam-groove in its under surface, substantially as set forth, whereby, when the two sections are placed end toward end, said projections D stand toward the plain surfaces, and are adapted to fit back to back and act as guides by which the two parts are brought together.



410,548. LAMP-CHIMNEY HOLDER. FREEMAN HARMON, Bar Mills, assignor of one-half to Charles B. Harmon, Biddeford, Me. Filed Feb. 2, 1889. Serial No. 298,465. (No model.)

Claim.—1. The combination, in a lamp-chimney holder, of the detachable yoke C, having a hinged part *c*, the thumb-screw *d*, and guards E, each provided at its upper end with a horizontal wire piece *e*, substantially as and for the purposes set forth.

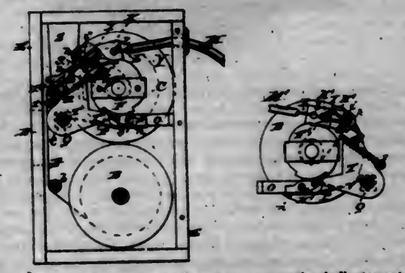
2. In a lamp-chimney holder, a detachable and adjustable yoke adapted to fit a lamp-neck, and carrying vertical and elastic standards, each of which has at its upper end a horizontal curved piece to fit upon a lamp-chimney, the several parts combined and operating substantially as set forth.

410,549. INCANDESCENT GAS-BURNER. CHARLES B. HARRIS, New York, N. Y. Filed Apr. 20, 1889. Serial No. 308,045. (No model.)

Claim.—1. An incandescing pencil consisting of magnesia, or similar refractory substance, in tubular form.

2. The combination, with a gas-burner, of a group of tubular incandescing pencils, of the character described, arranged or hung vertically above the burner, so as to be raised to incandescence by the heat of the burner.

3. The combination, substantially as set forth, with a burner, of a series of incandescing pencils or filaments, and a centrally-arranged light-reflecting core, of the same or like material.



4. The combination, substantially as set forth, with a burner, of a group of incandescing pencils or filaments, and a reflector of like material arranged in the interior of said group in such manner as to reflect the light and heat outwardly.

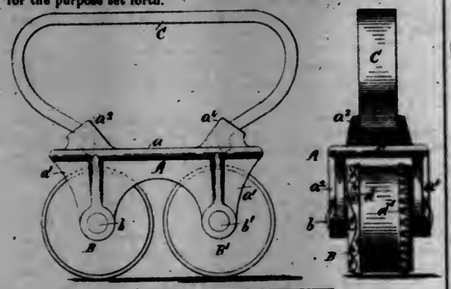
5. The combination of a circular burner, a circular series of incandescing elements or pencils arranged above the burner, a support for the elements or pencils extending up from the center of the burner, and an interior reflecting-core arranged within the circle of incandescent material upon said central support.

6. The combination of the circular burner having an interior air-supply inlet for supplying air to the interior of the annular flame, an exterior air-supply inlet for supplying air to the exterior of the flame; and simultaneously-adjustable air-supply regulators, as F and *s*, for regulating simultaneously both the interior and exterior supply of air.

7. The combination of a circular burner, its flange having air-inlets, the movable ring F, having corresponding apertures, the air-tubes G, leading to the interior of the burner, the band or collar *s*, having corresponding apertures, and interlocking devices, as *f* and s^3, for locking the ring and band together for simultaneous adjustment.

410,550. STREET OR STATION INDICATOR. HENRY HERTHAN, Brooklyn, assignor of one-half to Charles F. Crowley, New Brighton, N. Y. Filed Feb. 26, 1888. Renewed July 31, 1889. Serial No. 319,264. (No model.)

Claim.—1. In a car or public-conveyance station-indicator, a tape with the stations marked thereon attached at its ends, respectively, to two storage-rollers B C and intermediately running over two guide-rollers *b c*, said indicator-tape moved longitudinally in intermittent movements by the pull-cord M, acting on and attached to a swinging follower-block K, to which is attached the pawl G, acting on the ratchet-wheel F, and governed by the radial arm H and controlling-spring I, all combined and arranged as described and set forth.



2. In a station-indicator, an actuating mechanism for moving and controlling the tape on which the names of the stations are written, consisting of a radial arm fulcrumed to the axle of the tape-drum, and carrying at its outer end a sliding follower, to which is attached a pawl for actuating a ratchet-wheel on said tape-drum, in combination with a pull-strap for driving said follower forward, and a tension-spring for habitually drawing it back against a stop-block adapted to receive it, substantially as described.

3. In a station-indicator for railway-cars and similar purposes, an indicator-tape mounted on two carrying-rollers, which are moved forward in a series of intermittent movements by a ratchet-wheel mounted on the axle of one of the tape-rollers, and actuated by a pawl attached or pivoted to a swinging follower carried on a radial arm fulcrumed on the same axle, the said pawl and swinging or radial arm coupled together with an intermediate follower, substantially as described.

4. In a station-indicator for railway-cars and similar purposes, a ratchet-wheel for operating the indicator-tape in intermittent movements, and provided with an actuating-pawl and a holding pawl or dog, and also with a guiding-follower T, placed on a rock-shaft and adapted to lift the actuating-pawl and the holding-dog simultaneously off from the ratchet, so it may be rotated in either direction, substantially as described.

410,551. EMBOSSING DEVICE FOR LAUNDRY-WORK. EDWARD HOLM, MARIUS JOHANSEN, and EMIL ANDERSEN, Chicago, Ill., assignors, by mesne assignments, to said Holm. Filed Feb. 21, 1889. Serial No. 300,726. (No model.)

Claim.—In a device for the ornamentation of laundry-work, the combination, with the bracket-frame, consisting of the top part *a*, the sides a' a^4, extending downwardly therefrom, and the legs a^3 a^5, rising upwardly from each end, of the embossing-rollers provided with designs or configurations, as described, the shafts upon which said rollers are loosely mounted, and the curved handle C, substantially as and for the purpose set forth.

410,552. PIPE-COUPLING. DAVID KENNEDY, Jr., Erie, Pa., assignor of one-half to Brastus B. Lipton, same place. Filed Oct. 8, 1888. Serial No. 287,531. (No model.)

Claim.—1. In a pipe-coupling, the combination, with the heads or collars *a*, each provided at its outer end with a suitable packing, of movable coupling-sleeves surrounding said heads and each provided at its outer end with a series of projecting segments, the segments on one of said sleeves interlocking with the segments on the opposing sleeve, whereby the two sleeves are held from turning in opposite directions, and which form together a continuous sleeve inclosing both heads, with its joint overlapping the meeting ends of the two heads, said sleeves being free to turn on said heads when coupled and having a limited lengthwise movement thereon, and a locking-lever pivoted to one of said sleeves, and engaging with the opposing sleeve, whereby the two sleeves are drawn together, substantially as set forth.

2. In a pipe-coupling, the combination, with the heads or collars *a*, each provided at its outer end with a suitable packing, of coupling-sleeves surrounding said heads and provided with interlocking segments which together form a continuous sleeve inclosing both heads, a connecting-shank formed on each sleeve and engaging between lugs formed on the opposing sleeve, and locking-levers pivoted to each sleeve and engaging with the shank of the opposing sleeve, whereby the two sleeves are drawn together, substantially as set forth.

3. The combination, with two adjacent pipes provided at their ends with heads or collars *a*, of the coupling-sleeves D, surrounding said heads, a shank or connecting-bar *h*, arranged on one of said sleeves and engaging between two jaws on the opposing sleeve, and a locking-lever J, attached to said last-mentioned coupling-sleeve and bearing against the connecting-shank *h*, substantially as set forth.

4. The combination, with two adjacent pipes provided at their ends with heads or collars *a*, of the coupling-sleeves D, surrounding said heads and each provided on diametrically-opposite sides with a connecting-shank *h*, and a pair of jaws or lugs *i*, and with a cam-lever J, pivoted between said jaws, substantially as set forth.

5. The combination, with two adjacent pipes, each provided at its end with a head or collar *a*, of coupling-sleeves D D, respectively surrounding the heads and provided with interlocking segments *d*, a pair of jaws *i*, arranged on one side of each coupling-sleeve, a cam-lever J, pivoted between said jaws, a connecting-shank *h*, and recessed lug *k*, arranged on the opposite side of the coupling-sleeve, and a spring-catch, whereby the cam-lever J of one coupling-sleeve is attached to the lug *k* of the opposite coupling-sleeve, substantially as set forth.

6. In a pipe-coupling, the combination, with the heads *a* and coupling-sleeves D, surrounding said heads, of a connecting-shank *h*, secured to each sleeve and engaging between a pair of jaws *i*, formed on the opposing sleeve, and a cam-lever J, pivoted to each sleeve between said jaws and provided with an adjustable wear-plate which bears against the shank of the opposing sleeve when the sleeves are secured together, substantially as set forth.

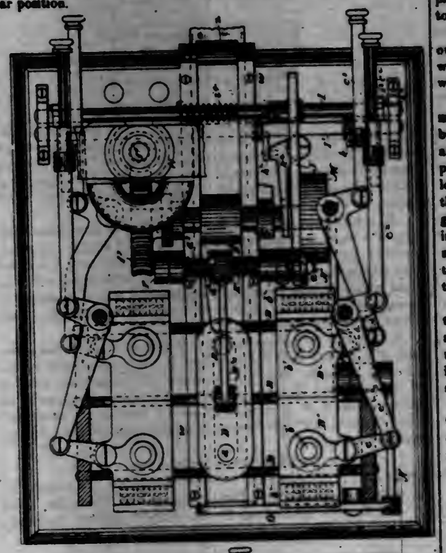
410,553. ART OF PACKING CIGARS. WILLIAM F. LANE, Allegheny, assignor to the Union American Cigar Company, (Limited,) Pittsburg, Pa. Filed Feb. 13, 1889. Serial No. 299,698. (No model.)

Claim.—1. As an improvement in the art of shaping and packing cigars, the following successive steps: first, arranging a series of layers of cigars and interposed presser-plates, each layer consisting of a definite number of cigars definitely spaced, the spacing being proportioned to the diameter of the cigar, and the number in a row proportioned to the size of the box in which the cigars are to be packed, second, subjecting said series of layers to compression sufficient to reduce the height thereof proportionately to the height of the box in which said cigars are to be packed, and, finally, transferring the layers as such successively to the box by means of the intermediate presser-plate, substantially as and for the purposes described.

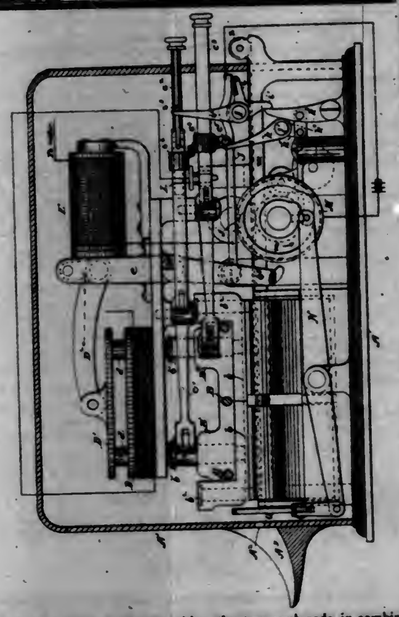
2. As a step in the art of shaping and packing cigars, subjecting a series of layers of cigars and interposed presser-plates to compression, the cigars of each layer being spaced or definitely separated proportionately to the diameter of the cigar and the reduction to be effected to allow for change of form, and, finally, utilizing the interposed presser-plates as carriers for transferring the separate layers as such from the press to the cigar-box or final receptacle, substantially as and for the purposes described.

410,554. CAR-COUPLING LINK-HOLDER. HENRY C. MILLER, Soldiers' Home, Leavenworth County, Kans. Filed July 20, 1888. Serial No. 280,567. (No model.)

Claim.—The combination of the side springs united by the plate *f*, the rods *g*, the pulleys, and the lateral chains, substantially as described.



410,555. TICKET-PRINTING MACHINE. JOHN A. MILLIKEN, New York, and CHARLES H. MILLIKEN and EDWARD D'ARCUR, Brooklyn, assignors of one-fourth to Charles F. Smith, Brooklyn, N. Y. Filed May 8, 1888. Serial No. 272,568. (No model.)



Claim.—1. In a ticket-printing machine, a ticket-way, channel, or tablet, one or more impression-plates or type-forms arranged on each side of said way, channel, or tablet and out of printing position, in combination with systems of leverage for moving said plates or forms into printing position, substantially as set forth.

2. The combination, with two independently-operated impression-plates or type-forms for printing different kinds of tickets, of a single printing-magnet, which is adapted to operate in conjunction with either of said mechanisms to print any form of ticket required.

3. The combination, with two independently-operated impression-plates or type-forms for printing different kinds of tickets, of a hammer adapted to operate in conjunction with either of said plates or forms to print any kind of ticket desired.

4. In a ticket-printing machine, the combination, with two carriages, each provided with engraved plates, of a push-rod for throwing one of the said carriages into a position for printing, and a separate push-rod for throwing both carriages simultaneously into a similar position.

5. In a ticket-printing machine, the two push-rods, in combination with the type-carriages, the former for operating the type-carriages, and each being provided with lugs or projections so arranged that one of said rods may be operated alone while the other cannot be moved without coincidently operating its fellow.

6. The combination, herein described, with two similar sets of mechanism on opposite sides of the machine, the said mechanism consisting of carriages having type-plates and a system of leverage for moving the same into a position above the ticket-strip where the printing is done, of a tablet or way over which the ticket-strip passes, located intermediate of the two sets of mechanism.

7. In a ticket-printing machine, a centrally-located ticket-strip way, channel, or tablet, a hammer or striking apparatus located directly above the same, two sets of printing-plates located on each side thereof, and manually-operated mechanism for throwing the printing-plates into position to be struck by the hammer or striking apparatus to drive them against the ticket-strip.

8. In a ticket-printing machine, two motors, both adapted to feed out the ticket-strip, in combination with an electro-magnet which when energized will lock one of the motors and when not energized will allow a spring to unlock the same motor, as set forth.

9. In a ticket-printing machine, an electromotor and a spring or mechanical motor, both adapted to feed out the ticket-strip, in combination with an electro-magnet in circuit with the electromotor, the armature of said magnet being constantly subjected to spring or other power in opposition to the pull of the magnet, and a pawl or other locking device for the spring or mechanical motor, connected with the armature in such a manner that when the said magnet is energized it will act on its armature to lock said mechanical motor, allowing the electromotor to drive the feeding mechanism, and when said magnet is not energized it will allow the power opposing the magnet to act through the armature to unlock said mechanical motor to drive the feed-rollers.

10. In a ticket-printing machine, the combination, with an electric circuit, including an electric motor, the frame of the machine, and an insulated locking-bar, as J, of a rock-shaft, as I, geared to push-rods under control of the operator, whereby said arm J may be brought into contact with the frame of the machine to short-circuit the motor, substantially as described.

11. In a ticket-printing machine, a bar, as J, and an electric motor for the feeding mechanism included in the same electric circuit, in combination with the feeding mechanism, the said bar being adapted to lock the feeding mechanism and simultaneously short-circuit the motor, as set forth.

12. In a ticket-printing machine, a hammer for driving the type or impression-plate against the ticket-strip, in combination with an electro-magnet and a spring, either of which is arranged to operate the hammer, for the purpose specified.

13. In a ticket-printing machine, the means for mechanically driving the type or impression-plate against the ticket-strip, consisting of a movable element, as M, moved by any suitable motor and provided with a notch, in combination with a spring-actuated rock-shaft carrying two arms, one of which is connected with the impression-plate and the other adapted to enter said notch in the movable element and allow a rocking movement of the shaft to drive the impression-plate against the ticket-strip, substantially as described.

14. In a ticket-printing machine, a printing-magnet and an electric motor controlling the feeding mechanism, the magnet being located in a shunt-circuit to the motor, in combination with a mechanical-locking and circuit-controlling arm, as J, for locking the mechanism which the motor drives and for switching the electric current through the motor and closing the circuit of the printing-magnet.

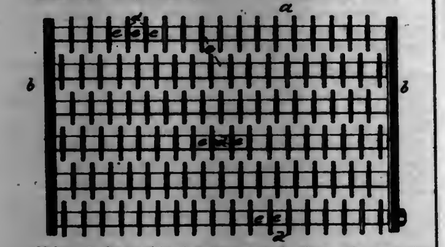
15. A knife-operating wheel and a pair of feed-rollers geared together and adapted in one rotation to feed out and cut off the length of one ticket from the ticket-strip, in combination with the push-rod c^3, the clutch *m*, and intermediate leverage, whereby the clutch is operated simultaneously with the push-rod to uncouple the cam-wheel from the feed-rollers and prevent its movement during the rotation of the shaft, substantially as described.

16. In a ticket-printing machine, two independent sets of mechanism for printing different kinds of tickets, each set consisting of a system of leverage and an engraved plate or type form operated thereby, both sets being adapted to print upon the same ticket-strip, as described.

17. In a ticket-printing machine, a single way, passage, or channel for the strip to be printed upon, a pair of printing-plates or type-forms arranged on each side of said way or channel, and systems of leverage corresponding to the plates or forms of each pair for moving one or both members of each pair into position to print upon said strip.

18. In a ticket-printing machine, a ticket channel or tablet, a hammer located above the same, a laterally-moving plate or type-form located normally at one side of said ticket-channel or tablet, and mechanism consisting of a system of leverage for moving said plate or type-form into a position adjacent to the said ticket channel or tablet, where it may be struck by the hammer.

19. In a ticket-printing machine, a ticket channel or tablet and hammer located adjacent to or above the same, a plurality of independently and laterally moving plates or type-forms, and mechanism consisting of a system of leverage for moving said plates or type-forms into a position to be struck by the hammer and caused to make an impression.



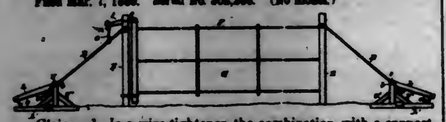
20. In a ticket-printing machine, the combination, with a ticket way, channel, or tablet, of a series or plurality of impression-plates or

type-forms arranged adjacent thereto, a system of leverage for throwing one of the said plates or forms into a position to print upon the ticket-strip, another system of leverage acting in connection with the first system for throwing two of said plates or forms into a similar position, a third system of leverage acting in connection with said first and second systems for throwing three of said plates or forms into a similar position, and so on throughout the series, whereby any number of tickets may be printed by operating the proper system of leverage.

21. In a ticket-printing machine, the combination, with a ticket way, channel, or tablet, of a series or plurality of impression-plates or type-forms arranged adjacent thereto, a system of leverage for throwing one of the plates or forms into a position to print upon the ticket-strip, another system of leverage acting in connection with the first system for throwing two of said plates or forms into a similar position, a third system of leverage acting in connection with said first and second systems for throwing three of said plates or forms into a similar position, and so on throughout the series, whereby any number of tickets may be printed by operating the proper system of leverage, all in combination with a striking device adapted to drive one or more of the plates or forms against the ticket-strip to make the impression, substantially as described.

22. In a ticket-printing machine, a knife for severing a ticket from the ticket-strip, mechanism for operating said knife, a feeding device for feeding out the ticket-strip and connected with the knife-operating mechanism by a suitable clutch, all in combination with an actuating rod or lever, and connections between said rod or lever and clutch, whereby the operation of said rod or lever will open the clutch and disconnect the knife mechanism from the feeding mechanism, thus allowing the ticket-strip to be fed out without the operation of the knife, substantially as described.

410,556. DOOR-MAT. WILLIAM J. MYERS, Hartford, Conn., assignor to George P. Bissell & Co., same place. Filed Apr. 27, 1889. Serial No. 308,784. (No model.)



Claim.—1. In combination, in a mat, the frame, the crosswise-extending rods, and the disk-shaped scrapers arranged at intervals along the rod and projecting therefrom, all substantially as described.

2. In a mat and scraper, in combination with the frame, the rods extending crosswise of the frame and detachably secured to the said frame at opposite ends, and the disk-shaped scrapers secured at intervals along each rod and held rigidly thereon, all substantially as described.

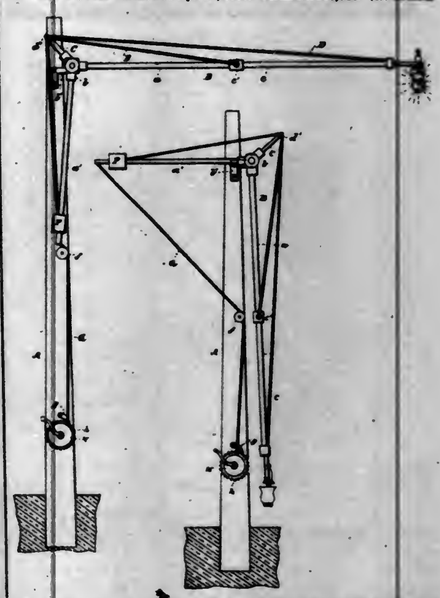
3. In a mat and scraper, in combination with the frame having threaded sockets, the crosswise rods having the opposite ends provided with a right-hand thread and a left-hand thread, respectively, said rods being angular in cross-section, the scraper-disks rigidly secured on the rods, and the collars or equivalent device for holding the disks against movement lengthwise on the rod, all substantially as described.

410,557. WIRE-TIGHTENING DEVICE. JOHN MCDONNALL, Barnett, Kans., assignor of one-half to Washington W. Aldrich, same place. Filed Mar. 7, 1889. Serial No. 302,966. (No model.)

Claim.—1. In a wire-tightener, the combination, with a supporting upright, of a lever pivoted to said upright, said lever provided at a point near its free end and upon its upper face with a notch and at a point near its pivot-point and on its under face with a pin, and a loop adapted to engage the notch, as and for the purpose set forth.

2. In a wire-tightener, the combination, with an upright, of a lever *l*, pivoted thereto, said lever provided on its upper face and at its free end with a notch *n* and on its under face near its pivot-point with a pin *p*, a loop O, arranged to engage notch *n*, and a loop *o*, arranged to engage pin *p*, as and for the purpose set forth.

410,558. PINION-HOLDER FOR PINION-POLISHING MACHINES. GRANVILLE HUTTER, Waltham, Mass., assignor to the United States Watch Company, same place. Filed Apr. 20, 1888. Serial No. 309,091. (No model.)

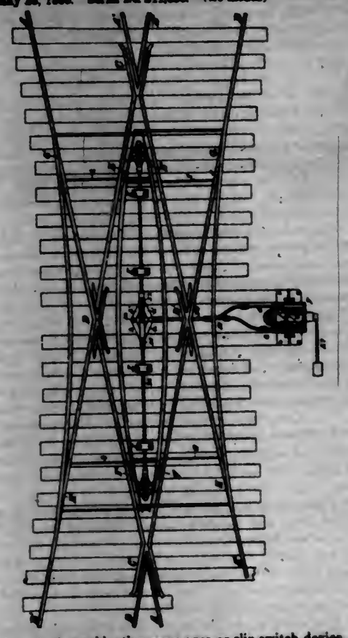


Claim.—1. A holder for pinions for leaves of pinions to be polished, composed of a block A to hold and support the pinion at and with a portion of its perimeter exposed, and heads D D^3 on opposite sides of the pinion-holding block A, in combination with a guideway C, having the block and heads D D^3 held thereon, substantially as described, for the purpose specified.

2. A holder for pinions for leaves of pinions to be polished, composed of a block A to hold and support the pinion at and with a portion of its perimeter exposed, a carrier B for said block A, and the block adjustable vertically thereon, and heads D D^3 on opposite sides of the pinion-holding block A, in combination with a guideway C, having the block and heads D D^3 held thereon, substantially as described, for the purpose specified.

3. A holder for pinions for leaves of pinions to be polished, composed of a block A to hold and support the pinion at and with a portion of its perimeter exposed, and heads D D^3 on opposite sides of the pinion-holding block A, and each carried by and adjustable on separate blocks E E^3, in combination with a guideway C, having the several blocks A E E^3 held thereon, substantially as described, for the purpose specified.

410,559. MAST-ARM. WILLIAM H. O'BRIEN, New Orleans, La., assignor to the Star Iron Tower Company, Fort Wayne, Ind. Filed June 19, 1888. Renewed Apr. 26, 1889. Serial No. 308,642. (No model.)



Claim.—1. The combination of the mast-arms at right-angles to each other, and each having one end inserted in a socket of the triple-socket iron pivoted to the vertical pole, the extension-section, the socket *c'*, and the operating-rope, substantially as specified.

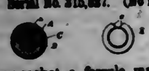
2. The combination of the mast-arms at right-angles to each other, the triple-socket iron pivoted to the pole, the weight F, and the operating rope or wire, substantially as specified.

3. The combination, with the vertical post, of the mast consisting of the arms *a a'* and the extension-section, the socket *c'*, the pivoted triple-socket iron, the brace-arm, the brace-rods, the weight attached to the arm *a'*, the pulley *f*, pivoted on the pole, the drum having the ratchet-wheel, the pawl, and the wire rope, substantially as specified.

410,560. COMBINED CROSSING AND SWITCH. CHARLES PARTRIDGE, Cincinnati, Ohio, assignor to The Weir Frog Company, same place. Filed May 20, 1889. Serial No. 311,396. (No model.)

Claim.—1. A combination cross-over or slip-switch device, combined with and operated by duplex horizontally-moving rods actuating duplex-jointed links, substantially as specified.

2. In combination with the duplex rods 14 and 16, having connection with switch-rails and operated by a switch-stand, the central duplex links *a a' b b'*, hinged to each other and to the duplex rods and switch-bars, substantially as herein described.



3. In combination, the duplex rods 14 and 16, hinged, respectively, to opposing duplex links, which duplex links are hinged to the switch-rails, whereby the said rails are moved toward or from each other as the duplex rods are moved, substantially as herein set forth.

4. In combination, the duplex rods 14 and 16, respectively hinged to opposing duplex links at their center and at either end of the crossing, the latter links being hinged to their respective switch-rails, whereby the moving of the duplex rods simultaneously moves the switch-rails of the crossing, substantially as specified.

5. The combination of the double-acting switch-stand, the duplex switch-bars 10 and 11, and the duplex central links hinged to said bars and conversely hinged to duplex rods 14 and 16, which are connected with the switch-rails, substantially as specified.

6. The combination of the parallel duplex rods 14 and 16, each provided with slots 23 and 17, and hinged to duplex links at the two ends and to the central duplex links operated by the switch-bars, substantially as specified.

410,561. CARRIAGE-BOW SOCKETS. RUDOLF H. PFAFF, Ashtabula, Ohio, assignor to the Ashtabula Carriage Bow Company, same place. Filed June 27, 1889. Serial No. 315,257. (No model.)

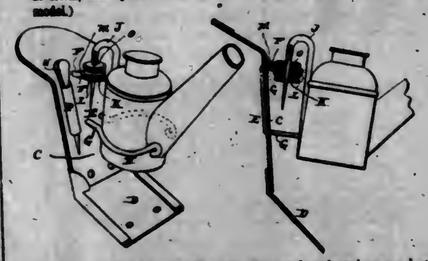
Claim.—1. In a bow-socket, a ferrule made of a single rolled piece of metal, the meeting edges of said ferrule being cut angularly, whereby a groove is formed along said meeting edges, substantially as set forth.

2. In a bow-socket, the combination, with a stiffener provided with a tenon, of a ferrule, said tenon fitting in said ferrule, substantially as set forth.

3. In a bow-socket, the combination, with a ferrule, of a filler and stiffener, each provided with a tenon fitting in said ferrule, substantially as set forth.

4. In a bow-socket, a ferrule made of a flat piece of metal, two of the opposite edges of which are cut angularly to each and in opposite directions, the ferrule being bent round until said angular edges meet at the inner side of the ferrule, whereby a groove is formed between the upper portion of said meeting edges, substantially as set forth.

5. In a bow-socket, the combination, with a ferrule, of a stiffener brazed to said ferrule, substantially as set forth.



6. In a bow-socket, the combination of a wood filler, a stiffener inserted therein, each said filler and stiffener provided with a tenon, and a ferrule in which said tenons are inserted, substantially as set forth.

7. The combination of a bow-socket provided with an interior rib, a filler provided with a groove in which said rib fits, a stiffener inserted in said filler, said stiffener and filler each provided with a tenon, and a ferrule provided with a groove at its meeting edges, said groove fitting around said socket-rib, said tenons fitting in said ferrule, substantially as set forth.

8. In a bow-socket, the combination, with a stiffener provided with a tenon, of a ferrule provided with an opening in which said stiffener is inserted.

9. The combination of a bow-socket provided with an interior rib, a filler provided with a groove fitting around said rib, said filler also provided with a slot, a stiffener fitting in said filler-slot, said stiffener and filler each provided at corresponding ends with a tenon, said tenons lying in the same transverse plane, and a ferrule made of a single bent piece of metal, the meeting edges of said metal cut angularly, whereby a groove is formed, said groove fitting around said socket-rib, said tenons fitting in said ferrule, said ferrule and stiffener brazed together, and said ferrule and socket also brazed together, substantially as set forth.

410,562. ATTACHMENT FOR MINERS' LAMPS. WARREN C. ROCKWELL, Mount Carmel, Pa., assignor to Isaac Goldschmidt and George B. Renn, same place. Filed Mar. 13, 1889. Serial No. 303,119. (No model.)

Claim.—1. In a lamp-holding attachment for miners' caps or hats, the combination, with the lamp-supporting bracket carrying the coils L, of the block K, fitted in said coils and having the central perforation for the reception of the lamp-hook, as set forth.

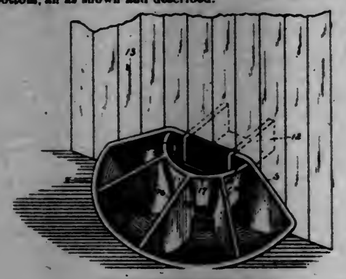
2. In a lamp-holding attachment for miners' caps or hats, the combination, with the lamp-supporting bracket and the coils L, of the block K, fitted in said coils and having a central perforation, and the plate O, secured to the coil and extending over the said block, as set forth.

3. The combination, with the plate C, of the wire bracket secured thereto, carrying the coils L and having the curved portions H, and the block fitted in said coils, as set forth.

4. The improved lamp-holding attachment for miners' caps or hats, consisting of the leather plate C, the metallic plate D, secured to the lower end thereof, the keeper P, secured on the front side of the plate C, the lamp-holding bracket secured to said plate and carrying the coils L, and the elastic block fitted in said coils, as set forth.

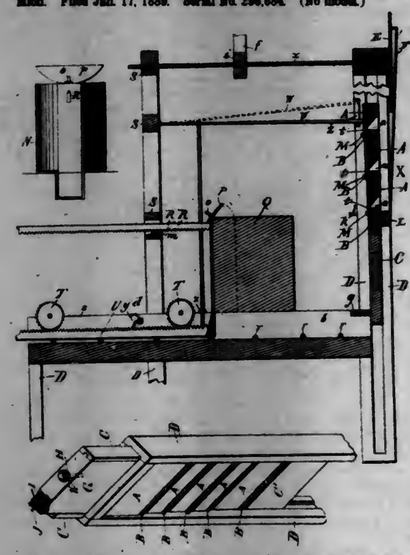
5. The combination of the lamp-holding bracket, the coils hinged thereto, and the elastic block fitted in the coils, as set forth.

6. The combination of the bracket and the swinging elastic block supported thereby, as set forth.



7. In a lamp-holding attachment, the plate C, the bracket E, secured thereto and having its lower end bent to form clamping-arms G for the lamp, and the block K, attached to the upper end of the bracket E and provided with a perforation for the passage of the hook of the lamp, as set forth.

8. In a lamp-holding attachment, the plate C, attached to the miner's hat or cap, the block K, hinged to the plate C to receive the lamp-hook, and the clamping-arms G for the lamp, as set forth.

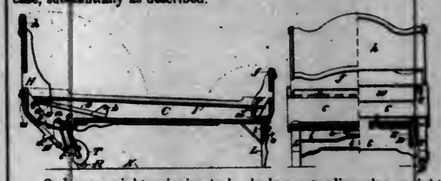


410,563. FEED-TROUGH. HENRY C. SEWARD, Mount Olive, N. J. Filed Dec. 31, 1888. Serial No. 294,266. (No model.)

Claim.—A trough for feeding cattle and the like, consisting of the base-receptacle having a vertical back, a downwardly-inclined bottom joining the lower edge of the vertical back, an outwardly-inclined front wall slightly turned inward at its top at 9 to prevent

the food working over the edge, and carved at its junction with the bottom at 7, and a separate device having a curved back and radial partitions seated and secured within said base-receptacle, the said back wall and the partitions being cut away at their junction with the inclined bottom, all as shown and described.

410,564. EXCELSIOR-MACHINE. CHARLES G. SMITH, Detroit, Mich. Filed Jan. 17, 1889. Serial No. 296,684. (No model.)



Claim.—1. The combination, in an excelsior-machine, of the frame C, to receive the plate C', the shaving-knives A, and the slitting-knives B, the plate C', fitted in the frame C at the bottom to support the knives, the shaving-knives A, fitted in the frame C and resting on top of the plate C', the slitting-knives B, fitted in the frame C, resting on top of one or more of the shaving-knives A, the plate or cross-head G, set on and fastened at top of the frame C to retain the knives in place, all substantially as set forth.

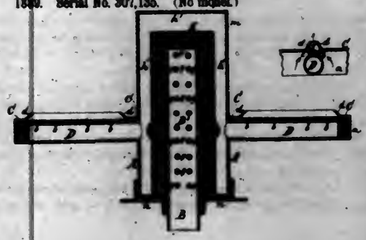
2. In an excelsior-machine, the combination of the frame C and the plate C', to receive the shaving-knives A and the slitting-knives B, the shaving-knives A, the slitting-knives B, the top plate or cross-head G, to retain the knives in the frame C, the standard D, in which the frame C reciprocates, and the table *b*, which supports the block to be cut up, all substantially as set forth.

3. The combination, in an excelsior-machine, of a table or bench *b*, provided with groove, the groove running full length of table, in which the cog-bar U, supporting the carriage-frame N, runs, the cog-bar U, supporting carriage, the carriage-frame N, to carry the block, propelled and held in position by the cog-wheel T, the cog-wheel T, the bar *i*, and the weight A, which forces the block toward the knives, substantially as shown and set forth.

410,565. FOLDING BED. HENRY M. WOOD, Chicago, Ill. Filed Mar. 2, 1889. Serial No. 301,796. (No model.)

Claim.—1. In an upright swinging bed, a bed-case standing when upright with its bottom in front and its head resting posteriorly upon the floor, in combination with a two-legged stool provided with a pair of foot-rollers, and at its top horizontally pivoted to the bottom of said bed-case, so as to alternately stand upright with and be oppositely inclined and thrust forward feet foremost by said bed-case, and a spring connecting to the head of said case said stool and imparting thereto elastic resistance as a front-leg support to said bed-case, substantially as described.

2. In an upright swinging bed, a bed-case standing when upright with its bottom in front and its head resting posteriorly upon the floor, in combination with a two-legged stool provided with a pair of foot-rollers and pivoted at its top transversely to the bottom of said bed-case, so as to alternately stand upright with and be oppositely inclined and rolled forward by said bed-case, and a spring connecting to said bed-case said stool and imparting thereto elastic resistance as a front-leg support to said bed-case, and a pivoted folding brace provided with a self-dislodging cam, and connecting to said bed-case said stool, and arresting, holding, and releasing the same as a rigid head-leg support to said bed-case, substantially as described.



3. In an upright swinging bed, a rigid bed-case having a weight fixed to its head and standing when upright with its bottom in front and its head resting posteriorly upon the floor, in combination with a two-legged stool provided with a pair of foot-rollers and pivoted at its top to the bottom of said bed-case, so as to permit said case to incline forward from an upright half-way to a horizontal position, but only by tilting and thrusting forward, feet foremost, the said stool, and a pivoted folding brace connecting the head of said case and said stool and opening with and arresting their extension from each other, all as a means for making the head, along with its weight, an effective counterpoise to the foot of said bed-case in the more inclined positions of the bed, substantially as described.

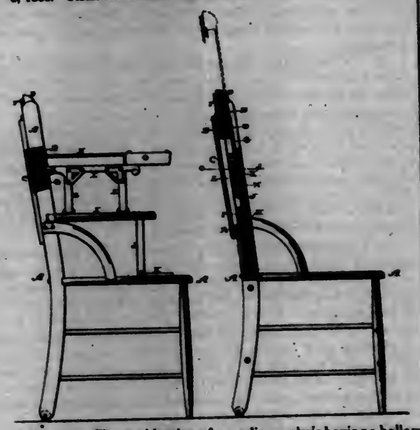
4. In a folding bed, the combination, with a bed-case and a movable bed-bottom therein, of an oscillating lever-frame serving as a folding foot-board for the bed, but pivoted to the interior bottom of said case and having a cross-bar extending beneath and supporting one end of said bed-bottom between its standards as a means for raising and lowering said bed-bottom within said bed-case, substantially as described.

5. In a folding bed, the combination, with a bed-case and a movable bed-bottom therein, of an oscillating lever-frame serving as a folding head-board for the bed, but pivoted to the interior sides and at the bottom of said case, and having its standards provided at the sides of said bed-bottom with lug-pins projecting beneath it, and an oscillating guide-frame transversely pivoted to the interior of said case, so as to project across and rest upon said lug-pins, and having a cross-bar extending beneath and supporting one end of said bed-bottom, all as a means for raising and lowering said bed-bottom in said bed-case, substantially as described.

6. A folding and upright swinging bed consisting of the bed-case C, the movable interior bed-bottom I, the oscillating head-board and foot-board lever-frames A H and *f* F J, and guide-frame *g* G, the lever and guide frames pivoted to said case and imparting vertical motion to the bed-bottom therein, and the two-legged stool T *t*, provided with the foot-rollers R and pivoted to the bottom of said case, and the springs S, connecting said stool to said case and imparting elastic resistance thereto as a front-leg support for said case, and the folding braces D, each provided with a self-dislodging cam *d*, and connecting to said case, and arresting, holding, and releasing said stool as a rigid head-leg support for said bed, substantially as described and set forth

410,566. GAS-BURNER FOR LIGHTING, COOKING, AND HEATING PURPOSES. JOHN H. KEYSER, New York, N. Y. Filed Apr. 13, 1889. Serial No. 307,135. (No model.)

Claim.—1. The reservoir A, having hollow burner-arms D, of tubular form, about midway of its height and in communication at their inner ends with its interior and closed at their outer ends and connected to a circular ring *a*, in combination with a plate having burner-passages and a radially-slitted burner-plate attached to the casting of the gas-burner, and a supply-pipe B, having extension-pipe B', perforated along its periphery and terminating above the burner-arms in the portion *m* of the reservoir, substantially as described.



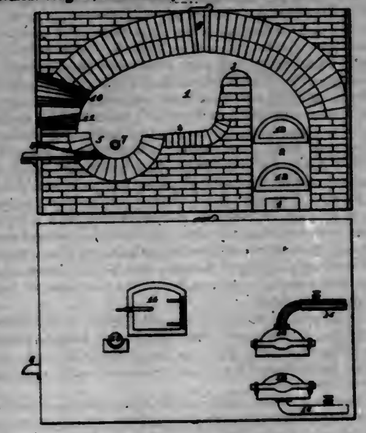
2. In a gas-burner, the combination of the reservoir A, having burner-arms D, of tubular form, about midway of its height and in communication at their inner ends with its interior and closed at their outer ends and connected to a circular ring *a*, radially-slitted burner-plate attached to the casting of the gas-burner, a supply-pipe B, having extension-pipe B', perforated along its periphery and terminating above the burner-arms in the portion *m* of the reservoir, and the finely-perforated or wire-gauze cylinder E, completely inclosing the perforated extension-pipe B', and having a gas-chamber between the inner surface of the reservoir A and the outer surface of the wire-gauze cylinder, substantially as described.

3. In a gas-burner, in combination, the reservoir A, hollow burner-arms D between its ends, the plate C, immediately above said burner-arms and provided with burner-passages, the supply-pipe B, perforated extension-pipe B', and wire-gauze cylinder E, substantially as and for the purpose described.

4. In a gas-burner, in combination, the reservoir A, supply-pipe B, perforated extension-pipe B', wire-gauze cylinder E, plate C, having burner-passages, inclined wind-guards *d*, and hollow burner-arms D, substantially as described.

5. In a gas-burner, in combination, the reservoir A, supply-pipe B, hollow arms D, plate C, having burner-passages attached to the casting of the gas-burner, and inclined wind-guards *d*, substantially as described.

410,567. CHAIR. JOHN HUDSON, Baldwinsville, Mass. Filed May 3, 1889. Serial No. 309,804. (No model.)



Claim.—1. The combination of an ordinary chair having a hollow or recessed back, a folding child's chair which is adapted to be closed therein, and a removable slide which is placed therein in front of the child's chair after it has been returned to position, substantially as described.

2. The combination of an ordinary chair having a hollow or recessed back, the grooves or guides secured to opposite inner edges of this back, a slide which is placed in the guides, the seat of the child's chair hinged to the back of the chair A and provided with folding arms and legs or supports, substantially as set forth.

410,568. PROCESS OF PRODUCING ALUMINIUM. MARTIN WARNER, Rotheram, assignor of one-half to John A. Hall, Axial, and Albert H. Weber, Denver, Colo. Filed Aug. 3, 1886. Serial No. 283,230. (No specimens.)

Claim.—1. The process of producing the metal aluminum herein described, consisting in treating a fused aluminous fluoride or fluorides, while in a molten-metallic bath and protected from oxidizing agents, with a reagent whose elements dissociate at a temperature below the fusing-point of the aluminous fluoride or fluorides, and having an element of such affinities that it displaces the aluminum in the fluoride or fluorides, but having no element capable of uniting with the aluminum, substantially as set forth.

2. The process of obtaining aluminum by treating a base of fused aluminous fluoride or fluorides, while in a bath of molten metal and protected from oxidizing agents, with a sulphide of silicon or equivalent reagent, substantially as set forth and described.

REISSUES.

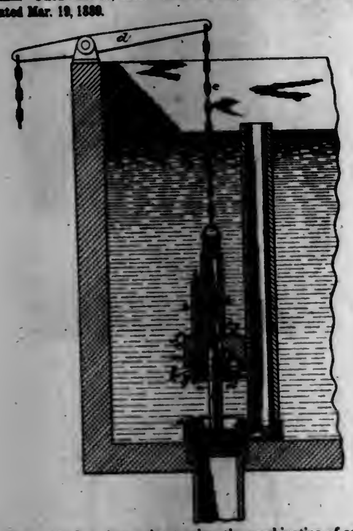
11,028. ROTARY STEAM-ENGINE. JOSEPH H. DOW, Cleveland, Ohio, assignor of one-half to William Chisholm, same place. Filed Aug. 6, 1889. Serial No. 319,956. Original No. 302,545, dated Nov. 6, 1883.

Claim.—1. In a rotary steam-engine, the combination, with engine-shaft and a double-cone sleeve mounted on the engine-shaft, substantially as indicated, of bucket-wheels mounted on the respective conical sections of the said sleeve, substantially as set forth.

2. In a rotary steam-engine, the combination, with engine-shaft

and double-cone sleeve mounted on the shaft, of bucket-wheels mounted on the said sleeve, said bucket-wheels having hubs set facing each other, said wheels and hubs having conical bores made to fit the respective conical sections of the sleeve, substantially as set forth.

3. In a rotary steam-engine, the combination, with engine-shaft and a double-cone sleeve mounted on the shaft, of bucket-wheels and attached hubs set facing each other mounted on the said sleeve, the sleeve having external screw-threads at the respective ends thereof, and nuts for engaging such threads, said nuts being made to abut the respective outer faces of the bucket-wheels, substantially as set forth.



4. In a rotary steam-engine, the combination, with stationary disks and intervening steam-chamber, substantially as indicated, of sleeves for closing the inner periphery of the steam-chamber, said sleeves being screwed together and having external flanges made to clamp the disks as against internal pressure, substantially as set forth.

5. In a rotary steam-engine, the combination, with stationary disks and intervening steam-chamber, said disks having series of chutes and vent arranged thereon, substantially as indicated, of sleeves made to close the inner periphery of the steam-chamber, said sleeves having external flanges made to cover the faces of the inner series of chutes, substantially as set forth.

6. In a rotary steam-engine, the combination, with stationary disks, chutes, and vents, and rotary wheels with buckets, substantially as indicated, of rings made to cover the faces of the outer series of buckets, said stationary disks having recesses to receive such rings, substantially as set forth.

7. In a rotary steam-engine, in combination, stationary disks and opposing rotating wheels bearing, respectively, chutes and buckets arranged in series, substantially as indicated, annular paths between the different series, the relative width of such paths as compared with the buckets or chutes operating therein being such as to include annular steam-distributing passage-ways between adjacent buckets and chutes, substantially as set forth.

11,029. **WATER-CLOSET VALVE.** EDWIN L. KINSEY, Springfield, Mass. Filed June 28, 1880. Serial No. 315,989. Original No. 300,905, dated Mar. 19, 1880.

Claim.—1. In a water-closet valve, the combination of an upper weighted member to which the lifting-chain is attached, with the lower member loosely connected thereto and having a vertical play independently of the upper member and provided with an opening through which the minor flush of water passes, and the valve-seat upon which the lower member first closes, substantially as shown.

2. In a water-closet valve, the combination of the upper weighted member provided with a lifting device at its lower end and the lifting-chain attached to it at its upper end, with the lower perforated vertically-moving member which has an independent vertical play or movement of its own and which is raised by the lifting device, the valve-seat, and a means for retarding the closing of the upper weighted member after the lower perforated member has become seated upon the valve-seat, substantially as specified.

3. The combination, with a valve-seat and a guiding-spindle supported therefrom, of a valve comprising two members, the upper of which consists of a body and an upwardly and downwardly projected hollow spindle open from its bottom, the bore of which is of two diameters, substantially as described, and having a laterally and downwardly extending passage *k*, and a lifting-abutment *l* on said lower spindle-extension, and the lower member consisting, essentially, of an open-work disk adapted for a vertical movement with relation to said lower spindle-extension, substantially as described.

4. The combination, with a valve-seat and a guiding-spindle supported therefrom, of a valve comprising two members, the upper of which consists of a body and an upwardly and downwardly projected hollow spindle open from its bottom, the bore of which is of two diameters, substantially as described, and having a laterally and downwardly extending passage *k*, and a lifting-abutment *l*, vertically adjustable on said lower spindle-extension, and the lower member consisting, essentially, of an open-work disk adapted for a vertical movement with relation to said lower spindle-extension, substantially as described.

5. The combination, with a valve-seat and a guiding-spindle supported therefrom, of a valve comprising two members, the upper of which consists of a body and an upwardly and downwardly projected hollow spindle open from its bottom, the bore of which is of two diameters, substantially as described, and having a laterally and downwardly extending passage *k*, and a regulating-screw therefor, and a lifting-abutment *l* on said lower spindle-extension, and the lower member consisting, essentially, of an open-work disk adapted for a vertical movement with relation to said lower spindle-extension, substantially as described.

6. The combination, with the valve-seat and a guiding-spindle supported therefrom, of a valve comprising two members, the upper of which consists of a cylindrical body recessed on its under side having an upwardly and downwardly projected hollow spindle, the bore of which is of two diameters, substantially as described, and having a lateral and downwardly-extending passage *k*, and the lower extension of the spindle screw-threaded and provided with an apertured abutment-nut *l*, and the lower member consisting of a sleeve, a concentric collar, and radial connecting-arms *p*, and the said collar provided with a washer *q*, attached at and extending outwardly from its edge, substantially as and for the purpose described.

7. The combination, with the valve-seat and a guiding-spindle supported therefrom, of a valve comprising two members, the upper of which consists of a cylindrical body *f*, recessed on its under side, and an upwardly and downwardly projected hollow spindle open from its bottom, the bore of which is of two diameters, substantially as described, and having a lateral and downwardly-extending passage, and an adjusting-screw therefor, and provided with the apertured adjustable abutment-nut *l*, and the lower member consisting of the sleeve *m*, the collar *n*, flanged and screw-threaded, and the connecting-arms *p*, and the washer *q*, and nut *s*, combined and operating substantially as and for the purpose described.

8. In a water-closet valve, the combination of the upper weighted vertically-moving member provided with a water-channel through it and having a lifting device secured thereto, the perforated lower member loosely attached to the upper one, and a guiding-spindle common to both members, substantially as specified.

9. In a water-closet valve, the combination of the upper weighted vertically-moving member, the lifting-chain attached to its upper end, the perforated valve or lower member loosely connected to and having an independent movement from the upper member, and a guiding-spindle extending from the valve-seat and which is common to both members, substantially as shown.

PHOTO LITH. NORRIS PETERS

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF

UNITED STATES COURTS IN PATENT CASES.

COMMISSIONER'S DECISIONS.

EX PARTE JLJINSKY.

Decided August 24, 1889.

JOINDER OF INVENTIONS.

An apparatus attached to a photographer's lamp for feeding a magnesium spray to the flame may be claimed in the same application with other parts of the lamp.

ON petition.

PETROLEUM-LAMPS.

Application filed March 23, 1889, No. 304,475.

Mr. C. T. Burchard and *Mr. A. C. Fraser* for the applicant.

FISHER, *Acting Commissioner:*

This is a petition from the action of the Primary Examiner requiring a division of petitioner's application because it embraces two distinct inventions.

The invention described and claimed in this application is a lamp for the use of photographers. The oil-reservoir is so constructed that when it is desired to use the lamp a sufficiency of oil may be supplied to the wick; but when not in use the oil is absorbed, so that the lamp may be safely packed and transported without danger of leakage. The lamp is also adapted to be used either for ordinary purposes or, when supplied with a ruby chimney, in the photographer's dark-room. Attached to the lamp is an apparatus by which a spray of magnesium may be fed to the flame for use in the production of flash-light photographs.

It will be seen from this brief description of the lamp that it is one especially designed and adapted for the several usages desired by photographers, and as such constitutes a unitary invention. All the several parts may therefore be included in the same application.

The petition is granted.

DECISIONS OF THE U. S. COURTS.

U. S. Circuit Court—Southern District of Ohio, Western Division.

YALE & TOWNE MANUFACTURING COMPANY *et al. v.* CONSOLIDATED TIME LOCK COMPANY.

Decided May 16, 1889.

1. LITTLE—TIME-LOCKS—VALIDITY.

The first and seventh claims of reissued Letters Patent No. 8,550, granted January 1, 1879, to the Yale Lock Manufacturing Company, as assignee of Samuel Little, for an improvement in time-locks, *Held* valid, and the seventh claim *Held* not an expansion of the original patent, on the authority of *Yale Lock Co. v. Berkshire Nat. Bank* (17 Fed. Rep., 531) and *Yale Lock Co. v. New Haven Sav. Bank*, (32 Fed. Rep., 167.)

2. INFRINGEMENT.

Defendant's lock was substantially identical with the lock of the defendant in *Yale Lock Co. v. Berkshire Nat. Bank*, except that in the latter there was an additional dog controlled by the time mechanism, which dog added nothing to the efficiency or value of the lock. The defense of that case was assumed by a lock company, or its president, who afterward became president of defendant, and all the questions presented here were presented in that case. On the authority of that case *Held* that defendant's lock was an infringement.

SUIT BY the Yale & Towne Manufacturing Company and others against the Consolidated Time Lock Company for the infringement of a patent.

Messrs. Wetmore & Jenner for the complainants.

Mr. W. C. Cochran and *Messrs. Parkinson & Parkinson* for the defendant.

SAGE, *J.:*

This suit is for the infringement of the first and seventh claims of reissued Letters Patent No. 8,550, granted January 1, 1879, to the Yale Lock Manufacturing Company, as assignee of Samuel Little, for an improvement in time-locks. This patent has been repeatedly sustained by the courts. The first and seventh claims were held valid by Judge Shipman in *Yale Lock Manufg. Co. v. Norwich Nat. Bank* and *Same v. New Haven Sav. Bank*, (6 Fed. Rep., 377;) by Judge Lowell in *Yale Lock Co. v. Berkshire Nat. Bank*, (17 Fed. Rep., 531,) and again by Judge Shipman in *Yale Lock Co. v. New Haven Sav. Bank*, (32 Fed. Rep., 167,) decided September 10, 1887, upon petition for rehearing. In this case claims 1 and 7 were considered in the light of *Miller v. Brass Co.* (104 U. S., 350) and of subsequent cases; and Judge Shipman, concurring with Judge Lowell in *Yale Lock Co. v. Berkshire Nat. Bank*, cited above, held that both claims were valid, and particularly that the seventh claim of the reissued patent was not an undue expansion of the original patent.

Upon the question of infringement there is no material difference between the lock manufactured by the defendant in this case and that used by the defendant in the case of *Yale Lock Co. v. Berkshire Nat. Bank*. The time mechanism is the same in both locks. In the Berkshire lock it controls two dogs, in the defendant's but one; but the extra dog in the Berkshire lock adds nothing to its efficiency or value. In other particulars the two locks are substantially identical. It was true in the Berkshire lock, as it is in the defendant's lock, that after the lever has moved into the releasing position the dog is still held in the locking position by the supporting mechanism until the latter is moved by the combination-lock. The defense of the Yale Lock Company case against the Berkshire National Bank was assumed by the Hall Safe Lock Company, of Cincinnati, Ohio, or by Mr.

Hall, its president, who subsequently became president of the defendant company, which carried on the manufacture of the lock and mechanism now claimed to be an infringement. All the questions presented here were presented in that case, and it was decided adversely to the defendant.

I have read the opinions of Judge Shipman and of Judge Lowell, and, aside from considerations of comity, which, however, I am not at all inclined to disregard, have found them so entirely satisfactory that I think it unnecessary to enter into further details. Upon the authority of the cases decided by them a decree for an injunction and account, with costs, will be entered against the defendant.

U. S. Circuit Court—Southern District of Ohio, Western Division.

NATIONAL CABLE RAILWAY COMPANY *v.* MT. ADAMS & EDEN PARK INCLINED RAILWAY COMPANY.

Decided May 24, 1889.

1. HOVEY—ENDLESS-ROPE RAILWAYS—ANTICIPATION.

The first claim of Letters Patent No. 195,372, for improvement in endless-rope traction-railways, granted to Asa E. Hovey September 18, 1877, which is "the construction and arrangement together of the brackets * * * and rails * * * forming the frame or skeleton for a rope-tunnel for endless-rope traction-railways, said-brackets forming a support for the groove-rails and for the planking forming the sides or shell of the tunnel," is void for want of invention, having been anticipated by the Gardner patent, No. 19,736, of March 23, 1858, the Thompson patent, No. 131,913, of October 1, 1872, and the structure used in 1873 by the Clay Street Hill Road, of San Francisco, Cal.

2. INVENTION.

Any differences in construction and material between the structure described by the first claim of the Hovey patent and the devices covered by the prior patents and used by the Clay Street Hill Road do not constitute invention, but merely involve ordinary mechanical skill, and are not patentable.

3. INFRINGEMENT.

If such first claim could be sustained by limiting its scope, so as to make it cover all of the elements described in the specifications, it is not infringed by the structure used by defendant, the Mt. Adams & Eden Park Inclined Railway Company.

4. ANTICIPATION.

The first branch of the sixth claim of said Letters Patent, in reference to the combination, "with the rope tunnel or chamber, of pulleys journaled in the same, upon which the rope runs," was anticipated by the Gardner patent and is not patentable.

5. SAME.

The second branch of the sixth claim, relating to the "means for lubricating the bearings of said pulleys from the outside of the tunnel," lacks invention, and is not patentable, in view of the well-known use of tubes to carry oil to inaccessible journals.

6. INFRINGEMENT.

Even if such sixth claim were patentable, it is not infringed by defendant, who does not use any oil reservoirs or tubes leading from the outside of the tunnel to the shaft-bearings, such as are covered by said sixth claim.

BILL for infringement of patent, filed by the National Cable Railway Company against the Mt. Adams & Eden Park Inclined Railway Company.

The first claim of complainant's patent is as follows:

1. The construction and arrangement together of the brackets A A and rails B B', forming the frame or skeleton for a rope-tunnel for endless-rope traction-railways, said brackets forming a support for the groove-rails, and for the planking forming the sides or shell of the tunnel, substantially as herein described and specified.

Mr. George Harding for the complainant.

Messrs. Parkinson & Parkinson and *Messrs. Ramsey, Maxwell & Ramsey* for the defendant.

JACKSON, *J.*:

As the assignee and present owner of Letters Patent No. 195,372, for improvement in endless-rope traction (or cable) railways, granted to Asa E. Hovey September 18, 1877, the complainant brings this suit to restrain the defendant from infringing the same, and for an account of profits. The complainants insist that the defendant infringes the first and sixth claims of said Letters Patent. The defendant sets up various defenses: Anticipation by prior public use of like structures and by prior patents, want of patentable novelty, and denial of infringement. The issues thus raised and presented have been carefully examined and considered in connection with the evidence in the cause, and, without going into details or a full review of the facts established by the evidence and of the law applicable thereto, the conclusions of the court are the following, viz:

1. That, considered in the light of the prior art, as shown more particularly in the Gardner patent, No. 19,736, of March 23, 1858, and in the Thompson patent, No. 131,913, of October 1, 1872, and in the structure actually used and employed in 1873 by the Clay Street Hill Road of San Francisco, Cal., the device or combination covered by the first claim of said Hovey patent, No. 195,372, is wanting in novelty and patentable invention, the same having been anticipated by said prior patents and the structure used by said Clay Street Road.

2. That whatever differences in construction and material exist between the structure described in and by the first claim of said Hovey patent, No. 195,372, and the devices covered by the foregoing prior patents, together with that actually used and employed in 1873 by the Clay Street Hill Road of San Francisco, such differences do not constitute invention, but merely involve the exercise of ordinary mechanical skill, and were not, therefore, patentable.

3. That if the first claim of said Letters Patent No. 195,372 could be sustained by limiting its scope and operation, so as to make it cover and embrace all the elements of the combination described in the specifications, including the sill C and the planking resting thereon, which forms the sides or shell of the tunnel, then, as thus limited and confined to the specific structure described in the patent, it is not infringed by the defendant's structure.

4. That the first clause or branch of the sixth claim of said Letters Patent, in reference to the arrangement or combination "with the rope tunnel or chamber of pulleys journaled in the same, upon which the rope runs," was anticipated by the Gardner patent, No. 19,736, and is wanting in patentable novelty; that, in respect to the second clause of said claim relating to the "means for lubricating the bearings of said pulleys from the outside of the tunnel, substantially as described and shown," no patentable invention is shown, in view of the general and well-known use of tubes for carrying oil to inaccessible journals.

5. But, if said sixth claim contained any patentable device, the same is not infringed by the defendant, who employs a different means for oiling its journal-boxes. Defendant does not use or employ any oil-reservoirs or oil-tubes leading from the outside of the tunnel to the shaft-bearings such as those described in the specifications and drawings of said Letters Patent No. 195,372, and complainant certainly cannot properly insist upon such a broad construction of the latter clause of said sixth claim as to cover any and all openings or holes made in the covering of the tunnel for the purpose of reaching the journals with oil directly applied.

6. It follows from the foregoing conclusions that the complainant's bill must be dismissed, which is accordingly ordered and adjudged, with costs.

U. S. Circuit Court—Southern District of Ohio.

LEONARD *et al. v.* WHITE'S GOLDEN LUBRICATOR COMPANY.

Decided May 4, 1889.

TRADE-MARKS—WHAT CONSTITUTES.

The word "Valvoline," compounded and used on packages of lubricating-oils by plaintiffs, and registered as a Trade-Mark, may be used for that purpose, and the use thereof by defendant in the same manner will be enjoined, though defendant uses his own name in connection with the word.

ON MOTION for temporary injunction.

Messrs. Kittredge & Wilby for the complainants.
Messrs. Jordan & Jordan for the respondent.

SAGE, *J.*, (orally:)

This is a motion for a temporary injunction to restrain defendant from the infringement of complainant's Trade-Mark, "Valvoline." The complainants set forth in their bill that they are, and have been for many years, engaged in the manufacture of lubricating-oils; that since about the year 1873 they have used as a Trade-Mark for their lubricating-oils the word "Valvoline," a fanciful word invented by themselves, and applied to their packages as a Trade-Mark, and that in the month of May, 1881, it was registered under the statutes of the United States. According to the registry certificate the Trade-Mark consists of the word "Valvoline," as shown in the *fac-simile* attached to the certificate. Extending through the center of it is a half-moon or crescent containing dots or stars; but these, it is said, may be omitted and some other device substituted, or they may be omitted altogether, without material change. That the defendants have been using this word as a designation or mark for their lubricating-oils is not denied. They do not use the crescent or half-moon either with or without the dots or stars, but they use the word "Valvoline" in connection with their own name—that is to say, their oil is sold as "White's Golden Lubricator Valvoline No. 1 or 2," and other numbers, and is so labeled.

The defense is that "Valvoline" is a descriptive word; that it is really a compound made up of the words "valve" and "oleine;" that its literal signification is "valve-oil," and that the law of Trade-Marks does not permit a descriptive word, or, rather, a word descriptive of the article, to be appropriated as a Trade-Mark, which is undoubtedly the law, so settled that it requires no verification.

It would be out of all reason to say that a man should not be at liberty to sell a gun as a gun because some other person had chosen to appropriate that name as a Trade-Mark for the guns he wanted to sell; and hence no person has any right to appropriate as a Trade-Mark a word of the language which is descriptive of the article to which the Trade-Mark is applied; but that is quite different from the proposition presented in this case. Here there was no such word as "Valvoline." The article sold was known in the language and to the trade as lubricating-oil. That was the appellation descriptive of that kind or grade of oil, and it could not be appropriated as a Trade-Mark. But these complainants compounded the word "Valvoline," and at the same time made it their Trade-Mark. Now, if they had originated that word and applied it descriptively to their lubricating-oils, without appropriating it as a Trade-Mark, they would thereby have abandoned it to the public and made it public property, and that, once done, would put an end to their right to it as a Trade-Mark.

The defendant cites *In re Leonard & Ellis' Trade-Mark*, (L. R., 26 Ch. Div., 288,) decided in 1884; but the decision was upon grounds not applicable here. It appeared from the evidence that, although the word had been registered as a Trade-Mark in the United States prior to its use in England, the complainants had in England, before applying for registration, used it as descriptive of their lubricating-oils, which any one had the right to manufacture, and not as a Trade-Mark, and the court held that by this descriptive use prior to the time when they had the word registered the complainants lost their right to the exclusive use. The court also questioned whether a word used alone as a Trade-Mark in a foreign country before the passing of the Trade-Marks act of 1875 could be registered under that act if it had not been so used in England. Selborne, L. C., said that he was not disposed to doubt that if the word had been used in the United Kingdom as a Trade-Mark before the passing of the act it might have been registered under the act; but he confirmed the finding of the court below that it had been used descriptively, and not as a Trade-Mark, and that it had been thereby dedicated to the public of the United Kingdom. The defendant in this case has substituted its own name for that of the complainants in connection with the word "Valvoline," so that there is no pretense that the defendant is selling lubricating-oils as the oils of the complainant, because it is clearly stated in their labels to be "White's Valvoline Oil;" but that does not relieve the defendant. The authorities upon this point are numerous; but it is not necessary to refer to any other than the case of *Menendez* v. *Holt*, (128 U. S., 514; 9 Sup. Ct. Rep., 143,) which is the latest decision of the United States Supreme Court upon this subject.

The motion for a temporary injunction, to continue until the final hearing and decree, will be granted upon the complainants executing a bond, with sureties in the sum of $2,000.

TRADE MARKS REGULATIONS OF JAPAN.

Imperial Ordinance No. LXXXVI.

TRADE MARKS REGULATIONS.

Promulgated December 18, 1888.

Article I.—Any person desirous of using a trade mark to distinguise his own merchandise may register such trade mark under these regulations and may use the same exclusively. Trade marks should be composed of distinctive diagrams, or characters, or of both combined, as their essential parts.

Art. II.—Trade marks of the following nature will not be registered:—

1. Those that contain a scandalous design.
2. Those the essential parts of which consist of a common designation of merchandise, or of a foreign or domestic national flag.
3. A mark closely resembling one already in use by another person for a similar article.

Art. III.—Applications for registration of trade marks should be made to the Minister of State for Agriculture and Commerce, accompanied by written detailed statements and specimens of the marks.

NOTE.—All applications, written detailed statements and specimens will be submitted to the Patents Bureau.

Art. IV.—On the receipt of an application for registration of a trade mark, the Director of the Patents Bureau shall require the judges of the Bureau to examine the same, and should such examination prove satisfactory, the trade mark will, with the approval of the Minister of State for Agriculture and Commerce, be duly registered and a certificate to that effect issued.

Art. V.—The registration certificate shall bear the signatures of the Minister of State for Agriculture and Commerce and of the Director of the Patents Bureau, and should be handed to the applicant with the detailed statement and specimen of the trade mark.

Art. VI.—The term of exclusive use of any trade mark shall be 20 years, computed from the date of registration.

Art. VII.—The exclusive use of a trade mark shall be limited to merchandise specified by the applicant in accordance with the classification of merchandise as fixed by the Minister of State for Agriculture and Commerce.

Art. VIII.—When more two or more persons apply for registration of the same or a similar trade mark for similar merchandise, registration will be granted according to priority in date of application; otherwise registration will not be granted.

NOTE.—When one applicant withdraws his application the foregoing provision will not apply.

Art. IX.—When a person who has secured or is about to secure registration of a trade mark dies, his right shall devolve upon his heir.

Art. X.—Even though a trade mark has been registered, should it be found to fall under the provisions of Art. II. or to have been registered in contravention of Art. VIII. such registration shall be declared null and void.

Art. XI.—In matters relating to the examination of, and judgment and arbitration on, trade marks, the Patents Regulations shall apply.

Art. XII.—The rights pertaining to a trade mark may be sold or transferred or made property in common only in the event of the owner of a registered trade mark selling or transferring his business, or admitting another into partnership. In such a case application should be made to the Patents Bureau to have such contract registered, and no contract that is not so registered shall be valid as regards a third person.

Art. XIII.—Trade marks even which have already been registered shall become invalid under the following circumstances:—

1. When without proper reason a trade mark is not put into use within 6 months from the date of registration.
2. When without proper reason the use of a trade mark has been suspended for one year.
3. When the particular business using a trade mark has been relinquished.
4. When fraud has been discovered with regard to the number of places of production or quality of the merchandise to which a trade mark is applied.
5. When a disfigured or defaced trade mark has been used.

Art. XIV.—Any owner of a trade mark who desires to renew registration of his trade mark after the expiration of the term for which registration was originally granted, may apply for such renewal of his certificate.

Art. XV.—Application, stating particulars, may be made for renewal of any certificate which has been defaced or lost.

Art. XVI.—Any owner of a registered trade mark who discovers that his detailed statements or specimens were imperfect, may apply for revision of his certificate by submitting revised statements and specimens with a view to securing the validity of his trade mark.

NOTE.—This will not apply in any case where essential alterations in a trade mark are involved.

Art. XVII.—The following fees shall be paid for applications or demands in connection with trade marks:—

1. For registration of a trade mark—1 *yen* for each trade mark, as applicable to one variety of merchandise.
2. For registration of sale, transfer, &c., of a trade mark—1 *yen* for each trade mark as applicable to one variety of merchandise.
3. For renewal of registration certificate—1 *yen* for each certificate.
4. For revision of registration certificate—2 *yen* for each trade mark as applicable to one variety of merchandise.
5. For arbitration—7 *yen* for each case.

Art. XVIII.—On the issue of a certificate of registration of a trade mark, or of a revised certificate, or a renewed certificate, a registration fee of 10 *yen* should be paid for each variety of merchandise to which the trade mark applies.

Art. XIX.—Official trade mark reports will be printed from time to time by the Patents Bureau, and provided for the inspection of the public. Such reports may also be purchased at a reasonable price.

Art. XX.—Copies of documents in connection with registered trade marks may be obtained from the patents Bureau on payment of a reasonable fee.

Art. XXI.—Any one who infringes the rights of exclusive use of a registered trade mark will be held responsible for the indemnification of the owner of such trade mark.

Art. XXII.—Three years will be the full term for indemnification for loss as above.

Art. XXIII.—Any one who applies a trade mark similar to that of another to the same or similar merchandise in the full knowledge of that fact, and sells such merchandise, or who with such knowledge sells such merchandise on behalf of another, shall be liable to major confinement for a period not exceeding 6 months and not less than 15 days, or to a fine not exceeding 100 *yen* and not less than 10 *yen*.

Any one who obtains a registration certificate by fraudulent means, or affixes the word "registered" to any trade mark which has not been registered, or who with full knowledge of the fact sells on behalf of another merchandise bearing such false or fraudulent trade marks, shall be liable to the same punishment as above.

Art. XXIV.—In any of the foregoing events the infringing trade mark shall be effaced, and should the mark be inseparable from the goods the latter shall be destroyed.

Art. XXV.—Investigation into offences coming under the provisions of the first clause of Art. XXII., shall take place on the complaint of the injured party.

In such case judge may, on the motion of the complainant, order the temporary suspension of merchandise connected with the offence.

Art. XXVI.—The provisions of the Criminal Code as to the concurrence of several offences will not apply to contraventions of these regulations.

Art. XXVII.—Detailed rules for the carrying out of these regulations shall be specially prepared by the Minister of State for Agriculture and Commerce.

Art. XXVIII.—These regulations will be put in force on 1st February, 1889.

Changes in Classification.

(ORDER No. 578.)

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., September 2, 1889.

The following changes are directed in Division IV:

New Class 189, Iron Structures, and sub-classes thereunder are established, as follows:

1. Jails.
2. Buildings.
3. Grilles.
4. Metallic ceilings.

The following sub-classes are established:

In Class 14, Bridges:

11. Flooring.
12. Truss, Bow-string.

In Class 108, Roofing:

8. Flashing.

In Class 139, Fire Escapes and Ladders:

20. Fluid-check.
21. Fly-check.
22. Escapement-check.
23. Governor-check.

ROBERT J. FISHER,
Acting Commissioner.

Additional Sub-Classes.

(ORDER No. 579.)

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., September 3, 1889.

The following additional sub-classes are hereby established in Division XXVI:

In Class 171, Electricity, Generation:

121. Inductoriums—
122. Induction-coils.
123. Transformers, Rotary.
124. Transformers, Stationary.
125. Pyro-magneto-electric devices.

In Class 172, Electricity, Motive-Power:

126. Motors, Reciprocating.

ROBERT J. FISHER,
Acting Commissioner.

Publishers' Catalogues.

This Office would be pleased to receive from manufacturers and publishers such catalogues, circulars, price-lists, or other advertisements relating to the sciences and mechanical arts as are published by them for gratuitous distribution; but notice is hereby given such manufacturers or dealers who feel disposed to send their publications that not less than three copies should be forwarded in order that the subjects may be properly indexed, classified, and catalogued in the Scientific Library for convenient and ready reference.

Issue of September 10, 1889.

19,312.—RADIATOR.—*Thomas H. Williams*, Jersey City, N. J., assignor to himself and *Samuel D. Tompkins*, same place. Application filed July 10, 1889. Serial No. 317,068. Term of patent 14 years.

19,313.—CELERY-DISH.—*Joseph Locke*, Toledo, Ohio, assignor to *The W. L. Libbey & Son Company*, same place. Application filed April 6, 1889. Serial No. 306,258. Term of patent 3½ years.

TRADE-MARKS.

[Certificates of registration of Trade-Marks numbered 8,191 and upward are registered under the act of March 3, 1881.]

16,990.—MEATS AND MEAT FOOD PRODUCTS.—*Armour & Co.*, Chicago, Ill. Application filed March 9, 1889. Used since May 1, 1879.

"The representation of a shield bearing a diagonal cross-band."

16,991.—SMOKING-TOBACCO AND PLUG-TOBACCO FOR CHEWING.—*Arnold, Carlton & McCord*, Atlanta, Ga. Application filed August 12, 1889. Used since May 15, 1889.

"The words 'HENRY GRADY.'"

16,992.—CIGARETTE-PAPER.—*Joseph Bardou et Fils*, Perpignan, France. Application filed August 7, 1889. Used since May, 1874.

"The word 'GOUDRON.'"

16,993.—PERFUMERY AND PERFUMED TOILET PREPARATIONS AND EXTRACTS.—*F. C. Calvert & Co.*, Bradford, Manchester, county of Lancaster, England. Application filed December 14, 1888. Used since August, 1888.

"The device of a circular line with four arrows radiating from a star in the center."

16,994.—ICE-MAKING MACHINES.—*Alexander Conacher*, New York, N. Y. Application filed August 6, 1889. Used since May 17, 1889.

"The word 'ZERO.'"

16,995.—SHOES.—*M. Ellin & Co.*, Philadelphia, Pa. Application filed June 29, 1889. Used since June 7, 1889.

"'E E E E,' suggestive of 'FOR EASE.'"

16,996.—LIQUID STAIN FOR FURNITURE.—*Fleury & Faust*, New Orleans, La. Application filed August 8, 1889. Used since December, 1887.

"The letters and character 'F & F' and the representation of a bedstead."

16,997.—TOILET SOAP.—*Granite City Soap Company*, Fall River, Mass. Application filed August 9, 1889. Used since July 1, 1888.

"The representation of a white elephant and the words 'WHITE ELEPHANT.'"

16,998.—LIQUID SHOE-BLACKING.—*John M. Hillan*, Shenandoah, Pa. Application filed August 1, 1889. Used since July 15, 1889.

"The word 'ECLAT.'"

16,999.—BOILER CLEANSING MATERIAL.—*S. W. Lord & Co.*, Philadelphia, Pa. Application filed August 10, 1889. Used since July 15, 1889.

"The representation of a safety-valve and an eagle perched thereon."

17,000.—HEATING AND COOKING STOVES.—*The Michigan Stove Company*, Detroit, Mich., Buffalo, N. Y., and Chicago, Ill. Application filed August 5, 1889. Used since January, 1882.

"The words 'WORLD'S BEST.'"

17,001.—NERVINE AND GENERAL RESTORATIVE.—*Victor H. Monroe*, Seymour, Ind. Application filed July 27, 1889. Used since January 1, 1889.

"The words 'ELIXIR VITÆ, OR MONROE'S NERVINE SPECIFIC.'"

17,002.—MINERAL WATERS.—*John Morgan*, New York, N. Y. Application filed August 9, 1889. Used since March 1, 1872.

"The combination of a siphon-bottle and five cupids."

17,003.—GINGER-ALE.—*John Morgan*, New York, N. Y. Application filed August 9, 1889. Used since August 1, 1889.

"The combination of an eagle standing on a shield, the latter extending across a green band with red edges, and green stalks or plants of ginger."

17,004.—COUGH-SYRUP.—*Lon J. McConnell*, Carnesville, Ga. Application filed August 1, 1889. Used since July 26, 1889.

"The letters 'P. C. C.'"

17,005.—FLOOR AND BATH MATS.—*McKesson & Robbins*, New York, N. Y. Application filed July 25, 1889. Used since July 1, 1889.

"The word 'KORKOZY.'"

17,006.—BEER.—*P. M. Ohmeis & Co.*, New York, N. Y. Application filed August 1, 1889. Used since June 22, 1889.

"The representation of a star together with the word 'MILWAUKEE' and the letters 'V Y V.'"

17,007.—CIGARS.—*Onrida Cigar Co.*, Oneida, N. Y. Application filed August 9, 1889. Used since September, 1887.

"The words 'OLD HOMESTEAD.'"

17,008.—COGNAC BRANDY.—*Pector & Ducout, Jr.*, Paris, France. Application filed July 9, 1888. Used since 1867.

"The representation of a rooster mounted on a globe and the words 'COGNAC DEL GALLO.'"

17,009.—CORDAGE.—*The Schlichter Jute Cordage Company*, Philadelphia, Pa. Application filed July 18, 1889. Used since June 13, 1889.

"'KEYSTONE,' whether expressed pictorially or in word."

17,010.—CIGARS, CIGARETTES, AND TOBACCO.—*Nicholaus Schubmehl*, Binghamton, N. Y. Application filed August 6, 1889. Used since June 10, 1889.

"The letters and characters 'C. & E. B. & L. F.'"

17,011.—LADIES' AND CHILDREN'S UNDER-CLOTHING, GARMENTS, CORSETS, AND EMBROIDERIES, LACES, AND TRIMMINGS FOR THE SAME.—*Stapley & Smith*, London, England. Application filed August 10, 1889. Used since 1883.

"The representation of two hands in the act of sewing."

17,012.—LADIES' AND CHILDREN'S UNDER-CLOTHING, GARMENTS, CORSETS, AND EMBROIDERIES, LACES, AND TRIMMINGS FOR THE SAME.—*Stapley & Smith*, London, England. Application filed August 10, 1889. Used since 1883.

"The word 'STERLING' and the character '£.'"

17,013.—LADIES' AND CHILDREN'S UNDER-CLOTHING, GARMENTS, CORSETS, AND EMBROIDERIES, LACES, AND TRIMMINGS FOR THE SAME.—*Stapley & Smith*, London, England. Application filed August 10, 1889. Used since 1883.

"The representation of a dog's head with the word 'ALPINE.'"

17,014.—VARIOUS TOILET PREPARATIONS.—*William S. Thomson*, London, England. Application filed June 8, 1889. Used since January, 1874.

"A bottle-stopper or representation thereof the upper portion of which is in the shape of a crown."

LABELS.

6,011.—Title: "DR. GETMAN'S PAIN RELIEF OR MOUNTAIN HERB LINIMENT."—*Getman & Lainson*, Ida Grove, Iowa. Application filed August 16, 1889.

6,012.—Title: "MEXICAN FILLER." (For cigars.)—*Frederick C. Lauer*, Minneapolis, Minn. Application filed August 17, 1889.

6,013.—Title: "COIN GUM." (For packages of chewing-gum with which coin is given away.)—*Frank A. Seeber* and *Jacob S. Ammon*, Reading, Pa. Application filed August 13, 1889.

DISCLAIMERS.

308,482.—*George Whysall*, Toledo, Ohio, and *John A. Lambing*, Wilkinsburg, Pa. IMPROVEMENT IN GAS-FURNACES FOR STEAM-BOILERS. Patent dated February 26, 1889. Disclaimer filed September 4, 1889.

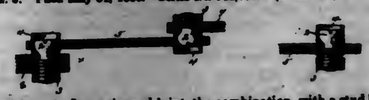
Enter their disclaimer to the first claim of said patent, which is in the following words:

"1. A combustion-chamber of a furnace having grate-bars and adapted to the combustion of solid fuel, and having a gas-supply pipe or port entering the combustion-chamber through the wall thereof, and having its opening at said wall above the normal level of the fuel on the grate-bars, substantially as and for the purposes described."

PATENTS

GRANTED SEPTEMBER 10, 1889.

410,569. ROLLER-STUD. SATTERLEE ARNOLD, Morristown, N. J. Filed May 27, 1889. Serial No. 312,382. (No model.)



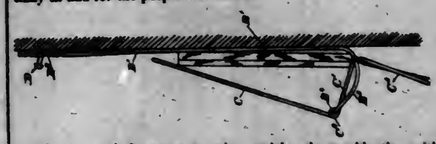
Claim.—1. A roller-stud consisting of a shank having a conical or tapered bearing portion, combined with a roller having a tapered interior fitting said bearing portion.

2. The combination, with a roller-stud consisting of a shank having a conical or tapered bearing portion and a roller having a tapered interior fitting said bearing portion, of a part, as *a*, to which said stud is attached, a grooved cam in which said roller works, and a shaft by which said cam is carried.

3. The combination, with a roller-stud consisting of a screw-threaded shank having a conical or tapered bearing portion and a roller having a tapered interior fitting said bearing portion, of a part, as *a*, into which said shank is tapped, a set-nut on said shank, a grooved cam in which said roller works, and a shaft by which said roller is carried.

410,570. UNIVERSAL JOINT. SATTERLEE ARNOLD, Morristown, N. J. Filed May 31, 1889. Serial No. 312,730. (No model.)

Claim.—1. In a universal joint, the combination, with a stud having a threaded stem and a head with a convex under or inner surface and a slotted or nicked upper or outer face, of a cup or socketed bushing having an inner concave face and an outer convex face, said faces being parallel with each other and with the convex face of the head of said stud, and a pitman or other moving part to which the stem of said stud is attached.



2. In a universal joint, the combination, with a stud having a threaded stem and a head with a convex under or inner surface and a slotted or nicked upper or outer face, of a cup or socketed bushing having an inner concave face and an outer convex face, said faces being parallel with each other and with the convex face of the head of said stud, and a pitman or other moving part to which the stem of said stud is attached, and which is provided with a concave seat in which the convex face of the said bushing fits.

3. In a universal joint, the combination, with a stud having a threaded stem and a head with a convex under or inner surface and a slotted or nicked upper or outer face, of a cup or socketed bushing having an inner concave face and an outer convex face, said faces being parallel with each other and with the convex face of the head of said stud, a set-nut on said threaded stem, and a pitman or other moving part to which the stem of said stud is attached.

4. The combination, with a headed stud having a threaded stem and nicked head, the part of which head adjacent to said stem is convex, of a pitman or similar moving part having opposite concave and convex faces, and a set-nut on the said threaded stem.

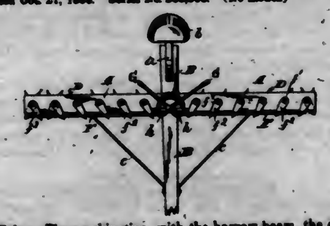
410,571. RACK FOR PAPERS, &c. SAM J. BRAMER, Pittsburg, Pa. Filed Dec. 31, 1888. Serial No. 294,682. (No model.)

Claim.—1. In a rack for papers or other articles, the combination of a pivoted holder and an inwardly-projecting gravity-lever, by which the holder is pressed against the contents of the rack, substantially as and for the purposes described.

2. As a rack for papers or other articles, the combination, with the main frame, of a lever on which the contents of the rack are supported, and a holder which is pressed by depression of the lever against the said contents, substantially as and for the purposes described.

3. As a rack for papers or other articles, the combination, with the main frame, of a lever on which the contents of the rack are supported, a holder connected with the lever and operated thereby, and a projection or tongue adapted to prevent overturning of the holder, substantially as and for the purposes described.

4. As a rack for papers or other articles, the combination of the frame B, having projecting side pieces B^2, and a holder C, journaled to the frame and having an inwardly-supporting lever or frame forming the support for the contents of the rack, substantially as and for the purposes described.

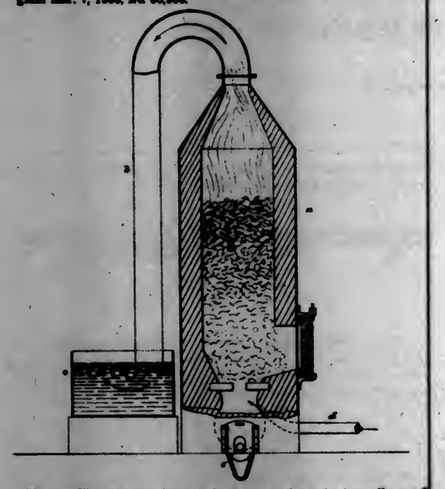


410,572. MOLDING-CUTTER. EDWIN BENJAMIN, South Evanston, Ill., assignor to the Benjamin Machine Company. Filed May 1, 1889. Serial No. 309,162. (No model.)

Claim.—1. The combination, in heads for cutting moldings, of cutters fitted to each other by tongues and grooves.

2. The combination, in heads for cutting moldings, of two or more cutters united to produce the desired outline, the smaller cutter or cutters being rabbeted at or near its outer edge and the larger being tongued to correspond, as and for the purpose set forth.

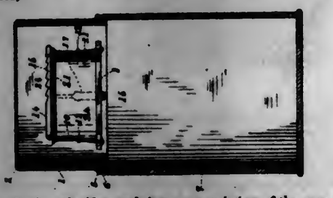
410,573. DISK HARROW. HERBERT D. BLAKEMORE, Moline, Ill. Filed Oct. 27, 1888. Serial No. 289,303. (No model.)



Claim.—The combination, with the harrow-beam, the disks, and their yokes having spindles free to turn in said beam, of the yoke-arms fast at one end to the said spindles, the lever-rods pivotally connecting the outer ends of the yoke-arms, and the lever G G, pivotally connected to the beam on a common vertical pivot, with their shorter

arms crossed and pivotally connected to the adjacent ends of the lever, substantially as shown and described.

410,574. PROCESS OF OBTAINING ALLOYS OF ALUMINIUM.



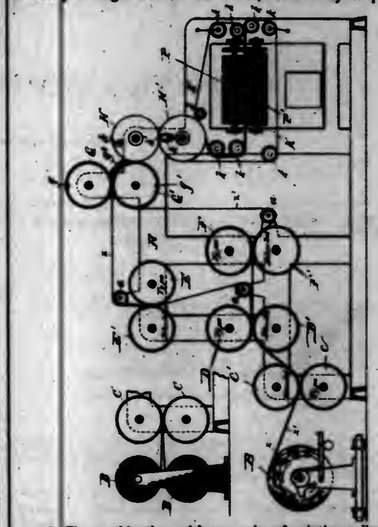
Léon G. Reis, Paris, France. Filed Jan. 24, 1888. Serial No. 297,440 (No model.) Patented in France Mar. 6, 1888, No. 189,171, and in Belgium Mar. 7, 1888, No. 80,908.

Claim.—The herein-described process of producing alloys of aluminium with copper or other metal in the immediate presence of ignited fuel, said process consisting in placing the said metal (copper, &c.) and a mixture of flux containing aluminous clay or aluminous salt or earth and common salt (or other suitable chloride) upon and in direct contact with a bed of fuel, and in then igniting said fuel and subjecting said metal and mixture to a melting heat in the immediate presence of the burning fuel, thereby effecting the reduction of aluminium and alloying it directly with said metal, as specified.

410,575. ASH SIFTER AND DUMPER.

Robert T. Brown and Samuel Page, Buffalo, N. Y. Filed June 8, 1889. Serial No. 313,612. (No model.)

Claim.—1. An ash sifter and dumper consisting of the case 1, in combination with a reversible plate 8, secured between the cranks of a crank-shaft mounted in bearings in the case 1 and provided with a handle for operating it, two bail-shaped frames 10 and 11, pivoted to the plate 8, one of which is provided with a notched bar for securing the two frames, and two cross-bars 13, secured to the frames, the whole combined for conjoint action in securing and dumping the ash-pan, substantially as described.



2. The combination of the case 1, the reversible plate 8, secured between the cranks of a crank-shaft mounted in bearings in the case 1 and provided with a handle for operating it, the frame-bars 10 and 11, pivoted to the plate 8, and each having cross-bars 13, vertical bars 23, secured to the cranks, and a removable sieve 21, substantially as described.

410,576. ROTARY PRINTING-MACHINE.

John J. Claire, Chicago, Ill. Filed May 10, 1888. Serial No. 273,407. (No model.)

Claim.—1. The combination, with a series of printing-cylinders arranged in the same path to print the outsides of two webs passing together between them, of a series of printing-cylinders arranged in divergent paths to print the insides of the two webs, substantially as specified.

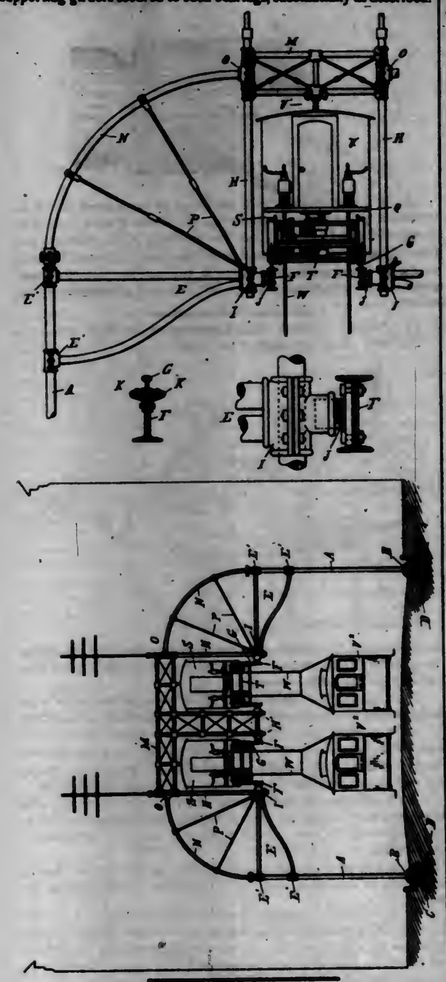
2. The combination, with two pairs of printing-cylinders in the same path to print the outsides of two webs passing between them, of two pairs of printing-cylinders in divergent paths to print the insides of said webs, and a single pair of cutting-cylinders for simultaneously cutting both webs into sheets, substantially as specified.

3. The combination, with two pairs of printing-cylinders in the same path to print the outsides of two webs passing between them, of two pairs of printing-cylinders in divergent paths to print the insides of said webs, a single pair of cutting-cylinders for simultaneously cutting both said webs into sheets, and a sheet-folding mechanism into which the sheets are simultaneously delivered from said cutting-cylinders, substantially as specified.

4. The combination, with a paper-roll having two webs of paper wound thereon, of two pairs of printing-cylinders arranged in the same path to print the outside of each web, two pairs of printing-cylinders arranged in divergent paths to separate the two webs and print the inside thereof, and a pair of cutting-cylinders between which both webs are fed and by which they are cut simultaneously, substantially as specified.

410,577. ELEVATED RAILWAY.

Lorenzo J. Cody, Sault Ste. Marie, Mich. Filed Feb. 2, 1889. Serial No. 298,627. (No model.)



Claim.—1. In an elevated railway, a two-rail roadway having each rail independently adjustably supported above the roadway, substantially as described.

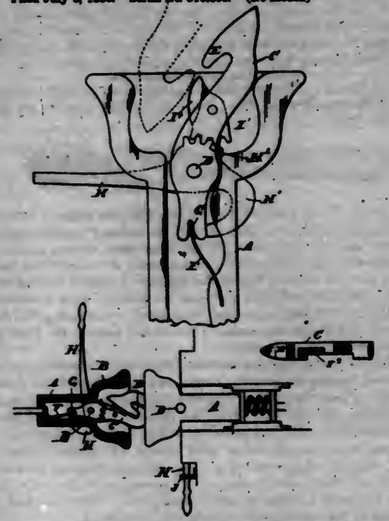
2. In an elevated railway, the combination of the following elements: the two rows of posts on opposite sides of the roadway, the bracketing devices secured on top thereof, the rail-supporting girders secured to the inner ends of the bracketing devices, the rails independently adjustably supported, and the overhead cross-trusses provided with the hangers supporting the bracketing devices, substantially as described.

3. In an elevated railway, the combination of the following elements: the two rows of posts on opposite sides of the roadway, the bracketing devices vertically adjustably secured on top thereof, the bearings laterally adjustably secured to the ends of the bracketing devices, the rail-supporting girders secured thereto, the track-rails supported thereon, the overhead cross-trusses, and the hangers from said cross-trusses adjustably supporting the ends of the bracketing devices, substantially as described.

4. In an elevated railway, the combination of the following elements: the posts on opposite sides of the roadway, the brackets provided with fittings adjustably clamped to the posts, the inwardly curved or inclined extensions on the top of the posts, the hangers secured to said extensions, the cross-trusses connected to the upper ends of said hangers, the fittings adjustably connecting the lower ends of the hangers to the ends of the brackets, and the bearings adjustably secured to said fittings and having bolting-flanges, to which rail-supporting girders are bolted, substantially as described.

5. In an elevated railway, the combination of the following elements: the posts provided with the base B, bolted to the foundations C, the brackets provided with the fittings adjustably clamped to the posts, the curved extensions N on the posts, the hangers suspended from said extensions, the fittings adjustably securing said hangers to said extensions, the cross-trusses vertically adjustably secured to the hangers, the fittings adjustably connecting the hangers and brackets, the bearings laterally adjustably supported by the bracketing devices, and the rail-supporting girders secured to such bearings, substantially as described.

410,578. FARE-REGISTER.



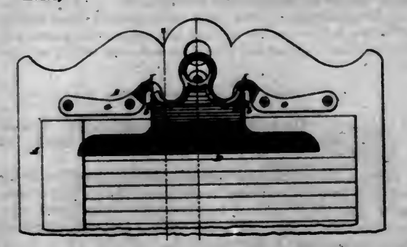
Henry B. Coffey, Stockton, Cal. Filed Oct. 15, 1888. Serial No. 288,168. (No model.)

Claim.—A fare-register comprising the case A, the dished toothed wheel B, provided with a fixed arbor D^9 and a pin B', an angular-shaped elbow-support E, rigidly fixed to the said arbor, the wheels C and D, provided with their ratchet-teeth, journaled on studs fixed to elbow E, the angular spring F, fixed to said elbow, and the striking-pin C', adapted to engage the wheel C with the wheel D, all substantially as specified.

410,579. CAR-COUPLING.

Daniel Coupe, Grand Rapids, Mich. Filed July 8, 1889. Serial No. 316,998. (No model.)

Claim.—1. In a car-coupling, a vertical plane coupling-hook pivoted in the draw-bar and projecting with its hooked front end beyond the mouth of the draw-head and with its rear end slotted in rear of its pivot, and a spring secured in the draw-bar and engaging with its free end into the slot in the rear end of the coupling-hook, substantially as described.



2. In a car-coupling, coupling-hooks C, pivotally secured by the vertical pivot-pin D in the draw-bar and provided with the hook E, projecting beyond the draw-head, and the rear extension in rear of its pivot provided with the vertical slot G, and the spring F, secured in the rear end of the draw-bar and engaging with its free end into the slot G of the coupling-hook, substantially as described.

3. In a car-coupling, the combination of the vertical plane coupling-hook pivoted in the draw-bar, the spring engaging with the rear end of said hook, the spreader pivotally secured in the draw-head, and the uncoupling-lever engaging with said coupling-hook and spreader to simultaneously operate them in uncoupling, substantially as described.

4. In a car-coupling, the combination of a vertical-plane coupling-hook C, pivoted in the draw-bar, the spring F, engaging with the rear end thereof, the spreader I, pivotally secured under the coupling-hook in the mouth of the draw-head, and the uncoupling-lever H, provided with the slot H^3, engaging the rear end of the spreader, and the rearwardly-curved arm H', engaging with the rear end of the coupling-hook, substantially as described.

410,580. PAPER-CLIP FOR WRITING-TABLETS.

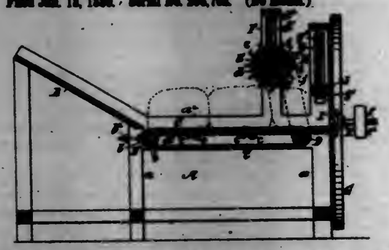
Warren K. Crowell, New York, N. Y., assignor of one-third to William Barclay, Kearney Township, N. J. Filed Oct. 9, 1888. Serial No. 287,681. (No model.)

Claim.—1. The superimposed spindle E, having the central lug F and diverging shoulders *a a*, and forming at its ends the bearings

b b, combined with the spring C, clip D, and board A, substantially as and for the purpose set forth.

2. The transverse bar embodying the superimposed spindle, the central leg, and the extensions having turns I, passing around the extremities of said spindle, combined with the spring and clip, substantially as set forth.

3. The transverse bar embodying the superimposed spindle, extensions, and diverging shoulders *a a*, the ends of the spindle forming bearings *b b*, combined with the spring and the clip, the sides of the latter being sprung upon said bearings, substantially as set forth.



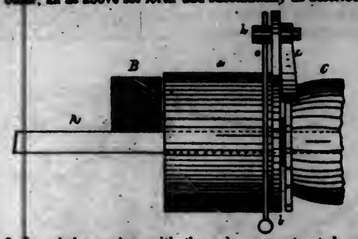
410,581. TOOL FOR DRESSING ABRASIVE SURFACES. GEORGE G. CROWELL, Cincinnati, Ohio. Filed Feb. 27, 1889. Serial No. 301,243. (No model.)

Claim.—1. In a tool of the class described, the shank *c*, the forward end of which is cut away to form the recess *f'*, terminating in the rear abutting shoulder *f*, and the front offset bearing-arm *e*, in combination with the clamping-section *g*, fitting the recess *f'* and having its rear end abutting against the shoulder *f*, and its forward end offset to form the bearing-arm *g*', and the binding-screw *i*, inserted through the clamping-section and terminating in the bottom of the recess *f'*, and the wheel *a*, mounted for rotation between the bearing-arms, substantially as specified.

2. In a tool of the class described, the shank *c*, cut away at its front end, forming the shoulder *f* and recess *f'*, and beyond the recess offsetted to form the perforated bearing-arm *e*, and having the bottom of its recess provided with a rib *h* and threaded opening *f*², in combination with the clamping-section *g*, mounted in and fitting the recess, and having its rear end abutting against the shoulder *f*, perforated, as at *g'*, and grooved, as at *K*, to receive the rib, and extended to form a forward offset bearing-arm *g*', agreeing with the arm *e*, the screw *i*, inserted through the perforations *g'* and *f*², and the wheel *a*, mounted in the bearing-arms, substantially as specified.

410,582. VEGETABLE-SLICER. JAMES BYRNE, New York, N. Y. Filed Jan. 18, 1889. Serial No. 296,702. (No model.)

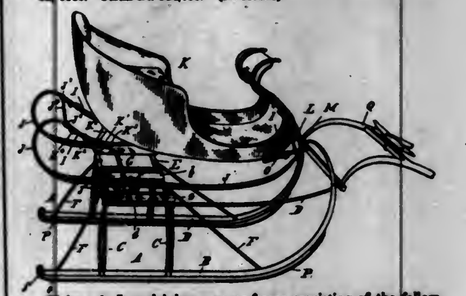
Claim.—1. In a vegetable-slicer, the combination, with an inclined chute and a table, of an endless apron, a roller having fixed bearings and a roller having adjustable bearings, anti-friction rollers beneath said apron, an automatically-adjustable rotary feeder, a main shaft, gearing, substantially such as described, operating the feeder and the apron from the main shaft, and a rotary cutter on the main shaft, substantially as specified.



2. The combination, with feeding mechanism and a main shaft operating said feeding mechanism, of a rotary wheel on the main shaft and having oblique notches in its hub and rim, two or more series of oblique radial cutters having their ends seated in said notches, each series comprising two or more parallel cutters having their cutting-edges in one plane, substantially as specified.

3. The combination, with feeding mechanism, of a cutter-bearing wheel having the rim and hub provided with oblique notches, and cutters having their ends secured in said notches, substantially as specified.

410,583. RECOIL-SPRING FOR BABY-CARRIAGES. WILLIAM L. FAY, Elyria, Ohio. Filed Dec. 28, 1888. Serial No. 294,242. (No model.)



Claim.—1. In a baby-carriage with the axles attached to the frame thereof and so constructed as not to revolve, a spring in combination with one or more of its wheels and connected with each other by any intermediate mechanism, all for the purposes above set forth and substantially as described.

2. In a baby-carriage with the axles so constructed as not to revolve, a spring in combination with one or more of its wheels, so constructed and connected that they will operate in conjunction with each other, all as above set forth and substantially as described.

3. In a baby-carriage with the axles so constructed as not to revolve, a spring in combination with the wheels thereto, and all so constructed and connected that the revolving of the wheels in one direction will increase the tension of the spring, and revolving said wheels in the opposite direction will decrease the tension of said spring, all for the purposes above set forth and substantially as described.

410,584. SLEIGH. SETH C. FIELD, New Boston, Mich. Filed June 12, 1888. Serial No. 314,063. (No model.)

Claim.—1. In a sleigh, a runner-frame consisting of the following elements: an angle-iron runner B, knees C, raves D, and axle-frame E, substantially as described.

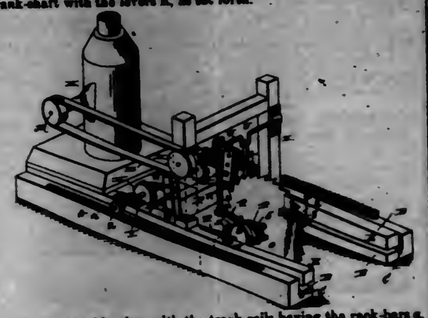
2. In a sleigh, the combination, with the runner thereof, of a detachable shoe having a hook *e* and studs *g*, substantially as described.

3. In a sleigh, the combination, with the runner thereof, of a detachable shoe secured at its rear end by a hook and at the forward end by a stud and bolt passing through an aperture in the runner, and at or near the middle by standards, substantially as described.

4. In a sleigh, the combination, with an angle-iron runner, of a detachable shoe having the hook *e*, studs *g*, and standards *m* and *n*, adapted to embrace said angle-iron, and the sleeves *o*, substantially as described.

5. In combination with a sleigh, a shoe having a wide bearing adapted to be detachably secured to the runner, substantially as described.

6. In a sleigh, the springs, the body flexibly connected thereto, the axle, the frames supporting said axle, the braces for said frames, the knees for supporting the frames, the angle-runners from which the knees rise, and the shoes connected to the runners and having supplemental bars, substantially as described.

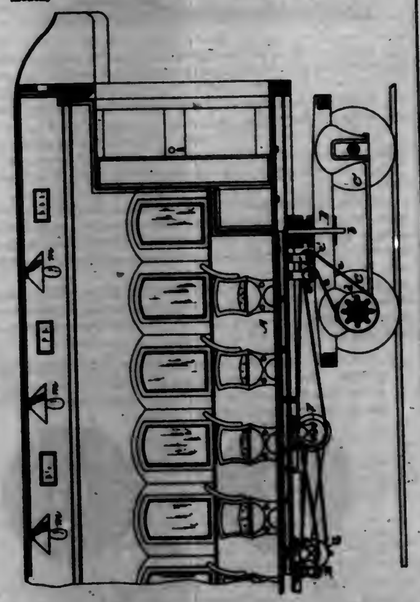


7. In a sleigh, the runners, the shoes, the bifurcated knees rising from the runners, and the frames supported on the knees, substantially as described.

8. In a sleigh, the shoe having the socket and stud, the runner having one end fitting in the socket, and having an opening to receive the stud, and the catch on the runner engaging the said stud, for securing the shoe and runner together, substantially as described.

9. In a sleigh, the angle-runners, the shoes connected to said runners, the standards connecting the runners and shoes, the knees rising from the runners, the frame supported on the knees, the axle bearing on the frames, the springs supported on the axle, and the body supported on the springs, substantially as described.

410,585. STONE-SAWING MACHINE. JAMES C. PERRIGO, Belton, Tex. Filed Mar. 26, 1888. Serial No. 268,150. (No model.)



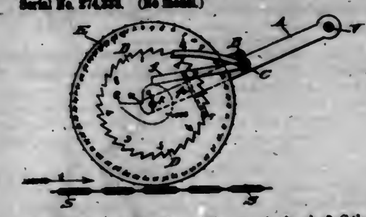
Claim.—1. In a sawing-machine, the combination of the carriage, the rotary saw-arbor journaled thereon, the saw secured on said arbor, the ratchet-wheels secured on the saw-arbor on opposite sides of the saw, the levers E, having the plates 5 at their outer ends loosely mounted on the saw-arbor, the pawls pivoted between the plates 5, the crank-shaft arranged in rear of and above the saw-arbor, mechanism for rotating the crank-shaft, and the pitmen connecting the crank-shaft with the levers E, as set forth.

2. The combination, with the track-rails having the rack-bars *a*, of the carriage mounted on the track-rails, the transverse shaft Y on the carriage, the pinions Z on said shaft, engaging the rack-bars, the stirrups U, mounted on the carriage adjacent to the shaft Y, the ratchet-wheels X on said shaft Y, the pawls pivoted in the stirrups U and engaging the ratchet-wheels X, the pitmen pivoted to said stirrups and driven by the saw-arbor, and mechanism for rotating the saw-arbor, as set forth.

3. As an improvement in sawing-machines, the combination of the track-rails having the rack-bars *a* on their upper sides, the carriage mounted on the rails, the shaft Y on the carriage, provided at its ends with pinions engaging the rack *a*, the ratchet-wheels X on said shaft, the brackets V on the carriage adjacent to said shaft, the stirrups U, pivoted to said brackets, the pawls pivoted in said stirrups and engaging the ratchet-wheels X, the saw-arbor mounted in the carriage, the pitmen connecting the stirrups U with the saw-arbor, the ratchet-wheels P on the saw-arbor, the crank-shaft above and in rear of the saw-arbor, the levers E, loosely mounted on the saw-arbor, the pawls on said levers engaging the ratchet-wheels P, the pitmen connecting said levers with the crank-shaft, and mechanism for rotating the crank-shaft, as specified.

410,586. ELECTRIC LIGHTING OF RAILWAY-CARS. THEODORE M. FOOTE, Boston, Mass. Filed Apr. 26, 1888. Serial No. 271,799. (No model.)

Claim.—1. In an electric-lighting system, the combination of the dynamo K, the storage-battery L, the lighting plant *m* the automatic electric switch H, and the automatic speed-regulator G, substantially as described.



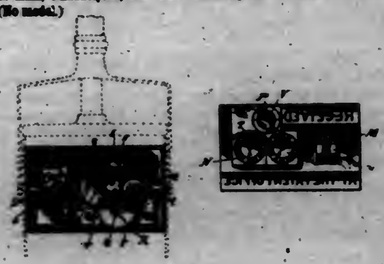
2. An electric-lighting system containing the combination of the driving-pulley *d*, the automatic reversing-clutch F, the automatic speed-regulator G, the automatic electric switch H, the dynamo K, the storage-battery L, and the lighting plant *m*, substantially as and for the purposes described.

3. In a railway-car having the usual swiveling-trucks and a combination of car-wheels with an electric-lighting system for said car, the combination consisting of the pulley C upon an axle of the car-truck, the belt *c*, led from said pulley toward and near to the center of oscillation between the car and truck, the guide-pulleys *c'* *c*², attached to the body of the car near said center of oscillation, and the automatic reversing-clutch F, substantially as and for the purpose described.

4. In a railway-car having the usual swiveling-trucks and a combination of the car-wheels with an electric-lighting system for said car, the combination of the pulley C on one of the axles of a car-truck, the belt *c*, leading from said pulley toward and near to the center of oscillation between the car and the truck, the guide-pulleys *c'* and *c*², attached to the body of the car near the center of oscillation between the car and its truck, an automatic reversing-clutch F, and a speed-regulator G, substantially as described.

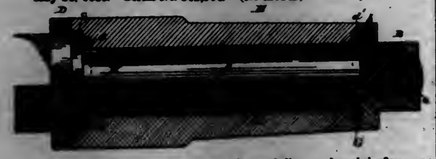
5. An electric-lighting system adapted to be driven from a source of power of varying velocity, in which the power which drives the dynamo K is transmitted through the speed-regulator G and controlled thereby within a predetermined maximum velocity, in combination with an electric switch H, said dynamo K, and a lighting system, substantially as described.

410,587. REGISTER FOR SLAT-FENCE LOOMS. WILLIAM M. GRAY and WILLIAM M. WEBER, Crawfordsville, Ind. Filed May 18, 1888. Serial No. 274,233. (No model.)



Claim.—The combination of the arm A, the shaft C thereon, carrying the pawl *h* and the arm *f*, and pawl *p* and the shaft K, with the disk E, provided with brads on its periphery, loose on the shaft K, the cam *m*, fixed to the disk E to vibrate the arm *f*, and the ratchet-wheel D, also loose on the shaft K and engaged by the pawls *h* and *p*, the said disk E and ratchet-wheel D being marked with figures on their surfaces.

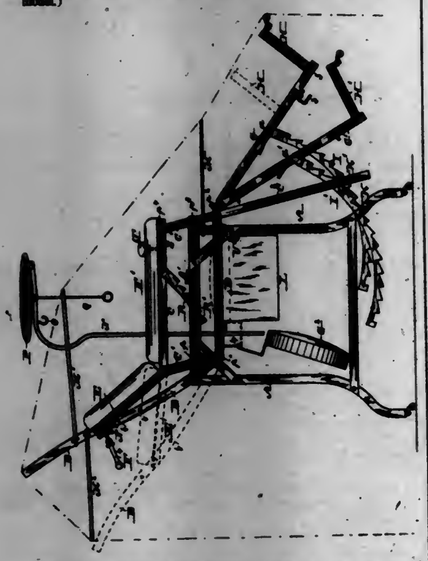
410,588. MATCH-SAFE. ELI P. HAMMOND, Syracuse, N. Y. Filed Apr. 11, 1889. Serial No. 306,702. (No model.)



Claim.—A match-safe and burning-match extinguisher comprising a body, a central partition across the body, a hinged cover upon the match-receiver, and a detachable cover upon the extinguisher, provided with an opening to receive the burning match.

410,589. SELF-INKING TIME AND DATING STAMP. BENJAMIN B. HILL, Philadelphia, Pa. Filed Feb. 16, 1887. Serial No. 227,511. (No model.)

Claim.—The combination, in a self-inking hand-stamp and with fixed inscription-plate thereof, of multiple printing-disks having their axes substantially at right angles to the face of the fixed inscription-plate, wheel-work connecting said disks, an oscillating box containing said wheel-work, having its top and bottom formed of the permanent inscription-plate of said stamp and a second plate secured thereto, said second plate being provided with bearings for the shafts of the wheel-work, and a shaft connected with the wheel-work passing through said second plate and provided with means, as the knob Y, for turning the shaft at the will of the operator, substantially as described.

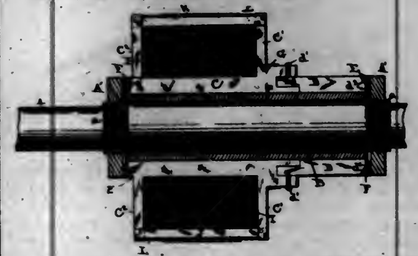


410,590. AXLE-BOX. CHARLES R. HORNOR, Bourne, Tex. Filed May 23, 1888. Serial No. 312,264. (No model.)

Claim.—1. The combination, substantially as hereinbefore set forth, of the axle formed with a collar C, the axle box or hub formed with recesses *c*, *d*, and *d'*, the anti-friction rods or rollers, of the same diameter from end to end, extending the entire length of the journal end of the axle, the rings or washers at each end surrounding the ends of the rods and seated in the recesses *d* and *d'* in the box, and the nut on the outer end of the axle bearing against the end washer, the end of the box, and the outer ends of the rods.

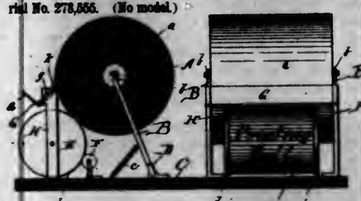
2. The combination, substantially as hereinbefore set forth, of the axle, the axle box or hub, the anti-friction rods or rollers extending the entire length of the journal end of the axle, and the rings or washers formed with recesses opening inwardly for the ends of the rods and in which they are free to move.

410,591. INVALID-CHAIR. LENA M. HOFFMAN, Philadelphia, Pa. Filed Jan. 11, 1888. Renewed Dec. 19, 1888. Serial No. 294,129. (No model.)



Claim.—1. An invalid-chair having a frame A, with the upper side bars A', the seat frame C C D, consisting of the horizontal bars C and D and the connecting-bars C', pivoted to said horizontal bars and to the side bars A', the back-support D, with openings and secured to the lower portion of frame C C D, and the link or rod E, pivotally secured to said frame C C D and to the back-support D, said parts being combined substantially as described.

2. In an invalid-chair, the frame A, with cross-bar K, in combination with the pivoted frame C C D, consisting of the horizontal bars C D and the pivoted connecting-bars C', the latter frame having the depending side bars C², with pins K', the separate leg-rests G G', each having a rack-bar pivoted thereto and adapted to engage with the pins K', and cross-bar K, substantially as and for the purpose set forth.



3. An invalid chair having a stationary frame and a vertically-adjustable seat-frame, separate foot-rests, each having a sleeve pivoted on a cross-bar of the seat-frame, a link connecting said leg-rests, and fastening devices for said rests, said parts being combined substantially as and for the purpose set forth.

410,592. ARMATURE. JOHN B. JOHNSON, Yonkers, N. Y. Filed Mar. 27, 1889. Serial No. 305,081. (No model.)

Claim.—An armature of the Gramme type, consisting of the shaft A, the series of bars C, having the recesses *c* and the wide thin radial arms C C², the bars J, connecting the arms C C² of adjoining bars C, the core H, the commutator-segments D, having tenons *d*, secured in the recesses *c*, and means for retaining the bars and segments in place upon the shaft, substantially as described.

410,593. PAPER-ROLL HOLDER AND PRINTER. GUY L. KENNEDY, Chicago, Ill., assignor, by mesne assignments, to the Merchants Roll Paper Supply Company, same place. Filed June 29, 1888. Serial No. 278,555. (No model.)

Claim.—1. In a printing paper-roll holder, the combination of a roll-supporting cylinder mounted in a swinging frame with a stationarily-journaled type-wheel against which the roll rests, whereby the roll is rendered automatic in retaining its contact with said wheel, substantially as specified.

2. The combination, with a paper-roll cylinder, a swinging frame supporting said cylinder, and springs acting upon said frame, of a stationarily-journaled type-wheel against which the roll rests, substantially as specified.

3. The printing paper-roll holder consisting of a cylinder for carrying the paper, a spring-depressed frame supporting said cylinder with the paper resting in constant contact with the type-wheel, the type-wheel, and a knife for severing the paper, substantially as specified.

4. In a paper-holder, the combination of a revoluble printing-roller and a core for supporting a roll of paper, the latter situated above and resting upon said printing-roller and removable without disturbing the printing-roller, substantially as described.

410,594. ROLL WRAPPING-PAPER HOLDER, PRINTER, AND CUTTER. GUY L. KENNEDY, Chicago, Ill., assignor, by mesne assignments, to the Merchants Roll Paper Supply Company, same place. Filed Jan. 26, 1888. Serial No. 297,549. (No model.)

Claim.—1. In a roll-paper holder and printer, the combination of the type-cylinder with the impression-roller and inking roller, the cylinder being supported by the rollers, substantially as set forth.

2. In a roll-paper holder and printer, the combination of the type-cylinder with stationarily-journaled impression and inking rollers by which the cylinder is supported, substantially as specified.

3. The combination, with the knife and the type-cylinder, of the supporting-wire *n*, substantially as set forth.

4. The roll-paper holder, printer, and cutter, consisting of a paper-cylinder, a stationarily-journaled impression-roller, a stationarily-journaled inking-roller, a type-cylinder supported between said impression and inking rollers, and a knife, substantially as set forth.

5. The roll-paper, holder, printer, and cutter, consisting of a stationarily-journaled paper-cylinder, a stationarily-journaled smoothing-roller, acting also as an impression-roller, a type-cylinder and inking-roller, and a knife, the smoothing-roller being below the plane of the paper-cylinder, and the paper being passed around it with an abrupt change of direction, substantially as set forth.

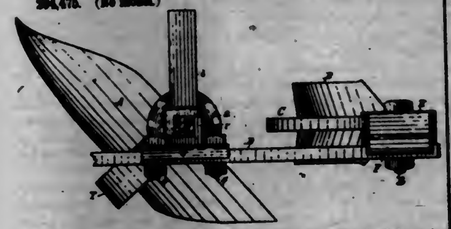
6. The roll-paper holder, printer, and cutter, consisting of the paper-cylinder, a smoothing and impression roller, a printing cylinder, an inking-roller, a paper-supporting wire *n*, and a knife, all the parts being constructed and relatively arranged as set forth, substantially as specified.

7. In a printing-paper holder, a type-cylinder supported between the impression and the inking rollers, and held against end play by flanges *f* and *g*, in combination with said rollers, substantially as set forth.

8. In a printing roll-paper holder, a type-cylinder supported by stationarily-journaled rollers at either side, in combination with such rollers, substantially as set forth.

410,595. PRINTING-HOLDER FOR ROLL WRAPPING-PAPER. GUY L. KENNEDY, Chicago, Ill., assignor, by mesne assignments, to the Merchants Roll Paper Supply Company, same place. Filed May 3, 1888. Serial No. 309,445. (No model.)

Claim.—1. The printing-paper holder consisting of a roll-paper cylinder, a type-cylinder, a pressure-roller, a knife, and an inclosing-box made in two parts, the type-cylinder being in one part of the box and the pressure-roller in the other, substantially as set forth.

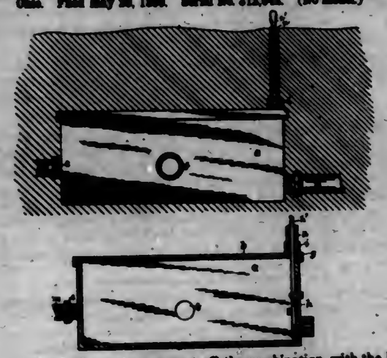


2. The printing-paper holder consisting of a roll-paper cylinder, a type-cylinder, a pressure-roller, a knife, and an inclosing-box made in two parts, the roll and type cylinders being in the lower half and the pressure-roller and knife in the upper half, substantially as set forth.

3. The paper-roll holder inclosed in a protecting-box and provided with knife swinging in said box and through a slit therein, substantially as set forth.

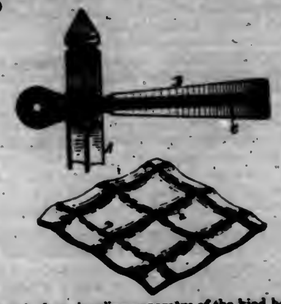
4. In a paper-roll holder and cutter, a knife suspended by swinging vertical supports and movable into operating position by the friction of the paper in its passage, substantially as set forth.

5. In a paper-roll holder and cutter, a knife suspended upon vertical swinging supports movable by and with the paper into cutting position, and retreating to a position back of said cutting position after the paper is severed, substantially as set forth.



410,596. CULTIVATOR. HENRY D. KIPP, Kalamazoo, Mich., assignor to L. G. Lull & Co., same place. Filed Dec. 24, 1888. Serial No. 294,475. (No model.)

Claim.—1. In a cultivator, the combination of the draft-bar, the vertically-edgewise blocks, having the serrated engaging faces, said blocks being attached to the front end of the draft-bars by adjusting-bolts, shares attached to the outer blocks, the transverse bar, the blocks attached to the draft-bars in the rear of the front shares, said blocks having the horizontal serrated engaging faces, the upper block provided with the raised recessed portion with which the ends of the transverse bars are attached, and the channeled portions with which the ends of the draft-bars are attached, the rear shares having their standards attached to the lower blocks, and the securing-bolts, substantially as set forth.



2. In a cultivator, the blocks having the horizontal serrated faces engaging each other, the upper block being provided with a raised recessed portion with which one end of the transverse bar of the cultivator is attached and a channeled portion with which one end of the draft-bar is attached, a share and its standard, said standard being attached to the lower block, and the securing-bolts, all combined, substantially as set forth.

410,597. RAIN-WATER CUT-OFF. HENRY W. KENNEY, Columbus, Ohio. Filed May 20, 1889. Serial No. 312,042. (No model.)

Claim.—In a rain-water cut-off, the combination, with the box *a*, located within the earth, its inlet-pipe sockets *c* and *f*, outlet-pipes *d*, and detachable slotted lid *b*, of the pivoted valve-plate A, having handle *k*, passing through slot *g* of said lid and projecting above the ground, substantially as and for the purpose set forth.

410,598. SEMAPHORE-SIGNAL FOR RAILWAYS. CHARLES H. KOTZ, Philadelphia, assignor to the National Switch and Signal Company, Bethlehem, Pa. Filed June 6, 1889. Serial No. 313,296. (No model.)

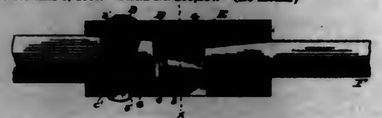
Claim.—1. In a signaling apparatus of the kind hereinbefore referred to, a reflector the surface of which has the shape or approximately the shape of the segment of a paraboloid and is corrugated, as described, said reflector being rotatable about an axis coincident with the axis of the paraboloid of which it is a segment, substantially as and for the purpose set forth.

2. In a signaling apparatus of the kind hereinbefore referred to, a reflector the surface of which has the shape or approximately the shape of the segment of a paraboloid and is impressed with two sets of corrugations or waves at right angles to each other, substantially as and for the purpose set forth.

410,599. SEMAPHORE-SIGNAL FOR RAILWAYS. CHARLES H. KOTZ, Philadelphia, Pa. Filed July 16, 1888. Serial No. 317,737. (No model.)

Claim.—In a semaphore-signaling apparatus, a reflector having the shape of a paraboloidal segment formed or provided along its upper edge with a downwardly-reflecting overhang or hood and rotatable about an axis coincident with that of the paraboloid, in combination with a lamp or other source of light located at the focal point

of the paraboloid, substantially as and for the purposes hereinbefore set forth.



410,600. METHOD OF MAKING BLANKS FOR KNITTED DRAWERS. DWIGHT P. MILLS, Naugatuck, Conn. Filed Jan. 15, 1889. Serial No. 296,267. (No model.)

Claim.—The herein-described method of making knit drawer-blanks, which consists, first, in providing a tubular fabric with certain lengths containing a section of firm fabric at each end and an intermediate section of a looser and more elastic character, and then cutting both thicknesses of the flattened tube longitudinally on substantially the straight and diagonal lines shown, thereby forming the parts designed for the waist portion of one member and ankle portion of the other member from each of said firm sections, substantially as described, and for the purpose specified.

410,601. DRILL-CHUCK. EDWARD MOTLE, Grass Valley, Cal. Filed Jan. 3, 1889. Serial No. 295,267. (No model.)

Claim.—The herein-described drill-chuck, provided at its respective ends with inwardly-tapering longitudinal drill and shaft sockets, a contracted cylindrical channel connecting the same, and with a diametrical slot passing entirely through the chuck and through the drill-socket, the said shaft-socket having oppositely-disposed diametrical tapering slots in its walls, substantially as set forth.

410,602. COPY-HOLDER. GEORGE HUNT, Brooklyn, N. Y. Filed Oct. 9, 1888. Serial No. 287,603. (No model.)

Claim.—1. In a copy-holder, the combination, with the paper-table and its support, of a friction device at the horizontal joint or axis of the paper-table operating constantly to resist motion of the paper-table about said axis due to gravity, but capable of being overcome by muscular force applied to the paper-table to vibrate the same, whereby the paper-table is caused to remain at any inclination to which it may be adjusted without obliging the user to operate the friction device independently of the paper-table, as set forth.

2. In a copy-holder, the combination of a pivoted horizontally-arranged carrier-arm 18, a vertical two-part support, and a paper-table, substantially as set forth.

3. In a copy-holder, the combination of a crom-strip, as B, adapted to be attached to the base of a type-writing machine, the pivoted carrier-arm, the vertical support, and a paper-table, substantially as set forth.

4. In a copy-holder, the combination of an extensible crom-strip, as B, the pivoted carrier-arm, the vertical support, and the paper-table, substantially as set forth.

5. In a copy-holder, the combination of the crom-strip provided with a compressible or yielding end, the carrier-arm, the vertical support, and the paper-table, substantially as set forth.

6. In a copy-holder, the combination of the crom-strip consisting of the bar portion, the screw, and the nut, the arm 18, the vertical support, and the paper-table, substantially as set forth.

7. In a copy-holder, the combination of the carrier-arm having an inclined abutment, the hinged support, and the paper-table, substantially as set forth.

8. In a copy-holder, the combination of the carrier-arm having a vertical abutment, the hinged support, and the paper-table, substantially as set forth.

9. In a copy-holder, the combination of the carrier-arm having a vertical and an inclined abutment, the hinged support, and the paper-table, substantially as set forth.

10. In a copy-holder, the combination of the paper-table provided with the rearwardly-extending perforated arms 7 7, the perforated and threaded paper-table support 8, the thumb-screw 13, passing through one of said arms and engaging with the threaded portion of the paper-table support, and the pin 12, passing through the other of the said arms 7 and into the perforated portion of the paper-table support, substantially as set forth.

11. In a copy-holder, the combination of the adjustable paper-table, the pivoted carrier-arm, and the two-part rotatable support hinged to the carrier-arm, substantially as set forth.

12. A copy-holder provided with an extensible crom-strip B, adapted to be secured between the sides of the type-writing machine bed or frame, substantially as set forth.

410,603. CASH INDICATOR AND REGISTER. THOMAS RUSSELL, Mount Sterling, Ky. Filed Dec. 13, 1887. Serial No. 257,737. (No model.)

Claim.—1. The combination of the cent key-lever c^3, having a finger swinging in a plane transverse of the plane of said lever, and a fulcrum c^4, the stop-pins c^{12} and c^{13}, the shaft J, having a ratchet-wheel c' and an index c^7, and the dial c^6, substantially as described.

2. The combination of the cent key-lever c^3, having a finger swinging in a plane transverse of the plane of said lever, and a fulcrum c^4, the shaft J, having a ratchet-wheel c', and the spring c^5, having its free end fitting in the space between two teeth of the ratchet-wheel, substantially as described.

3. The combination of the key-lever c^3, having a hinged spring-finger c^{14}, and the shaft J, having a ratchet-wheel c' and an index c^7, substantially as described.

4. The combination of the key-lever c^3, having a hinged spring-finger c^{14}, the shaft J, having a ratchet-wheel c' and an index c^7, and the spring c^5, having its free end fitting between two teeth of the ratchet-wheel for controlling the movement of the latter, substantially as described.

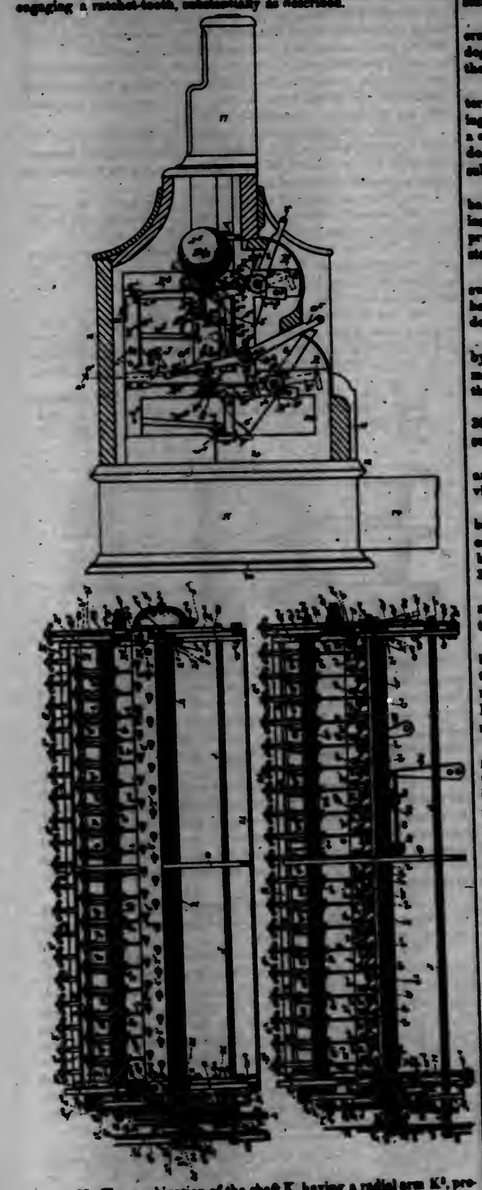
5. The key-lever c^3, comprising the finger c^{14}, formed with an under-cut or bevel c^9, the pivot c^8, by which the finger is hinged to the key-lever, and the spring c^5, substantially as described.

6. The combination of the key-lever c^3, having a hinged spring-finger c^{14}, formed with a bevel c^9, and the shaft J, having a ratchet-wheel c' and an index c^7, substantially as described.

7. The combination of the key-lever c^3, having a hinged spring-finger c^{14}, formed with a bevel c^9, the shaft J, having a ratchet-wheel c' and an index c^7, and a spring c^5, having its free end fitting between two teeth of the ratchet-wheel for controlling the movement of the latter, substantially as described.

8. The combination of the key-lever c^3, having a finger and a fulcrum c^4, the shaft J, having a ratchet-wheel c' and gear-wheel A, the gear-wheel B, meshed by the gear-wheel A, having a finger or projection C, the lantern-wheel D', having pins a, with which the finger or projection engages, and the short shaft $K^{\times}$, having an index K', substantially as described.

9. The combination of the rod B^2, the key-lever c, and boring c^2, the stop-plate c^3, and spring c^5, having one end hooked over the key-lever on the inner side of its shaft and the other end secured to the stop-plate, substantially as described.



10. The combination of the gear-cylinder k, having elongated guide-tooth K, and the key-lever c, having rack-segment c', substantially as described.

11. The combination of the gear-cylinder k, having a shaft K, provided with a radial arm s^2, the stop-pin s^3, the returning-spring s^5, and a key-lever c, having a rack-segment c', substantially as described.

12. The combination of a key-lever having a rack-segment, a gear-cylinder having a shaft, a short shaft having a ratchet-wheel and an index, and the shaft and pivoted spring-dog connection between the cylinder-shaft and the ratchet-wheel, substantially as described.

13. The combination of the key-lever c, having rack-segment c', the gear-cylinder k, the shank K, having a radial arm K^2, provided with a pivoted dog D^2, the spring connecting the pivoted dog to the arm, the ratchet-wheel D, with which the dog engages, the lantern-wheel D', turning with the ratchet-wheel, and a short shaft $K^{\times}$, having an index K', substantially as described.

14. The combination of the shaft K, provided with a radial arm, a short shaft having a ratchet-wheel and an index, the pivoted spring-dog connection between the arm and ratchet-wheel, and a spring d, engaging a ratchet-tooth, substantially as described.

15. The combination of the shaft K, having a radial arm K^2, provided with a pivoted dog D^2, the spring connecting the pivoted dog to the arm, the ratchet wheel D, with which the dog engages, the lantern-wheel D', turning with the ratchet-wheel, the short shaft $K^{\times}$, having an index K', and a spring d, engaging the ratchet-teeth in front of the dog, substantially as described.

16. The combination of the lantern-wheel D', having pins a, and the swinging lever d^2, having perforated spring d^3, and tooth or projection d^4, working through the spring, substantially as described.

17. The combination of the key-lever c, pressure-bar E, lantern-wheel D', having pins a, and the swinging lever d^2, having outer end d^{10}, projecting beneath the pressure-bar and provided with perforated spring d^3, and stud or projection d^4, working through the spring, substantially as described.

18. The combination of the lower lantern-wheel D', having peripheral finger E, the upper lantern-wheel G, and the vertically-swinging dog or lever F, having an inverted pawl f^4, for engaging the pins of the upper lantern-wheel, substantially as described.

19. The combination of the lower lantern-wheel D', the upper lantern-wheel G, and the connection between the lantern-wheels, comprising a swinging dog or lever F, formed with a hub having two wings f, a spring bearing on the projections, inverted pawl f^4, jointed to the dog or lever, and a spring bearing on the heel or butt of the spring, substantially as described.

20. The combination of a key-lever, a supporting-rod, pressure-bar beneath the lever having crom-arms $E^{\times}$, and horizontal pin on the inner end E^2 of a crom-arm, a spring bearing on the pin to retain the pressure-bar in normal position, the upright bar S, and pin E^7, substantially as described.

21. The combination of the longitudinally-moving bar S, the swinging pawl S^7 thereon, having spring S^8, the hammer-lever S^4, the hammer S^5, lifting device for the bar, and alarm S^9, substantially as described.

22. The combination of the upright bar S, the pawl S^7, the pin S^{11}, by which the pawl is pivoted to the bar, the pawl-spring S^8, the hammer-lever S^4, pin S^6, by which the lever is pivoted, the hammer S^5, the bell S^9, and the hammer-spring S^8, substantially as described.

23. The combination of the upright bar S, having a projection 39, the rock-bars 36 and 34, the spring-bolt 29, and drawer-lid M, substantially as described.

24. The combination of a key-lever pressure-bar having crom-arms $E^{\times}$, the upright bar S, having pin E^7, and the bell-operating devices, substantially as described.

25. The combination of a key-lever, supporting-rod, pressure-bar beneath the lever having crom-arms $E^{\times}$, and horizontal pin on the inner end of a crom-arm, a spring bearing on the pin to retain the pressure-bar in normal position, the upright bar S, a pin E^7, and a projection 39, substantially as described.

26. The combination of a key-lever, pressure-bar having crom-arms $E^{\times}$, the upright bar S, having the projection 39, the pin E^7, and the bell-releasing devices, substantially as described.

27. The combination of a shaft, device for turning the shaft, combined ratchet and gear wheel mounted loosely on the shaft, connection between said shaft and said ratchet-wheel by which the latter is rotated on each movement of the shaft, the stud L', the gear-wheel H, mounted on the stud, having pinion I, and the short shaft having registering-wheel y^5 and the index G^9, substantially as described.

28. The combination of a key-lever having a rack-segment, a gear-cylinder having a shaft, combined ratchet and gear wheel mounted loosely on the shaft, radial arm and spring-dog connection between said shaft and said ratchet-wheel by which the latter is rotated on each movement of the shaft, the stud L', the gear-wheel H, mounted on the stud, having pinion I, the short shaft $L^{\times}$, having registering-wheel y^5 and the index G^9, substantially as described.

29. The combination of a shaft, device for turning the shaft, combined ratchet and gear wheel mounted loosely on the shaft, connection between said shaft and said ratchet-wheel by which the latter is rotated on each movement of the shaft, the stud L', the gear-wheel H, mounted on the stud, having pinion I, the short shaft $L^{\times}$, having registering-wheel y^5 and pinion P, the registering-wheel y, mounted on the stud, having pinion I', and the sleeve G^{10}, mounted on the short shaft, having registering-wheels y^5 and index G^{10}, substantially as described.

30. The combination of a key-lever having a rack-segment, a gear-cylinder having a shaft, combined ratchet and gear wheel mounted loosely on the shaft, radial arm and spring-dog connection between said shaft and said ratchet-wheel by which the latter is rotated on each movement of the shaft, the stud L', the gear-wheel H, mounted on the stud, having pinion I, the short shaft $L^{\times}$, having registering-wheel y^5 and pinion P, the registering-wheel y, mounted on the stud, having pinion I', and the sleeve G^{10}, mounted on the short shaft, having registering-wheel y^5 and index G^{10}, substantially as described.

31. The combination of a shaft, device for turning the shaft, combined ratchet-wheel and gear-wheel mounted loosely on the shaft, connection between said shaft and said ratchet-wheel by which the latter is rotated on each movement of the shaft, the stud L', the gear-wheel H, mounted on the stud, having pinion I, the short shaft $L^{\times}$, having registering-wheel y^5 and pinion P, the registering-wheel y mounted on the stud, having pinion I', the sleeve G^{10}, mounted on the short shaft, having registering-wheel y^5 and pinion I^2, the registering-wheel y', mounted on the stud, having pinion P, and the sleeve G^{12}, mounted on the sleeve G^{10}, having registering-wheel y^4 and index G^{12}, substantially as described.

32. The combination of a key-lever having a rack-segment, a gear-cylinder having a shaft, combined ratchet and gear wheel mounted

loosely on the shaft, radial arm and spring-dog connection between said shaft and said ratchet-wheel by which the latter is rotated on each movement of the shaft, the stud L', the gear-wheel H, mounted on the stud, having pinion I, the short shaft L^x having registering-wheel y^6 and pinion I^2, the registering-wheel y, mounted on the stud, having pinion I', the sleeve G^{2a}, mounted on the short shaft, having registering-wheel y^5 and pinion I^4, the registering-wheel y', mounted on the stud, having pinion I^3, and the sleeve G^{2d}, mounted on the sleeve G^{2a}, having registering-wheel y^4 and index G^{2b}, substantially as described.

33. The combination of the five-cent shaft K, device for turning the five-cent shaft, the short shaft K^x, the ratchet-wheel D, and the wheel D', having peripheral finger E, carried by the short shaft, connection between said five-cent shaft and said ratchet-wheel by which the latter is impelled forward, the dollar-shaft L, device for turning the dollar-shaft, the short shaft L^x, combined ratchet-wheel G' and lantern gear-wheel G, having pins g, mounted on said dollar-shaft, connection between said dollar-shaft and the last-named ratchet-wheel by which the latter is impelled forward, connection between the peripheral finger and the pins, the stud L', the gear-wheel H, mounted on the stud, having pinion I, and the short shaft L^x, having registering-wheel y^6 and the index G^2, substantially as described.

34. The combination of a cent-shaft J, having an index, five-cent shaft K, short shaft K^x, having an index, dollar-shaft L, short shaft L^x, having an index, levers by which the main shafts are impelled in one direction only to produce continuous registration, connections, substantially as shown, between the cent-shaft and the short shaft K^x, connection, substantially as shown, between the five-cent shaft and dollar-shaft, and connection, substantially as shown, between the dollar-shaft L and the short shaft L^x.

35. The combination of a key-lever having a cam, and a tablet-rod having a tablet normally transverse of the register and provided with a projection on which the cam operates to impart a one-quarter of a rotation to the rod to exhibit the faces of the tablet longitudinally of the register, substantially as described.

36. The combination of a key-lever having a cam, a stop-pin, a tablet-rod having a projection with which the cam engages for rotating the rod, and also a projection bearing against the stop-pin, and a spring for returning the rod when the latter is released, substantially as described.

37. The combination of a pivoted bar having recesses and inclines leading thereto on its edge, a key-lever having a cam, and a tablet-rod having a projection with which the cam engages for rotating the rod, and also a projection with which the pivoted bar engages for retaining the rod when the latter is advanced, substantially as described.

38. The combination of a pivoted bar having recesses and inclines leading thereto on its edge, a key-lever having a cam, a stop-pin, and a tablet-rod having a projection with which the cam engages, and also a projection with which the pivoted bar engages, the bar projection adapted to bear against the stop-pin when in normal position, substantially as described.

39. The combination of a pivoted bar having recesses and inclines leading thereto on its edge, a key-lever having a cam, a stop-pin, and a tablet-rod having three projections—to wit, a projection on which the cam operates, a projection with which the bar engages, and a projection arrested by the stop-pin—substantially as described.

40. The combination of a pivoted bar having recesses and inclines leading thereto on its edge, a key-lever, a tablet-rod rotated by the key-lever and retained by the pivoted bar, and means by which the latter is operated to release the tablet-rod, substantially as described.

41. The combination of the lower bar w, having recesses and inclines leading thereto on its edge, arms w^2, by which the bar is pivoted, inward extension w^{10} to one of the arms, the upper pressure-bar R', having cross-arms R^x, the pitman w^3, upper key-lever, and a tablet-rod rotated by the key-lever, retained by the pivoted bar, and released by the pressure-bar, substantially as described.

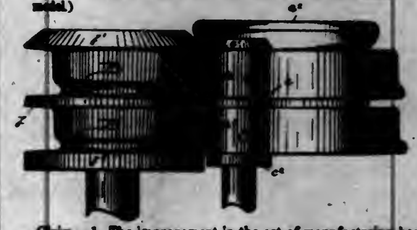
42. The combination of the upper bar w^9, having recesses and inclines leading thereto on its edge, arms w^2, by which the bar is pivoted, inward and downward extension w^3 to one of the arms, the lower pressure-bar having cross-arms R^x, lower key-lever, and a tablet-rod rotated by the key-lever, retained by the pivoted bar, and released by the pressure-bar, substantially as described.

43. The combination of a tablet-rod having a pin or projection, a key-lever engaging the pin or projection by which the rod is rotated, a pivoted notched bar by which the rod is retained, and a pressure-bar by which the bar is lifted and the rod is released, substantially as described.

44. The combination of the upper plate V, lower plate V', tablet-rods T' T^2, turning freely in the plates, lower tablet T', upper tablet T^2, lower key-lever operating the lower tablet-rod, the upper key-lever operating the upper tablet-rod, pivoted lower bar for retaining the upper tablet-rod, pivoted upper bar for retaining the lower tablet-rod, lower pressure-bar for releasing the upper tablet-rod, and upper pressure-bar for releasing the lower tablet-rod, substantially as described.

45. The combination of the pivoted bars w and w^2, key-levers c and δ, and the tablet-rods T' and T^2, having projections engaged by the key-levers and pivoted bars, substantially as described.

46. The combination of the key-levers c and δ, the pressure-bars R and R', having cross-arms, the upright bar S, having horizontal pins engaged by the pressure-bars, and the alarm mechanism connected with the upright bar, substantially as described.



47. The combination of the shaft K, having radial arm s^5, the shaft L, having radial arm s^3, the pivoted arms Z' and Z, the connecting-rod s^6, and mechanism for moving the pivoted arms to release the radial arms, substantially as described.

48. The combination of a shaft having a radial arm s^5, the hinged arm, the pitman 2, and disk or wheel 1, having eccentric wrist-pin 26, to which the pitman is connected, substantially as described.

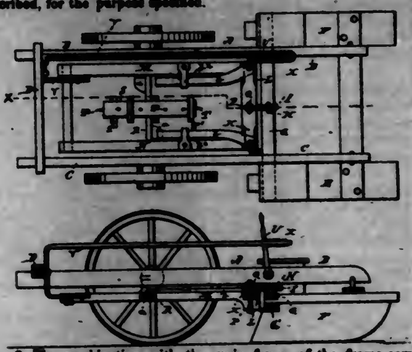
49. The combination of a shaft having a radial arm s^5, the hinged arm, the curved pitman 2, and the disk having eccentric wrist-pin 26, to which the pitman is connected, and the eccentric stop-pin 27, substantially as described.

50. The combination of a shaft L, having a radial arm s^3, hinged arm Z, pitman 2, and operating-shaft 25, disk or wheel 1 on the inner end of the operating-shaft, having eccentric wrist-pin 26, and button s^4 on the outer end of the operating-shaft, substantially as described.

410,604. PROCESS OF MANUFACTURING ROLLED RINGS OR TIRES. JAMES HEWTON, Maywood, assignor to himself and CHARLES H. FOSTY, Chicago, Ill. Filed Feb. 26, 1889. Serial No. 301,224. (No model.)

Claim.—1. The improvement in the art of manufacturing heavy tires or rings, consisting in first casting an annulus or ingot with a central opening heavy enough for two or more blooms or rings of the weight required, and then severing the ingot or annulus into two or more separate blooms or rings by pressure, and simultaneously densifying the bloom or ring by crowding the material displaced by the severing-instrument into the bloom or ring, substantially as specified.

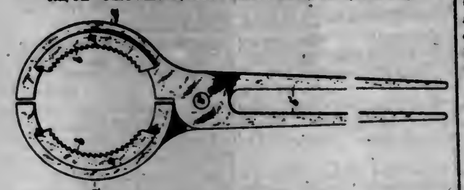
2. The process consisting in making a single annulus heavy enough for two or more blooms or rings of the weight required and severing by pressure the annulus into two or more blooms or rings, and simultaneously densifying the blooms or rings by crowding the material displaced by the severing-instrument into the same, and finally rolling the blooms or rings to the diameter and shape required, substantially as specified.



3. The process consisting in simultaneously rolling and severing by pressure an annulus into two or more blooms or rings of the size required, substantially as specified.

4. The process consisting in first casting an annulus, as A, and then simultaneously cutting off the imperfect top portion, as a', and severing by pressure the annulus into blooms or rings, as a a, and simultaneously densifying the same by crowding the material displaced by the pressure-severing tabs into the body of the blooms or rings, whereby several blooms are produced at once, the scales are densified, and the loss of metal incident to casting each bloom separately is saved, substantially as specified.

5. The process of producing two or more blooms at once by heating and then severing by pressure an annulus into two or more parts or blooms, substantially as specified.



410,605. MARKING AND DROPPING ATTACHMENT FOR CORN-PLANTERS. BRYAN O'DONNELL, Vail, Iowa. Filed Apr. 23, 1888. Serial No. 308,288. (No model.)

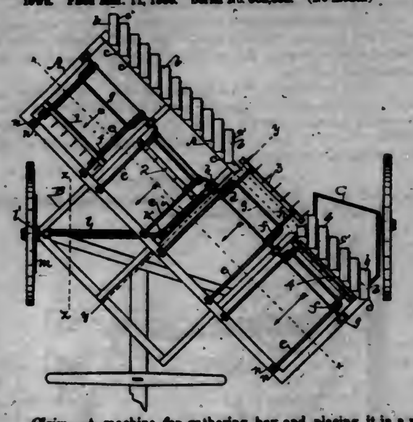
Claim.—1. In a marking and dropping planter, the combination, with the main frame A, composed of parallel side beams B C, united at their front and rear ends by cross-bars and supported by the bearing-wheels, of the shorter beams M N, hinged at their forward ends to the transverse brace-bar G and located intermediate of the beams B C and parallel therewith, designed to support the axle E, provided on opposite sides and ends with tappets a, said beams M N being adapted to have a vertical movement within the side beams B C, and whereby raise and lower the axle E, the marker-wheel S, secured to said axle intermediate of the beams M N and provided with markers T and spurs T, the cross-bar K, pivoted at its center upon a pin P, projecting from the bar L, the levers b b, pivoted at their forward ends to the outer ends of the bar K and passing through guides b^3, secured to the beams M N, the rear ends of said levers lying adjacent to and adapted to be struck by the tappets a when the axle E revolves, and the forwardly-projecting pin I, passing through a staple H on the slide G, as described, for the purpose specified.

2. The combination, with the main frame, of the frame composed of the shorter parallel beams M N, located within the main frame and supporting the axle E, provided with the opposed tappets a, the wheel S, secured to said shaft, the cross-bar K, loosely pivoted at its center by the pin P and provided in its ends with the levers b b, passing through guides b^3 b^3 and engaging the tappets on the axle, the forwardly-projecting pin I, located in the forward edge of the bar L at the center thereof and engaging a staple H on the seed-slide, whereby a hinged connection is made, the lever V, passing over the frame, bent at its rear end to engage the beam M, the forward end bent to receive the coiled spring X, the lever U, secured to the side beam B, passing upwardly and passing at the rear end of the coiled spring, substantially as described.

410,606. METAL-FORMING TOOL. ALEXANDER S. PATTON, Creighton, Pa. Filed June 16, 1888. Serial No. 277,206. (No model.)

Claim.—1. A metal-working tool of the class described, consisting, essentially, of two segmental jaws formed integral with pivoted handles, and segmental dies fixed to the opposing edges of said jaws and having the serrated working-faces, substantially as and for the purpose described.

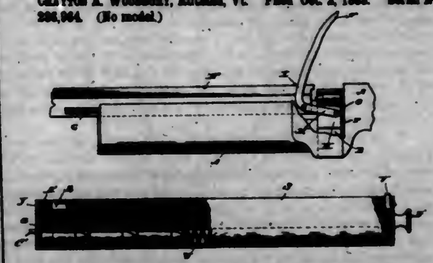
2. A metal-working tool for reducing oblong or other shaped metallic articles to an approximately-cylindrical shape, consisting, essentially, of a pair of segmental jaws formed integral with handles which are pivoted together, and the segmental dies conforming to the curvature of said jaws and removably fixed to the inner opposing edges of the jaws, said dies having the serrated working-faces, substantially as and for the purpose set forth.



3. A metal-working tool of the class described, consisting, essentially, of two segmental jaws which are made dovetailed in cross-section, the pivoted handles, and the segmental dies tightly and removably fixed to the dovetailed edges of the jaws and having the serrated working-faces, substantially as and for the purpose described.

410,607. PROCESS OF PREPARING AND HARDENING LIME-STONES. GEORGE J. RANDALL, Marketer, Longley Road, County of Surrey, England. Filed Apr. 22, 1889. Serial No. 308,151. (No specimens.)

Claim.—1. The process herein described for hardening, preserving, and preparing oolitic and other limestones, consisting in subjecting the stone to a temperature sufficient for the purposes hereinbefore set forth, immersing said stone in a bath of the compound of lime, acetic acid, and cane-sugar, then removing said stone thus treated and rubbing to a face with a fine grit, and then drying the same, substantially as set forth.



2. The process herein described for hardening, preserving, and preparing oolitic and other limestones, consisting in subjecting the stone to a temperature sufficient for the purposes hereinbefore set forth, immersing said stone in a bath of the compound of lime, acetic acid, and cane-sugar, then removing said stone thus treated and rubbing to a face with a fine grit, and then drying the same, substantially as set forth.

410,608. SIDE-DELIVERY HAY-RAKE. MADISON REW, Grinnell, Iowa. Filed Mar. 11, 1889. Serial No. 302,883. (No model.)

Claim.—A machine for gathering hay and placing it in a row parallel with its line of advance, comprising an oblong frame having a pole extending forward from its front side at an acute angle to the frame, supporting traction-wheels at the opposite sides and end portions of the frame and in parallel position with the pole, a series of rake-teeth independently connected with the rear side of the frame, a rotating shaft having beads or cranks extending in different planes in bearings attached to the cross-pieces of the frame in front of the rake-teeth, forks pivoted to the cranks of the shaft, to swing at right angles to the line of rake-teeth to move hay laterally to the line of advance, and a driver-wheel fixed to one of the traction-wheels and connected with the rotating crank-axle by means of shafts and bevel-gears arranged and combined substantially as shown and described, to operate in the manner set forth.

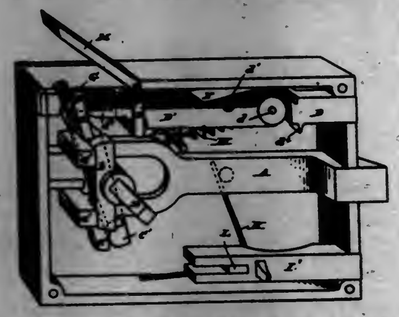
410,609. MAGAZINE FIRE-ARM. MARK F. RICHARDSON and CLAYTON A. WOODBURY, Rutland, Vt. Filed Oct. 2, 1888. Serial No. 286,964. (No model.)

Claim.—1. The combination, in a magazine fire-arm, of the longitudinally-movable barrel, the revolvable magazine having a series of cartridge-chambers, the vertically-movable cartridge-elevator adapted to register alternately with the magazine and barrel, and the lever pivoted to the barrel and connected to the cartridge-elevator, substantially as described.

2. The combination of a revolvable multichambered magazine, a vertically-movable cartridge-elevator adapted to register successively with the several chambers of the magazine as the latter revolves, and mechanism intermediate of said magazine and said elevator, whereby as the elevator reciprocates the magazine is caused to revolve, as and for the purpose set forth.

3. In a magazine-gun, the combination of a longitudinally-movable barrel, a vertically-movable cartridge-elevator, and a lever pivoted to said barrel and connected to the elevator for the purpose set forth, substantially as described.

4. In a magazine-gun, a stock having a vertical opening B, and a groove O in the rear side thereof, and flanges P at the sides of said



groove, a vertically-movable cartridge-elevator working in the opening B, a longitudinally-movable barrel, and an operating-lever pivoted to the barrel and connected directly to the elevator, all in combination, substantially as described.

5. The combination of the revolvable magazine, a revolvable cap on the discharge end thereof adapted to open and close the magazine, a vertically-movable cartridge receiver or elevator, and connections between the same and the cap, whereby the latter will be automatically operated, for the purpose set forth, substantially as described.

6. The combination, with a stock having the bore C and notches W, of the magazine, revolvable in said bore, and a detent secured in the magazine to engage the notches, for the purpose set forth, substantially as described.

7. The combination, in a magazine fire-arm, of a revolvable cap at the discharge end of a magazine having the opening E' and an eccentrically-arranged cam-pin C', and a vertically-movable cartridge receiver or elevator having the cam slot or groove engaged by said pin, substantially as described.

410,610. LOCK. MICHAEL RIEDERER, Cincinnati, Ohio. Filed Apr. 2, 1888. Serial No. 269,515. (Model.)

Claim.—1. In a door-lock, the combination of a knob-bolt, an outer knob operating independently of the inner knob, an arm attached to the stem of the outer knob and adapted to throw the knob-bolt, the combination-plate set in the end of the said arm and provided with variously-placed openings, a series of tumblers in the line of travel of the said plate, and means for adjusting the tumblers to the positions of the openings in the said plate.

2. In a door-lock, the combination of a knob-bolt, an outer knob operating independently of the inner knob, an arm attached to the stem of the outer knob and adapted to throw the knob-bolt, the combination-plate set in the end of the said arm and provided with variously-placed openings, a series of tumblers in the line of travel of the said plate, and means for adjusting the tumblers to the positions of the openings in the said plate, and an auxiliary bolt attached to the tumblers and adapted to be thrown out by them as the knob-bolt is withdrawn.

3. In a door-lock, the combination of a knob-bolt, an outer knob operating independently of the inner knob, an arm attached to the stem of the outer knob and adapted to throw the knob-bolt, the combination-plate set in the end of the said arm and provided with variously-placed openings, a series of tumblers in the line of travel of the said plate, and means for adjusting the tumblers to the positions of the openings in the said plate, and an auxiliary bolt attached to the tumblers and adapted to be thrown out by them as the knob-bolt is withdrawn, and an electric switch adapted to be moved by the said auxiliary bolt so as to close an electric circuit to ring a bell.

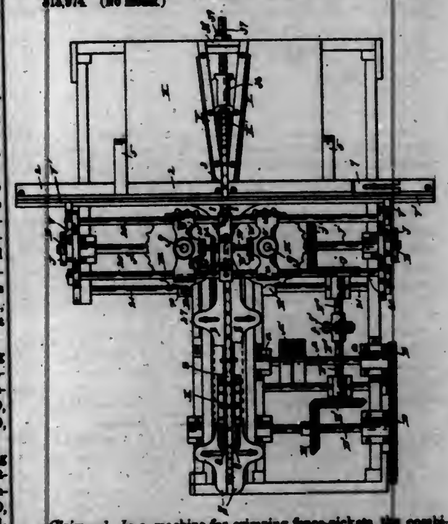
4. In a lock, the combination of knob-bolt A, provided with lug a^3, outer knob turning independently of the inner knob, arm C, attached to stem of outer knob and provided with lug c', combination-plate G, provided with openings g and attached to the arm C, bolt D, tumblers D', and means for dropping one or more of the tumblers D, substantially as and for the purposes specified.

5. In a lock, the combination of knob-bolt A, provided with lug a^3, outer knob turning independently of the inner knob, arm C, attached to stem of outer knob and provided with lug c', combination-plate G, provided with openings g and attached to the arm C, bolt D, tumblers D', and levers H, passing through the door and each upholding one of the tumblers D in the lock, substantially as and for the purposes specified.

6. In a lock, the combination of knob-bolt A, provided with lug a^3, outer knob turning independently of the inner knob, arm C, attached to stem of outer knob and provided with lug c', combination-plate G, provided with openings g and attached to the arm C, bolt D, tumblers D', levers H, passing through the door and each upholding one of the tumblers D in the lock, spring F, and pin d', substantially as and for the purposes specified.

7. In a lock, the combination of knob-bolt A, provided with lug a^3, outer knob turning independently of the inner knob, arm C, attached to stem of outer knob and provided with lug c', combination-plate G, provided with openings g and attached to the arm C, bolt D, tumblers D', levers H, passing through the door and each upholding one of the tumblers D in the lock, and shaft I, provided with leaf i.

8. In a lock, the combination of knob-bolt A, provided with lug a^3, outer knob turning independently of the inner knob, arm C, attached to stem of outer knob and provided with lug c' and yoke c^3, combination-plate G, provided with openings g and held in yoke c^3, bolt D, tumblers D', and means for dropping one or more tumblers D', substantially as and for the purposes specified.



9. In a lock, the combination of knob-bolt A, provided with lug a, outer knob turning independently of the inner knob, arm C attached to stem of outer knob and provided with lug c', combination-plate G, provided with openings g and attached to the arm C, bolt D, tumblers D', and means for dropping one or more of the tumblers D', switch-lever P, provided with projection p, and wire W, and plate O, having wire attached thereto, substantially as and for the purpose specified.

10. In a lock, the combination of knob-bolt A, provided with lug a^3, outer knob turning independently of the inner knob, arm C, attached to stem of outer knob and provided with lug c', combination-plate G, provided with openings g and attached to the arm C, bolt D, tumblers D', and means for dropping one or more of the tumblers, lugs d^3 on bolt D, lever n', having dog n, link n^2, arm n^3, and rock-shaft n^4, rigidly connected to arm n^3, clapper and clapper-spring, and gong, substantially as and for the purposes specified.

11. In a lock, the combination of knob-bolt A, provided with lug a^3, outer knob turning independently of the inner knob, arm C, attached to the stem of outer knob and provided with lug c' and yoke c^3, combination-plate G, provided with openings g and held in yoke c^3, bolt D, tumblers D', and means for dropping one or more tumblers D', and outer casing provided with hinged portion M near the combination-plate, substantially as and for the purposes specified.

12. In a lock, the combination of knob-bolt A, provided with lug a^3, outer knob turning independently of the inner knob, and arm C, attached to stem of outer knob and provided with lug c' and yoke c^3, substantially as and for the purposes specified.

410,611. FENCE-PICKET-CRIMPING MACHINE. MARIAN. M. SHELLABERGER, Beaver Falls, Pa. Filed June 12, 1888. Serial No. 313,974. (No model.)

Claim.—1. In a machine for crimping fence-pickets, the combination of the endless carrier provided with a series of dies and the rotary disks arranged on opposite sides of the carrier and carrying a series of dies which mesh with those on said carrier, substantially as specified.

2. The combination of the die-bearing disks, the die-carrier bearing dies arranged between said disks, the channeled bar arranged at right angles to the carrier to receive the rod or wire for the pickets, and the table provided with divergent stop-flanges to check the legs of the picket, substantially as specified.

3. The combination of the die-bearing disks, the interposed die-carrier bearing dies, and the parallel grooved guides to receive and guide the legs of the completed picket, substantially as specified.

4. The combination, with the die-bearing disks and the interposed die-carrier bearing dies, of the transverse channeled bars and the feed-bar fitting in said channel and geared to the die-bearing disks, substantially as specified.

5. The combination, with the die-carrier bearing dies, of the die-bearing disks having their shafts mounted in laterally-movable brackets, and the right-and-left screw-bolts connecting said brackets in pairs, whereby they may be moved toward or from each other, substantially as specified.

6. The combination, with the die-carrier bearing dies, of the die-bearing disks having their shafts mounted in laterally-movable brackets which are connected in pairs by right-and-left screw-bolts, and the adjusting-chain connecting rigid pulleys on the said screw-bolts, whereby when said chain is moved all the brackets are operated simultaneously, substantially as specified.

7. The combination, with the die-carrier bearing dies, of the upper and lower parallel guide-rods, the sliding brackets mounted in pairs on said guide-rods and connected by right-and-left screw-bolts carrying sprocket-pulleys, the die-bearing disks having vertical shafts mounted in bearings in the said brackets, and the sprocket-chain engaging said sprocket-pulleys and passing around intermediate pulleys 25 and 26, substantially as and for the purpose specified.

8. The combination, with the die-carrier bearing dies, of the upper and lower parallel guide-rods, the sliding brackets mounted in pairs on said guide-rods and provided with revolvable nuts, the right-and-left screw-bolts connecting said brackets in pairs and provided with rigid pulleys connected by an endless chain, and the die-bearing disks provided with shafts mounted in bearings in the said brackets, substantially as specified.

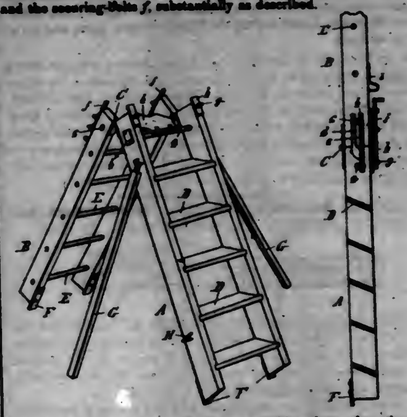
9. The combination, with the die-carrier bearing-dies, of the movable brackets mounted on parallel guide-rods and provided with revolvable nuts, the retaining or locking pins or rods fitting in peripheral perforations in the said nuts, the right-and-left screw-bolts connecting said brackets in pairs and connected together for simultaneous operation, and the die-bearing disks provided with shafts mounted in bearings in the brackets, substantially as specified.

10. The combination, with the die-carrier bearing dies, of sliding brackets connected by right-and-left screw-bolts which are geared together for simultaneous operation and the die-bearing disks having their shafts mounted in bearings in the said brackets, substantially as specified.

11. The combination, with opposing disks bearing dies, of a carrier arranged between the disks and provided with a groove or channel and the dies provided with webs or ribs secured in said grooves or channels, substantially as specified.

12. The combination of an endless carrier provided with dies, the sprocket wheels or pulleys supporting said carrier, the rotary disks arranged on opposite sides of the carrier and provided with dies to mesh with the dies on the carrier, and the divided shaft having separable sections which are geared, respectively, to the sprocket wheels or pulleys and the rotary disks, and having their contiguous ends provided with perforated disks which are engaged by clamping-bolts, substantially as specified.

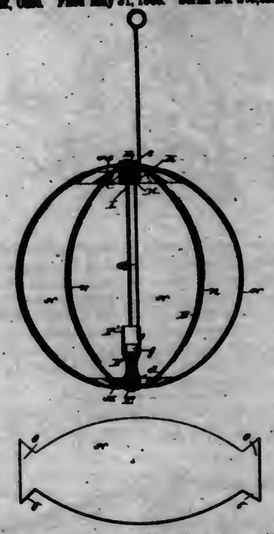
13. The combination, with a die-carrier having its dies arranged in groups with intervening blanks, of the die-bearing disks arranged on opposite sides of said die-carrier and having blank spaces to correspond with the blanks on the carrier, substantially as specified.



14. The combination, with a die-carrier, of the shaft J', geared to the said carrier, the die-bearing disks provided with shafts having miter-wheels G', the movable miter-wheels G, feathered on the shaft J', and provided with grooved hubs, and the yokes engaging the grooved hubs and having their threaded arms extended through suitable brackets and engaged by nuts, substantially as specified.

15. The combination, with a die-carrier and the opposing die-bearing disks, of the shaft J', geared to said die-bearing disks and carrying cams J, and the feed-bar carried by sliding brackets having anti-friction rollers bearing on the said cams, substantially as and for the purpose specified.

410,612. EXTENSION STEP-LADDER. WILLIAM SMITH, Shiloy, Mich. Filed Apr. 27, 1889. Serial No. 308,827. (No model.)



Claim.—1. In a ladder consisting of two parts hinged together, the combination of the sides thereof with a top step having a pivotal connection with one side through the top round on that side and a sliding connection with the top round of the other side, and securing devices—such as the bolts f—substantially as described.

2. In a ladder composed of two parts hinged together, the combination of a round a, pivotally held in the top of one part, the plates b' for securing said round a in position, the top step b, secured at one end to the round a and having a sliding connection with the round c, and the securing-plate f, substantially as described.

3. In a ladder composed of two parts hinged together, the combination of a round a, pivotally held in the top of one part, the plates b', for securing said round a in position, the top step b, secured at one end to the round a and having a sliding connection with the round c, the securing-bolts f, the overlapping base h, and the step i, substantially as described.

410,613. LAWN LANTERN OR ILLUMINATOR. JAS. H. SPRAGUE, Berwick, Ohio. Filed May 31, 1888. Serial No. 275,622. (No model.)

Claim.—1. In a lantern or illuminator, the combination, with the cover or envelope, of the frame having the upper and lower spools or blocks O D, provided with recesses in their outer ends, and radial slots communicating with the recesses, the rings arranged horizontally in the recesses of the spools or blocks, the ribs passing through the said radial slots and having hooks or loops on their ends engaging the rings, and the adjusting-wire attached to the lower spool or block and adjustably secured at its upper end to the upper spool or block, substantially as specified.

2. In a lantern or illuminator, the combination, with the frame having the extending ribs, of the cover or envelope surrounding the frame and comprising the tapered sections or gores N N, secured together at their side edges, the flaps O O on the upper and lower ends of the gores, folded inward and secured to the inner surfaces of the

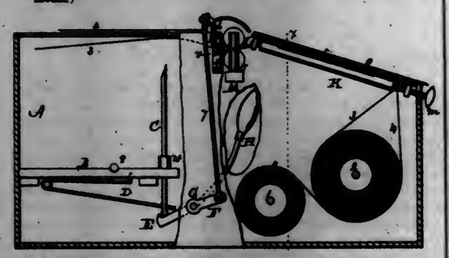
same, and the ears e e on the side edges of the said flaps, affixed to the adjacent sections or gores to prevent the upper and lower ends of the same from separating, substantially as specified.

3. In a lantern or illuminator, the cover or envelope comprising the tapered sections N, secured together at their adjacent side edges to form the angles n, and having the flaps O at their upper and lower ends, as set forth.

4. In a lantern or illuminator, the combination, with the cover or envelope, of the frame arranged therein and comprising the upper and lower spools or blocks C D and the radial elastic ribs pivotally connected at their ends to the said spools or blocks, the lower spool or block being extended upward to form the integral candle-socket F, the sleeve F', embracing the candle-socket, and the adjusting-wire connected at its lower end to the sleeve F' and passing upward and engaging the upper sleeve or block, for the purpose set forth.

410,614. MACHINE TAP AND DRILL. CHRISTIAN STEBNER, New York, N. Y. Filed Mar. 9, 1889. Serial No. 302,695. (No model.)

Claim.—1. The combination, substantially as hereinabefore set forth, of a twist-drill provided, as described, with a tapping device above and in connection with the spiral portion of said drill, and parallel sides located between the taper cutting-edges and the tapping-teeth, all arranged and operating substantially as set forth.



2. In a twist-drill, the combination of a tap having a portion of its threads upon the spiral grooved portion of the drill.

410,615. CULTIVATOR AND HARROW. JOSEPH STOATS, Oxford, Miss. Filed June 10, 1889. Serial No. 313,799. (No model.)

Claim.—The pivotally-connected yielding frame for harrows and cultivators, consisting of the center beam A, to the rear end of which is secured the transverse end piece *a* by braces *a' a'*, the side beams B B, the front ends of which are pivotally connected to the front end of the center beam A, while their rear ends are inclined outwardly and adjustably secured to the standard *c* on the end piece *a* by means of inwardly-reaching levers *d d*, while to each end of beams B B are attached the shovels D D, and the levers O O and ratchets J J, for controlling such shovels, as set forth.

410,616. AUTOGRAPHIC REGISTERING APPARATUS. JOHN B. THIM, Dayton, Ohio. Filed Apr. 13, 1889. Serial No. 307,164. (No model.)

Claim.—1. In an autographic registering apparatus, the combination of the frame A, the spools 1 and 2, so arranged that the strip 4 of the former is drawn beneath the roll 3 to give tension to both of said strips by moving the same in contact in opposite directions, the tablet-frame K, with its transfer-paper, and feeding-rollers I J, with handle to operate the latter, substantially as shown and described.

2. In an autographic registering apparatus, the combination of the frame, the rollers 1 and 2, with the arrangement of the strips of paper as being withdrawn therefrom, the tablet-frame K, to support said strips with the intermediate transfer-paper, the carrying-rollers I and J, the shears of parts 5 and 6, connecting-rod 7, crank F, shaft G, and operating-lever H, substantially as described.

3. In an autographic registering apparatus, the combination of the frame, the detachable filing-block B, with thimble-guides *w w*, the angular filing-pin C, held loosely in said guides, the depressing-spring D, attached to said block and bearing downwardly against the transverse part of said pin, arm E, shaft G, and operating-arm H, substantially as described.

4. In an autographing registering apparatus, the combination of the frame A, shaft G, arm E, filing-pin C, carried upwardly by said arm to pierce the under strip of paper as it is thrust against the top of said frame and pierced by the filing-pin points entering orifices *z z* of said top, the crank F, connection-rod 7, the moving blade 6 and fixed blade 5, and the operating-handle H, these parts to simultaneously sever the two strips of paper and fix the under strip on the said filing-pin, substantially as described.

5. In an autographic registering apparatus, the combination of the frame A, the shaft G, with the operating-handle H attached, crank F, connection-rod 7, and shears of parts 5 and 6, to sever the strips of paper carried forward by the feeding-rollers, substantially as described.

6. In an autographic registering apparatus, the frame having the top with orifices *z z*, in combination with the filing-block B, with guides *w w*, held down against cleats in said frame, the bolt S, to hold the same down against the depressing-springs D D, the arm E, shaft G, with operating-arm H attached, and filing-pin C, to pierce the under strip 3, substantially as described.

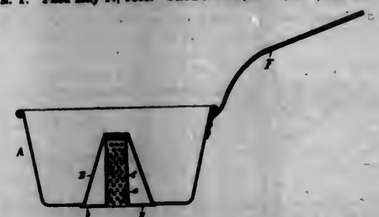
410,617. SHEET-METAL VESSEL. DAVID V. TRIPP, Nevada, Iowa. Filed May 1, 1889. Serial No. 309,283. (No model.)

Claim.—A rim or top having an annular shoulder or flange on its inside, and fastening devices for attaching a bail or handles thereto, in combination with a sheet-metal vessel having its top edge bent outward over the shoulder on the inside of said rim, substantially as shown and described, for the purpose stated.

410,618. CORDING ATTACHMENT FOR SEWING-MACHINES. EDWIN J. TOOF, New Haven, Conn. Filed July 22, 1881. Serial No. 34,404. (Model.) Patented in England Mar. 11, 1882, No. 1,193.

Claim.—The improvement in cording attachments for sewing-machines herein described, the same consisting in the combination, with the presser-foot or holder having a transverse slit in one side of the lower portion of the shank at its junction with the foot and parallel therewith, and having a recess at the front and an aperture at the rear in the upper surface of said foot portion, of a cord-guide having a guiding channel-way therein and provided with a spring-metal shank having projections complemental to the recess and aperture in the foot, whereby the said shank may be sprung within the transverse slit in the presser-foot or holder and firmly seated by the engagement of the said projections upon the shank, with the recess and opening at the front and rear portions, respectively, of the foot, as set forth.

410,619. RUFFLER FOR SEWING-MACHINES. EDWIN J. TOOF, New Haven, Conn. Filed May 20, 1882. Serial No. 62,705. (No model.) Patented in England Mar. 11, 1882, No. 1,194.



Claim.—1. The combination, with a ruffling and shirring attachment for sewing-machines, consisting of a frame, gathering-blade, and operating-levers adapted to be supported in position by the presser-bar of said machine, of a separator-plate hinged to said frame upon a bearing which is at right angles to the line of feed, the said separator-plate being thus parallel with and operating in direction with said blade, substantially as and for the purpose set forth.

2. The combination, in a ruffling and shirring attachment for sewing-machines, consisting of a supporting-frame adapted to be secured to the presser-bar of said machine, and a gathering-blade operated by connecting-levers, of a separator-plate the shank of which forms a part of the same and is hinged to the supporting-frame at one side thereof to permit the operator to swing said plate from beneath said blade, substantially as described, and for the purpose set forth.

3. The combination, in an attachment adapted to ruffle and shirr, of a supporting-frame adapted to be held in position by the presser-bar of a sewing-machine, a gathering-blade operated by a connecting-lever, an adjustable separator-plate hinged to the foot part of the said frame, and a supplemental or guard plate adapted to be independently secured to the cloth-plate of the machine, whereby the said attachment may be operated for shirring with the hinged separator-plate moved out of operative position without operating the blade against the feed-dog, substantially as set forth.

410,620. COOKING UTENSIL. WHITFIELD WARD, New York, N. Y. Filed May 17, 1889. Serial No. 311,128. (No model.)

Claim.—A cooking-vessel combining a conical hood B, a cylindrical perforated hood within said conical hood, and a perforated ring D between said hoods, substantially as and for the purpose described.

410,621. MAGAZINE FIRE-ARM. CHARLES P. H. WEATHERBY, New York, N. Y. Filed June 14, 1889. Serial No. 314,232. (No model.) Patented in Belgium June 27, 1889, No. 82,363.

Claim.—1. The combination, in a fire-arm, of a barrel open at the breech, a movable breech-block, an inclined cartridge-chamber extending downward in the stock at an angle to the line of the barrel and with a straight inclined forward face 5, and a carrier parallel to the line of the barrel and movable in said chamber upon an inclined guideway, substantially as described.

2. The combination of the barrel, stock having an inclined chamber, carrier in said chamber parallel with the line of the barrel, and inclined guideway for a slide connected with the carrier, substantially as set forth.

3. The combination of the barrel open at the breech, and stock having an inclined chamber and an inclined face *y*, and a carrier in said chamber parallel to the line of the barrel, and inclined guideway therefor, substantially as set forth.

4. The combination, with the longitudinally-movable breech-block having a terminal slot or recess, of an L-shaped dog, one arm extending into said recess and bearing with its inner end against the forward face of the recess in the block and the other arm extending forward and provided with a catch at its outer end, substantially as set forth.

5. The combination of the barrel, stock having an inclined cartridge-chamber, case for holding the cartridges adapted to said chamber, spring arranged to bear upon and eject the case, and movable catch 2, arranged to bear upon and hold the case in position, substantially as set forth.

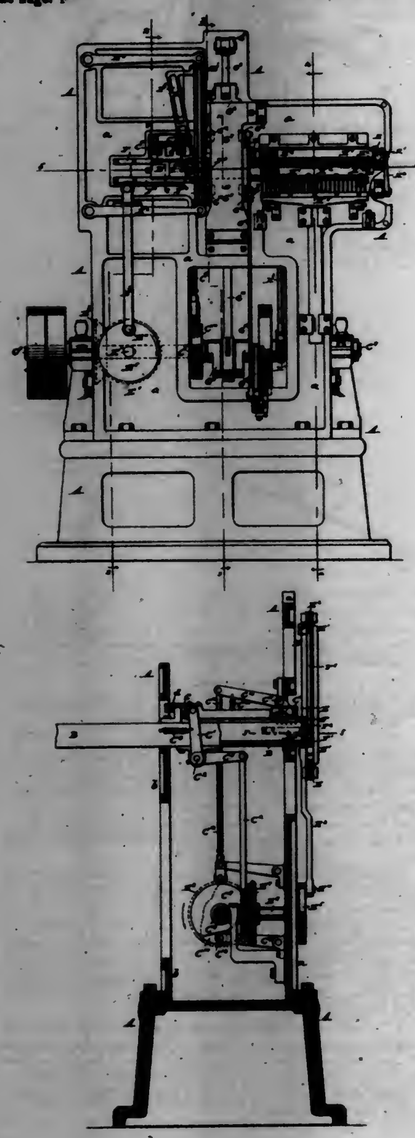
6. The combination of the barrel, stock having an inclined chamber, horizontal carrier supported to move in an inclined direction in said chamber, and case located in said chamber and having a lower and a side edge opening for the passage of the carrier, substantially as described.

7. The combination, with the barrel, stock, and chamber of a magazine-gun, of a closing-piece located below the barrel and movable into position to close and open the cartridge-chamber and provided with a projecting operating-arm, substantially as set forth.

410,622. MATCH-MACHINE. JOHN H. WHITE, Washington, D. C. Filed Feb. 4, 1887. Serial No. 226,565. (No model.)

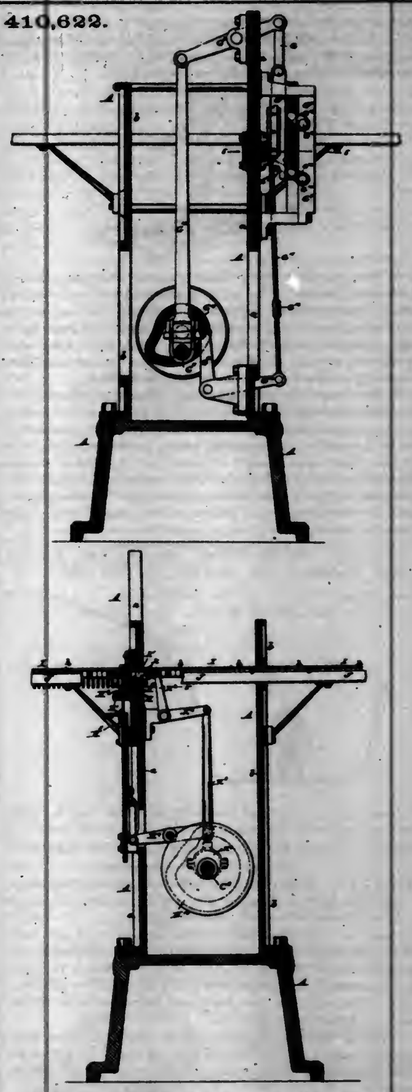
Claim.—1. In combination with the trough or conductor for the blanks, the toothed feeding-head, the peripherally-acting cam C^9, and intermediate connections for advancing the head, the spring C^9, to retract the head when relieved from the cam, the depressing-cam C^7 and its intermediate connections, and the lifting-spring C^{10}, whereby the feeding-head is positively engaged and moved forward with the blank and speedily lifted and retracted when relieved from the action of the cams.

2. The reciprocating feeding-head grooved in its sides, in combination with the rock-shaft and its arms provided with projections to enter the grooves and guide the head.



3. In combination with the trough or guide for the blanks and the slicing-knife movable across the mouth of the trough to sever the slice from the blank, the guide bars or rails F F', arranged outside of the knife and transversely of the mouth of the trough, as described, in position to receive and sustain the edges of the slice as it is severed by the knife.

4. In combination with the trough or guide for the blanks, the slicing-knife movable across the mouth of the trough, the guide-bars F F', lying outside of the knife in position to receive the edges of the slice, and the reciprocating finger F^9, for advancing the slice between the guides beyond its original position in order that the next succeeding slice may enter the guides.



5. In combination with the knife-carrying frame, the trough or guide E, the guides F F', the reciprocating plate provided with the finger to move the slices edgewise, and the inclined bar F^x, attached to the knife-frame and acting to move said plate, whereby the retraction of the knife is caused to effect the advance of the slice edgewise from its original position.

6. The trough to guide the blanks, in combination with the slicing-blade movable across its mouth, the frame in which said blade is mounted, the guides F F', to receive and sustain the slice, the reciprocating slide L^2, its yielding arm L', and the roller mounted in said arm opposite the edge of the knife to sustain the slice, whereby the slices are formed and delivered to the supporting-guides.

7. In combination with the guide or channel for the blanks, the guides F, to sustain the blanks, the traveling roller, the reciprocating finger F^9, to advance the blank, and the reciprocating finger M, whereby the blank is given an initial movement and carried within reach of the finger F^9

410,622.

8. In a mechanism for dividing wooden slices into splints, the combination of a supporting-anvil, a series of parallel connected blades having their edges presented toward the anvil, a pressure mechanism to urge the knives toward the anvil, and an independent mechanism for reciprocating the knives longitudinally, whereby the cutting-edges are caused to act in the direction of their length as they are urged toward the anvil.

9. In combination with a series of vertical dividing-knives and their supporting-plate G^2, grooved in its edges, the rock-shafts and their arms G^{12}, with rollers or studs entering the grooves of said plate, the lever G^3, connected to said plate, and the pitman, lever, and cam for operating the rock-shafts.

10. In a machine for forming match-splints, the combination of a trough or conductor to sustain the blanks, a blade movable lengthwise across the trough to remove slices from the blanks, transverse guides F F', lying outside of the knife to sustain the edges of the successive slices, a feed-finger which reciprocates lengthwise of the guides to advance the successive slices, an anvil to sustain the advanced slices on one side, and a series of parallel knives acting transversely of the guides to divide the slices into splints, whereby the splints are left in position between the guides.

11. In a match-machine, a mechanism for dividing the wooden slices into splints and retaining said splints in line, the same consisting of guides F F', to engage and sustain the edges of the slices, an anvil to sustain the slice on one side, a series of parallel knives extending transversely of the guides, and mechanism, substantially as shown, for advancing said knives edgewise against the slice, whereby the slice is divided into splints and the latter left in position between the guides.

12. In combination with the dividing-knives, the guides F F', and means for advancing the splints past the dividing-knives, the guide-rails adapted to receive and hold the lower ends of the splints, and the vertically-reciprocating head H^3, provided with pins or projections to force the splints upward.

13. In combination with the overlying splint-receiving frame and the vertically-movable splint-lifting head, the intermediate splint-guiding rails H H^3, with an opening at one end to permit the splints to enter laterally between them, the rail H^3 having its upper edge at suitable distance below the receiving-frame to permit the escape of fractured splints.

14. In a match-machine, the parallel splint-guiding rails H and H^3 and the reciprocating finger to feed the splints sidewise between said rails, a reciprocating feeder H^5, with its pins or fingers to deliver the splints endwise from the rails, and the yielding stop or finger H^6 at the end of the rail, as and for the purpose described.

15. In combination with the splint-receiving frame overlying the stop-plate, toothed or notched on its under side, and a splint lifting or ejecting head H^3, having a series of teeth or pins to deliver the splints through the receiving-frame, the teeth of the overlying plate being arranged opposite the spaces between the pins or teeth of the lifting-head, whereby the adjoining splints are projected on opposite sides of the frame.

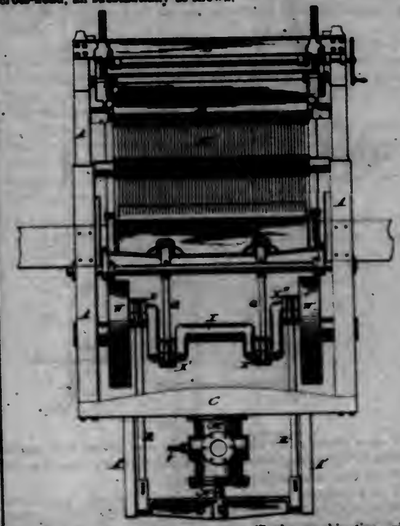
16. In a match-machine, the combination of a continuous guide or channel, a slicing-knife by which the wooden slice is delivered into said guide, the reciprocating feeder for advancing the slices lengthwise of the guide, a series of parallel knives lying transversely of the guide and of the path in which the slices advance and acting to divide the slice while supported in the guide into splints.

17. In combination with a continuous guide or channel, a slicing-knife E, whereby the wooden slice is delivered into said channel, a reciprocating finger whereby the slice is advanced through said guide from its normal position, a series of parallel knives acting transversely of the guide to divide the slice supported therein, and a reciprocating ejecting-head acting to deliver the splints endwise from the guide, said parts constructed and arranged for joint operation substantially as described.

18. In combination with a guide or channel constructed, substantially as described, to sustain the edges of a wooden slice and the ends of the splints produced therefrom, a series of parallel knives acting transversely of the guides to divide the slice therein into splints, and a reciprocating feed device arranged to act on the successive slices, whereby the slices are advanced edgewise through the guide one against another, and thus the slices and splints advanced in close order to and beyond the dividing-knives.

410,623. GANG-SAW MILL. TIMOTHY S. WILKIN, Milwaukee, Wis. Filed Mar. 1, 1888. Serial No. 301,092. (No model.)

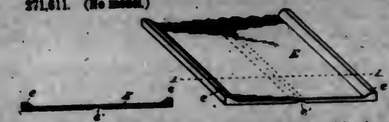
Claim.—1. In a gang-saw mill, the combination, with a frame-work, of a reciprocating saw-sash, a cranked shaft below but connected with the sash, a cylinder below the shaft, a piston working in the cylinder, and a connection between the piston and cranked shaft.



2. In a gang-saw mill, the combination, with a frame-work, of a shaft provided with two sets of cranks diametrically opposite each other, a saw-sash connected with one set of cranks, a cylinder, and a piston working in said cylinder and connected with the other set of cranks.

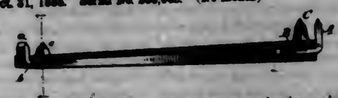
3. In a gang-saw mill, the combination, with a main frame, of a saw-frame, a cranked shaft, a cylinder provided with a piston, a pitman or pitmen connecting the saw-frame with the cranked shaft, and a pitman or pitmen connecting the cranked shaft with the piston-rod.

4. In a gang-saw mill, the combination, with the main frame, of a saw-frame, a cranked shaft journaled in the main frame, a cylinder mounted directly beneath the shaft, a piston working within said cylinder, a cross-head secured to the piston-rod, and a pitman or pitmen connecting the cranked shaft with the cross-head, and an independent pitman connecting the saw-frame with the cranked shaft.



5. In a gang-saw mill, the combination, with the main frame, of a saw-frame, a cranked shaft journaled in the main frame and connected with the saw-frame by means of a pitman, a cylinder located upon the main frame beneath the shaft, a single piston working within said cylinder and having its rod extending from the lower end of said cylinder, a cross-head secured to the said piston-rod, and pitmen connecting the cross-head with the cranked shaft.

6. In a gang-saw mill, the combination, with a main frame, of a reciprocating saw gate or frame, a cranked shaft journaled in the main frame, a pitman connecting the saw-gate with the cranked shaft, a cross-bar C, extending across the main frame near its lower end, a cylinder mounted upon said cross-bar between the uprights A A of the main frame, a single piston working within said cylinder and having its rod extending from the lower end thereof, a cross-head secured to said piston-rod, and pitmen connecting the cranked shaft with the cross-head, all substantially as shown.

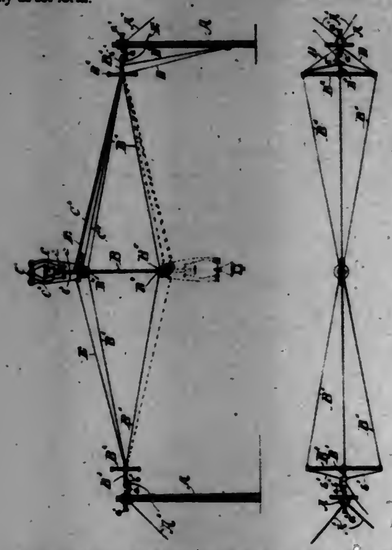


7. In a reciprocating gang-saw mill, the combination, with the main frame, of a shaft provided with four cranks K K' K'' K''', a reciprocating saw-frame, pitmen Q Q, connecting the cranks K' K'' with the saw-frame, a cylinder, a piston working within said cylinder, and pitmen R R, connecting said rod of said piston with the cranks K' K'''

410,624. PROCESS OF MANUFACTURING HORSESHOE-NAILS. HARRY A. WILLS, Brighton Park, Ill. Filed Apr. 23, 1888. Serial No. 271,611. (No model.)

Claim.—The hereinbefore-described process of making horseshoe-nails, which consists in first rolling a heated bar so as to form a continuous blank having a longitudinal rib along each lateral edge and a continuous V-shaped groove along the center, then slightly widening and deepening the groove by suitably-beveled hammer-dies when the blank is cool to compress the metal at that point, and then simultaneously cutting from the blank two finished nails, substantially as and for the purposes specified.

410,625. HORSESHOE. WILLIAM ZIEGLER, De Leuw, Mo. Filed Oct. 31, 1888. Serial No. 289,665. (No model.)



Claim.—The combination, with a horseshoe having a slot parallel with its face, of an L-shaped calk consisting of a wedge-shaped point for contact with the ground and a backwardly-projecting portion fitting the slot, and the auxiliary calk with threaded stem bearing against the backwardly-projecting portion of the L-shaped calk.

410,626. STRUCTURE FOR SUPPORTING LAMPS ABOVE STREETS. JOHN B. ADAMS, Indianapolis, Ind., assignor to the Jenney Electric Company, same place. Filed Oct. 11, 1888. Serial No. 287,331. (No model.)

Claim.—1. A structure for supporting lamps over streets, consisting of a bridge pivoted between suitable posts and provided with suit-

able supports for said lamp, located on one side of the axis, substantially as set forth.

2. As a structure for supporting lamps over streets, a pivoted or invertible bridge having suitable supports for the lamp, located on one side of the axis, substantially as set forth.

3. In a structure for supporting lamps over streets, the combination of the posts, and a truss structure carrying the lamp pivotally secured between said posts and on one side of the axis of said structure, whereby it may be inverted, substantially as set forth.

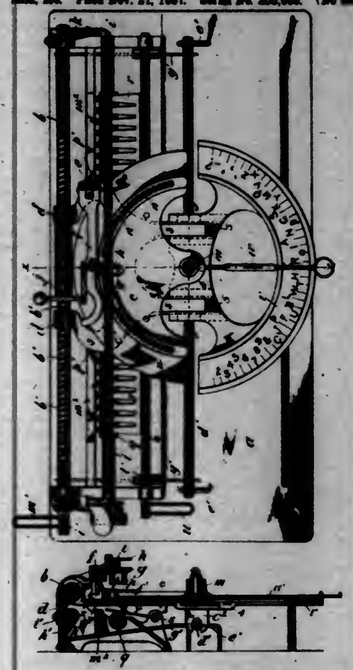
4. In a structure for supporting lamps over streets, the combination of a bridge pivotally arranged above said street, the lamp mounted on said bridge and pivoted at its top in the frame in which it is mounted and to one side of the axis of said structure, substantially as set forth.

5. In a structure for supporting lamps over streets, the combination of the posts arranged on each side of the street, the bridge structure pivotally secured between said posts, the lamp on the top of said structure, and a counterbalance-weight on its bottom, substantially as set forth.

6. The combination, in a structure for supporting lamps above streets, of the posts A, the U-shaped part a, secured at its top, the bridge structure, consisting of central post B, the trusses B', and end frames B^2, said end frames being provided with the arms B^3, terminating in the U-shaped part b', said U-shaped parts b' and a being interlocked and pivoted together, and the means for securing and operating the structure, substantially as set forth.

7. In a structure for supporting lamps above streets, the combination of the end posts, the bridge structure pivotally secured between said posts, the lamp mounted on the top of said bridge structure and pivoted in the top of its frame, and the means for securing said lamp from turning on its pivot when desired, substantially as set forth.

8. The combination of the posts A, the bridge structure pivotally secured between them, the lamp C, mounted on the top of said bridge in the frame C^2, and shaft journaled in bearings in said frame, the part c, secured to the base of the frame and extending up to rest against one side of the base of the lamp, the pivoted part c' resting against the other side of said base, and the means, substantially as described, for operating it, whereby the lamp may be secured from swinging and released when desired, substantially as set forth.



9. In a structure for supporting lamps over streets, the combination of the end posts and a truss-bridge carrying the lamp on one side of its axis, consisting of a central post connected by a pair of truss-cables secured to each of its ends, to the ends of the arms of the end frames which extend out in a plane at right angles to said central post, said end frames being connected to said end posts, substantially as set forth.

10. The combination of the posts A and the bridge structure pivotally secured between them, consisting of the central post B, the truss-cables B', the end frames B^2, and the arms B^3, pivotally connected to said posts A, substantially as set forth.

11. The combination of the posts A, the bridge structure consisting of the central post B, connected by truss-cables to suitably-formed end frames which are pivotally supported by said posts, said central post B being provided with a coupling B^4 at its top and bottom, and said coupling being formed with laterally-projecting wings, and the clamping-jaws b^4, bolted thereon, said truss-cables being clamped between said jaws and said wings, substantially as set forth.

12. The combination of the posts A, the parts a, formed with U-shaped ends secured in the tops of said posts, a coiled spring a^2, interposed between the outer end of said parts and said posts, the truss-bridge carrying the lamp on its top and provided with the U-shaped parts b', attached to its ends, which are interlocked and pivotally connected with said parts a, substantially as set forth.

410,627. TYPE-WRITING MACHINE. DANIEL ALLEN, Jr., Boston, Mass., assignor to the Type-Writer Improvement Company, Portland, Me. Filed Nov. 21, 1887. Serial No. 255,693. (No model.)

Claim.—1. In a type-writer, the combination, with the paper support or guide, the longitudinal guides, the carriage movable thereon, and the feeding mechanism for automatically feeding the carriage forward when a type has been depressed, of the movable type-carrying segment bearing concentric rows of type mounted on said carriage in fixed guides at right angles to the line of movement of the carriage and a shifting-bar mounted on fixed guides and engaging said segment to shift the same, whereby the types in said concentric rows may be brought to the proper printing-point, substantially as described.

2. In a type-writing machine, the combination, with a paper support or guide, a carriage mounted on longitudinal guides, and a printing-lever thereon, of a type-carrying segment provided with concentric series of characters mounted on an axis or pivot which is movable in fixed guides on and at right angles to the line of movement of the carriage, and a shifting-bar mounted in fixed guides and engaging said pivot, whereby the types in said concentric series may be brought to the proper printing-point, substantially as described.

3. In a type-writing machine, the combination of a carriage mounted on longitudinal guides and made in two parts or sections, one of which is independently movable in fixed guides at right angles with the usual movement of the carriage, a type-carrying segment having a plurality of series of printing-characters pivoted to the said independently-movable section, a printing-lever pivoted to the other section of the carriage and engaging said printing-characters to print the same, and a shifting-bar mounted in fixed guides and engaging said independently-movable section for moving the section to bring either series of characters into operative relation with the printing-lever, as set forth.

4. In a type-writing machine, the combination of a carriage made in two parts or sections, one of which is independently movable at right angles with the usual movement of the carriage, a type-carrying segment having a plurality of series of printing-characters pivoted to the said independently-movable section, a printing-lever pivoted to the other section of the carriage, a laterally-sliding bar, as d', arranged to be engaged by slotted lugs with the independently-movable section of the carriage, and means, substantially as described, for moving said rod laterally, and with it the type-carrying segment and the section of the carriage supporting it, as set forth.

5. In a type-writing machine, the combination of a carriage made in two parts or sections, one of which is independently movable at right angles with the usual movement of the carriage, a type-carrying segment having a plurality of series of printing-characters pivoted to the said independently-movable section, a printing-lever pivoted to the other section of the carriage, and a laterally-sliding bar, as d', arranged to be engaged by slotted lugs on the independently-movable section, a spring-controlled rock-shaft journaled in fixed bearings, and connections between said rock-shaft and rod, whereby the latter is moved by the rotation of the former, as set forth.

6. In a type-writer, the combination, with the longitudinally-movable carriage, the type-segment carrying concentric rows of printing-characters thereon and movable in fixed bearings in a direction at right angles to the line of movement of the carriage, and the printing-lever, of centering-pins co-operating with the type-segment to center the type in any of said concentric rows, substantially as described.

410,628. TYPE-WRITING MACHINE. GEORGE K. ANDERSON, Memphis, Tenn. Filed Nov. 15, 1887. Serial No. 255,203. (No model.)

Claim.—1. In a type-writing machine, the combination, with a pivoted impression-plate, of a series of pivoted key-bars adapted to swing from the same center as the plate and printing-characters carried by one of said parts.

2. In a type-writing machine, the combination, with a series of pivoted key-bars, of a pivoted plate and a series of printing-characters carried by the pivoted plate directly above the key-bars.

3. In a type-writing machine, the combination, with a series of pivoted key-bars, of a pivoted impression-plate, a series of printing-characters, and a paper-feed mechanism independent of and operated by the plate, all substantially as shown.

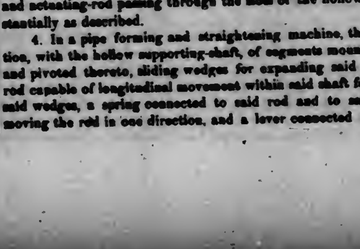
4. In a type-writing machine, the combination, with a series of key-bars C, of a pivoted plate D, provided with a printing-plate K, a spring M, to hold the plate down, a support I for the inner ends of the key-bars, and stops g g, to limit the movement of the plate.

5. In a type-writing machine, the combination, with pivoted key-bars C, of a pivoted plate D, having printing-plate K, a spring M, a paper-feed mechanism, and a pawl carried by the plate to actuate the feed mechanism.

6. In combination with base-board A, support B, and key-bars C, plate D, provided with pawl m, and printing-plate K, feed-rolls O P, a shaft Q, provided with ratchet U, a spring o, to keep the pawl in engagement with the ratchet-wheel, and a pawl n, to prevent the backward rotation of the wheel U.

7. In a type-writer, the combination, with a series of pivoted key-bars and a pivoted impression-plate, of a series of printing-characters, a paper-feed mechanism actuated by the pivoted plate, an inking-ribbon, and a shaft upon which said ribbon is wound, actuated by the paper-feed mechanism.

8. In a type-writing machine, the combination, with a series of key-bars and with a pivoted impression-plate, of a series of printing-characters, a feed mechanism for the paper, actuated by the plate, an ink-ribbon, and an adjustable frame for supporting the ribbon, arranged substantially as shown, whereby the ribbon is caused to travel in one or the other direction, as desired.



9. In a type-writing machine, the combination, with a paper-feed mechanism, of a series of pivoted key-bars and a pivoted plate provided on its under face with type and arranged directly over the key-bars, substantially as shown, whereby the pressure of the key-bars against the plate causes the actuation of the feed mechanism.

10. In a type-writing machine, the combination, with a paper-feed mechanism provided with a shaft Q, having wheels T T', of a bar Z, pivoted to the frame of the machine at a point between its ends, shafts W W', located at opposite ends of bar Z and provided with wheels Y Y', and a ribbon V, wound upon the shafts W W', all substantially as shown.

11. In a type-writing machine, the combination, with the bar Z, pivoted between its ends and provided at opposite ends with shafts W W', having wheels Y Y', a sliding rod s, adapted to rock or tip the bar Z, and a fixed rotary shaft Q, provided with wheels T T', all substantially as shown.

12. In combination with the block B and pivoted plate D, arranged substantially as shown, a spring M, bearing at its ends upon the plate and the block, a screw h, passing through the spring and screwing into the block B, and a coiled spring i, surrounding the screw and bearing upon the spring M.

410,629. TYPE-WRITING MACHINE. HORACE L. ARNOLD, Brooklyn, N. Y., assignor to the Arnold Type-Writer Company. Filed Sept. 2, 1887. Serial No. 248,568. (No model.)

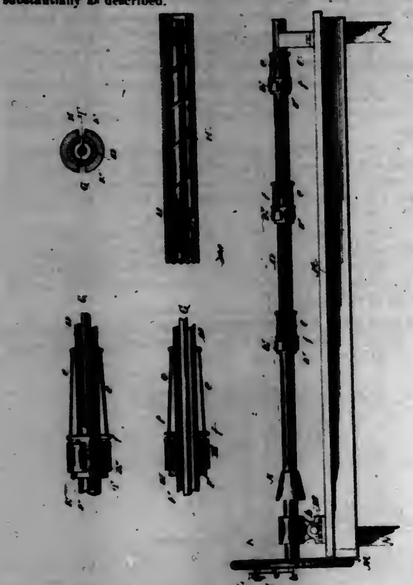
Claim.—1. In a type-writing machine, the combination of a shell-like type-carrier provided with type on one side and index-holes on the other, an abutment, an impression device, and an index-pin, substantially as set forth.

2. In a type-writing machine, the combination of a sleeve adapted to slide and oscillate, a shell-like type-carrier secured thereto and provided on one side with type and on the other with index-holes, a bearing for said sleeve, an impression device, and an index-pin, substantially as set forth.

3. In a type-writing machine, the combination of a sleeve adapted to slide and oscillate, a shell-like type-carrier secured thereto, and provided with type on one side and index-holes on the other, a bearing for said sleeve, an abutment for said type-carrier, an impression device, and an index-pin, substantially as set forth.

4. In a type-writing machine, the combination of a curved type-carrier provided with a head or support at its top, a sleeve attached to said head or support, an abutment in rear of said carrier and beneath said head or support, a bearing for said sleeve, and an impression device, substantially as set forth.

410,630. PIPE-FORMING MACHINE. CLARENCE E. AINSWORTH, Minneapolis, Minn. Filed Sept. 26, 1888. Serial No. 286,702. (No model.)



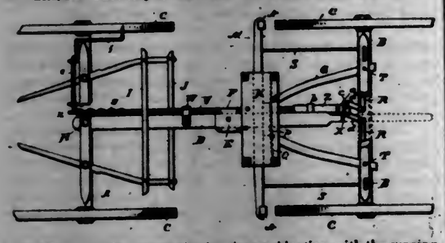
Claim.—1. In a pipe forming and straightening machine, the combination, with the supporting-shaft, of segments mounted thereon and secured thereto, and wedges for expanding said segments mounted on said shaft, adapted to slide longitudinally thereof and to engage the inner faces of said segments, substantially as described.

2. In a pipe forming and straightening machine, the combination, with the supporting-shaft, of segments mounted thereon and pivotally secured thereto, sliding wedges for expanding said segments mounted on said shaft, adapted to slide longitudinally thereof and to engage the inner faces of said segments, and an actuating-rod for moving said wedges, substantially as described.

3. In a pipe forming and straightening machine, the combination, with a hollow supporting-shaft provided with slots, of segments pivotally mounted on said shaft, sliding wedges for expanding said segments laterally, an actuating-rod capable of longitudinal movement through the hollow shaft, and connections between the said wedges and actuating-rod passing through the slots of the hollow shaft, substantially as described.

4. In a pipe forming and straightening machine, the combination, with the hollow supporting-shaft, of segments mounted thereon and pivoted thereto, sliding wedges for expanding said segments, a rod capable of longitudinal movement within said shaft for actuating said wedges, a spring connected to said rod and to said shaft for moving the rod in one direction, and a lever connected to the said

rod for moving it in the opposite direction against the said spring, substantially as described.



5. In a pipe forming and straightening machine, the combination, with the hollow supporting-shaft, of segments mounted thereon and pivoted thereto, sliding wedges for expanding said segments, an actuating-rod for said wedges, a spring for moving said rod in one direction, a lever for moving said rod in the opposite direction and compressing said spring, and a locking device for said lever for holding the spring compressed, substantially as described.

6. In a pipe-forming device, the combination, with the supporting-shaft and expansible segments, of a conical centering-collar mounted on said shaft, substantially as described.

7. In a pipe forming and straightening machine, the combination, with the supporting-shaft mounted in suitable bearings, of segments mounted thereon and secured thereto, wedges for expanding said segments mounted on said shaft, adapted to slide longitudinally thereof and engaging the inner faces of said segments, said shaft being capable of rotating in its bearings, and thereby rotating said segments and wedges, substantially as described.

8. In a pipe forming and straightening machine, the combination, with the supporting-shaft provided with a balance-wheel, of bearings for said shaft, one of said bearings engaging said shaft on the under side only, the other of said bearings being pivoted, and a spring-latch for engaging said balance-wheel and holding said shaft in an elevated position, substantially as described.

410,631. **WAGON-BRAKE.** WILLIAM W. ATTEBERRY, Chesterfield, Ill. Filed May 6, 1889. Serial No. 309,770. (No model.)

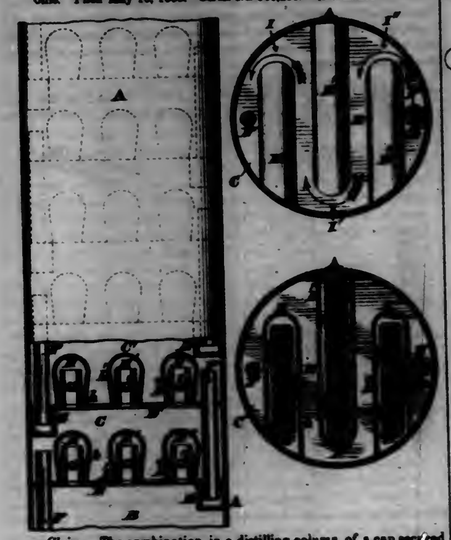
Claim.—1. In a wagon-brake, the combination, with the running-gear, of a plate mounted upon the front ends of the rear bounds and having downwardly-extending brackets or hangers, the brake-bar arranged to slide longitudinally in said brackets and having downwardly-extending guide-studs, a block secured centrally to the rear side of the brake-bar, a spring secured to the rear side of said block and bearing against the rear ends of said brackets or hangers and to force the brake-bar normally in a forward direction, levers pivoted to the under side of the rear axle, rods connecting the outer ends or arms of said levers with the ends of the brake-bar, a longitudinally-sliding rod mounted in bearings attached to the reach, links connecting the rear end of said sliding rod with the inner ends of the levers, a rock-shaft mounted in bearings attached to the front axle and having a crank at its inner end connected by the chain with the longitudinally-sliding rod, and an operating-lever at the outer end of said rock-shaft, substantially as and for the purpose set forth.

2. In a wagon-brake, the combination of the longitudinally-sliding brake-bar, a spring arranged to force the said brake-bar normally in a forward direction, levers pivoted to the under side of the rear axle, rods connecting the outer ends or arms of said levers with the longitudinally-sliding brake-bar, a longitudinally-sliding rod mounted in bearings attached to the reach of the running-gear and having at its rear end an upturned flange provided with the transverse slot, a plate extending through the said slot and having a ring encircling the longitudinally-sliding rod, bolts connecting the said plate adjustably with the longitudinally-sliding rod, links connecting the rear end of said adjustable plate with the inner ends or arms of the brake-operating levers, and a rock-shaft journaled in bearings attached to the front axle and having an operating-lever at its outer end and provided at its inner end with a crank connected by a chain with the longitudinally-sliding rod, substantially as herein set forth.

410,632. **CULINARY UTENSIL.** CORNELIUS BERKEY, Hartford, Conn. Filed Oct. 2, 1888. Serial No. 286,948. (No model.)

Claim.—1. In combination, a vessel *a*, a dependent cylinder secured thereto and constructed in sections *c c'*, the lower one of which is adapted to support a heat-generating device, and means for adjusting one section of said cylinder in relation to the other section, whereby the heat in the casing *a* may be increased or decreased, substantially as set forth.

2. In combination, a vessel *a*, a dependent cylinder communicating with said vessel and adapted to support a heat-generating device, a vessel *g*, supported within said vessel *a*, a water-chamber supported between said vessels *a* and *g*, and a non-conducting shield *j*, secured to said water-chamber upon its lower side and exposed directly to the heat from the dependent cylinder and in contact with the said water-chamber throughout its entire length and breadth, substantially as set forth.



3. In combination, a vessel *a*, provided with dependent cylinder for supporting a heat-generating device, a vessel *g*, supported within said vessel *a*, a water-chamber *i*, supported beneath said vessel *g*, a perforated cover *m* for said vessel *g*, and dampers for said dependent cylinder and the vessel *a*, substantially as set forth.

410,633. **COMBINED SHOE OR BOOT SCRAPER AND BELL-PULL.** THEODOR BÖHM and LEOPOLD ROSENBERG, Berlin, Germany. Filed Feb. 5, 1889. Serial No. 298,716. (No model.)

Claim.—The combination of a frame with a scraper pivotally connected therewith and with a pawl connected to the scraper and engaging a ratchet-wheel, and with a series of interruptions upon said ratchet-wheel, and with a bell-wire acted upon by said interruptions to intermittently ring the bell, substantially as specified.

410,634. **DISTILLING-COLUMN.** EDWARD BOLTON, Cincinnati, Ohio. Filed May 10, 1889. Serial No. 310,253. (No model.)

Claim.—The combination, in a distilling-column, of a cap secured over the steam-pipe, said cap being closed at its upper end, but perforated at its sides, which perforated portions are wider at top than at bottom, whereby the jets of steam issuing from said cap are projected down into the liquid, substantially as herein described.

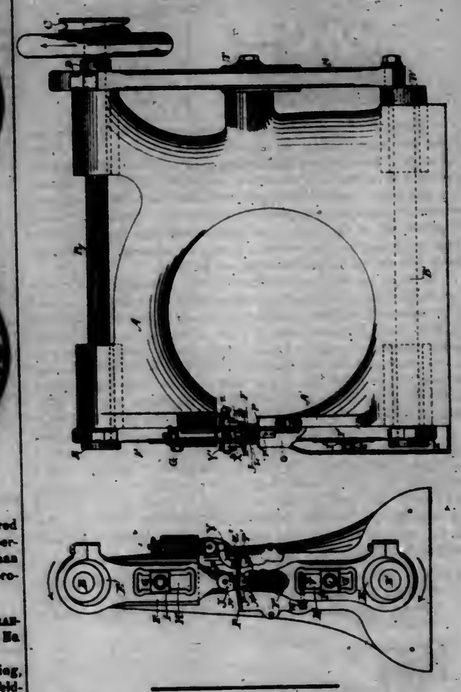
410,635. **METHOD OF PRODUCING ARTIFICIAL STONE.** GRANVILLE M. BARNES, New Milford, Conn. Filed Jan. 30, 1889. Serial No. 298,126. (No specimens.)

Claim.—The within-described composition of matter, consisting, in the proportions named, of emery, ground silex, or corundum, feldspar, and silicate of soda, consolidated by the treatment specified.

410,636. **SEAM-FINISHING MACHINE.** PETER A. COUPAL, Boston, and JOSEPH COUPAL, Quincy, Mass. Filed Jan. 26, 1889. Serial No. 297,712. (No model.)

Claim.—1. In a machine for finishing the seams of boots and shoes, the combination of the work-support P, hammers F and F', eccentrics E and E', studs G and G', a guide for holding and directing the work upon the support to the hammers, and mechanism for rotating the eccentrics, all substantially as specified.

2. In a machine for finishing the seams of boots and shoes, the combination of a work-support, hammer F, provided with an oscillating foot J, hammer F', provided with an oscillating foot J', means for guiding the seam to the hammers, and mechanism for actuating the hammers, all substantially as specified.



3. In a machine for finishing the seams of boots and shoes, the combination of a work-support, hammers F and F', arranged and operated as described, and a guide comprising an under yielding support P', an upper pressure-spring Y', and side fingers Z' and Z², all substantially as and for the purpose specified.

4. In a machine for finishing the seams of boots and shoes, the combination of a work-support, hammers F and F', arranged and operated together as described, guide-fingers Z' and Z², secured to adjustable side pieces X' and X², and an adjusting-screw Z, for regulating the distance apart of said fingers, all substantially as specified.

5. In a machine for finishing the seams of boots and shoes, the combination of a work-support, mechanism for guiding the seam, hammers F and F', oscillating foot J, attached to hammer F and constructed with a V-shaped heel L and roughened surface K, an adjusting-spring M, and a rest or stop on the hammer, all as and for the purposes specified.

6. In a machine for finishing the seams of boots and shoes, the combination of a work-support, mechanism for guiding the seam, hammers F and F', oscillating foot J, attached to hammer F and constructed with a groove K', an adjusting-spring M', and a stop N', attached to the yielding piston F², all as and for the purposes specified.

7. In a machine for finishing the seams of boots and shoes, the combination of a work-support, mechanism for guiding the seam, hammer F', mounted upon a yielding piston F², hammer F, the supporting-spring U, the securing-nut V, and locking-screw W, all as and for the purposes specified.

410,637. **INSULATOR.** WILLIAM H. DAVIS, Plymouth, Mass. Filed Apr. 25, 1889. Serial No. 308,863. (No model.)

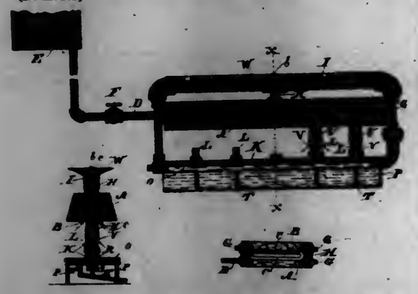
Claim.—1. The combination, with an insulator, of a bridle made to form a loop, and a shield mounted in the loop and adapted for connection with the opposite sides thereof, substantially as specified.

2. The combination, with an insulator, of a bridle made to form a loop, and a shield of semicircular form mounted in the loop and having its opposite ends formed to engage with the opposite sides of the loop, substantially as specified.

3. The combination, with an insulator, of a bridle consisting of two strands, the terminals of one being twisted around the other strand, and the terminals of the other strand being bent to engage with each other, and the two strands being oppositely bent intermediate their ends to form a loop, and a shield-plate mounted in the loop and provided with opposite hook ends for the engagement with the opposite portions of the loop, substantially as specified.

4. A bridle for insulators, made of wire in two strands, the strands being oppositely bent intermediate their ends to form a loop, and the shield-plate provided with opposite hook ends to engage the opposite portions of the loop, as set forth.

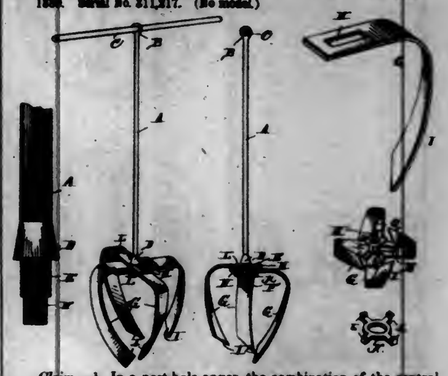
410,638. OIL-STOVE. JOHN DE MOOT, Jr., Cleveland, Ohio, assignor to the Taylor & Boggis Foundry Company, same place. Filed Apr. 19, 1889. Serial No. 307,708. (No model.)



Claim.—1. In an oil-stove, the combination, with a fender provided with a longitudinal slot extending from one edge of the fender inwardly, of a wick-tube provided with a wick-shaft chamber, and also provided at its base with an angular flange secured to the reservoir-top, said fender located in contact with said flange, and below said wick-shaft chamber, a continuous uninterrupted air-space being formed longitudinally of the fender and reservoir-top, said fender provided with projecting handles, whereby it may be removed from engagement with the oil-stove, substantially as set forth.

2. In an oil-stove, the combination, with a fender provided with two longitudinal slots extending from one edge inwardly, and provided with outwardly-projecting handles on the end of the fender opposite to the open end of the said slots, of a pair of wick-tubes, each provided at the base with an angular flange and provided above said flange with a wick-shaft chamber, the longitudinal walls of said slots extending, respectively, on either side of said wick-tube, said fender located in a horizontal plane intermediate of said angular flange and said wick-shaft chamber, with both of which it engages, substantially as set forth.

3. In an oil-stove, the combination, with a standard provided on opposite sides with recessed ledges, and provided at one end with a lug having an opening, of a reservoir provided at its sides with a projecting top resting on said ledges and provided with a projecting end portion having an opening, said opening registering with said end lug-opening, said reservoir provided at its forward end with a lug having engagement with the under side of said standard, substantially as set forth.



410,639. DEVICE FOR VAPORIZING HYDROCARBON OIL AND BURNING THE SAME. ASA DOREY, Chicago, Ill., assignor to Jeremiah B. Selby, Milwaukee, Wis. Filed Aug. 13, 1888. Serial No. 282,636. (No model.)

Claim.—1. A vapor-burning device consisting of an oil-vaporizing chamber having a central longitudinal slot, the opposite side walls of which slot incline inwardly toward each other from the bottom of the chamber to the top, forming a constantly-narrowing flue and terminating at the top of the chamber in a long narrow opening for the passage of the vapor, vapor-discharge pipe having a series of burner-tubes L, located in a line immediately below the slot in the chamber, in combination with a longitudinal superheating vapor-tube located above and in line with the slot in the chamber, which superheating vapor-tube is connected by pipes directly with the vaporizing-chamber and with the vapor-discharging pipe, whereby the entire product of the vaporizing-chamber passes through the superheating vapor-tube to the vapor-discharging pipe, substantially as described.

2. In a device for vaporizing and burning carbon oil, an oil-vaporizing chamber provided with an oil-supplying pipe, said chamber having a central longitudinal slot, the walls of which incline inwardly from the bottom to the top of the chamber, forming a constantly-narrowing flue for the passage of vapor, and terminating at the top of the chamber in a long narrow aperture, in combination with a discharge-pipe leading from the chamber and passing above in line with and at a short distance from the slot in the chamber, which pipe continues and extends below the chamber and the slot therein, a series of vapor-discharging tubes in said pipe below the slot in the chamber and thereon frustum-of-cone chimneys, each provided with a side aperture or apertures, which chimneys are adapted to lead the discharged vapor and the air introduced through the side apertures upward into the flue formed by the inclined walls of the slot in the chamber, by which device the entire supply of oil vaporized and burned is led into the vaporizing-chamber and through the superimposed superheating-pipe and is discharged into and is burned above the slot in the chamber, substantially as described.

410,640. POST-HOLE DIGGER. JOHN C. DOBLER, Creighton, Mo., assignor of one-half to Richard R. Walden, same place. Filed May 18, 1889. Serial No. 311,217. (No model.)

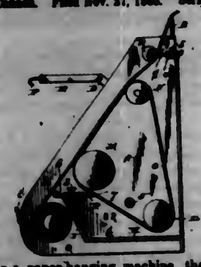
Claim.—1. In a post-hole auger, the combination of the central stock having a squared lower end, the cutting-blades having longitudinal slots in their upper horizontal portions, a spacing-washer having upwardly-extending lugs or studs adapted to be fitted between the adjacent edges of said cutting-blades, and a nut for securing said washer and cutting-blades in position upon the stock, substantially as and for the purpose set forth.

2. In a post-hole auger, the combination of the central stock having an annular flange and a squared section below said flange, the blades or cutters having longitudinally-slotted horizontal upper portions and downwardly-extending spirally-curved outer portions provided with inwardly-curved ends, the washer having upwardly-extending lugs or studs, and a nut or key for securing the said washer and cutting-blades upon the lower end of the stock, substantially as set forth.

410,641. CRUSHER. WILLIAM JOHNSTON, Pittsburg, Pa. Filed July 23, 1888. Serial No. 280,833. (No model.)

Claim.—1. In a crusher, the combination of the shafts rocking in opposite directions, the jaws secured thereon, said jaws having curved inclined plates on their rear sides, with the frame provided with the corresponding curved inclined plates, and means, substantially as described, for imparting motion to said shafts and jaws whereby said jaws are caused to approach each other.

2. The combination of a pair of jaws provided with curved inclined plates, said jaws rocked in opposite directions and the frame provided with inclined curved plates, rocking shafts for carrying said jaws, and levers attached to the outer end of said rock-shafts, and mechanism for operating said levers to cause the jaws to approach one another, substantially as described.



3. In a crusher, the combination of the rocking jaws having serrations on their inner faces, the inclined plates or portions secured to the jaws and frame of the machine, respectively, the rock-shafts and levers, and means, substantially as described, for imparting motion to said levers and thereby operating the crushing-jaws.

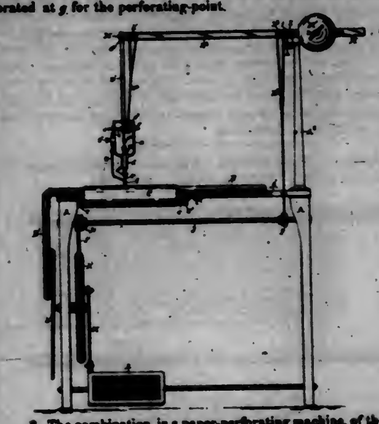
4. In a crusher, the rocking jaws inclined toward each other provided with detachable corrugated crushing-faces, inclined plates for forcing said jaws toward each other, said plates secured to the jaws and frame of the machine, respectively, and a hopper for feeding material between said jaws, the rock-shaft for supporting the levers at the outer ends of said rock-shafts, and links for imparting motion to the levers and thereby to the crushing-jaws, as described.

5. In a crusher, the combination of a pair of rocking corrugated jaws, moving inclined plates secured to said jaws, and inclined curved plates secured to the frame of the machine, said plates causing the jaws to approach each other when the supporting-shaft is rocked, rock-shafts for supporting said jaws, a hopper for supplying material between the jaws, and a guide or casing for conducting the crushed material from between said jaws, and means, substantially as described, for operating said jaws.

6. In a crusher of the character described, the frame 1, the shafts 2 and 3, secured thereon, the pulleys and gearing mounted on said shafts, the balance-wheels 7 7, secured to the shaft 2, and the links 9, connected to said wheels, the levers 10, and rock-shafts 11, in combination with the rocking jaws 14, having removable corrugated crushing-faces 17, curved inclined plates secured on the rear sides of said jaws, and similar curved plates 20, secured to the frame of the machine, the whole constructed and arranged to be operated substantially as and for the purpose described.

410,642. PAPER-HANGING MACHINE. ERASMUS L. JONES, Pittsburg, Ontario, Canada. Filed Nov. 27, 1888. Serial No. 291,966. (No model.)

Claim.—1. In a paper-hanging machine, the combination of a casing having an inclined open front side, a paste-receptacle within said casing, a roller arranged transversely in the paste-receptacle, rollers arranged transversely at some distance from the upper and lower ends of the casing near the inclined front side thereof, an endless belt passing over said rollers, and rollers to support the wall-paper and guide it over the front part of said belt and in contact therewith, substantially as set forth.



2. The combination, with the casing, of the partition within the same, forming a paste-pot, a series of rollers, journaled in the sides of the casing, an endless belt moving over said rollers to feed the paste to the wall-paper, the cylindrical rod in the lower front corner of the casing adapted to support the roll of paper, and the guide-roller in the upper end of the casing, as set forth.

3. In a paper-hanging machine, the combination of the casing having an inclined front side, a roller within the casing to support the wall-paper, a guide-roller near the upper end of the casing, a paste-conveying belt, and a vertically-disposed knife at the top of the casing, substantially as set forth.

4. In a paper-hanging machine, the combination of the series of transverse rollers, the paste-conveying belt moving over said rollers, a lower scraper designed to bear against the belt, an upper scraper designed to bear against the wall-paper, the cylindrical rod in the lower front corner of the casing, and the guide-roller in the upper end of the same, as set forth.

410,643. PAPER-PERFORATING MACHINE. ALBERT B. LA ROE, Cincinnati, Ohio. Filed Aug. 6, 1888. Serial No. 282,205. (No model.)

Claim.—1. The combination, in a perforating-machine, of the frame, the bed, a vertically-rocking and horizontally-swinging bar mounted above said bed-plate, the swinging yoke D, the bar connecting it with the end of the swinging bar, the vertically-reciprocating point-carrier mounted in said yoke, and the adjustable finger G, perforated at *g* for the perforating-point.

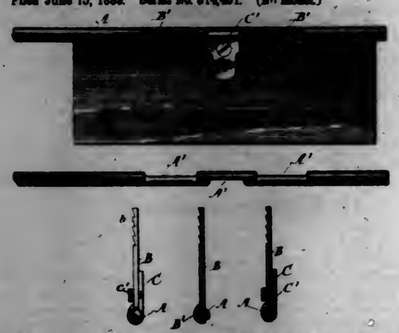
2. The combination, in a paper-perforating machine, of the frame, the bed-plate, the upwardly-projecting standard A^2, the vertically-rocking and horizontally-swinging bar H, mounted upon said standard, the rod D', hinged to said arm H, the perforator-head fitted with the reciprocating point-carrier secured to the lower end of said rod D', the transverse shaft J, means for imparting motion to said shaft, and the bands and pulleys for communicating motion from said shaft to the reciprocating point-carrier, arranged substantially as and for the purpose set forth.

410,644. GATE. EDGAR M. LIVELY and LOUIS P. LIVELY, Canton, Tex. Filed Apr. 19, 1889. Serial No. 307,770. (No model.)

Claim.—1. The combination, with the gate having its bottom rail pivoted at one end, of the horizontally-swinging arm arranged above the gate, the vertical lever pivotally mounted on the gate and having its upper end connected with the free end of said arm, the vertical latch pivoted on the gate, and the connecting-bar between the latch and lever, as set forth.

2. The combination, with the gate and the horizontally-swinging arm arranged above the gate and provided in its free end with a longitudinal slot and a series of transverse perforations, of the vertical lever pivoted on the gate and having its upper end entering said slot, the pin passing through one of said transverse perforations and engaging the lever, the vertical latch, also pivoted on the gate, and the horizontally-sliding connecting-bar between the lower ends of the latch and the lever, as set forth.

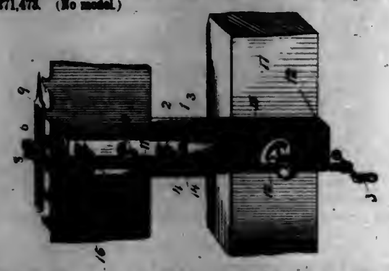
410,645. VEHICLE-WHEEL. SAMUEL C. HEAD, Grove, Mich. Filed June 7, 1889. Serial No. 313,402. (No model.)



Claim.—1. In a vehicle-wheel, the combination, with the rim, the inner concentric ring, and the spokes uniting the said ring and rim, of a hub inside the concentric ring, and radially-arranged springs of corrugated flat bar-steel interposed between and having their ends secured to the said hub and ring, substantially as set forth.

2. In a vehicle-wheel, the combination, with the rim, the inner concentric ring, and the spokes uniting the said ring and rim, of a hub inside the concentric ring, the radially-arranged springs interposed

between and having their ends secured to the said hub and ring, and the cover-plates secured to the hub with their circumferences resting against the sides of the concentric ring, substantially as set forth.

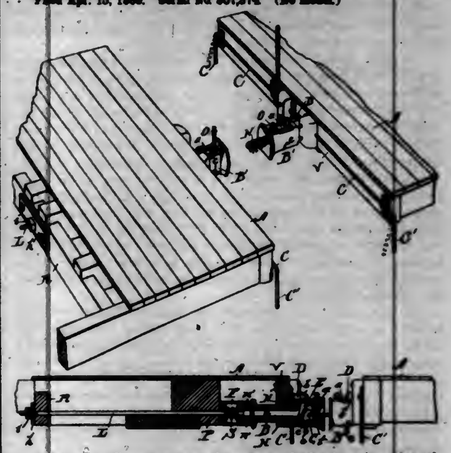


3. In a vehicle-wheel, the combination, with the rim, the inner, concentric ring, and the spokes uniting the said ring and rim, of the hub, the radially-arranged springs secured at one end to the said ring and provided with flanges at the other end resting against the hub, and the rings encircling the said flanges and hub and securing them together, substantially as set forth.

410,646. STOVE-DAMPER. WILLIAM C. METZNER, Chicago, Ill. Filed June 15, 1888. Serial No. 314,451. (No model.)

Claim.—In a stove-damper, the combination of the shaft A, having the recesses A' on one side thereof and having a recess A^3 on the other side thereof and between said recess A', a space being left between the ends of the recesses A' A' and the recess A^3, a blade B, having tongues B' lying in the recesses A' A', a clip C applied to the blade B and extending into the said recess A^3, and a bolt C' extending through said clip and said blade and binding said clip and said blade to said shaft, substantially as shown and described.

410,647. DEVICE FOR JOINTING THE TEETH OF BAND-SAWS. JAMES R. MILES, East Saginaw, Mich. Filed Apr. 12, 1888. Serial No. 271,473. (No model.)



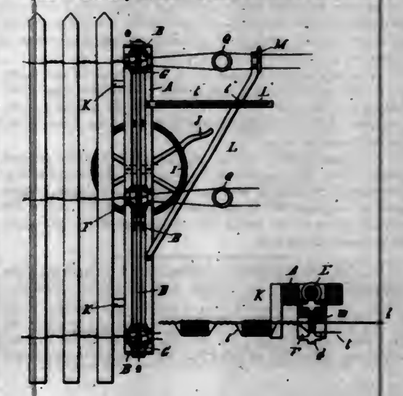
Claim.—The combination of the plates 1 2 3, bolted together to form the space 18, the sliding bar 11, the adjusting-screw 12, the pivoted post 5, and the handle 13, as and for the purpose herein set forth.

410,648. CULTIVATOR. EDWARD POOLE, Perkyoe, Ark. Filed June 12, 1889. Serial No. 313,964. (No model.)

Claim.—The combination, in a cultivator, of the central beam, the tooth-bars arranged in pairs, pivoted to the beam by a common pivot, and adapted to overlap, the links pivoted to the tooth-bars, the standards having double arms formed integral, as shown and described, and having their arms pivoted to the tooth-bars by the bolts which pivot the links thereto, the perforated locking-plate, and the locking-arms pivoted to the front tooth-bars and engaging the locking-plate, as set forth.

410,649. CAR-COUPLING. ANDREW P. PREVOST, Kawkawlin, Mich. Filed Apr. 16, 1888. Serial No. 307,374. (No model.)

Claim.—1. For supporting the outer end of a draw-bar, the collar H, having the wings H" and the cap-piece H', said collar adapted to environ the outer end of the draw-bar and support it by being bolted to the end cross-beam of the car, substantially as and for the purposes specified.



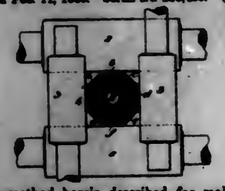
2. A draw-head provided with the chamber M, having the gravitating dog G pivotally located therein, the reciprocating head E, having the spur *x*, extended plate *a*, and post *b*, said head adapted to be actuated by the arm D and operate the pin and dog, for the purposes specified.

3. The basket-frame F, containing the cup K and spring S, and having the rod L passing therethrough, said frame adapted to be secured to the rear end of a draw-bar, and all of said parts arranged to operate as and for the purposes specified.

4. In a car-coupler, in combination with the frame of a car, the draw-bar having the head B', provided with the chamber M, the dog G, located in said chamber and having the groove *d*, the pin O, link N, the reciprocating head E, having the spur *x*, post *b*, and plate *a*, the actuating-rod C, having the arm D, and the collar H, said parts arranged to operate for the purposes specified.

5. A car-coupler comprising the following elements: the draw-bar having the head B' and shoulders *n n'*, the collar H, reciprocating head E, dog G, pin O, and link N, the actuating-rod C, having the arm D, the frame F, cup K, spring S, and rod L, when arranged as and to operate for the purposes set forth.

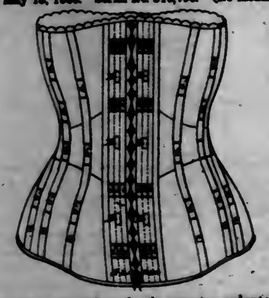
410,650. PICKET-FENCE MACHINE. EDWARD EDMONDS, Perry, Mich. Filed May 27, 1889. Serial No. 312,272. (No model.)



Claim.—1. In a wire-fence machine, a twister-wheel provided with the central wire-passage communicating with the slotted periphery, and a detachable plug secured between such central aperture and the periphery, substantially as described.

2. In a wire-fence machine, a twister-wheel provided with one or more eccentric wire-passages and a central wire-passage connecting with one of said eccentric wire-passages, and a detachable plug between said passages, substantially as described.

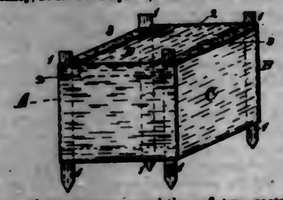
3. In a picket-fence machine, the combination, with a frame, twister-wheels journaled therein, and suitable gearing for driving the same, of an outrigger pivotally connected to said frame, a bracket provided with slotted annular bearing having a groove on its inner surface, and a guide-wheel secured in said bearing, substantially as described.



4. In a picket-fence machine, a wire-spreading device adapted to be slidingly secured by the tension of the wires in front of the machine, and consisting of a wheel having peripheral grooves, substantially as described.

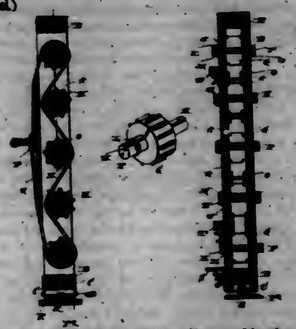
410,651. MAKING METAL ROLLS. CHARLES M. SEEWAR, Munhall, Pa. Filed Feb. 11, 1889. Serial No. 299,692. (No model.)

Claim.—The method herein described for making rolls, which consists in casting an ingot of octagonal shape, reducing the same to a bloom of octagonal cross-section by subjecting the ingot to a simultaneous vertical and lateral rolling pressure, and finally turning the bloom into cylindrical form, substantially as and for the purposes described.



410,652. MAGNETIC BODY-WEAR. GEORGE A. SCOTT, New York, N. Y. Filed May 15, 1889. Serial No. 310,796. (No model.)

Claim.—1. The combination of a chest-vesture adapted to human environment, provided with open band-sockets, and a series of magnetized metal bands inserted therein, substantially as and for the purpose explained.



2. The combination of a chest-vesture provided with open band-sockets and a series of different metal bands inserted therein, so placed relatively as to induce galvanic action when applied to a human body, substantially as and for the purpose explained.

410,653. PLANT-PROTECTOR. IRA H. SHERMAN and WILLIAM T. CROWN, Sidney, N. Y. Filed Apr. 22, 1889. Serial No. 308,172. (Model.)

Claim.—A plant-protector consisting of two rectangular end frames covered with cloth secured thereto, said end frames being connected by cloth secured to their tops and vertical edges by cloth, creating the top and sides of the protector, and removable stretcher inserted between the upper ends of the uprights of the end frames, substantially as described.

410,654. FENCE-MACHINE. THOMAS G. SHUTES and MANSFIELD R. SHUTES, York, Nebr. Filed June 22, 1889. Serial No. 315,155. (No model.)

Claim.—1. In a fence-machine, the combination of the frame having bearings for the twisting-shafts and slots extending from said bearings to the outer edges of the frame-bars, the shafts journaled in said bearings and having longitudinal grooves adapted to register with said slots, the split rings or lap-rings adapted to be adjusted upon the projecting ends of said shafts, and means for rotating the latter, substantially as set forth.

2. In a fence-machine, the combination of a frame having bearings for the twisting-shafts and slots extending from said bearings to the outer edges of the frame-bars, the shafts journaled in said bearings and having sprocket-wheels located between the frame-bars, said shafts and sprocket-wheels being provided with longitudinal diametrically-opposite grooves adapted to register with the slots in the frame-bars, the split rings adjustable upon the projecting ends of the shafts, and an operating-chain having its ends connected together detachably, substantially as set forth.

3. In a fence-machine, the combination of the frame having bearings for the twisting-shafts and slots extending from said bearings to the outer edges of the frame-bars, the shafts journaled in said bearings and having sprocket-wheels located between said frame-bars, said shafts and sprocket-wheels being provided with longitudinal grooves or recesses, the split rings adjustable upon the projecting ends of the shafts, an operating chain passing over the series of sprocket-wheels, and a clamp connecting the ends of the chain detachably and provided with a handle by means of which said chain may be operated to rotate the twisting-heads, substantially as set forth.

410,655. MACHINE FOR TRIMMING THE EDGES OF FABRICS. ROSWELL T. SMITH, Haskins, N. H., assignor to himself and NOAH W. GODDARD, same place, and GEORGE H. DUNHAM, New York, N. Y. Filed Mar. 16, 1887. Serial No. 231,140. (No model.)

Claim.—1. The combination, with a support over which the cloth may be drawn and cutting devices mounted on the edges of said support for trimming the fibers or threads projecting at the edges of the fabric, of an exhaust-chamber having walls extending above and over the sides of said cloth-support and means for withdrawing air from the exhaust-chamber, whereby as the fabric is passed over the cloth-support the fibers or threads projecting at the edges thereof will be drawn into the line of the cutting devices by the action of the currents of air and severed by said cutting devices.

2. The combination, with a support over which the cloth may be drawn and cutting devices mounted on the edges of said support for trimming the fibers or threads projecting at the edges of the fabric, of an exhaust-chamber having walls extending above and over the sides of said cloth-support, means for withdrawing air from the exhaust-chamber, whereby as the fabric is passed over the cloth-support the fibers or threads projecting at the edges thereof will be drawn into the line of the cutting devices by the action of the currents of air and severed by said cutting devices, and a receiving-cham-

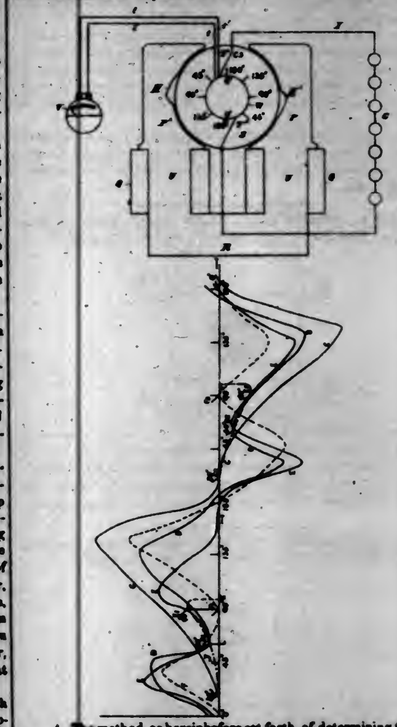
ber communicating with the exhaust-chamber for retaining the severed fibers.

3. The combination, with a divided support or guide over which the cloth may be drawn and cutting devices mounted on the edges of said support, of an expansible exhaust-chamber having an end which consists of a movable bulk-head adapted to carry one of the parts of the cloth-support and its accompanying cutting device, said exhaust-chamber having walls extending above and over the sides of the cloth-support, means for withdrawing air from the exhaust-chamber, whereby as the fabric is passed over the cloth-support the fibers or threads projecting at the edges thereof will be drawn into the lines of the cutting devices by the action of the currents of air and severed by said cutting devices, and a device for moving and adjusting the bulk-head, and cutters mounted upon the cloth-support for trimming the fibers or threads projecting at the edges of the fabric.

4. The combination, with a support or guide over which the cloth may be drawn and cutting devices mounted upon the sides of the cloth-support, of an exhaust-chamber having walls extending above and over the sides of the cloth-support and forming air-passages at the sides of the cloth-support, means for withdrawing air from said exhaust-chamber, whereby as the fabric is passed over the cloth-support the fibers or threads projecting at the edges thereof will be drawn into the line of the cutting devices by the action of the currents of air and severed by said cutting devices, a feed-roll for driving the fabric over the cloth-support, and means for operating said feed-roll.

5. In a machine for trimming the edges of textile fabrics, the combination, with a support for the cloth having marginal cutters, of an inclosing frame-work forming an exhaust-chamber beneath said support, hoods overhanging the margins of the support and forming air-passages communicating with the exhaust-chamber, a blower having its casing communicating with the exhaust-chamber, and a receiving-chamber communicating with the said blower-casing and constructed of foraminous material to permit the passage of the air-blast and prevent the escape of the clippings, substantially as specified.

6. In a machine for trimming the edges of textile fabrics, the combination, with a divided support for the cloth, of an inclosing frame-work forming an exhaust-chamber beneath the same, having its top made in two intersecting portions lying a little beneath the cloth-support, hoods overhanging the margins of the said support and forming air-passages communicating with the exhaust-chamber, a movable bulk-head forming one wall of said chamber and supporting one of the hoods, a blower having its casing opening into said chamber, cutters mounted on the margins of the said support beneath the hoods, mechanism for operating said blower and cutters, and a diaphragm lying on the divided top of the exhaust-chamber, the central portion of the support being cut away above the top of the exhaust-chamber, and the space between the said top and the support being closed at the sides and left open at the ends, substantially as specified.



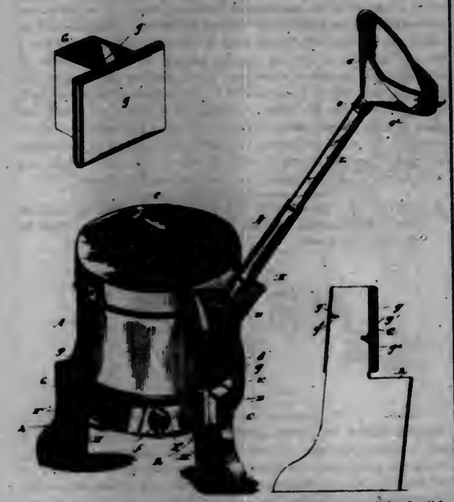
7. The combination, with a support or guide over which the cloth may be drawn and cutting devices mounted on the edges of said support for trimming the fibers or threads projecting at the edges of the fabric, of an exhaust air-chamber having walls extending above and over the sides of said cloth-support, whereby open hoods are formed whose leaves project above and over the edges of the cloth-support and inclose the edges of the fabric when the machine is in use, means for withdrawing air from the exhaust-chamber, whereby as the fabric is passed over the cloth-support the fibers or threads projecting at the edges thereof will be drawn into the line of the cutting devices by the action of the currents of air and severed by said cutting devices, and a feeding device for giving progressive movement to the fabric.

410,656. METHOD OF DETERMINING THE SHAPE OF POLE-PIECES FOR DYNAMOS. JOHN G. STATTER, London, County of Middlesex, England. Filed Mar. 20, 1888. Serial No. 304,543. (No model.) Patented in England Feb. 23, 1887, No. 2,895; in Belgium Feb. 2, 1888, No. 80,487; in France Apr. 13, 1888, No. 188,496, and in Spain May 14, 1888, No. 7,943.

Claim.—1. The method of determining the shape of the pole-pieces of dynamo-electric machines or motors, consisting of exploring the armature at various points around the same under different positions of the commutator-brushes to determine the electro-motive forces at various points around the armature and under different positions of the brushes, plotting out the curves of the electro-motive forces so obtained, and from these exploratio-curves determining the excess of the inductive effect over the self-inductive effect in the coils passing under the brushes in the various positions of said brushes.

2. The method of determining the shape of the pole-pieces of dynamo-electric machines or motors, consisting, first, in obtaining a curve which represents the excess of induction over self-induction, then removing experimentally less metal than required from the pole-pieces at the point indicated by the curve so obtained, then replotting the curve, and again experimenting until sufficient correction be obtained to make the inductive effect equal to the self-inductive effect.

3. The method of determining the shape of the pole-pieces of a dynamo-electric machine or motor to prevent sparking when the brushes are shifted, which consists in plotting out exploration-curves obtained in substantially the manner described, setting up ordinates corresponding to the various positions of the commutator-brushes in their several positions, and joining by a line the points where these ordinates cut their respective curves.



4. The method, as hereinbefore set forth, of determining the shape of the pole-pieces of a dynamo-electric machine or motor to vary the magnetic effect of said pole-pieces upon said armature and render the magnetic effect of said pole-pieces on said armature equal to the self-induction generated in the coils of the armature passing under the brushes at the time to prevent sparking, which consists in running said dynamo or motor under normal conditions, placing the brushes at several points around the commutator and measuring the differences of potential between adjacent coils around the armature for each position of the brushes, plotting the curves of said differences of potential by setting out the angular distances around the commutator as abscissæ and the differences of potential as ordinates for every position of the brushes, erecting ordinates corresponding to the angles at which the brushes are located in the several positions, noting the points where these ordinates cut their curves and joining the points so located by a line the angular position, size, and form of which will indicate the position, shape, and proportionally the amount of metal to be cut from the pole-pieces.

5. The method of determining the shape of the pole-pieces of dynamo-electric machines or motors to prevent sparking when the brushes are shifted, which consists in running said dynamo or motor with a constant current and resistance, or a variable load, respectively, changing the position of the brushes around the commutator, measuring the difference of potential between the adjacent coils around the commutator to correspond with each position of the brushes, plotting the curves of said differences of potential, setting out ordinates corresponding with the various positions of the brushes and noting the points where the said ordinates cut their corresponding curves, joining the points so located by a line and constructing the pole-pieces to correspond with the position and shape of this line and substantially in proportion to the area inclosed by said line, then running the dynamo under normal conditions again and shifting the brushes as before, measuring the differences of potential between the adjacent coils around the armature as before, and shaping the pole-pieces until the curves representing the differences of potential in adjacent coils cut the zero-line of said curves at points corresponding to the location of said brushes.

410,657. WASHING-FLUID. JOHN H. STEWART, Reidsville, N. C. Filed Oct. 4, 1888. Serial No. 287,316. (Specimens.)

Claim.—The herein-described composition of matter, forming a washing compound, and composed of soap, strained coffee, gum-arabic, saltpeter, soapstone, borax, and carbonate of ammonia, in the proportions specified.

410,658. COMBINED MILKING STOOL AND BUCKET. JOHN H. STEWART, Reidsville, N. C. Filed Nov. 6, 1888. Serial No. 290,155. (No model.)

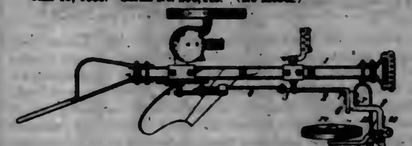
Claim.—1. The combination, with the milk-bucket, of the flexible belt or strap encircling the bucket, and the supporting-legs having keepers *g* affixed to their upper ends and fitting on the belt or strap, substantially as specified.

2. The combination, with the milk-bucket, of the flexible belt encircling the bucket, the stirrups secured at intervals to the belt and provided with keepers through which the belt extends, and the supporting-legs fitting at their upper ends in the stirrups, substantially as specified.

3. The combination, with a milk-bucket, of the removable belt encircling the bucket, the stirrups G, provided on their inner sides with keepers *g*, through which the belt extends, and having interior transverse ribs *g'*, and the supporting-legs fitting at their upper ends in the stirrups and provided with transverse grooves which are engaged by the said ribs, substantially as specified.

4. The combination, with the milk-bucket provided at its lower edge with the lateral flange D, and having a rib *d* parallel with and above the flange, of the adjustable belt encircling the bucket between the flange and rib and bearing at its edges against the same, and the supporting-legs fixed to the said belt, substantially as specified.

5. The combination, with a milk-bucket, of the adjustable belt encircling the same at its bottom, the yoke fixed to one end of the belt to receive the other end, and provided with a set-screw to engage the latter, the movable stirrups arranged on the belt, and the supporting-legs fitting in the stirrups and provided with the inward-extending shoulders extending under the bottom of the bucket, substantially as specified.

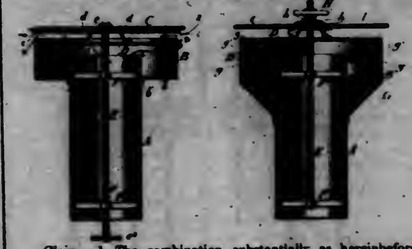


6. The combination, with a milk-bucket, of a removable hollow block fitting in the spout of the bucket and having a receiver or funnel connected thereto, substantially as specified.

7. The combination, with a milk-bucket provided with a lip or spout, of the block fitting in the said lip or spout and provided with a bore, the flexible tube fitting at one end in the said bore and provided at its free end with a receiver or funnel, substantially as specified.

8. The combination, with a milk-bucket provided with a lip or spout, of the removable block fitting in the lip or spout and provided with an inclined bore and a short tube I, the flexible tube inclosed at its lower end in a metallic shell fitting in the tube I, and the receiver or funnel connected to the free end of the flexible tube, substantially as specified.

9. The combination, with a milk-bucket provided with a lip or spout, of the block fitting in the lip or spout and provided with a bore, the flexible tube fitting at its lower end in the said bore, and the receiver or funnel provided with a tube fitting in the upper end of the flexible tube and having a rib *n'*, and the socket O, inclosing the upper end of the flexible tube, substantially as specified.



410,659. PLOW. GALEARD B. ST. JOHN, Kalamazoo, Mich. Filed Jan. 16, 1889. Serial No. 296,442. (No model.)

Claim.—1. In a plow, the combination, with a suitable support therefor, of a caster-standard for the forward wheel, a cam on said standard, substantially as described, with a notch therein to receive the traveler of a spring, a spring, substantially as described, with a traveler mounted in its free end and bearing on the periphery of said cam and adapted to engage with the notch therein and hold the caster in normal position, as set forth.

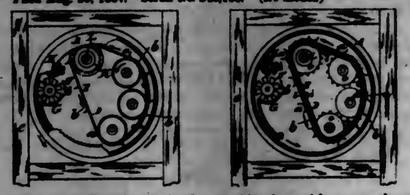
2. In a plow, the combination, with a tilting-arm, of the bifurcated arm 8, the spring 11, mounted between the members of said arm and having traveler 12, the caster-standard 9, and the cam 10, secured thereto between the members of said arm, substantially as and for the purpose set forth.

410,660. CHIMNEY-COWL. ISAAC J. TURNER, Princeton, N. J. Filed Jan. 8, 1889. Serial No. 296,747. (No model.)

Claim.—1. The combination, substantially as hereinbefore set forth, of the flue or body portion, the guard around the upper edge of the flue or body portion and extending above it, a flat deflector or disk above the flue, and the imperforate top plate or cap above the deflector.

2. The combination, substantially as set forth, of the flue, the imperforate top plate or cap, and the flat deflector below the cap and above the flue and held away from the cap.

3. The combination, substantially as hereinbefore set forth, of the flue, the guard around the upper end of the flue, the cap above the guard, and the deflector, having a downwardly-projecting flange below the cap and above the flue.

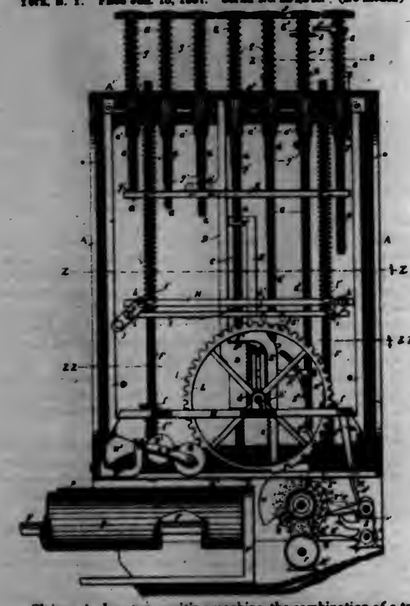


4. The combination, substantially as hereinbefore set forth, of the flue, the guard around the upper end of the flue, the imperforate top plate or cap above the guard, the flat deflector having a downwardly-projecting flange below the cap and over the flue, and the deflector-flange G below the upper end of the flue.

5. The combination, substantially as hereinbefore set forth, of the flue, a guard around the upper end of the flue, an adjustable cap above the guard, and an adjustable deflector below the cap and within the guard.

6. The combination, substantially as hereinbefore set forth, of the flue, the cap, the deflector below the cap and above the flue, the adjusting-rod, the supporting-brackets, and device, substantially as described, on the rod for varying the distance between the deflector and the upper end of the flue.

7. The combination, substantially as hereinbefore set forth, of the flue, the guard around the upper end of the flue, the deflector-flange around the upper end of the flue within the guard, the deflector above the flue and having downwardly-projecting flanges, the cap above the deflector, the brackets which connect the cap to the deflector, the adjusting-rod, the brackets in the flue in which it is mounted, the adjusting-wheel adjustably secured to the adjusting-rod, and the flanged plate connecting the adjusting-wheel with the cap.

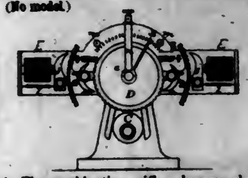


410,661. ROTARY BOLT. JOHN H. WALSH, Mason City, Iowa. Filed Aug. 20, 1887. Serial No. 246,103. (No model.)

Claim.—1. In a flour-bolt, the combination, with a round reel having an unobstructed bolting-surface on the inside adapted to allow for the movement in close proximity thereto, of an independent elevator mounted and operating inside said reel, an elevator with buckets thereon adapted to carry up the stock on the ascending side of the reel in close proximity thereto and carry the unbolted residue of stock across from the ascending to the descending side, and an apron interposed between said elevator and the lower part of the reel to prevent any stock spilled from the buckets falling to the bottom of said reel, substantially as set forth.

2. The combination, with a substantially cylindrical flour-bolt having an unobstructed internal bolting-surface, of an elevator, substantially as described, mounted and revolving inside of and independently of said reel, but at about the same rate of speed, and adapted to carry up the stock on the ascending side of the reel in close proximity thereto and the unbolted residue across the reel to the descending side, and a fixed apron mounted inside the path of said elevator and adapted to catch any stock spilled from the buckets of the elevator, substantially as described.

410,662. TYPE-WRITING MACHINE. GEORGE C. BLICKENSDERFER, Erie, Pa., assignor to the Blickensderfer Manufacturing Company, New York, N. Y. Filed Jan. 13, 1887. Serial No. 224,246. (No model.)



Claim.—1. In a type-writing machine, the combination of a type-wheel, a rack-bar and pinion for revolving said wheel, a presser-plate on the end of said rack-bar in position to be acted upon by keys, key-rods for acting upon said plate, which have necks which pass through said plate varying distances and in their action depress said plate varying distances, a second rack-bar operated from the type-wheel in an opposite direction and parallel with the first-named rack-bar, a plate on said last-named rack-bar which lies parallel with the presser-plate and impinges against the ends of the necks of the key-rods which pass through the presser-plate, substantially as and for the purposes set forth.

2. In a type-writing machine, the combination, substantially as set forth, of a type-wheel mounted on a plate or frame which is movable at right angles to the axis of said wheel and is retained from said movement by catches, a rack-bar for revolving said wheel, a presser-plate for moving said rack-bar, a series of keys for moving said presser-plate and rack-bar varying distances which extend through said presser-plate varying distances, a second rack-bar which lies parallel with the first-named rack-bar and is moved in an opposite direction thereby by said type-wheel, and supports a plate at its end which is parallel with the presser-plate, and impinges against the ends of the necks of the keys which pass through the presser-plate, and moves sidewise when so pressed upon and loosens the catches which retain the frame which supports the type-wheel and allows said wheel to move at right angles to its axis by the force exerted by the key upon both the presser-plate and the secondary plate.

3. In a type-writing machine, the combination, substantially as set forth, of the type-wheel L, mounted on the plate or frame M, which is supported by the catches O, the spur-gear L′ on the hub of said wheel, the rack-bar D, for engaging with said spur-gear and revolving said wheel, the presser-plate K on the end of said rack-bar, a series of keys G, of varying lengths, passing through said plate K, with abutting shoulders at varying distances from the ends of said keys, the rack-bar E, lying parallel to the rack-bar D and moving in opposition thereto, the plate I on the end of said rack-bar E, the plate H, hung on said plate I by parallel links J and supported by the spring k', the rod j, connecting the links J at one end of said plates, the rods F, springs f' and f^2 on said rods F, for reacting the said working parts, and the springs o o, for reacting the catches O O.

410,663. REGULATOR FOR DYNAMO-ELECTRIC MACHINES. JULIUS M. BRADFORD, Portland, Me. Filed Dec. 27, 1887. Serial No. 258,119. (No model.)

Claim.—1. The combination, with a dynamo-electric machine, of two stop-motion regulating devices, electric circuits for controlling said regulating devices, a line-current indicator and two regulating-wheels for controlling the dynamo, and two eccentrics arranged on the driving-shaft for obtaining accumulative and differential action, substantially as described.

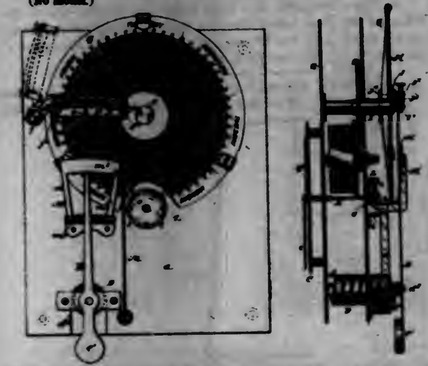
2. The combination, with a dynamo-electric machine, of two regulating devices, electric circuits for controlling said regulating devices, a line-current indicator, two contact-arms, a series of resistance-conductors, and two regulating-wheels for moving the contact-arms over the resistance-conductors, and two eccentrics arranged on the driving-shaft for obtaining accumulative and differential action, substantially as set forth.

3. In a circuit-regulator arranged to variably increase or decrease the action of a dynamo-electric machine, and in which a strong increase or decrease of the line-current is not necessary to produce variable action, the combination of a line-current indicator, two or more regulating devices, and electric circuits for controlling said regulating devices, eccentrics for operating the regulating devices, and regulating-wheels for controlling the dynamo in such a manner that its generative power may remain stationary or be diminished or increased, substantially as set forth.

4. The combination, with a dynamo-electric machine, of two regulating devices, electric circuits for controlling the regulating devices, a line-current indicator and two regulating-wheels for controlling the dynamo, and two eccentrics arranged on the driving-shaft for obtaining accumulative and differential action, substantially as described.

5. The combination of an oscillating lever b c, spring g, pawl a, stop-motion latch j, temporary magnet E, spring l, and disengaging-pin m with the wheel D, for regulating a dynamo-electric machine, substantially as set forth.

6. The combination, with two or more regulating devices and a driving-shaft carrying eccentrics for actuating said regulating devices, of two or more regulating-wheels for transmitting the action of the regulating devices through intermediate gearing to a shaft regulating a dynamo-electric machine, substantially as described.



7. The combination, with two or more regulating devices and a driving-shaft carrying eccentrics for operating said regulating devices, of two or more regulating-wheels carrying pinions held thereon in such a manner that they may turn with said wheels when the regulating devices act in concert to concentrate action, accumulating according to the operation of regulating devices, and slip without turning with said wheels when the regulating devices act in opposition for concentrating differential action, substantially as described.

8. The combination of a driving-shaft, eccentrics on said shaft, two toothed levers, each carrying a pawl, the regulating-wheels, two stop-motion latches, each having an electro-magnet and a spring to actuate it, two circuits, and a line-current indicator, substantially as described.

9. The combination of one or more toothed regulating-wheels, each having an untoothed gap or space, one or more regulating devices to move the regulating-wheels to the right or left to an extent that will be limited by their untoothed spaces, electric circuits, and a line-current indicator, substantially as described.

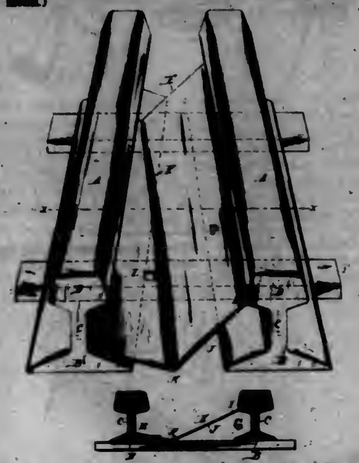
10. The combination of a driving-shaft carrying eccentrics, levers oscillated by said shaft, pawls carried by said levers, regulating-wheels and gearing for controlling a dynamo-electric machine, and stop-motion latches actuated by electro-magnets through changes in the intensity of the line-current to cut off the stroke of said levers at different points, substantially as described.

410,664. RECORDING-THERMOMETER CLOCK. WILLIAM F. BREWSTER, New York, N. Y. Filed Mar. 16, 1889. Serial No. 303,584. (No model.)

Claim.—1. In a recording-thermometer, the combination, substantially as set forth, of a recording-sheet, a mechanism for moving the same, a thermometer with its free end connected to an arm, a stylus on said arm, a holder independent of the recording-sheet, a marking medium mounted on said holder and disposed between the recording-sheet and stylus, and independent time-indicating devices connected with the mechanism for moving the recording-sheet, whereby the time at which a record of the temperature is being made on the recording-sheet can be readily read without disturbing the holder and marking medium mounted on said holder.

2. In a recording-thermometer, the combination, substantially as set forth, of a recording-sheet, a mechanism for moving the same, a thermometer with its free end connected to an arm, a stylus on said arm, a marking medium disposed between the stylus and recording-sheet, and a hammer connected to the mechanism for moving the recording-sheet, one portion of which is forked or split, substantially as described, whereby the recording-sheet and its support are permitted to move between such forked portions, while the hammer is operated by the mechanism for moving the recording-sheet.

3. In a recording-thermometer, the combination, substantially as set forth, of a recording-sheet, mechanism for moving the same, and a thermometer, one end of which is secured to the mechanism and its other or free end projects toward the plane occupied by the recording-sheet and is provided with an arm and stylus arranged to act upon the recording-sheet, whereby the whole instrument is made more compact in form and desirable in shape.

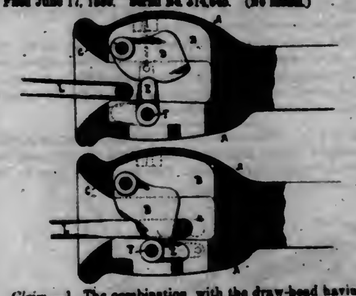


410,665. DENTAL JAW-PROP. ROBERT H. DAWYER, New York, N. Y. Filed Jan. 25, 1889. Serial No. 297,540. (No model.)

Claim.—1. In an implement of the character herein set forth, the cushion-heads combined with an intervening section and a yielding spring, one of the heads being made adjustable in or on said section and independently of the spring to vary the length of the prop, substantially as and for the purposes explained.

2. The herein-described prop, composed of the cushion-heads, one of which carries a screw, the intervening section, a yielding spring, and a retaining-bolt, combined and arranged substantially as and for the purposes set forth.

410,666. FOOT-GUARD FOR RAILWAY-TRACKS. EDWARD P. EDWARDS, Sterling, Ill. Filed Apr. 26, 1889. Serial No. 308,577. (No model.)



Claim.—1. The combination of one of the rails A, the ties F, and the guard E, provided with the flange G, adapted to rest under and against the ball D of said rail, and adapted at or near its opposite edge to be fastened to said tie, substantially as shown, and for the purpose described.

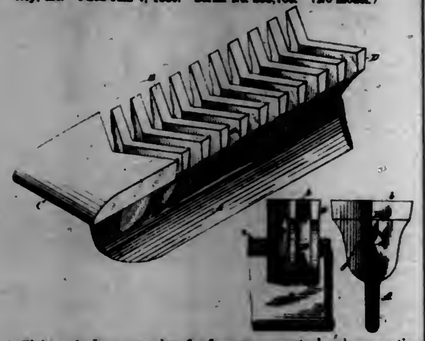
2. The foot-guard E, provided with the downwardly-projected flange G and the upwardly-projected flange H, substantially as shown, and for the purpose described.

3. In combination with the rails A A, the interposed foot-guard E, provided upon one edge with the downwardly-projecting flange G, adapted to rest against the neck C of one of said rails and to be in contact with the lower surface of the ball D of said rail, and provided, further, with the upwardly-projecting flange H, adapted to rest upon the web B of the opposite rail A, substantially as shown, and for the purpose described.

410,667. CAR-COUPLING. HENRY H. EVERETT, Passaic, N. J. Filed June 17, 1889. Serial No. 314,645. (No model.)

Claim.—1. The combination, with the draw-head having a tumbler pivoted therein and abutting against the inside of the head at the front, of a cam disposed in a slot in the head beneath the tumbler and adapted to lift the tumbler and hold the same poised on the end of each toe while the coupling and uncoupling take place.

2. In combination with the draw-head having the tumbler pivoted therein and the slot in the head beneath the tumbler, the double-acting cam-toe affixed to a rock-shaft and carrying an arm G, placed outside the draw-head and operated to the right or left, according to circumstances, whereby the tumbler may be disengaged by swinging up the cam-toe either from the front or rear, as the case may be, as set forth.



3. In combination with the double-acting cam-toe, the guide I on the draw-head, the arm G, made fast to the rock-shaft carrying the cam-toe, and the chain H, attached to the arm G and passing through said guide.

410,668. BOTTLE-STOPPER. BENJAMIN F. GREBER, Pittsburg, Pa. Filed June 15, 1889. Serial No. 314,371. (No model.)

Claim.—In a bottle-stopper, a locking-lever provided with inwardly-bent arms upon its lower ends, said arms terminating in trunnions and being bent upwardly and out of alignment with the main portion of the lever, in combination with a yoke provided with eyes upon its lower ends, through which the lever passes at the bend *g*, a cap-plate provided with perforations upon opposite sides, through which the yoke passes, and an elastic stopper-disk, all arranged and adapted to operate substantially as described.

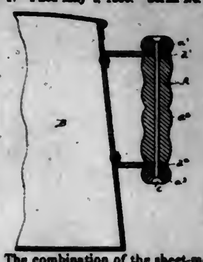
410,669. GRATE-BAR. LESTER HALL and OTTO J. BARTH, Kansas City, Mo. Filed Jan. 7, 1889. Serial No. 295,700. (No model.)

Claim.—1. In a grate-bar for furnaces, a central web supporting a number of upward projections, the latter being of angular shape, diverging outwardly in opposite directions, and so arranged that the web or central portion of the bar will be entirely below the fuel-surface and admit of a clear air-circulating space between the fire-surface proper and the top of the web, as herein described.

2. In a grate-bar, a central web with upward angular projections so arranged that the web of the bar will be entirely below the fuel-surface, and the first, last, and centrally-located projections extending outwardly beyond the line of the rest of the projections, substantially as and for the purpose herein set forth.

3. The grate-bar herein described, consisting of central web A, beveled on its upper surface *a*, and the plain-surface angular projections B, diverging in opposite directions, substantially so arranged that an uninterrupted air-space from side to side of the bar between its projections will exist, as herein described.

410,670. BRUSH-HOLDER FOR DYNAMO-ELECTRIC MACHINES. CHARLES D. JENNEY, Indianapolis, Ind., assignor to the Thomson-Houston Electric Company, of Connecticut. Filed Aug. 2, 1888. Serial No. 281,728. (No model.)

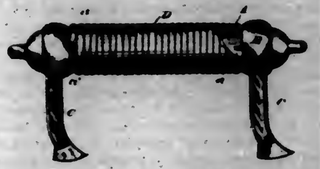


Claim.—1. The combination, in a brush-holder for dynamo-electric machines, of a brush-holder frame loosely mounted upon its shaft, an arm fixedly mounted on said shaft, a rod connecting said brush-holder frame and said arm, an adjustable spring whereby said brush-holder frame is forced forward, and a cam whereby the brush-holder frame may be retracted, substantially as set forth.

2. The combination, in a brush-holder for dynamo-electric machines, of the brush-holder frame revolubly mounted on its shaft, an arm fixedly mounted upon the same shaft, and a connection between said frame and said arm consisting of a tubular rod pivoted to one and extending through the other, a collar on said rod, a spring between said collar and the face of said arm, a smaller rod located inside said rod and connected to said collar, and a thumb-nut upon the outer end of said smaller rod, whereby the spring may be compressed or relaxed as said nut is turned, substantially as set forth.

3. The combination, in a brush-holder for dynamo-electric machines, of the brush-holder frame revolubly mounted upon its shaft, an arm fixedly mounted upon the same shaft, a rod pivoted to the brush-holder frame and extending through an opening in said arm, a yoke secured to said rod outside of said arm, and a cam secured to said yoke, substantially as and for the purposes set forth.

4. The combination, in a brush-holder for dynamo-electric machines, of the brush-holder frame C, the arm D, the hollow connecting-rod E, the screw-rod E^2 therein, the spring E^3, the thumb-nut E^4, the yoke E^5, and the cam E^6, substantially as set forth.

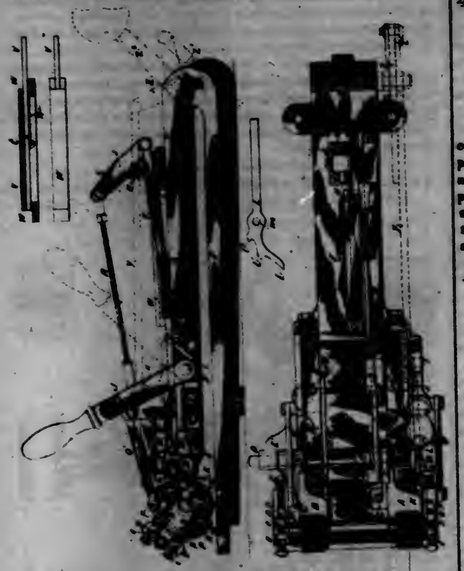


410,671. NON-HEAT-CONDUCTING HANDLE. HENRY L. PALMER, Brooklyn, N. Y. Filed May 4, 1889. Serial No. 309,559. (No model.)

Claim.—1. The combination of the sheet-metal strips *d*, the non-heat-conducting pieces d' d^2 d^3, and the rod *c*, said rod passing through said pieces and strips alternately and riveted at both ends, substantially as described.

2. The combination of the sheet-metal strips *d*, the non-heat-conducting pieces d' d^2 d^3, the rod *c*, and the vessel B, said rod passing through said pieces and strips alternately and riveted at both ends, and said strips secured to any convenient part of said vessel, substantially as described.

410,672. HANDLE. HENRY L. PALMER, Brooklyn, N. Y. Filed May 10, 1889. Serial No. 310,202. (No model.)

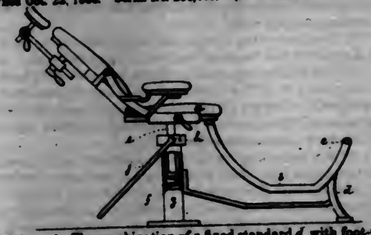


Claim.—1. A metal handle having a hollow hand-piece, the outer surface of which is wrapped with rattan, and tongues at the ends of the hand-piece securing the rattan in place, substantially as described.

2. In a metal handle, the combination, with the hand-piece, of tongues formed at the ends of the hand-piece, and a strip of rattan coiled on the same, its ends being placed below the tongues and fastened thereby to the hand-piece, substantially as described.

3. The combination, with a metal hand-piece having a non-heat-conducting covering, of tongues at the ends of the hand-piece, the ends of the covering being placed below the tongues and fastened thereby to the hand-piece, substantially as described.

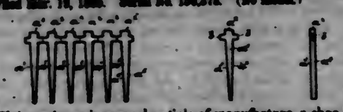
410,673. APPARATUS FOR THE CONSECUTIVE NUMBERING OF CHECKS, TICKETS, &c. JOHN PHILLIPS, London, England. Filed Nov. 5, 1888. Serial No. 290,053. (No model.) Patented in Belgium Oct. 1, 1888, No. 83,440.



Claim.—1. In numerical printing apparatus, the combination of a printing table or platform with a shaft held in bearings parallel to the said platform and provided with mechanism for imparting to it an oscillating motion around its axis, a numbering-head comprising a disk-holder and inking-table with a set of type-disks and inking apparatus held by a lever mounted on the said shaft and adapted to be fixed thereon at various points of its length, and ratchet mechanism adapted to turn the type-disks at each oscillation, substantially as described, and for the purpose specified.

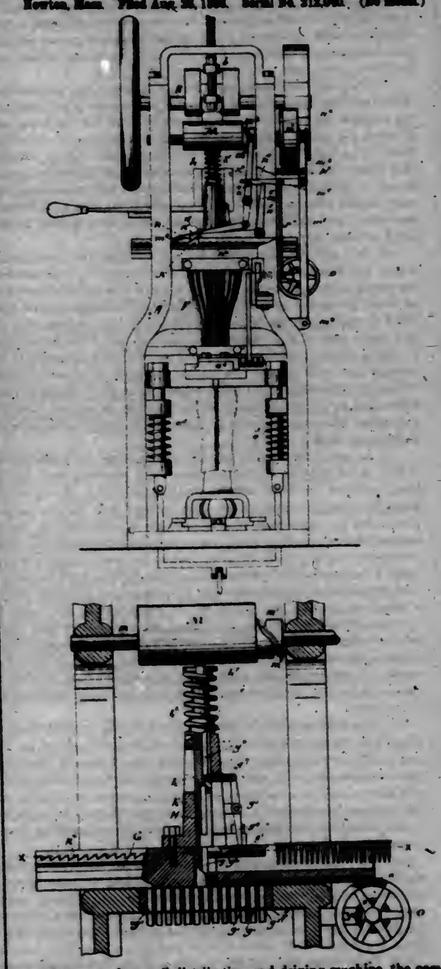
2. In numerical printing apparatus, the combination of a printing table or platform, with a shaft held in bearings parallel to the said platform and provided with mechanism for imparting to it an oscillating motion around its axis, two or more levers mounted on the said shaft at a variable distance from each other, each lever carrying at its free end a disk-holder and inking-table with a set of type-disks and inking apparatus, and ratchet mechanism adapted to turn the type-disks at each oscillation, substantially as described, and for the purpose specified.

3. In numerical printing apparatus containing two or more sets of type-disks mounted on an axle adapted to oscillate to and from the printing table or platform, the combination of printing-platform X with horizontal shaft D, held in a pair of bearings and provided with means for imparting to it an oscillating motion to and from the platform, a pair of disk-carriers A B, and levers mounted on the axle D at a variable distance from each other, each disk-carrier being shaped as a cylindrically-curved casing over the upper part of the circumference of the type-disks and adapted to serve as inking-table, two sets of type-disks, together with ratchet-wheel and axle supported by the disk-holder, a pair of multiple ratchet-pawls L, adapted to come in contact with the ratchet-wheels and turn the same during the up motion of the disk-holders, and inking apparatus mounted on the axles of the type-disks and provided with means to prevent it from turning with the disks or disk-holders, substantially as described.



410,674. DENTIST'S CHAIR. CARL RAUBE, Darmstadt, Germany. Filed Oct. 22, 1888. Serial No. 288,779. (No model.)

Claim.—1. The combination of a fixed standard *d*, with foot-piece *b* pivoted thereto, a seat-plate *a*, secured to the foot-piece, and an adjustable support beneath the seat, substantially as specified.



2. The combination of a fixed standard *d*, with foot-piece *b* pivoted thereto, a seat-plate *a*, secured to the foot-piece, a rod *c*, supporting the seat, a hollow foot *g*, receiving the rod *c*, a spring *f*, placed in the hollow foot *g*, and a clamp-screw and lever for locking the rod to the hollow foot, substantially as specified.

410,675. HEEL-NAIL. FREEMAN P. RAYMOND, 2d, Newton, Mass. Filed Mar. 19, 1889. Serial No. 303,573. (No model.)

Claim.—As an improved article of manufacture, a shoe-heel nail consisting of a shank of uniform thickness having parallel sides and tapering edges provided with homogeneous shoulders of the same thickness as the shank and in the same horizontal plane as the sides thereof, projecting at right angles from the edges below the upper end of the shank to form a short head which is of greater width at its upper end than the remainder of the shank, the said nails being formed from sheet metal, as described.

410,676. HEEL-NAILING MACHINE. FREEMAN P. RAYMOND, 2d, Newton, Mass. Filed Aug. 26, 1889. Serial No. 312,040. (No model.)

Claim.—1. In a nail distributing and driving machine, the combination, with a nail-distributer having a series of nail receiving and distributing passages the upper ends of which are arranged in a row,

of a traveling block G, having a single throat adapted to be brought successively over the said upper ends of said passages, and nail or fastening severing and supplying devices carried by and then movable with said traveling block, substantially as set forth.

2. In a nail distributing and driving machine, the combination, with a nail-distributer having a series of nail receiving and distributing passages the upper ends of which are arranged in a row and the lower ends of which are spread to distribute the nails, of a traveling block G, having a single throat, feeding appliances for intermittingly advancing said traveling block to bring said throat successively over the said upper ends of said receiving and distributing passages, and a nail-supplying device carried by the said traveling block and comprising comb or nail strip feeding appliances, and a reciprocating plunger or severing device arranged above the said throat and serving to sever the nails from a nail-strip, and thus cause them to pass through said throat to said receiving and distributing passages, substantially as set forth.

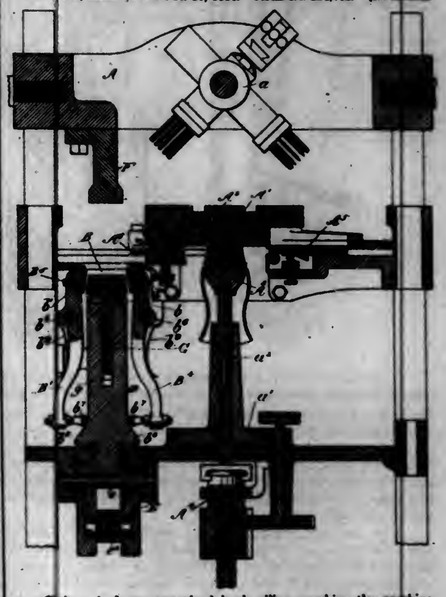
3. In a nail distributing and driving machine, the combination, with a nail-distributer having a series of nail receiving and distributing passages the upper ends of which are arranged in a row and the lower ends of which are spread to distribute the nails or fastenings, of a traveling block having a single throat, feeding appliances for intermittingly advancing said block to cause said throat to be brought into register with the upper ends of said passages successively, nail or fastening severing and supplying devices carried by said block, a gang of reciprocating nail-drivers, and a reciprocating nail-carrier movable from beneath said distributer to a position beneath said drivers, substantially as set forth.

4. In a nail distributing and driving machine, the combination, with a nail-distributer having a series of nail receiving and distributing passages the upper ends of which are in a row and the lower ends of which are spread to distribute the nails or fastenings, of a traveling block G, having a single throat to be brought into register with the said upper ends of said passages successively, said block having also a rack or series of ratchet-teeth, a feeding-pawl for intermittingly advancing said block, a detent for locking the latter after each forward movement, and nail or fastening supplying devices carried by said block, substantially as set forth.

5. In a nail distributing and driving machine, the combination, with a nail-distributer having a series of nail receiving and distributing passages the upper ends of which are in a row and the lower ends of which are spread to distribute the nails or fastenings, of a traveling block G, having a single throat to be brought into register with the said upper ends of said passages successively, said block having also a rack or series of ratchet-teeth, a feeding-pawl for intermittingly advancing said block, a detent for locking the latter after each forward movement, automatic appliances for disengaging the feeding-pawl and detent and for returning said traveling block to its original position, and nail or fastening supplying devices carried by said block, substantially as set forth.

6. In a nail distributing and driving machine, the combination, with a nail-distributer having a series of nail receiving and distributing passages the upper ends of which are in a row, of a traveling block G, having a single throat to be brought into register successively with the upper ends of said passages, a nail-supplying device carried by said traveling block and comprising a reciprocating plunger or severing device to cause the nails to enter said throat and passages, a rotary shaft to operate said plunger, feeding appliances operated by said shaft for intermittingly advancing said traveling block, a clutch, a stop-motion mechanism for disconnecting the parts or members of said clutch, and a tripping mechanism operated from said traveling block and serving to operate said stop-motion mechanism and disconnect the parts or members of said clutch, and thereby arrest the rotation of said shaft when a predetermined number of nails or fastenings have been supplied to said distributer, substantially as set forth.

7. The combination of a traveling block having a throat through which fastenings are adapted to be moved intermittingly in one direction and fastening-supplying mechanism carried thereby, comprising a reciprocating nail plate or strip feeding device for feeding the nail strip or plate to a nail-severing device or plunger, said nail-severing device or plunger being adapted to be reciprocated by a disconnected cam M as it is moved, and the spring k^3, substantially as described.



8. The combination, with the intermittingly-moving traveling block G, the support or post K, attached thereto, and thus moving therewith, and the severing device or plunger H, reciprocating in said support or post, of the extended cam M to operate said plunger in the different positions to which it may be moved, substantially as set forth.

9. The combination of the traveling block G, having a single throat, a rack carried thereby, a reciprocating pawl to engage said rack, and a cam for giving it an intermittent movement, a detent-pawl for locking it stationary, the comb or nail strip feeding and severing devices carried by said traveling block, comprising a reciprocating feed-pawl, a detent-pawl, and a movable plunger, and a cam and spring for reciprocating the plunger at given intervals, substantially as described.

10. The combination of the traveling block G, the feed-pawl g^3, its supporting-block g^5, the lever g^4, cam g^5, for operating it, the detent-pawl g^6, the plunger-bar A, the plunger H, the spring k^3, and cam M, substantially as described.

11. The combination of the cam d^3, the slide-bar D', having the incline p, and the latch m^2, controlling the position of the driven member m^3 of the clutch, with the rod p^2, a lever p^3, adapted to be moved by said incline to lift the latch and permit the spring to draw the driven member of the clutch into engagement with the fastenings, substantially as described.

410,677. **HEEL-NAILING MACHINE.** FREDERICK P. RAYMOND, 2d, Newton, Mass. Filed Dec. 16, 1886. Serial No. 221,702. (No model.)

Claim.—1. In an organized heel-nailing machine, the combination, with heel-attaching devices, of a heel-blank-edge molding or compressing apparatus consisting of vertical and lateral formers or pressers from which the blank is automatically transferred to said attaching devices connected substantially as described and automatically operated, and thereby adapted for conjoint and simultaneous use, one to mold the side edge of a heel-blank and the other to attach a previously-molded heel-blank, substantially as described.

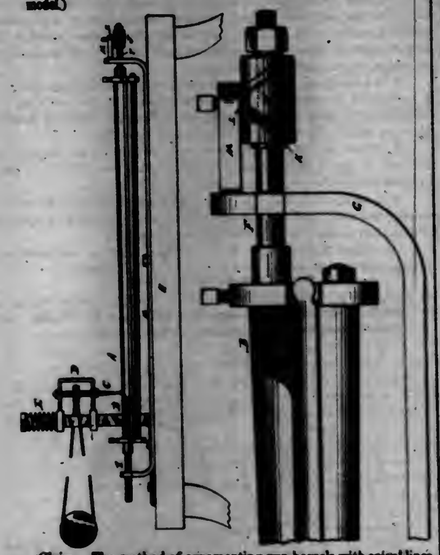
2. In a heel nailing or attaching machine, the combination of a heel-blank-edge molding or compressing apparatus, a heel-blank carrier for feeding the heel-blanks thereto, a device for transferring a molded heel-blank from the compressing apparatus to the attaching devices, the said attaching devices, and connected mechanism, substantially as described, for simultaneously and automatically operating the several parts, as set forth.

3. In a heel-nailing machine, the combination of the jaws b' b^2 b^3 b^4, the plate b^5, and the head b, substantially as described.

4. In a heel-nailing machine, the combination of the jaws b' b^2 b^3 b^4, their levers B' B^2 B^3 B^4, pivoted as described, the slide-head D, the head b, and the wedge or inclined surfaces b^5 upon the slide-head, against which the ends of the levers are held in contact, substantially as and for the purposes described.

5. In a heel-nailing machine, the combination of the jaws b' b^2 b^3 b^4, their levers B' B^2 B^3 B^4, a slide-head B, having the inclined surfaces b^5, and a roll b^7 at the lower end of each lever arranged to bear against the inclined surface b^5, and means for adjusting the position of the roll in relation to the end of the lever, substantially as described.

6. In a heel-nailing machine, the combination of the jaws b' b^2 b^3 b^4, their levers B' B^2 B^3 B^4, the slide-head D, having the inclined surfaces b^5, and the springs b^6, for holding the ends of the levers in contact with the inclined surface b^5, substantially as described.



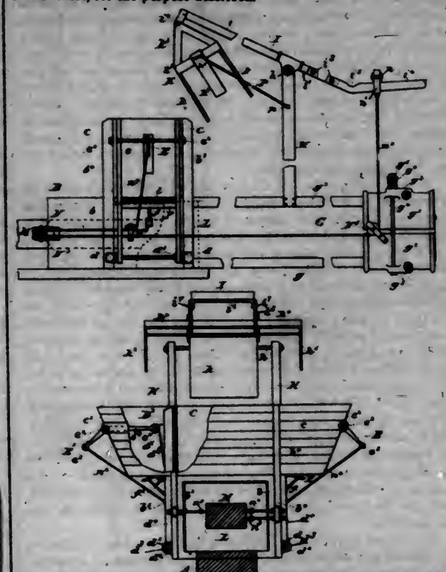
7. In a heel-nailing machine, the combination of the jaws b' b^2 b^3 b^4, adapted to have closing and opening movements imparted to them, the plate b^5, the head b, and the head F, substantially as described.

8. In a heel-nailing machine, the combination of the jaws b' b^2 b^3 b^4, the head b, and the plate b^5, the said head having an upward vertical movement simultaneous with the closing movements of the said jaws, as and for the purposes described.

9. In a heel-nailing machine, the combination of the carrier A^5 with the jaws b' b^2 b^3 b^4 and operating mechanism therefor, as described, the head b, and its lifting-rod G, adapted to be moved upward upon the release of the jaws to present the molded heel-blank to the transferrer A^5, substantially as described.

10. In a heel-nailing machine, the combination of the head b, the rod G, the lever g, and a cam for moving the same, substantially as described.

410,678. **METHOD OF ORNAMENTING GUN-BARRELS.** GODFREY A. RAGSDALE, Valley City, Dak. Filed Nov. 14, 1888. Serial No. 290,940. (No model.)



Claim.—The method of ornamenting gun-barrels with spiral lines, consisting in subjecting the gun-barrel to the action of a rotary abrading implement, and at the same time rotating the gun-barrel and moving the same in the direction of its length, so as to cause the said abrading implement to cut spiral lines into the outer surface of the barrel, substantially as set forth.

410,679. **BALING-PRESS.** BENJAMIN C. BOOT, Kansas City, Mo. Filed Aug. 14, 1888. Serial No. 282,716. (No model.)

Claim.—1. In a baling-press, the combination, with the feed-chamber for the material to be baled provided with a feed-opening, of an elevated receptacle over said feed-chamber, provided with an opening registering with said feed-opening, vibrating bars pivotally attached at their lower ends to the sides of said feed-chamber a suitable distance below the said feed-opening, sides to said elevated receptacle attached to said bars and adapted to vibrate to and from said feed-opening in the arc of a circle, and laterally-extended curved plates attached to the side of said feed-chamber beneath said vibrating sides, as and for the purpose described.

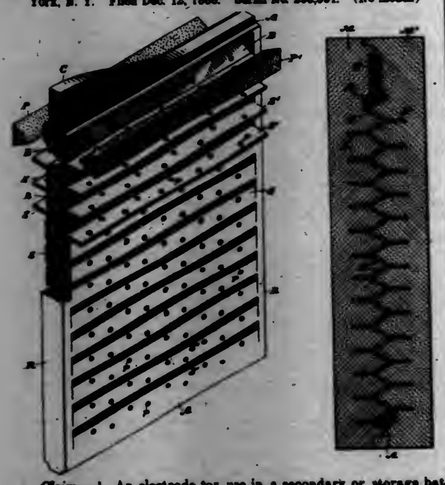
2. In a baling-press, the combination, with the feed-chamber for the material to be baled provided with a feed-opening, of a reciprocating plunger in said feed-chamber, an elevated receptacle over said feed-chamber, provided with an opening registering with said feed-opening and laterally-extended end portions, laterally-vibrating sides to said elevated receptacle, and a rock-shaft on each of said extended portions of said ends, a bell-crank lever on each of said rock-shafts adapted to move said sides into a vertical position, and elevating-ropes connected with said bell-crank levers and said plunger, as and for the purpose described.

3. In a baling-press, the combination, with the feed-chamber for the material to be baled provided with a feed-opening, of a reciprocating plunger in said feed-chamber, an elevated receptacle over said feed-chamber, provided with an opening registering with said feed-opening and laterally-extended end portions, laterally-vibrating sides to said elevated receptacle, rock-shafts having bell-crank levers on said extended portion of said ends, and an inclined projection on said vibrating sides in the path of the respective ends of said bell-crank levers, for the purpose described.

4. In a baling-press, the combination, with the feed-chamber for the material to be baled provided with a feed-opening, of a reciprocating plunger in said feed-chamber, an elevated receptacle over said feed-chamber, provided with an opening registering with said feed-opening and laterally-extended end portions, laterally-vibrating sides to said elevated receptacle, rock-shafts on said extended portions of said ends, and bell-crank levers on said rock-shafts having anti-friction vibrating end portion, an inclined projection on said sides in the path of the anti-friction ends of said bell-crank levers, and elevating-ropes connected with said bell-crank levers on said rock-shafts and with said plunger, for the purpose described.

5. In a baling-press, the combination, with the feed-receptacle for the material to be baled provided with a feed-opening, of a reciprocating plunger, an elevated receptacle over said feed-chamber, having an opening registering with said feed-opening, a baling-chamber having an opening communicating with said feed-chamber in the direction of the path of said plunger, a suitable standard on said baling-chamber, and an oscillating beam on said standard, extending at one end to a point over the opening in said elevated receptacle, a material-ejecting weight pivoted upon the said end of said beam, adapted to enter the opening in said elevated receptacle, and a rod pivotally attached at one end to said standard and at its opposite end to said weight at a described angle to said beam, for the purpose described.

6. In a baling-press, the combination, with the feed-chamber for the material to be baled provided with a feed-opening, of a reciprocating plunger, a pitman provided with traveler-rods and travelers on said rods in the rear of said plunger, an elevated receptacle over said feed-chamber, having an opening registering with said feed-opening, and a baling-chamber in communication with said feed-chamber and in the line of the path of said plunger, standards upon said baling-chamber extending above said elevated receptacle, and an oscillating beam on said standards, having one end portion extending to and over the said opening in said elevated receptacle, and provided with a weight pivotally attached thereto and adapted to enter said elevated receptacle, and an upwardly-inclined bar on the opposite end portion of said beam and a roller on said bar, sheaves on said feed and baling chambers, and a cable attached to said roller on said beam and extending through said sheaves and attached to said travelers on said pitman, for the purpose described.



7. In a baling-press, the combination, with the feed-chamber for the material to be baled having a feed-opening, of a reciprocating

plunger and a baling-chamber in communication with said feed-chamber, a pitman provided with longitudinal rods and travelers in rear of said plunger, an elevated receptacle over said feed-receptacle, having its opening registering with said feed-opening and provided with extended end portions and laterally-vibrating sides, rock-shafts on said extended end portions of said ends, and arms on said shafts adapted to elevate said sides and levers on said rock-shafts, standards on said baling-chamber extending above said elevated receptacle, and an oscillating beam on said standards having one end portion provided with a pivotally-attached material-compressing weight and extending over the said elevated receptacle, and its opposite end portion provided with an upwardly-inclined arm, laterally-extended arms on said weight adapted to move into the path of said arm on said rock-shaft, suitable sheaves on said baling-chamber and said feed-receptacle, and a cable attached to said roller on said beam and extending through said sheaves and attached to said travelers on said pitman, for the purpose described.

8. In a baling-press, the combination, with the feed-chamber for the material to be baled having a feed-opening, of a reciprocating plunger, a baling-chamber having an opening in communication with said feed-opening and in the line of the path of said plunger, a pitman on said plunger, and rods on said pitman provided with retarding ends, an elevated receptacle over said feed-chamber, having its opening registering with said feed-opening and laterally-extended portions, laterally-vibrating compressing sides to said elevated receptacle, and rock-shafts on said extended portions of said end, having bell-crank levers adapted to move said sides into a vertical position, standards on said baling-chambers extending above said elevated receptacle, and an oscillating beam on said standards having one end provided with a compressing-weight pivotally attached thereto and extending to and above said feed-receptacle, arms on said weight adapted to move into the path of the arms on said rock-shaft, and an upwardly-inclined notched arm on said beam opposite to that provided with said weight, and a roller on said arm, sheaves on said baling and feed chambers, and cables attached, respectively, to said roller on said beam and to said pitman and also to the bell-crank levers on said rock-shaft, and the rods on said pitman, substantially as and for the purpose described.

9. In a baling-press, the combination, with the feed-chamber for the material to be baled provided with a feed-opening, of a reciprocating plunger in said feed-chamber, an elevated receptacle over said feed-chamber provided with an opening registering with said feed-opening and laterally-extended end portions, laterally-vibrating side bars adapted to support the sides of said elevated receptacle, pivoted at their lower ends to the sides of said feed-chamber, rock-shaft on said extended end portions of said elevated receptacle, provided with side elevating bell-crank levers, and springs between said vibrating bars and the sides of said feed-chamber, for the purpose described.

410,680. SECONDARY BATTERY. JEAN T. VAN GEMPEL, New York, N. Y. Filed Dec. 12, 1888. Serial No. 293,391. (No model.)

Claim.—1. An electrode for use in a secondary or storage battery, made of a single piece of lead or analogous material having angular retaining-shelves on its opposite faces, said shelves being located in a common plane and having turned-up lips or ledges for holding the active material in place, substantially as described.

2. An angular or corrugated retaining plate or support for use in secondary batteries, having active material located in said angles or corrugations, and retaining lips or shelves for holding it secured in place, substantially as described.

3. A retaining plate or support for the active material in a secondary or storage battery, having a series of angular grooves or corrugations on its opposite faces, with retaining lips or shelves attached to the backs of said angular grooves and on the opposite side thereof, said lips or shelves being adapted to hold the active material more securely in place, substantially as described.

4. A retaining plate or support for the active material of a secondary or storage battery, having angular corrugations on its opposite faces, in combination with lips or shelves attached to the backs of the corrugations, substantially as described.

5. An electrode for a secondary or storage battery, consisting of a corrugated supporting-plate having lips integral with the backs or outer faces of the corrugations, and active material held in place between said lips and the corrugations, substantially as described.

6. An electrode for a secondary or storage battery, consisting of a corrugated or angular depressed supporting-plate having lips or ledges on the outer side or backs of said corrugations or angles, and active material in the shape of compressed bars or rods adapted to fit in the angles or corrugations, as shown, and held in place by said lips or ledges, substantially as described.

7. An electrode for a secondary or storage battery, consisting of a perforated corrugated sustaining-plate having perforated lips or ledges on the backs of the corrugations, with active material held in place by said lips or ledges, substantially as described.

8. Active material for use in storage-batteries in the shape of a bar, rod, or pencil, and composed of silicate of soda and oxide of lead in substantially the proportions named.

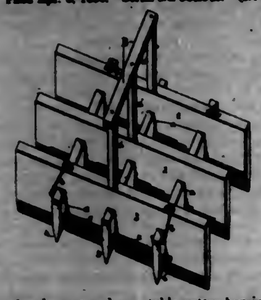
9. A compressed bar, rod, or pencil of active material for use in storage-batteries, said bar, rod, or pencil being composed of silicate of soda and oxide of lead, substantially as described.

10. Active material for use in storage-batteries, composed of silicate of soda and oxide of lead, substantially as described.

410,681. VELOCIPEDE. JAMES L. WATKIN, London, County of Middlesex, England. Filed Apr. 22, 1889. Serial No. 308,204. (No model.) Patented in England Mar. 27, 1888, No. 4,676.

Claim.—1. In a velocipede driven by the rear wheel or wheels and steered by the front wheel, constructing the steering-post forming the upward extension of the steering-fork with an aperture or loop immediately above the cogs or their equivalent forming the steering head or joint and below the level of the saddle, and adapting the upward extension of the steering-post above the said aperture or loop to receive the adjustable pillar carrying the transverse handle-bar, as and for the purpose set forth.

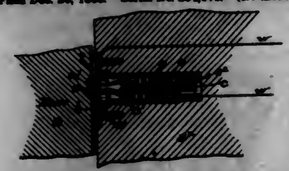
2. In a velocipede driven by the rear wheel or wheels and steered by the front wheel, constructing the frame in the manner hereinbefore set forth—*i. e.*, with a central aperture or loop in the steering-post and with the support for the saddle-pillar adapted to carry the said pillar out of the longitudinal center of the machine to enable a rifle or gun to be carried central on the machine, as and for the purpose set forth.



3. In a velocipede, the combination of the aperture or loop in the steering-post, or its equivalent, and the leather sheath or bucket for carrying a rifle, both combined, arranged, and operating as and for the purpose set forth.

4. In a velocipede, the combination, with the fork carrying the steering-wheel, of the double-forked frame consisting of the arms D D, the light-fork D', the cross-bar D^2, the mud-guard D^3 and of the slotted bar E fixed to the said frame and adapted to interlock with a catch *f*, carried by the brake-spoon F, as and for the purpose set forth.

5. In an upright standing gear for two-wheeled velocipedes of unstable equilibrium, automatically locking down the said gear to support the machine by means of a suitable catch carried on and operated by the brake-gear of the machine, as set forth.



6. In a velocipede, the combination of the loop or aperture in the head, of the seat-pillar supported out of the center of the machine, of the sheath or bucket for carrying a rifle, and of the upright standing gear, all constructed, arranged, and operating as and for the purpose set forth.

410,682. MEAT AND VEGETABLE CHOPPER. IRA M. BERRY, Sullivan, Ill. Filed Apr. 8, 1889. Serial No. 306,342. (No model.)

Claim.—The hand meat and vegetable cutter herein described, composed of the slotted blades 1 2 3, narrow blades 4 5 6, fitting in said slotted blades, hooks *b*, rod *c*, and handle β *c'*, constructed and arranged substantially as and for the purpose specified.

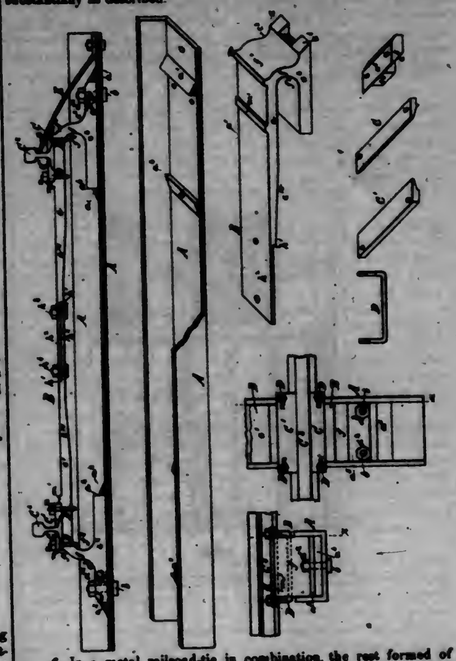
410,683. BURGLAR-ALARM. EDWIN H. CARHART, Providence, R. I. Filed Dec. 28, 1888. Serial No. 294,678. (No model.)

Claim.—1. A short-circuit spring for burglar-alarms, consisting of an electrically-connected shell or casing, a spring-actuated contact-pin provided with a cone-shaped head mounted within the shell, and an electrically-connected plate provided with an enlarged central opening through which the outer end of said pin slightly extends, thereby, when in its normal position, forming an annular space around the pin, substantially as hereinbefore described, and for the purpose set forth.

2. The combination of a mounted electrically-connected shell or casing, a spring-actuated contact-pin having its outer or free end provided with a cone-shaped head mounted within the shell, and an electrically-connected plate having an enlarged opening formed therein transversely to receive the head of said pin, and having the plate insulated from the adjacent end of the casing by means of an air-space *n'*, substantially as described.

3. The combination, with the electrically-connected shell *a* and apertured plate *b*, constructed and arranged substantially as shown and described, of the spring-actuated contact-pin *c*, having a cone-shaped head portion extending slightly through said plate, and forming, when thus in its normal open-circuit position, an annular space around the pin, but when the pressure upon the pin is removed the spring forces the head of the pin into engagement with the plate, thereby closing the circuit, substantially as hereinbefore set forth.

410,684. METAL RAILROAD-TIE. BENJAMIN W. BELLSCOTT, Flemington, N. J. Filed Apr. 10, 1889. Serial No. 306,902. (No model.)



Claim.—1. In a metal railroad-tie, in combination, a foundation-plate provided with abutment-ribs in rear of the standards of the rail-rest and a flexible transverse rail-rest having abutment-ribs for the rails between the said standards of the rail-rest, substantially as and for the purpose described.

2. In a metal railroad-tie, in combination, the plate A, provided with abutment-ribs *a a' a^3 a^3*, abutment-blocks a^2, having beveled portions c^3 and lugs c^4, and a flexible rail-rest B, having foot portions c^2, with beveled portions c^1 and a notch c^5, substantially as and for the purpose described.

3. In a metal railroad-tie, the flexible rail-rest B, formed with foot portions c^2, curved standard portions *f*, and abutments *m m'* inside of or between the standards, substantially as described.

4. In a metal railroad-tie, in combination, the flexible rail-rest B, having abutments *m m'* between its standards, chair-plates C C', and the foundation-plate A, having abutments for the feet of the rail-rest, substantially as described.

5. In a metal railroad-tie, in combination, the flexible rail-rest B, chair-plates C C', extended beyond the edges of the rail-rest, and gripping-clips D, passed under the rest and through the chair-plates, substantially as described.

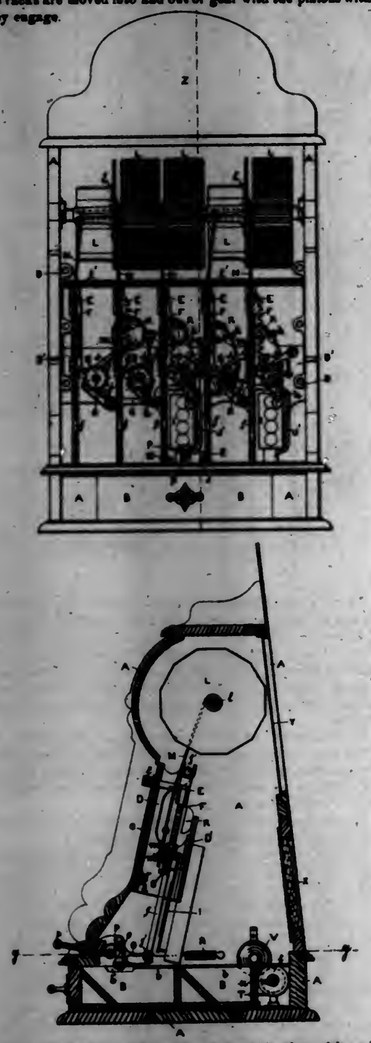
6. In a metal railroad-tie, in combination, the rest formed of two spliced parts *c c'*, provided with abutment-ribs *m m'*, and having parallel portions terminated in shoulders *h'*, then tapered for a portion of their length, then made of uniform thickness from said tapered portion to their standards *f*, then bent into curved standards of a thickness equal to the last-mentioned portion, and terminating in thicker abutting foot portions, substantially as and for the purpose described.

7. In a metal railroad-tie, in combination, the flexible rail-rest having abutment-ribs between its standards and provided with standards and abutting foot portions, said portions extending inward from said standards a greater distance than outward, substantially as and for the purpose described.

8. The flexible spliced rail-rest, in combination with a rigid foundation abutment-plate, substantially as described.

9. The abutment-ribs *a a'* of the foundation-plate A, made of less height than the abutment-ribs *a' a'* and with a bevel surface a^4, substantially as and for the purpose described.

10. The abutment-ribs *m m'* of the rail-rest, these *m'* being made of a less height than the ribs *m*, in combination with the differently-formed chair-plates C C' and the rails C^2 C^3, substantially as and for the purpose described.



11. The combination of the auxiliary braces E, rail-rest, rail, and foundation-plate A, substantially as and for the purpose described.

12. In combination with a rigid or solid plate or foundation, a flexible transverse rail-rest receiving the rail between its bearings, said transverse rail-rest yielding at once, under a load, bodily throughout its entire length and thickness between the foundation-supports, and in thus yielding assuming a downwardly-curved or approximately-segmental form, and when the load is withdrawn resuming its original straight shape, substantially as described.

410,685. CASH INDICATOR AND REGISTER. JAMES R. FARROW, Southport, and JAMES MCG. CARRIE, Salford, County of Lancaster, England. Filed May 20, 1889. Serial No. 275,894. (No model.) Patented in England Sept. 1, 1887, No. 11,956.

Claim.—1. In a cash indicator and register, the combination, with an index-plate cut with a slot and inscribed with a scale of the denomination of money, and an operating-rod or pointer, of a revolving drum, which displays or indicates the amounts of money to be registered at each transaction, a sliding rack which actuates the registering mechanism, and mechanism to register the amounts successively indicated.

2. In a cash indicator and register, the combination, with the index-plate having scales inscribed thereon, the operating-rod or connecting-piece E, and pointer *e*, of a sliding rack which actuates the registering mechanism and swinging rack-frame, by the movement of which the racks are moved into and out of gear with the pinions with which they engage.

3. In a cash indicator and register, the combination, with an index-plate having one, two, or more scales inscribed thereon—one for each denomination of money—one, two, or more operating-rods or connecting-pieces E, and pointers *e*—one for each scale—of one, two, or more sliding racks, which actuate the indicating and registering mechanism, one, two, or more sets of registering mechanism, and one, two, or more indicating-drums—one for each denomination of money—each operated by one connecting rod or piece E through a sliding rack.

4. In a cash indicator and register, the combination, with the sliding racks F, of the swinging rack-frame composed of the upright rods or pillars *f* and the cross-bars *f'*, substantially as described.

5. In a cash indicator and register, the combination, with the sliding racks F, of the pinions G, the pivoted levers H, the levers A, substantially as and for the purposes described.

6. In a cash indicator and register, the combination with the sliding rack F and swinging frame *f f'*, of the pinion G and the weighted guard or tumbler N.

7. In a cash indicator and register, the combination, with the sliding racks F and pinions G, having teeth *g* on their back of the catch or pawl levers J, the pivoted levers H and A, and the recording-disk I.

8. In a cash indicator and register, the combination, with the sliding rack and swinging rack-frame, of the pivoted lever *d*, substantially as and for the purposes described.

9. In a cash indicator and register, the combination, with the index-plate having scales inscribed thereon, the operating connecting rod or piece E, and pointer *e*, of the sliding racks F, revolving drums L, bands M, and pulleys *l*, substantially as described.

10. In a cash indicator and register, the combination, with the sliding racks and swinging rack-frame, of the pivoted fork O and swinging lever *o*, substantially as and for the purposes described.

11. In a cash indicator and register, the combination, with the sliding racks and swinging rack-frame, of the fork O, bracket P, swinging lever *o*, and spindle *p*, substantially as described.

12. In a cash indicator and register, the combination, with the sliding racks and swinging rack-frame, of a pivoted hook or catch S to lock or retain the racks out of gear with the pinions.

13. In a cash indicator and register, the combination of the sliding racks, swinging rack-frame, pivoted hook or catch S, and bolt or lock on the drawer, substantially as and for the purposes described.

14. In a cash indicator and register, the combination, with the cash-drawer, of a pulley *t*, band T, spiral spring U, and spindle *u*, substantially as described and shown.

410,686. HANDLE FOR BUCKETS OR FRUIT-BASKETS. OLIVER S. GANDY, Newport, N. J. Filed July 22, 1889. Serial No. 318,304. (No model.)

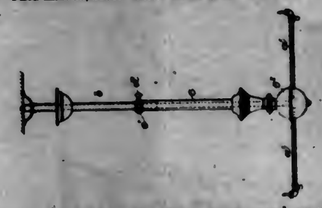
Claim.—1. The improved handle for baskets and other vessels, consisting of a bail provided at one end with a shoulder E and a hook D' and at its other end with a swinging hooked fork D, swiveled thereto, as set forth.

2. The movable handle for baskets, provided at one end with a rigid hook adapted to engage the rim of the basket and form a fulcrum and having a swinging hooked fork at its other end, as set forth.

410,687. WIRE-GUY GRIPPER. JAMES GIBSON, Kansas City, Mo. Filed Mar. 21, 1889. Serial No. 304,208. (No model.)

Claim.—1. In a gripping apparatus for wire rope having a base-plate, the combination therewith of cam-jaws consisting of opposite eccentrically-pivoted circular plates and operating-levers rigidly connected laterally with said cam-plates, and hinged and arranged to yield in a transverse relation thereto, for the purpose described.

2. In a grip apparatus for wire rope having a suitable base-plate, the combination therewith of opposite eccentrically-pivoted grasping cam-plates having pivot-bolts on said base-plate, and a hasp connected with one of said bolts and adapted to be removably secured to the other bolt, substantially as described.

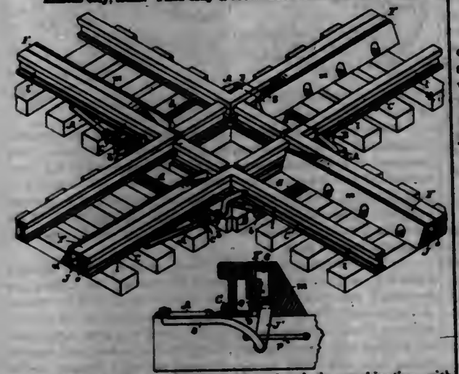


3. In a grip apparatus for wire rope having a suitable base-plate, the combination therewith of opposite eccentrically-pivoted grasping cam-plates having pivot-bolts on said base-plate, (one of said bolts having a flat head or plate and the other bolt a contracted head,) and a hasp hinged to the said plate on the head of one of said bolts at one end and having its opposite end provided with a suitable opening adapted to receive said contracted bolt-head and keyed thereto, for the purpose described.

410,688. ARTIFICIAL STONE. OTTO R. C. GOELZE, Detroit, Mich. Filed Feb. 27, 1889. Serial No. 301,256. (No specimens.)

Claim.—1. The composition of material consisting of litharge and acetate of lead and water, in the proportions named, mixed together in the manner described, and combined with sulphate of baryta, substantially as and for the purpose described.

2. The described composition consisting of sulphate of baryta, litharge, and acetate of lead, combined in the proportions named and in the manner specified, when used in combination with cement and water saturated with alum and borax in the formation of slabs of artificial stone, substantially as described.



410,689. ELECTRIC-LIGHT FIXTURE. JAMES C. HALLIDIE, Boston, Mass. Filed Mar. 26, 1889. Serial No. 304,946. (No model.)

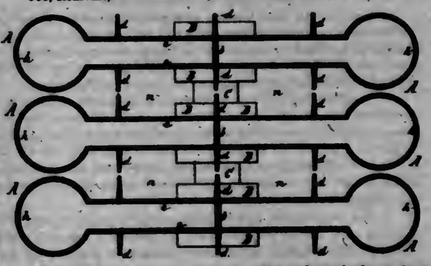
Claim.—1. A fixture *a*, of ordinary or approved construction, as described, combined with tubes *b c*, of greater diameter than the fixture and adapted to be telescoped one within the other to uncover the space between the said fixture and the said tubes, substantially as and for the purpose described.

2. A fixture *a*, of ordinary or approved construction, as described, combined with the surrounding tubes *b c*, of greater diameter than the fixture to leave a space between them and the fixture for the reception of electric conductors, the said tubes being adapted to be telescoped one within the other to uncover the space between the fixture and the tubes, and a locking device for retaining the tubes in adjusted position, substantially as and for the purpose set forth.

410,690. SIGNAL FOR RAILROAD CROSSINGS. DANIEL H. IRWIN, Kansas City, Kans. Filed May 1, 1889. Serial No. 309,191. (No model.)

Claim.—1. In a railroad-crossing signal, the combination, with the spring-supported shoe, of the upright shaft provided with an arm carrying a curtain or shield adapted to vibrate between the lamp and the glass-covered opening of the signal, and mechanism through which said shoe actuates said shaft, substantially as set forth.

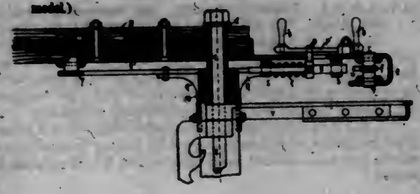
2. The combination of the spring-supported shoe, the downwardly-deflected arm, the sliding rod, the signal-operating levers having upwardly-bent forward or free ends and arranged upon opposite sides of a track or arm of the crossing, the crank rock-shaft connected to said shoe and said arm, wires connecting with said levers, the quadrant wheels or levers, the chains C' C'', the wires u, 9, and 10, link 8, and rod-wire C', the shaft L, having an arm at its lower end, to which are connected said rods or wires C', the spring applied to said arm or shaft and to a fixture, the signal G, and curtain or shield G', applied to the upper end of the shaft L, and the lamp secured to the upper end of the tube or pipe inclosing the shaft L, substantially as specified.



3. In a railroad-crossing signal, the combination, with a spring-supported shoe right-angular in cross-section, with its horizontal flange beveled downwardly at its ends, of the crank-ed rock-shaft, the plates fixed to the shoe and hinged or articulated to rigid staples on the rock-shaft, the signal-lever connected to said rock-shaft, and the signal-shaft connected to said lever, substantially as specified.

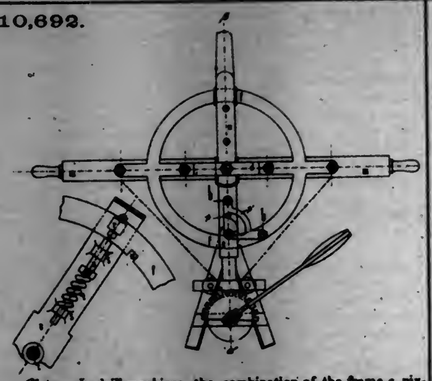
4. In a railroad-crossing signal, the combination, with a spring-supported shoe and a rock-shaft connected thereto, of the revolvable signal-shafts arranged on opposite sides of the crossing track, and the signal-levers connected respectively to said signal-shafts and to each other, one of said levers being connected to the said rock-shaft, substantially as specified.

5. In a railroad-crossing signal, the combination, with a spring-supported shoe and a rock-shaft connected to said shoe, of the signal-lever A, pivoted at one end on one side of the track and connected at its free end to the signal, and the signal-lever B, pivoted at the opposite side of the track and connected to a signal, and also connected at one end to an intermediate point of the lever A, whereby said levers and the signals connected thereto are simultaneously operated, substantially as specified.



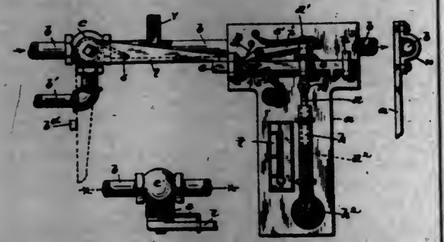
6. In a railroad-crossing signal, the combination, with a spring-supported shoe and a rock-shaft connected thereto, of the signal-lever connected to said rock-shaft, the revolvable signal-shaft provided with an arm which is connected to said signal-lever and bearing an actuating-spring whereby it is automatically returned to its normal position, and the curtain or shield fixed to an arm of the signal-shaft and arranged in a casing or closure provided with an opening to be closed by said curtain or shield, substantially as specified, for the purpose set forth.

410,691. STEAM AND HOT-WATER RADIATOR. THADDEUS C. JOY, Titusville, Pa. Filed Feb. 6, 1889. Serial No. 299,573. (No model.)



Claim.—The steam or hot-water radiator formed of a series of connected hollow circulating-sections, the intermediate portions of said sections having hollow columnar enlargement projections at their ends, which are in horizontal section a part of a circle and form a vertical air-column way a from bottom to top and end to end of the sections, and said intermediate portions of the sections being formed with projections which, with the enlargement projections, form a series of vertical air-column ways, as a a', from bottom to top of the sections, substantially as and for the purpose described.

410,692. DRILL-MACHINE. AUGUST KIRNER, Dortmund, near Dortmund, Germany. Filed Aug. 8, 1888. Serial No. 282,259. (No model.)



410,692.

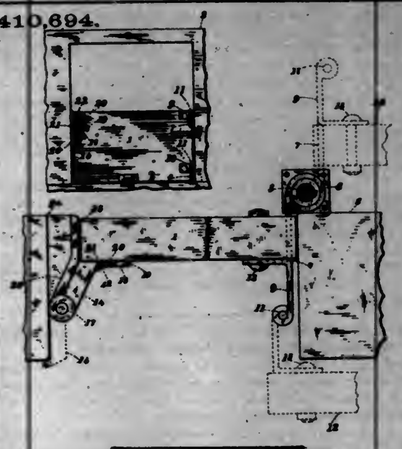
Claim.—In drill-machines, the combination of the frame *e*, pivoted at *w* to the king-bolt *c*, and having fixed to it the bar *n*, a catch *o*, and spring *i*, with the fifth-wheel *f*, having a slot-*s*, and with the sector *p'*, having handles *b*, substantially as and for the purpose described.

410,693. ANTI-FREEZING DEVICE FOR WATER-PIPES. CORNELIUS MILLER, Providence, R. I., assignor of one-fourth to George W. Pettis, same place. Filed Dec. 3, 1888. Serial No. 292,495. (No model.)

Claim.—1. The combination, with a mounted valve or cock, of mechanism connected with said valve and released by a piston of said mechanism actuated by the change in volume of mercury, alcohol, or other suitable liquid directly affected by thermal changes, substantially as hereinbefore described, and for the purpose specified.

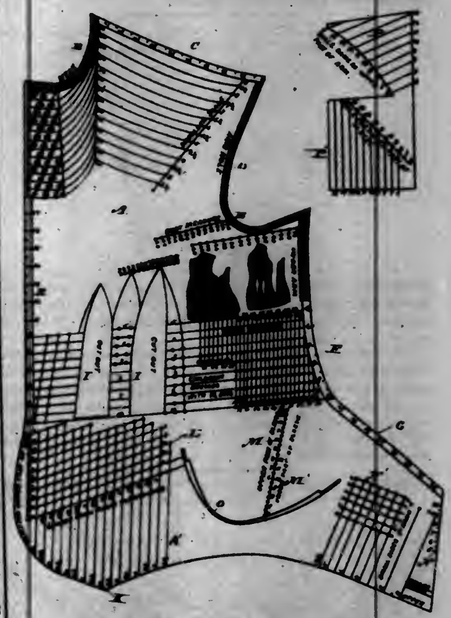
2. A self-closing valve having releasing mechanism consisting of a mounted spring-actuated bar adapted to retain the valve-lever in a normal position, a connection or link provided with a piston d^3, supported by a column of mercury or other suitable fluid having the property of expanding and contracting by thermal changes, and a spring-pawl or lever *i*, engaging both the said spring-actuated bar and link, substantially as described.

3. The combination, with a spring-actuated bar, a tripping-lever engaging said bar directly actuated by variations due to thermal changes in the height of a column of mercury, of a stop-valve provided with a lever engaging said bar and adapted to close the valve upon the withdrawal of the bar, substantially as hereinbefore described.



4. The non-freezing attachment for water-pipes, &c., substantially as hereinbefore described, the same consisting of a water-pipe *b*, a self-closing valve or cock *c*, located in said pipe, a mounted spring-actuated bar *e*, provided with a notch e^2, a spring-pawl *i*, engaging said notch, a mercury-holding tube *h*, an adjustable link or rod *d*, adapted to engage the pawl *i* and provided with a piston d^3, fitting said tube and in contact with the mercury, and a spring *d'*, for insuring the contact of the piston with the mercury.

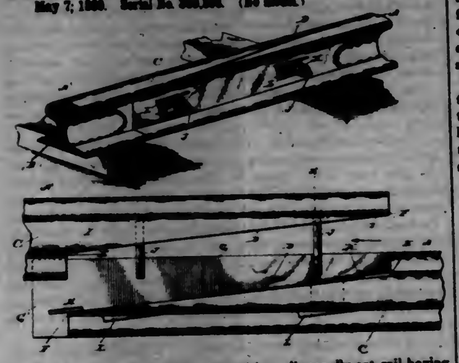
410,694. FREIGHT-CAR DOOR. JOHN MONTGOMERY, Jarvis, Ontario, Canada. Filed May 6, 1889. Serial No. 309,738. (No model.)



Claim.—1. A freight-car door consisting of a door 1, provided with double hinges mounted on a vertical pivotal bar, so as to be capable of opening either inside or outside of the car or of being moved up or down on the pivotal bar, in combination with a pivoted check-bar 14 and a latch-fastening device, substantially as described.

2. In a hinged car-door, the combination therewith of a pivoted check-bar and a latch-fastening device for holding it closed or permitting it to open outward, substantially as and for the purposes described.

410,694.

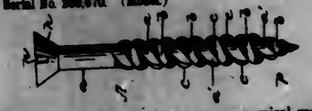


410,695. DRESS-CHART. JULIA PERLEY, Portland, Me. Filed Mar. 13, 1889. Serial No. 303,167. (No model.)

Claim.—1. In a dress-chart, the combination of a shoulder-scale C, graduated by numbers thereon, a neck-scale B, the latter being composed of a series of intersecting lines and numbers at the intersections of said lines, and connecting lines between the numerals on scale B and C, whereby a measurement of the neck of a garment being laid off by number on the neck-scale, the number on the shoulder-scale connected thereto indicates the proper shoulder-measure, substantially as set forth.

2. The combination, with the sleeve-scale A', of the separate scales P P', said scales being graduated by numbers, the numerals on the scale P corresponding with those on the scale A', and the numerals on the scale P' corresponding with similar numbers on the scale P, whereby, when a certain number on the scale P is applied in the manner set forth in the specification to its equivalent number, said number having been ascertained by measurement, the same numeral on the scale P' indicates the extreme point of the upper end of the under part of a dress-sleeve, substantially as set forth.

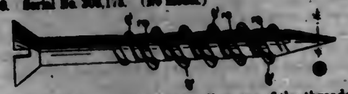
410,696. RAIL-JOINT. HIRAM B. POTTER, Canton, Kans. Filed May 7, 1889. Serial No. 309,891. (No model.)



Claim.—1. The combination, with a diagonally-cut rail having an integrally-formed base-plate extending beyond the end of the body of the rail, of a second oppositely-cut rail recessed at its base to receive said plate, substantially as set forth.

2. The combination, with a diagonally-cut rail having an integrally-formed base-plate extending beyond the end of the rail and of the full width of the rail's base throughout, of a similarly-cut rail adapted to overlap the first and having its base recessed to receive and rest upon the whole surface of said plate, whereby the joint may be supported and be held against torsional opening by spikes upon each side of the rail, binding together said plate and the superposed base of the other rail.

3. The combination, with the diagonally-cut rail A, provided with the integrally-formed slotted base G, of the similarly-cut rail A', recessed to receive said base and provided with the lugs to enter said slots, substantially as and for the purpose set forth.



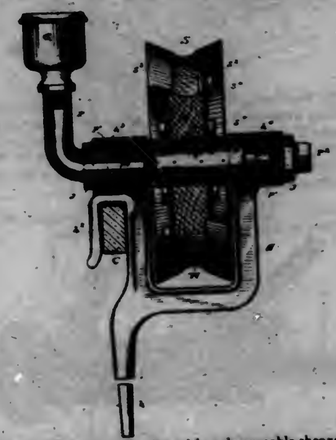
4. The combination, with the diagonally-cut overlapped rails, the bolts passing transversely through the overlapped ends, and the bosses formed integrally with one of said ends and having their outer surfaces parallel to the diagonally-cut faces, substantially as and for the purpose set forth.

410,697. WOOD-SCREW. CHARLES D. ROGERS, Providence, R. I., assignor to the American Screw Company, same place. Filed Feb. 12, 1889. Serial No. 300,070. (Model.)

Claim.—A screw provided with one or more spiral grooves impressed into the metal of a screw-blank and with spiral threads raised between the grooves and the adjacent normal surface of the blank by the compression and displacement of the metal in forming the grooves.

410,698. DRIVE-SCREW. CHARLES D. ROGERS, Providence, R. I., assignor to the American Screw Company, same place. Filed Apr. 6, 1889. Serial No. 306,173. (No model.)

Claim.—A rolled screw having the diameter of the threaded portion exceeding that of the plain or unthreaded portion, and having the bottom of the grooves between the said threads formed into low auxiliary ribs or projecting surfaces, the outer faces of which have substantially the same diameter as the said unthreaded portion.



410,699. SPOOL-HOLDER. ANDREW W. SAWYER, Providence, R. I. Filed Mar. 12, 1889. Serial No. 302,991. (No model.)

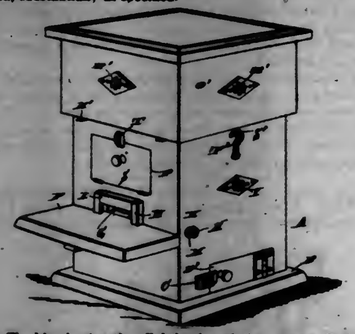
Claim.—1. The combination of the two-part frame portion sliding one upon the other, an attaching-pin secured to the back of said frame, a thread guide and cutter, and oppositely-arranged inwardly-extending divided arms *c*, having the free ends thereof arranged to enter and frictionally engage the interior of a spool, substantially as shown and described.

2. The spool-holder hereinbefore described, consisting of the attachable frame portion formed of two pieces sliding endwise one upon the other, oppositely-arranged spool-holding arms secured to the lower side of said frame, a thread guide and cutter secured to the upper portion of the frame, and hooks *h* at the vertical sides, substantially as shown, and for the purpose set forth.

410,700. CABLE SHEAVE AND HANGER FOR CABLE TRAMWAYS. HARRY C. BENSON, Brooklyn, N. Y., and ALBERT WAGGONER, Columbus, Ohio. Filed June 16, 1888. Serial No. 314,443. (No model.)

Claim.—1. In combination with a loose cable-sheave, a tubular shaft, a hanger comprising a pair of bearing portions, and screw-plugs adjustable within the respective bearing portions and having circumferential shoulders which coact with the ends of the shaft and terminal studs which project into the shaft at its respective ends, substantially as hereinbefore specified.

2. The combination of a hanger comprising a pair of bearing portions, screw-plugs adjustable within the respective bearing portions and having circumferential shoulders and terminal studs, one of the plugs being tubular and of L shape, a grease-cup applied to the latter, a tubular shaft provided with radial perforations and mounted between said shoulders upon said studs, and a cable-sheave mounted loosely upon said shaft, substantially as hereinbefore specified.



3. The combination of a hanger comprising a pair of bearing portions which are tapped and counterbored, screw-plugs adjustable within the respective bearing portions and having circumferential shoulders and terminal studs, one of the plugs being tubular and of L shape, a grease-cup applied to the latter, a tubular shaft provided with radial perforations and mounted between said shoulders upon said studs, and a cable-sheave mounted loosely upon said shaft and having a hub, the ends of which are in contact with the inner ends of said bearing portions of the hanger, and wooden segments around said hub, extending outward to the groove of the sheave, substantially as hereinbefore specified.

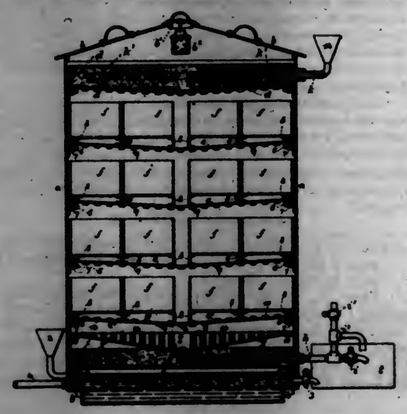
4. In combination with a trench having a cross-bar with central lugs and a socket beneath the same, a hanger having a leg the lower end of which is fitted to said socket, and a hook fitted to the cross-bar between its lugs and having a pair of bearing portions at top, plugs fitted to the latter, a grease-cup carried by one of said plugs, a tubular shaft, and a loose cable-sheave, substantially as hereinbefore specified.

410,701. BEE-HIVE. CHRISTIAN H. STORY, Sevierville, Tenn., assignor of one-half to William P. Mitchell, same place. Filed Sept. 3, 1888. Serial No. 284,916. (No model.)

Claim.—1. The hive having the brood-chamber D, having the opening P, provided with the pane R and hinged door S and the entrance G, the air-chamber E, arranged below the brood-chamber and having the opening A' in its side and a hinged door for the same, the bottom board C between the two chambers, provided with the opening U, and the slide V, adapted to open or close said opening and

having one end projecting from one side of the hive, for the purpose set forth, substantially as specified.

2. The hive having the alighting-board, the entrance G, the tube K, extending transversely through one side of the hive and in rear of the entrance G, said tube being provided with the opening L, arranged opposite the entrance and level with the bottom thereof, for the purpose set forth, and the wiper adapted to be inserted in the opening, substantially as described.



410,702. LIFTING-JACK. JOSEPH T. WEATHERLY, Flint, Ala. Filed July 30, 1888. Serial No. 319,162. (No model.)

Claim.—1. The combination of the hollow standard, the lifting-bar mounted therein and provided with ratchet-teeth on its sides and rack-teeth on its back, the links pivoted at their upper ends within the standard, the lever fulcrumed between the lower ends of the links and having a segmental gear at its end adapted to engage the rack-teeth on the lifting-bar, the pawls mounted on the standard and engaging the ratchet-teeth, and mechanism for disengaging the pawls from the ratchet-teeth, as set forth.

2. The combination of the hollow standard, the lifting-bar mounted in the standard and provided with ratchet-teeth on its sides, mechanism for raising the lifting-bar, the pawls mounted in the standard and engaging the ratchet-teeth, the treadle mounted on the rear of the standard, the pitmen connecting the treadle with the pawls, and the springs bearing on the pawls and adapted to throw them into engagement with the ratchet-teeth, as set forth.

410,703. BAKER FOR CLAMS. THOMAS C. AVERY, New York, N. Y. Filed Apr. 25, 1889. Serial No. 308,698. (No model.)

Claim.—1. The combination, in a clam-baker, of a case *a*, having a cover and door, a water-receptacle at b^2, comprising the bottom of the case, an open-work metal receptacle *c* for sea-weed, extending entirely across the case and located directly above the water-receptacle, an open-work metal receptacle *d* for sea-weed, also extending across the case and located in the top part thereof, and open-work metal baskets *f* to hold the material to be cooked, located between the sea-weed receptacles, substantially as and for the purpose set forth.

2. The combination, in a clam-baker, of a case *a*, having a cover and door, a water-receptacle at b^2, comprising the bottom of the case, an open-work metal receptacle *c* for sea-weed, extending entirely across the case and located directly above the water-receptacle, a receptacle *g* for the juice or liquid directly above the sea-weed receptacle *c* and a pipe therefrom for discharging the liquid, an open-work metal receptacle *d* for sea-weed, also extending across the case and located in the top part thereof, and open-work metal baskets *f* to hold the material to be cooked, located between the upper sea-weed receptacle and the receptacle *g*, and removable concave perforated metal trays *e e'*, for supporting the baskets *f*, substantially as and for the purposes set forth.

3. A clam-baking device consisting of a case *a*, having a cover and door, a water-receptacle at b^2, perforated metal receptacles *c d* for sea-weed, concaved perforated metal trays *e e'*, having ribs 8 thereon, perforated metal or wire baskets *f* for the material to be cooked, the conical tray *g*, having vertical pipes passing through it and forming a receptacle for the juice, and a pipe *h*, for discharging the juice, and a funnel 12 and pipes *k k'*, for returning the same within the case, substantially as set forth.

4. The combination, in a clam-baker, with the case *a*, of the door *a'*, extending across one side, the cover *b*, the auxiliary cover *b'*, and the basket b^2, substantially as set forth.

5. The combination, in a clam-baker, with the case, door, and cover, of the sea-weed receptacles *c d*, the juice-receptacle *g*, having vertical pipes 14, the delivery-pipe *h* and cock *i*, the siphon or overflow and cock *i'*, the return-pipes *k k'*, and funnel 12, substantially as set forth.

6. The combination, in a clam-baker, with the case, door, and cover, of the perforated metal trays *e e'*, the perforated metal or wire baskets *f*, the juice-receptacle *g*, having vertical pipes 14, and the delivery-pipe *h* and cock *i*, substantially as set forth.

410,704. TROUSERS-ELEVATOR. SAMUEL W. BROCK, Hamilton, Ohio. Filed May 2, 1889. Serial No. 309,209. (No model.)

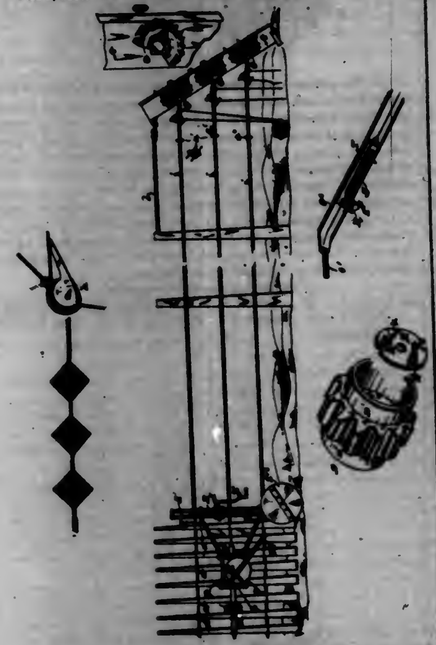
Claim.—1. In a trousers-elevator, the combination, substantially as set forth, of strips secured to the inner surface of the trousers near the side seams thereof, a button over each of said strips, and a strip pivoted to each of said secured strips and provided with notches adapted to engage said button.

2. In a trousers-elevator, the combination, substantially as set forth, of perforated strip D, adapted to be secured to goods, and a strip E, pivoted to the end thereof and provided in its edge with one or more notches adapted to engage a button.

3. In a trousers-elevator, the combination, substantially as set forth, of a piece D, provided with transverse grooves terminating in perforations, and a strap E, pivoted at its lower end to the upper end of piece D, and provided in its edge with one or more notches adapted to engage a button.

410,705. VEHICLE-SPRING. RICHARD H. CARPENTER, Jackson, Mich. Filed June 6, 1889. Serial No. 313,373. (No model.)

Claim.—1. In a vehicle-spring, the combination, substantially as hereinbefore set forth, of the four quarter-sections A, the center spring F, the coupling E, and bolt connecting the inner ends of the quarter-springs and the center spring, the short springs G, having their inner ends secured to the springs A, and the shackles H to couple the ends of the springs G and center spring F.



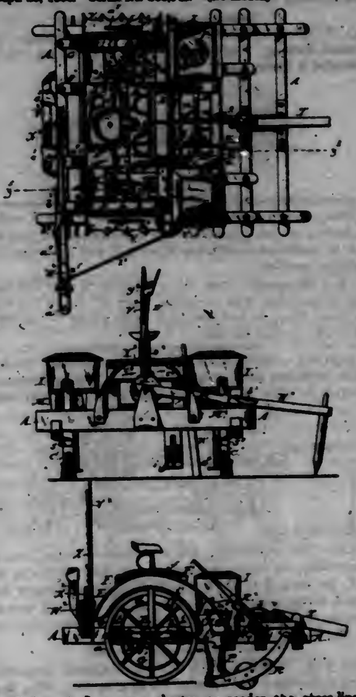
2. The combination, substantially as specified, of the center spring and quarter-springs A, the coupling E and its bolt for the inner ends of said quarter-springs, and the bolt centrally connecting the said quarter-springs, center spring, and coupling, the four short springs G, secured to the quarter-springs, the shackle H and its bolt for coupling the ends of the springs G and center spring F, and the shackle B and its bolt to couple the outer ends of the quarter-springs.

3. The combination, substantially as specified, of the quarter-springs, the short springs G secured thereto, the center spring F, the coupling E, spring-bar J, and bolts connecting the coupling-springs and spring-bar, and the shackle H to couple the outer ends of the short springs G and center spring F.

4. The combination of the axle C, having the downwardly-bent center part, the shackles B, secured upon each end of said axle, and the compound spring-coupling comprising the quarter-springs A, coupled to said shackle B, the coupling E for the inner ends of said quarter-springs, the center spring F, also secured to said center coupling, the short springs G, and the shackle H and its bolt for coupling the ends of said center spring and the short springs G.

5. A spring-coupling for connecting the body and gear of vehicles, consisting of four quarter-sections arranged in pairs, a semi-elliptic spring arranged between the said quarter-springs, a center coupling for said center and quarter springs, four short spring-sections G, secured upon the quarter-springs and having their outer ends curved above the quarter-sections and in the same plane as the upwardly-curved ends of the center spring, and shackle H and bolt *h* to couple the outer ends of the said short spring-sections and the ends of the center spring, substantially as and for the purpose set forth.

410,706. FENCE-MACHINE. ISAIAH R. REED, Canton, Okla. Filed Feb. 2, 1889. Serial No. 298,513. (No model.)



Claim.—1. The combination of the spool-frame A, provided with the spools B, the gear-wheels C, adapted to cause each set of the spools B to rotate in unison, the straps *d*, and the brace *b*, adapted to press against the adjacent post, substantially as and for the purpose specified.

2. The combination of the side pieces *a'*, the twister-heads provided with the journals D, and the disk K, having the notches *k* and *k'*, said notches being formed in pairs of unequal depth, and the lips or extensions *m*, the drive-chain E, and the adjustable arms I, carrying the wheel F, substantially as and for the purpose specified.

3. The combination of the sliding bar *n*, the wheel M, eccentrically attached thereto by the bolt *o*, the block *n'*, adjustably attached to the sliding bar *n* and provided with a groove adapted to receive the fence-wire *i*, opposite the groove, the guides or ways *p*, and the horn P, the whole being mounted on a twister-frame, substantially as and for the purpose specified.

4. The combination of the braces O', the picket-adjusters R, provided with the elongated slots S, and the shoulders T, and the bolts T, the whole being mounted on a twister-frame, substantially as and for the purpose specified.

410,707. CORN-PLANTER. JOSEPH G. HARRIS, Sedalia, Mo. Filed Sept. 25, 1888. Serial No. 286,048. (No model.)

Claim.—1. In a corn planter or seeder, the cross-line marker composed of two long bars, two adjustable short transverse bars connecting said long bars, and interposed wooden bars, in combination with the wheel-shaft and two wheels arranged thereon, one of which wheels is provided with teeth and fixed to the shaft and the other loose with reference to said shaft.

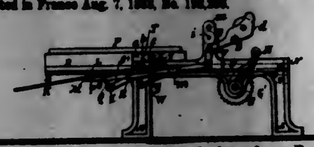
2. The combination, with the cross-line marker formed as described and provided with adjustable nibs, of slotted bows G G', adjustably fixed to the long bars of the cross-line marker, adjustable nibs *i i'*, arranged in the slots of said bows, the ratchet-wheel fixed upon the seeder-shaft, and the spring-detent *w*, fixed to the frame of the planter, as and for the purpose specified.

3. The combination, with the cross-line marker, as described, of the shaft B, wheel C, toothed or serrated wheel C', and the spring *c*, located between the said wheel C and plate *b*, as and for the purpose set forth.

4. The combination, with the frame of the planter, bows E, for the driver's seat, boards F F', fixed to said bows, the forked lever *e*, and spring *f*, of the cross-line marker, the wheel C', spring *c*, and the wheel C, whereby the cross-line marker may be thrown out of gear with the planter when it is desirable to move the latter from place to place, as set forth.

5. The combination, with shaft H, the hub *m*, fixed thereon, provided with pins, and the ratchet-wheel K, provided with segmental slots m^2, adjustably fixed to the said hub, and the pawl *w*, of the cross-line marker and the nibs adjustably fixed thereto, adapted to engage said ratchet-wheel, the gear-wheels on said shaft, and the grooved rollers, as and for the purpose specified.

6. The combination, with the planter-frame and the arc Y^2, secured to said frame, of the cars e^2, pivoted to said arc, each of which is provided with two holding-nibs, the one to catch and hold the lever W^2 and the other to take hold of the said arc as a brace, and the lever W^2, as and for the purpose specified.

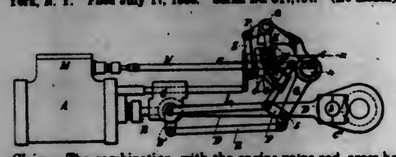


7. The combination, with pointed lever W and spring X, secured

thereto, of the planter-frame and the pin b^4 to receive the spring X, as set forth.

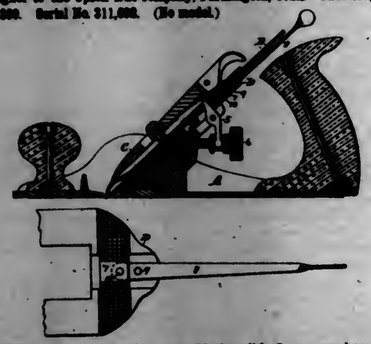
8. The combination, with the seeder-box, of the bed-plate fitting therein, slotted in one of its angles and fitted with two slides, one overlapping the other, each of said slides being arranged for limited adjustment, substantially as set forth.

9. The combination, with the cross-line marker, as described, of the pointed plate V and graduated concave plate U, as and for the purpose set forth.



410,708. LITHOGRAPHIC PRESS. GUSTAV HEIDENS, Dresden, Saxony, Germany. Filed Mar. 26, 1889. Serial No. 304,914. (No model.) Patented in France Aug. 7, 1888, No. 192,203.

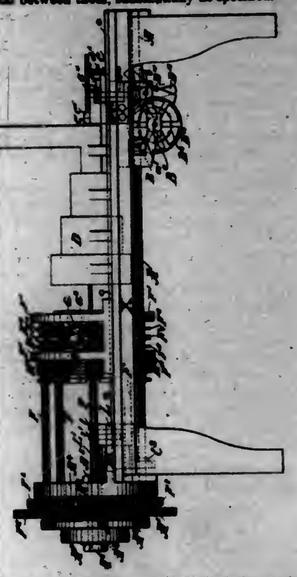
Claim.—1. In a lithographic press, the lever-frame R, with forks X and hook y, curved grooves Z, stud Q, elbow-lever U, and inking-roller S, in combination with bar K, stud P, and guide-bars O, substantially as specified.



2. In a lithographic press, the combination of plate T at the sides of slide D, provided with projecting studs or pins *a b c*, with the fork X, lever frame R, and springs W, with guides W', substantially as and for the purpose set forth.

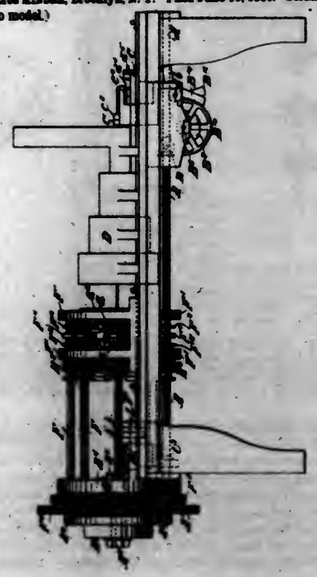
410,709. VALVE-GEAR FOR STEAM-ENGINES. CHARLES W. HUNT, West New Brighton, assignor to the C. W. Hunt Company, New York, N. Y. Filed July 17, 1888. Serial No. 317,797. (No model.)

Claim.—The combination, with the engine valve-rod, cross-head, and connecting-rod having a short arm, of the radius-arm G, the rocker F, and links E L, for moving the same, the swinging link H, the pivot 6 for the same upon the radius-arm G, the link 8, connecting the swinging link H with the rocker F and the sector, and connections to the valve-rod, substantially as set forth.



410,710. BENCH-PLANE. GEORGE KARRMANN, Unionville, assignor to the Upson Nut Company, Farmington, Conn. Filed May 23, 1889. Serial No. 311,602. (No model.)

Claim.—In a bench-plane, the friction-slide 7, arranged to move transversely under the upper end of the cutting-bit, and provided with operating mechanism, substantially as described, and for the purpose specified.



410,711. PROCESS OF MAKING SOLID-LINK CHAINS. JULIUS KINDER, Brooklyn, N. Y. Filed June 10, 1889. Serial No. 314,236. (No model.)

Claim.—1. The process of making a solid-link chain, consisting in taking a rod of metal and first indenting it by pressure on opposite sides and also in directions at right angles to each other to form portions on the bar of the approximate shape of chain-links, afterward puncturing and opening out by pressing aside the metal between the ends of said link-shaped portions and at the sides of said ends, further shaping by pressure said link-shaped portions into the form of links and severing said link-shaped portions from each other by incisions in the metal between them, substantially as specified.

2. The process of making a solid-link chain, consisting in taking a rod of metal and first indenting it by pressure upon opposite sides and also in direction at right angles to each other to form portions on the bar of the approximate shape of chain-links, afterward puncturing and opening out by pressing aside the metal between the ends of said link-shaped portions and at the sides of said ends, further shaping said link-shaped portions into the form of links by pressure and severing said link-shaped portions from each other by incisions in the metal between them, the links being ultimately forced into proper relative position by pressure applied between their adjacent ends after they have been pressed toward each other during the operation of severing, substantially as specified.

410,712. APPARATUS FOR MAKING SOLID-LINK CHAINS. JULIUS KINDER, Brooklyn, N. Y. Filed June 10, 1889. Serial No. 314,237. (No model.)

Claim.—1. The combination, with intermittently-operating apparatus for moving a rod of metal along, of a series of intermittently-operating dies for forming indentations in the rod opposite each other and also in directions at right angles to each other to form portions on the bar in the approximate shape of chain-links, intermittently-operating spacers acting on the metal between the ends of said link-shaped portions and at the sides of said ends to press said metal aside, and cutters for severing the links from each other, substantially as specified.

2. The combination, with intermittently-operating apparatus for moving a rod of metal along, of a series of intermittently-operating dies for forming indentations in the rod opposite each other and also in directions at right angles to each other to form portions on the bar in the approximate shape of chain-links, intermittently-operating spacers acting on the metal between the ends of said link-shaped portions and at the sides of said ends, and cutters operating to form incisions between the links and force said links apart to sever them from each other, substantially as specified.

3. The combination, with intermittently-operating apparatus for moving a rod of metal along, of a series of intermittently-operating dies for forming indentations in the rod opposite each other and also in directions at right angles to each other to form portions on the bar in the approximate form of chain-links, intermittently-operating spacers acting on the metal between the ends of said link-shaped portions and at the sides of said ends intermittently-operating cutters operating to sever said links from each other, and separators acting between the ends of said links to force them apart and into their proper relative position, substantially as specified.

4. The combination, with intermittently-operating apparatus for moving a rod of metal longitudinally, of a series of intermittently-operating dies, spacers, cutters, and separators adapted to press, open and cut, and separate the cut portions of said metal rod from each other, and an annealing-furnace through which said rod passes intermediate of said moving apparatus and said dies, spacers, cutters, and separators, substantially as specified.

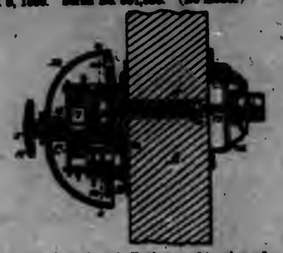
5. The combination, with intermittently-operating apparatus by which a rod of metal is reciprocated and moved along, of an annealing-furnace through which said rod is reciprocated and a number of dies, spacers, cutters, and separators acting intermittently to form said rod into chain, substantially as specified.

6. The combination, with intermittently-operating apparatus for moving a rod of metal longitudinally, comprising jaws for gripping said rod, of independently-operating jaws for gripping and feeding said rod and intermittently-operating dies, spacers, cutters, and separators acting on said rod to form it into a chain, substantially as specified.

7. The combination, with intermittently-operating apparatus for moving a rod of metal longitudinally, comprising jaws for gripping said rod, of independently-operating jaws for gripping and feeding said rod and an adjusting device for varying the degree of feed of said rod imparted by said feeding-jaws, substantially as specified.

8. The combination, with intermittently-operating apparatus for moving a rod of metal longitudinally, of a series of intermittently-operating dies and spacers for forming said rod into the shape of links and a series of sets of cutters acting subsequently on said links to sever them from each other, said sets of cutters operating in succession, substantially as specified.

9. The combination, with intermittently-operating apparatus for moving a rod of metal longitudinally, of a series of intermittently-operating dies and spacers for forming the said rod into the shape of links, a series of sets of cutters acting subsequently on said links to sever them from each other, and separators acting on the severed links to force them into proper relative positions, substantially as specified.



10. The combination, with intermittently-operating apparatus for moving a rod of metal longitudinally, of a series of intermittently-operating dies and spacers for forming said rod into the shape of links, a series of cutters acting subsequently on said links to sever them from each other, and separators acting on the severed links to separate them from each other, all said dies, spacers, cutters, and separators being withdrawn from contact with the metal substantially in unison, substantially as specified.

11. The combination, with intermittently-operating apparatus for gripping a rod of metal and moving it longitudinally, of a series of dies, spacers, and cutters operating on said rod to form it into a chain, and other grippers for gripping the chain, said last-named grippers co-operating with the grippers first named and moving in unison with the same, substantially as specified.

12. The combination, with intermittently-operating apparatus for gripping a rod of metal and moving it longitudinally, of independent feeding-grippers for said rod for feeding it forward, a series of dies, spacers, and cutters operating on said rod to form it into a chain, other grippers for gripping the chain co-operating with the grippers first named and moving in unison therewith and other feeding-grippers for the chain operating with the feeding-grippers first named and moving in unison therewith, substantially as specified.

13. The combination, with a series of dies, spacers, cutters, and separators, of cams operating to force the same inwardly, levers, and a number of other cams acting on said levers to move said dies, spacers, cutters, and separators outwardly, substantially as specified.

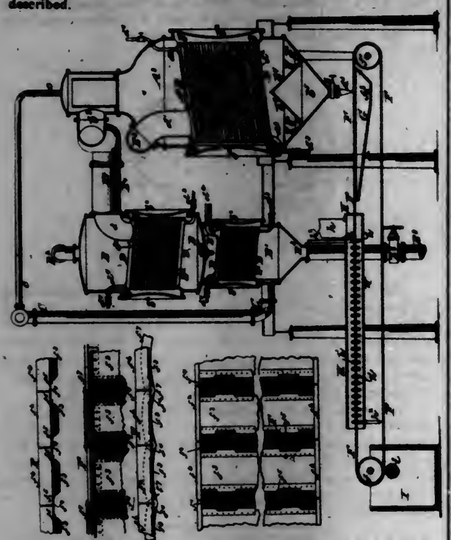
410,718. DOOR-BELL. HENRY LEARD, Bristol, assignor, by direct and mesne assignments, to P. & F. Corbin, New Britain, Conn. Filed Mar. 8, 1889. Serial No. 302,603. (No model.)

Claim.—1. In a door-bell, the combination of a spring-actuated alarm movement and hammer-wire, a slide 17, having a holding and releasing dog 18, arranged to move transversely to the movement of said hammer-wire, a spring 19, for holding said dog in engagement with said hammer-wire, and a push-button 21 at the other end of said slide for throwing said dog out of engagement with said hammer-wire, substantially as described, and for the purpose specified.

2. In a door-bell, the combination of the vibratory hammer-wire, the slide 17, push-button 21 at one end of said slide, a holding and releasing dog adapted to move with said slide transversely from and to the path of said hammer-wire, said dog being provided with a beveled face upon that side which first engages the hammer-wire when moving into its path, substantially as described, and for the purpose specified.

410,714. STEREOTYPE-BLOCK. JAMES G. MERRITT, Highland Falls, N. Y. Filed Nov. 9, 1888. Serial No. 290,267. (No model.)

Claim.—The combination of the block 1, having channels 2, forming opposite feet 3, and the opposite side plates 5, riveted to the opposite feet, as at 4, and having the heads of the rivets within the channels, said plates having the opposite inwardly-turned flanges 6 arranged slightly above the face of the plate, with the plate 8, having the opposite beveled edges 9, substantially as specified.



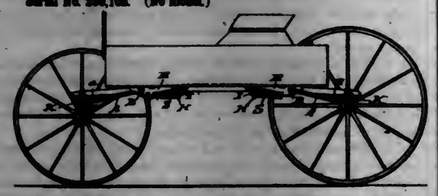
410,715. EVAPORATING APPARATUS. ALEXANDER MELLER, New York, N. Y., assignor of one-half to Robert Dunlop, same place. Filed Feb. 21, 1887. Renewed July 30, 1889. Serial No. 319,572. (No model.)

Claim.—1. The combination, with an upright closed evaporating-pan and a heating-drum arranged therein and containing tubes for circulation of liquor, of a partition arranged in the pan and forming below it in the lower part of the pan a compartment which communicates with the portion of the pan above the partition only through a restricted but uninterrupted and constantly-open aperture in the partition, whereby violent ebullition below the partition will be prevented and the precipitant allowed to deposit, substantially as herein described.

2. The combination, with an upright closed evaporating-pan and a heating-drum arranged therein and containing tubes for circulation of the conical head or partition b^4, extending nearly across the pan, and affording between its edges and the wall of the pan a restricted opening b^5, substantially as herein described.

3. The combination, with an evaporating-pan, as A^3, and a heating-drum arranged therein and containing tubes for circulation, of two heaters B B', connected for the passage of liquor from one to the other of them, and each provided with a heating-drum containing tubes for circulation, a pipe B^3, connecting the vapor-outlet of the pan with the heating-drum of the heater B, and a pipe c^3, for supplying the heating-drum of the heater B' with steam, a pipe B9, for feeding the first heater with liquor, and a pipe C, for conducting hot liquor from the second heater to the pan, substantially as herein described.

4. The combination, with an upright closed evaporating-pan A^1 and a heating-drum arranged therein and containing tubes for circulation, of the heater B' and tubes d therein for circulation, the said heater having its liquor-inlet at the top and its liquor-outlet near the bottom, and being provided at the bottom with an outlet B^2, furnished with a valve or gate, and serving for the removal of impurities from the heater while the apparatus is in operation, substantially as herein described.



5. The combination, with an evaporating-pan A^1 and a heating-drum arranged therein and containing tubes for circulation, of the two heaters B B', arranged one above the other and having a communicating opening controlled by a valve d^3, feed and delivery pipes B^3 C for the liquor, heating-drums containing tubes for circulation and arranged in the heaters, a pipe connecting the vapor-outlet of the pan with the drum of the first heater B, and the pipe for supplying steam to the drum of the second heater B', substantially as herein described.

6. The combination, with an upright evaporating-pan having at the bottom an outlet-nozzle A^3, and the heating-drum arranged in the pan, of an endless conveying and sieving or straining apron arranged below the outlet-nozzle and receiving precipitant therefrom, the nozzle being contracted in a direction lengthwise of the apron and having a width nearly equal the width of the apron, substantially as herein described.

7. The endless sieving or straining apron herein described, composed of alternate imperforate and perforated or reticulated sections and having flanges at the sides, substantially as herein set forth.

8. The combination, with an endless conveying and sieving or straining apron for receiving precipitant, of a drainage-box arranged beneath the apron in its upper travel and near the receiving end, and a heated drying-chamber, through which the apron passes after passing the drainage-box, substantially as herein described.

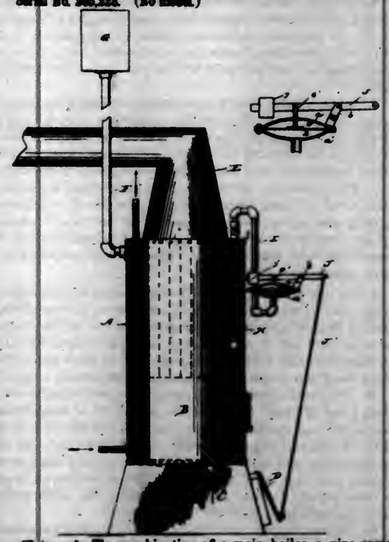
410,716. VEHICLE-SPRING. Gomer Norwood, Boston, Mass., assignor of one-half to Louis Kolb, Cincinnati, Ohio. Filed Feb. 8, 1889. Serial No. 299,102. (No model.)

Claim.—1. The combination of arms A, shaft B, crank D, spring-box E, provided with diaphragm or bearing e^2, spring S, rod F, and nut I, substantially as and for the purposes specified.

2. The combination of the arms A, shaft B, crank D, spring-box E, provided with diaphragm or bearing e^2, spring S, rod F, and bearing-plate at the end of rod F, substantially as and for the purposes specified.

3. The combination of the arms A, shaft B, crank D, spring-box E, provided with sides e and diaphragm or bearing e^2, bearing-plates G and H, spring S, rod F, and nut I, substantially as and for the purposes specified.

4. The combination of the arms A, shaft B, crank D, spring-box E, provided with sides e, and diaphragm or bearing e^2, bearing-plates G and H, each provided with a circumferential flange, spring S, rod F, and nut I, substantially as and for the purposes specified.

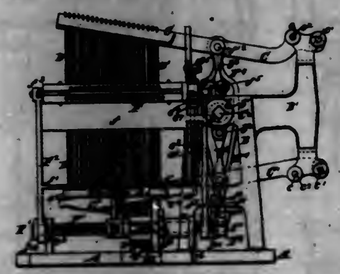


5. The combination of the arms A, shaft B, crank D, spring-box E, provided with sides e, and diaphragm or bearing e^2, bearing-plate G, having flange g and lug g', bearing-plate H, provided with flange A, spring S, rod F, and nut I, substantially as and for the purposes specified.

6. In a vehicle, the combination of two similar sets of devices, one located at the forward and the other at the rearward portion of the vehicle, each consisting, essentially, of the coil-spring, suitably supported, resting against a supporting-abutment fixed to the wagon-body, and the draw-rod F, arranged for compressing the spring, the draw-rod being connected to the lever D, the latter in turn being connected to the rod-lever A B, shackled to its respective end of the vehicle and nut or equivalent provision for adjusting the elasticity of the spring to meet the requirements of the carrying capacity of the vehicle independently of the spring at the other end of the vehicle, substantially as and for the purposes specified.

7. In a vehicle, the combination of rod B, provided at each end with rod A at right angles thereto, journal-bearing C, rod B, turning therein, and the spring S, provided with abutment secured to the vehicle-body, rod F, for compressing the spring, and the lever D, made separate from the rod B and adjusted thereon, the free end of the lever being connected to the rod F, substantially as and for the purposes specified.

8. In a vehicle, the combination of the rod B, provided at each end with rod A at right angles thereto, journal-bearing C, and the rod B, turning therein, and spring-box E, spring S, bearing against an abutment connected to said box, rod F, for compressing the spring, and the lever D, adjustable on the rod B, substantially as and for the purposes specified.



410,717. AUTOMATIC DRAFT-REGULATOR FOR HOT-WATER BOILERS. William P. Powers, La Crosse, Wis. Filed Feb. 25, 1889. Serial No. 300,923. (No model.)

Claim.—1. The combination of a main boiler, a pipe communicating therewith and extending above it for containing a column of water, by means of which the water in the boiler is held under greater than atmospheric pressure, a supplemental boiler or steam-generator so located as to be heated by the circulating water, containing water under a pressure lower than that in the main boiler, a pressure-chamber containing a diaphragm and communicating with the supplemental boiler, and a suitable heat-controlling device, the body of water in the supplemental boiler being in such quantity that the increase in volume when raised from the normal to the boiling-point will be less than the displacement of the diaphragm when raised to operate the heat-controlling device.

2. As an attachment for water-circulating systems, a supplemental boiler, a pressure-chamber communicating therewith containing a diaphragm and a body of water in the supplemental boiler, the quantity of water being such that the increase in volume when raised from its normal temperature to the boiling-point will be less than the displacement of the diaphragm when raised to operate the heat-controlling device.

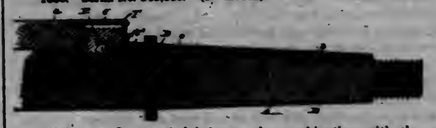
410,718. SHEDDING MECHANISM FOR LOOMS. Vernon Royle, Paterson, N. J. Filed Feb. 10, 1887. Serial No. 227,266. (No model.)

Claim.—1. The combination, with the lifting-wires and needles, the rocking bars, the cylinder and cylinder-frame, and mechanism, substantially as described, for operating the said parts, of a frame consisting of a base-plate A, having lugs or ears c^6 for supporting the cylinder-frame fulcrum, and having an opening for the lifting-wires and a raised rim around its margin and said opening, an upright or standard, and an upper guiding-frame for the needles secured at its one end only to the upright or standard, substantially as herein set forth.

2. The combination, with the lifting-wires, the needles, the rocking bars, and the cylinder, of a cylinder-frame having upright arms fulcrumed at the one end and connected by a stretcher or brace which is inclined to the perpendicular in order to properly direct the cards, and operating mechanism for the several parts, substantially as herein set forth.

3. The combination, with the lifting-wires and needles and the rocking bars, of the cylinder and the cylinder-frame having a rocking shaft which constitutes a fulcrum on which the frame may rock, and which is provided with a rigid arm having a bearing against the frame to move it in one direction, mechanism, substantially as described, for operating the several parts, and a spring interposed between said rigid arm and the cylinder-frame, and through which the arm moves the frame in the other direction, substantially as herein set forth.

4. The combination, with the lifting-wires, the needles, the rocking bars, the cylinder, and the cylinder-frame having an arm extending from its fulcrum, of mechanism, substantially as described, for operating the rocking bars, and the rod F^4, composed of two similar halves or sections connecting the upper bar with the arm on the cylinder-frame fulcrum, substantially as herein described.



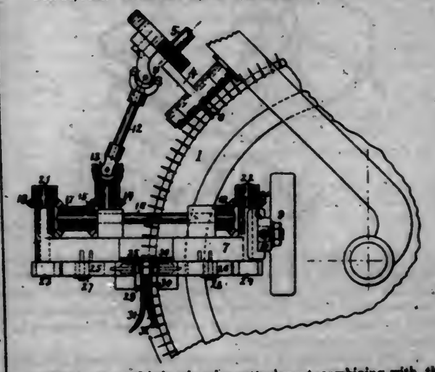
5. The combination, with needles, of lifting-wires, rocking bars for actuating the lifting-wires, a cylinder for operating the needles, a support on which said cylinder is mounted and with which it may receive longitudinal movement, mechanism, substantially such as described, for operating the several parts, a change-wire and needle corresponding to the lifting-wires and needles, a cam for effecting the lengthwise movement of the cylinder and its support, cam-surfaces against which said cam acts, and a connection between the change-wire and the cam, whereby the latter is rotated by the movement of the change-wire, substantially as specified.

6. The combination of the lifting-wires and needles, the rocking bars, the cylinder-frame, the cylinder held against lengthwise movement in the frame, bearings which permit of the movement of the frame in a direction lengthwise of the cylinder, mechanism, such as described, for operating said parts, a change-wire and needle corresponding to the lifting-wires and needles, a cam for effecting the lengthwise movement of the frame, cam-surfaces against which said cam acts, and a connection between the change-wire and the cam, whereby the latter is rotated by the movement of the change-wire, substantially as specified.

7. The combination, with the lifting-wires and the needles, the rocking bars, the cylinder and cylinder-frame and bearings which permit the lengthwise movement of said frame, and mechanism for operating the several parts, of a change-wire and needle corresponding to the lifting-wires and needles, a cam-wheel movable lengthwise of its axis with the frame, a lever upon which said change-wire acts, a clutch operated by said lever to impart motion to said cam-wheel, and a stationary cam with which said cam-wheel engages when turned, and whereby the frame is moved lengthwise, substantially as herein set forth.

8. The combination, with the lifting-wires and needles, the rocking bars, the cylinder and cylinder-frame, a shaft on which the said frame is fulcrumed, bearings which permit the lengthwise movement of said shaft and frame, and mechanism, substantially as described, for operating the several parts, of the change-wire and needle D' F^3, the cam-wheel and ratchet-wheel H^3 j' on said shaft, the lever I and its pawl j, and the stationary cam or cams with which the cam-wheel engages as it is turned, substantially as herein set forth.

410,719. AXLE-LUBRICATOR. James B. Shaw, Bishopville, S. C., assignor of one-half to Robert W. Spann, same place. Filed June 11, 1889. Serial No. 313,999. (No model.)



Claim.—1. In an axle-lubricator, the combination, with the receptacle and a feed-tube projecting therefrom and provided with a lug at its inner end, of an adjustable feed-regulating pin disposed in said tube and provided with a series of notches adapted to receive said lug, and a spring for retaining said pin in adjusted position, substantially as set forth.

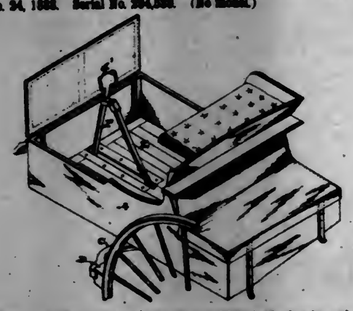
2. In an axle-lubricator, the combination, with a receptacle provided with an air-tight cover and with a feed-tube having a lug projecting from its inner end, of an adjustable feed-regulating pin disposed in said tube and provided with a series of notches adapted to receive said lug, and a spring for retaining the pin in adjusted position, substantially as set forth.

3. In an axle-lubricator, the combination, with the receptacle and a feed-tube projecting therefrom and provided with a contracted feed-opening at its outer end and with an interior lug at its opposite end, of an adjustable pin having a pointed end corresponding to the feed-opening and provided near its other end with a series of notches adapted to engage the lugs, and a spring for holding the pin in adjusted position, substantially as and for the purpose set forth.

410,720. TRIMMING ATTACHMENT FOR MACHINES FOR SEWING LOOPED FABRICS. Adelbert L. Travis, Piedmont, N. Y. Filed Dec. 21, 1888. Serial No. 294,260. (No model.)

Claim.—1. A fabric-trimming attachment combining with the intermittently-rotating pin-plate and sewing mechanism of a turning-off machine levers having points attached thereto in a position to pierce and sever the fabric, jaws on the levers behind the points and in a position to grip the trimmed edge of the fabric, yokes at the rear end of these levers affording surfaces at right angles to each other for cam action, cams for imparting motion to these levers, by which they are pushed toward the fabric and the points and jaws carried by them lifted while in contact with the work, positive rotary mechanism for revolving the cams from the sewing-machine shaft in such time that the severing and gripping elements will be withdrawn from the fabric during the feeding of the pin-plate, and a frame for supporting and guiding said levers and carrying said cams and rotary mechanism, as and for the purpose set forth.

2. A fabric-trimming attachment combining with the pin-plate of a turning-off machine slotted levers guided by fulcrum-pins on which they can slide and rock, points positioned on these levers where they can pierce opposite sides of the fabric impaled on said pin-plate,



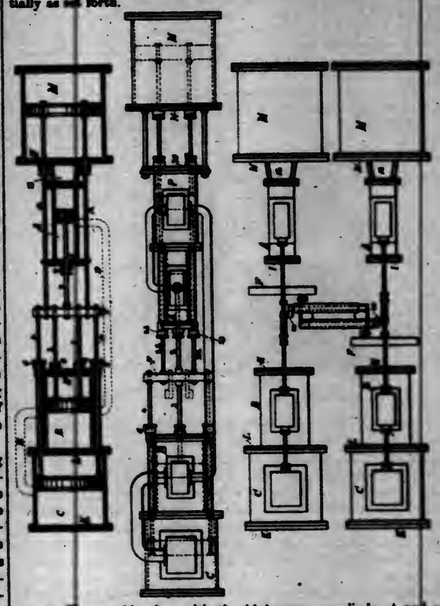
yokes at the rear ends of said levers affording surfaces at right angles to each other for cam action, cams for imparting motion to these levers, by which the points are pushed through the fabric in the direction of their axes and then lifted at right angles thereto, whereby the fabric is broken apart at a uniform height above the pin-plate, and a frame for supporting and guiding said levers through said fulcrum-pins and carrying said cams, as and for the purpose set forth.

3. A fabric-trimming attachment combining with the pin-plate of a turning-off machine slotted levers guided by fulcrum-pins on which they can slide and rock, points positioned on these levers where they can pierce opposite sides of the fabric impaled on the pin-plate, guides having openings through which the points enter and recede from the fabric, whereby severed portions thereof lodging on the points are removed, cams operating said levers to carry them toward and withdraw them from the fabric, and a frame for supporting and guiding said levers through said fulcrum-pins and carrying said cams and said guides, as and for the purpose set forth.

4. The combination, in an attachment to a turning-off machine, of levers situated on opposite sides of the fabric impaled on the pin-plate and guided by fulcrum-pins, so that they can slide in a direction to and from the fabric and rock to and from said pin-plate, jaws supported from these levers in a position to oppose each other, springs between the levers and the jaws, four-motion cams, positive connecting mechanism, and a frame for supporting and guiding said levers through said fulcrum-pins and supporting said cams and connecting mechanism, whereby the jaws may be caused to press the edges of the fabric with a spring-pressure when lifting, as and for the purpose set forth.

5. A trimming attachment for a turning-off machine combining with the pin-plate for feeding the fabric slotted levers guided by fulcrum-pins on which they can slide and rock, points positioned on these levers where they can pierce the fabric, jaws supported on these levers in a position to oppose each other on opposite sides of the fabric between the points and the sewing mechanism, cams acting upon these levers to slide them toward the fabric and then rock the ends with points and jaws upward from the pin-plate, and a frame for supporting and guiding said levers through said fulcrum-pins and supporting said cams, as and for the purpose set forth.

410,721. CARRIAGE-BRAKE. IRA WHALEN, Canton, Ohio. Filed Dec. 24, 1888. Serial No. 294,269. (No model.)



Claim.—1. The combination of a vehicle-body having pivotally attached thereto the S-shaped bars C, provided with suitable brake-blocks, the link-bars *a*, pivotally attached to the S-shaped bars C and to the spring-bar E, and the spring-bar E, formed of spring metal and having pivotally attached thereto the operating-lever F, substantially as and for the purpose specified.

2. The combination of a vehicle-body having pivotally attached thereto the S-shaped bars C, the links *a*, pivotally attached to the S-shaped bars C and to the spring-bar E, the spring-bar E, formed of spring metal, the operating-lever F, the roller G, and the pins or stops *d*, substantially as and for the purpose set forth.

410,722. EXPANSION-ENGINE. FREDERICK M. WEBSTER, Montclair, N. J. Filed Dec. 31, 1888. Serial No. 295,017. (No model.)

Claim.—1. The combination, with the high-pressure cylinder A and expansion-cylinders B and C, of the cross-head F between the cylinders A and B, and the piston-rods from the pistons of the respective cylinders connected to said cross-head F, substantially as set forth.

2. The combination, with the high-pressure cylinder A and the expansion-cylinders B and C, of the cross-head F between the cylinders A and B, the piston-rod 2 to the piston in the cylinder A, and the piston-rod 3 to the piston in the cylinder B, and the piston-rods 4, connected to the piston in the cylinder C, and passing through tubes or sleeves at the sides of the cylinder B and through the stuffing-boxes 6, all of the piston-rods being connected to the cross-head F, substantially as set forth.

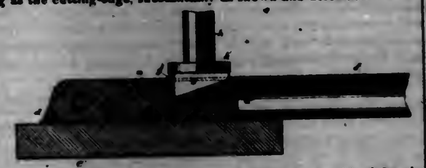
3. The combination, with the high-pressure cylinder A and expansion-cylinders B and C, of the cross-head F between the cylinders A and B, and the piston-rods of the respective cylinders connected to such cross-head, and a pump-cylinder M, to which the cylinder A is connected, substantially as set forth.

4. The combination, with the high-pressure cylinder A and expansion-cylinders B and C, of the cross-head F between the cylinders A and B, the piston-rods to the pistons of the respective cylinders connected to the cross-head F, the pump-cylinder M, connected with the cylinder A, and the piston-rods 12 of a pump-piston connected to the cross-head F, substantially as set forth.

5. The combination, with the high-pressure cylinder A, of the expansion-cylinders P, B, and C, and the cross-head F between the cylinders A and B, and the piston-rods to the pistons of the respective cylinders connected to said cross-head, substantially as set forth.

6. The combination, with the high-pressure cylinder A and expansion-cylinders P, B, and C, of the piston-rods to the pistons in the respective cylinders connected together, and the piston-rods to the two most distant cylinders passing through tubes or sleeves at the sides of the intermediate cylinders, and glands or packing-boxes at the ends of the respective sleeves or tubes, substantially as set forth.

7. The combination, with the high-pressure cylinders A A, of the expansion-cylinders B B C C and cross-heads F F, or equivalents F F, forming duplex expansion steam-engines, and the connections from the cross-head of one engine to the valves of the other, substantially as specified.

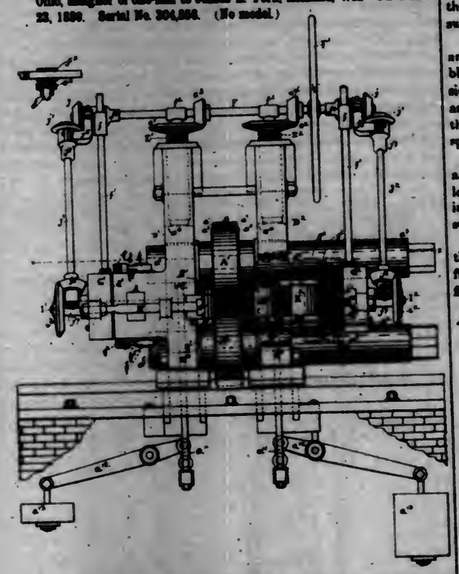


8. The combination, with the pump-cylinder M, of the high-pressure cylinder A and the expansion-cylinders B C, all in line with each other, the heads of the cylinders A and B facing each other and being removable one toward the other, substantially as specified.

9. The combination, with the pump-cylinder M, of the high-pressure cylinder A and the expansion-cylinders B, C, and P, all in line with each other, the heads of the cylinders A and B facing each other and being removable one toward the other, and the head of the cylinder P being removable toward the pump-cylinder M, substantially as specified.

410,723. DEVICE FOR SLOTTING TUBES. CHARLES H. WITHERS, Lake Rock, Conn. Filed Dec. 17, 1888. Serial No. 293,575. (No model.)

Claim.—1. In a metal-working die, the combination of a female die having a depression or groove therein extending out through one end thereof with a male die shaped to fit within such depression, the face of the male die which comes in contact with the surface of the metal to be punched being obliquely inclined to said surface of the metal, substantially as shown and described.



2. In a tube-slotting die, the combination of a combined female die and holder for the tube, consisting of a cylindrical stud having a depression or groove therein extending out through one end thereof, the upper edge of which groove forms the cutting-edge of the female die, with a male die shaped to fit within such depression or groove, the face of the male die which comes in contact with the surface of the tube to be punched being obliquely inclined to said surface, and the lower end and two sides only of said inclined face of the die acting as the cutting-edge, substantially as shown and described.

3. In a tube-slotting die, the combination of a combined female die and holder for the tube, consisting of a cylindrical stud having a depression or groove therein extending out through one end thereof, the upper edge of which groove forms the cutting-edge of the female die, and said stud having at its other end an enlarged part, whereby it is secured to the bed-plate of the press, the shoulder of which enlarged part forms a stop for the tube placed upon the holder, with a male die shaped to fit within such depression or groove, the face of the male die which comes in contact with the surface of the tube to be punched being obliquely inclined to said surface, and the lower end and two sides only of said inclined face of the die acting as the cutting-edge, substantially as shown and described.

4. In a tube-slotting die, the combination of the combined female die and holder for the tube, consisting of the cylindrical stud *a*, the depression or groove *a'* formed therein extending out through one end thereof, and the square end *b*, adapted to be secured by a bolt to the bed-plate of the press, with the male die, consisting of the punch *g*, having the inclined face *g'*, and provided with a stem and flange for securing it to the moving head of the press, substantially as shown and described.

410,724. ROLLING APPARATUS. LEVI D. YORK, Portsmouth, Ohio, assignor of one-half to James R. York, Ashland, Wis. Filed Mar. 23, 1889. Serial No. 304,256. (No model.)

Claim.—1. In an apparatus for rolling metal, the combination of top and bottom rolls, side rolls, blocks with which the side rolls are connected, screws for effecting the adjustment of these blocks toward and from each other, screws for effecting the adjustment of the upper roll, a shaft driving the screws for effecting the adjustment of the upper roll, other shafts transmitting motion to the screws for effecting the adjustment of the blocks with which the side rolls are connected, the shaft whereby the screws for effecting the adjustment of the upper roll are driven being supported in vertically-sliding boxes, and the shafts for transmitting motion to the screws whereby the adjustments of the sliding blocks are effected being supported to slide in the direction of the length of the shaft which drives the screws for effecting the adjustment of the upper rolls, substantially as specified.

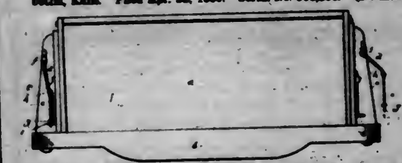
2. In an apparatus for rolling metal, the combination of top and bottom rolls, side rolls, movable blocks to which the side rolls are connected, side guides carried by said blocks, shafts, bevel-gear, and screw-connections, whereby an adjustment may be effected simultaneously between the several rolls, substantially as specified.

3. In an apparatus for rolling metal, the combination of the rolls A' A^2, the screws E' E^2, the shaft F, driving said screws, the side rolls B' B^2, sliding blocks by which said rolls B' B^2 are adjusted, screws for adjusting these blocks, and shafts J' J^2, for driving the screws for adjusting the said blocks, the shaft F being supported in vertically-sliding bearings, and the shafts J' J^2 being supported so as to move laterally correspondingly with the movement of the said blocks, substantially as specified.

4. In an apparatus for rolling metal, the combination of rolls A' A^2, having long journals a^4 a^4, the screws E' E^2, the shaft F, driving said screws, the side rolls B' B^2, sliding blocks by which said rolls B' B^2 are adjusted, screws for adjusting these blocks, and shafts J' J^2, for driving the screws for adjusting the said blocks, the shaft T being supported in vertically-sliding bearings, and the shafts J' J^2 being supported so as to move laterally correspondingly with the movement of the said blocks, substantially as specified.

5. In an apparatus for rolling metal, the combination of upper and lower rolls, side rolls having curved bearings on the journals of the lower roll, adjustable blocks for effecting the adjustment of the side rolls, and rollers supported by said blocks and sustaining the side rolls, substantially as specified.

6. In an apparatus for rolling metal, the combination of upper and lower rolls, screws for adjusting said rolls, loosely-running side rolls, adjustable blocks for effecting the adjustment of the side rolls, loosely-running rollers supported by said blocks and sustaining the side rolls, and gearing operating to adjust the rolls together, each of the side rolls and the rolls which sustain it being arranged in the apices of a triangle, substantially as specified.



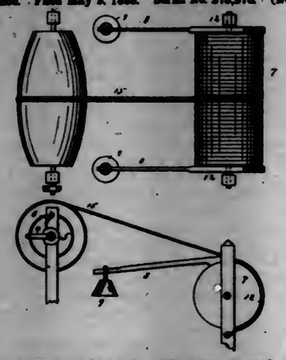
7. In an apparatus for rolling metal, the combination of upper and lower rolls, side rolls, adjustable blocks *g'*, receiving journals with which the side rolls are provided, sliding blocks G' G^2, connected with the blocks *g'*, and rollers K' K^2, supported in the sliding blocks G' G^2, substantially as specified.

8. In an apparatus for rolling metal, the combination of the top and bottom rolls, the adjustable side rolls, sustaining-rollers, sliding blocks supporting the sustaining-rollers, and blocks supporting the side rolls connected to the blocks supporting the sustaining-rollers, so as to be capable of moving independently of the blocks sustaining the side rolls away from the top and bottom rolls, substantially as specified.

9. In an apparatus for rolling metal, the combination of the top and bottom rolls, the adjustable side rolls having journals at their lower ends only, and supporting-blocks beneath the side rolls receiving their journals and sliding on the journals of the bottom roll, substantially as specified.

10. In an apparatus for rolling metal, the combination of positively-rotating top and bottom rolls, freely-turning side rolls, and freely-turning sustaining-rolls for said side rolls, substantially as specified.

410,725. WAGON-BOX FASTENER. ANDREW J. ADAMSON, Sabetha, Kans. Filed Apr. 22, 1889. Serial No. 308,260. (No model.)



Claim.—1. A wagon-body fastener or anti-rattler comprising a pair of toggle-links, the upper end of one link adapted to be stationarily pivoted to either the wagon-body or a portion of the running-gear, said toggle adapted to be straightened with its lower free end bearing down upon a stationary portion of one of said two parts of the vehicle, to which it is not pivoted, substantially as described.

2. A wagon-body fastener comprising a pair of toggle-links, in combination with a locking-plate having an aperture, said plate adapted to be secured to either a wagon-body or to the running-gear, and the toggle adapted to have one end pivoted to the other of said parts and having a stop a distance from its opposite end and to be straightened with its free end in said aperture and its stop bearing against said plate, for the purpose set forth.

3. A pair of toggle-links adapted to be stationarily pivoted at one end and having a stop a distance from its other end, in combination with a locking-plate adapted to be stationarily secured and having a lateral extension with an aperture to receive the free end of said toggle, and with a pair of ears between which the elbow of said toggle is adapted to fit, substantially as described.

4. The combination, with a wagon-body and a standard secured to the running-gear, of a locking-plate secured to the side of the wagon-body and having a horizontal perforated arm at its lower end, and a pair of toggle-links, the upper link being pivoted at its upper end to said standard and the lower link having an adjustable stop a distance above its lower free end, said toggle adapted to be straightened with its free end in said perforation and its stop bearing on said arm, for the purpose set forth.

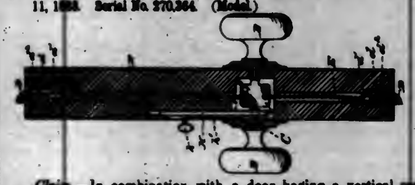
410,726. MANUFACTURE OF PAPER BARRELS. ADOLF BEAR, Ehrenfeld, near Cologne, Prussia, Germany, assignor to Kahnen & Co., same place. Filed May 9, 1888. Serial No. 273,270. (No model.)

Claim.—1. The method of making paper barrels, consisting in pasting a series of sheets of paper one upon the other, and then winding ropes under pressure around said pasted sheets for the purpose of pressing them together, substantially as herein shown and described.

2. The method of making paper barrels, consisting in pasting a number of sheets upon each other on a core, then removing the core, then inserting heads in the ends of the shell thus formed, and then pasting another series of sheets of paper upon the first series and over the edges of the heads, substantially as herein shown and described.

3. The method of making paper barrels, consisting in placing rings on the ends of a barrel-shaped core, then pasting a number of paper sheets one upon the other around said core, then removing the core, then placing heads in the ends of the shell thus formed and against the above-mentioned rings, and then pasting more sheets on said shell and over the edges of the heads, substantially as shown and described.

410,727. DEVICE FOR OPERATING HATCHWAY-COVERS, &c. JAMES R. BROWN, Brooklyn, N. Y., assignor of one-half to James H. Sherwood, same place. Filed Apr. 20, 1889. Serial No. 307,960. (No model.)



Claim.—1. The combination, with a shutter arranged and adapted to be closed or drawn across the well-hole and to be held back or open by a spring-latch, of the automatic thermostatic closing device consisting of the fusible wire L, secured at one end and passing around the well-hole and room and connected by the other to the swinging shelf N, the shelf N, hinged to the wall and held up directly by the fusible wire L, and the weight O, supported by the shelf and connected to and adapted to release the spring-latch, the whole arranged and operating as described, as and for the purposes set forth.

2. The combination, with a shutter arranged to be closed or drawn across the well-hole, of the direct releasing device, consisting of the spring-latch D and cord E, and the automatic thermostatic releasing device, consisting of the fusible wire L, secured at one end and connected by the other to the swinging shelf N, the shelf N, hinged to the side of the room, and the weight O, adapted to open the spring-latch D, the whole arranged and operating as directed, as and for the purposes set forth.

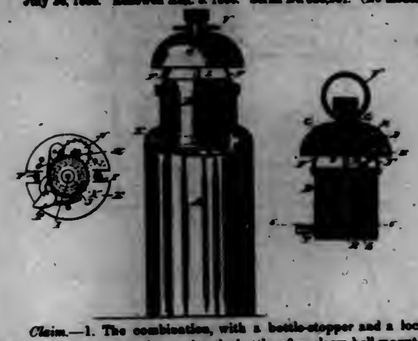
3. The combination, with the shutter A, arranged to be drawn across the well-hole by the weight W and rope *w* and to be drawn back from the well-hole or shaft by the windlass B and rope *b*, of the spring-latch D, adapted to engage and hold the shutter and be released by the cord E, and the automatic thermostatic device consisting of the fusible wire L, shelf N, weight O, and cords P and E, substantially as described, and for the purpose set forth.

4. The thermostatic device for releasing shutters and doors, consisting of the fusible wire L and chains *l*, fastened at one end and passing around the room and connected to the shelf N, the shelf N, held up directly by the fusible wire L, and the weight O, arranged to release the shutter, the whole arranged and operating as described, substantially as and for the purpose set forth.

410,728. LATCH. JOSEPH BROWN, Santa Rosa, Cal. Filed Apr. 11, 1888. Serial No. 270,364. (Model.)

Claim.—In combination with a door having a vertical recess therein and a chamber, as at *c*, a square rod extending through said chamber and having knobs or handles on the extreme ends thereof, and wings projecting from the opposite sides of the center, said wings being integral therewith, one having two and the other a single aperture therethrough, the bolt-frames *d* at the extremities of the vertical recess and having bolts therein actuated by springs, said bolts having connection with the wings on the square rod by a chain or other suitable means, the catch F, extending through the front edge of the door and surrounded by a coil-spring and manipulated by a wing on the rod C, and the vertical adjustable locking-plate H, having a bifurcated end, which plate fits over the square rod C, thus preventing said rod from turning, substantially as and for the purposes set forth.

410,729. VALVE-GEAR FOR GAS-ENGINES. EMIL CAPITAINE, Berlin, Germany. Filed Nov. 26, 1888. Serial No. 292,072. (No model.) Patented in Germany Feb. 4, 1888, No. 44,409.

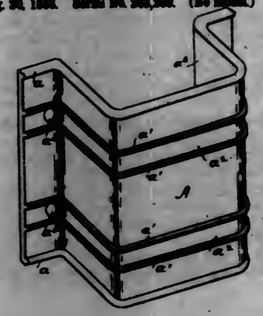


Claim.—1. In valve-gear for gas-engines, the combination, with a valve-stem and a reciprocating rod, of a hinged piece on the end of the reciprocating rod, which hinged piece is adapted to act on the valve-stem, and a spring-actuated mechanism, substantially as herein described, for inclining the hinged part so that the same will not strike the valve-stem at alternate strokes, substantially as set forth.

2. The combination, with a valve-stem, of a reciprocating rod, a hinged part on the end of said reciprocating rod, a lever pivoted on said hinged part, fixed springs acting on the lever, and fixed stops acting on said lever, substantially as set forth.

3. In a valve-gear, the combination, with a valve-stem, of a reciprocating rod, a hinged part on the end of said reciprocating rod, a lever pivoted on said hinged part and having a spring bearing on the hinged part, said lever also having two opposite arms, fixed springs that can act on said lever, and fixed stops that can act on the arms of said lever, substantially as set forth.

410,780. ALARM BOTTLE-STOPPER. ROBERT H. DEVEREAUX, Chicago, Ill., assignor of one-half to J. S. McDonald, same place. Filed July 26, 1888. Renewed Apr. 8, 1889. Serial No. 306,201. (No model.)



Claim.—1. The combination, with a bottle-stopper and a lock-bolt working therein and engaging the bottle, of an alarm-bell mounted on said stopper and a connecting and actuating mechanism simultaneously operating said bell and lock-bolt, substantially as described.

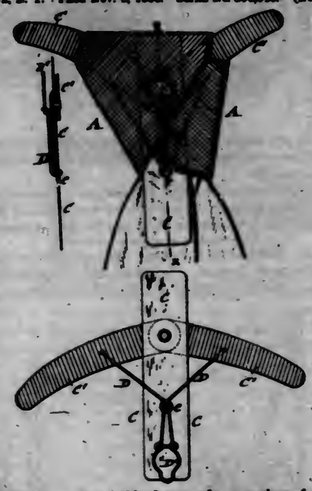
2. The combination, with a bottle-stopper and a lock-bolt working therein, of an alarm-bell mounted on said stopper and spring-controlled mechanism connected with and simultaneously operating said bell and lock-bolt, whereby when operated said mechanism will simultaneously withdraw said bolt and set the bell-ringing mechanism, and which when released will automatically and simultaneously ring said bell and cause the bolt to project, substantially as and for the purpose described.

3. The combination, with a bottle-stopper provided with a central bore, a bell mounted thereon, and a lock-bolt working therein, of a spring-controlled arbor working in the bore of the stopper, bell-ringing mechanism, and connections between said arbor and bolt, and between said arbor and the bell-ringing mechanism, whereby the rotation of said arbor in either direction will cause a simultaneous operation of said mechanism and bolt, substantially as and for the purpose described.

4. The combination, with a stopper provided with a central bore, a bell mounted thereon, and a lock-bolt working in said stopper, of an arbor working in the bore of said stopper, a bearing therefor, a pinion mounted thereon for engaging and operating said bolt, a winding-cap secured thereto, bell-ringing mechanism operated by said arbor, and a spring fixed at one end and attached at its opposite end to said arbor, substantially as described.

410,781. STAKE-POCKET. WILLIAM EVANS, Philadelphia, Pa. Filed Aug. 20, 1888. Serial No. 283,289. (No model.)

Claim.—1. A stake pocket or holder made from a blank of wrought metal having outside edge beads or flanges and strap or clip socket rolled or formed in the blank, substantially as set forth.



2. A stake pocket or holder made from a blank of sheet metal having outside edge beads or flanges and strap or clip socket projections rolled or formed in the blank, the edge beads and strap-pocket projections being of greater thickness in cross-section than the rest of the blank or holder, and the latter having a smooth or uncorrugated inside surface from top to bottom, substantially as set forth.

3. A stake pocket or holder made from a blank of wrought or sheet metal, having strap-sockets formed or rolled in the blank, and the holder having a smooth or uncorrugated inside surface from top to bottom, substantially as set forth.

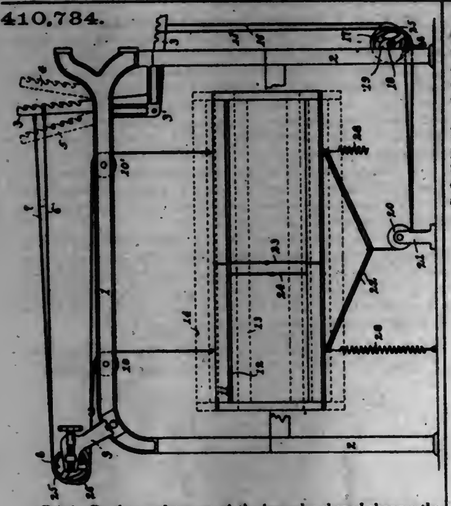
4. A blank sheet-metal strip for stake pockets or holders having one smooth or uncorrugated side, and on the other side strap-sockets and bead edges formed or rolled thereon, substantially as set forth.

5. A blank sheet-metal strip for stake pockets or holders having one smooth or uncorrugated side, and on the other side strap-sockets c^2, formed or rolled thereon, substantially as set forth.

410,782. NECKSCARF-FASTENER. ELIAS J. FREELAND, New York, N. Y. Filed Nov. 3, 1888. Serial No. 290,316. (No model.)

Claim.—1. A detachable fastener for a neckscarf, consisting of a flat center piece provided with an eyeleted opening in its lower part, arms pivoted to said center piece at its upper part, and a looped elastic cord passed through said eyeleted opening and having its ends connected to said arms, substantially as described.

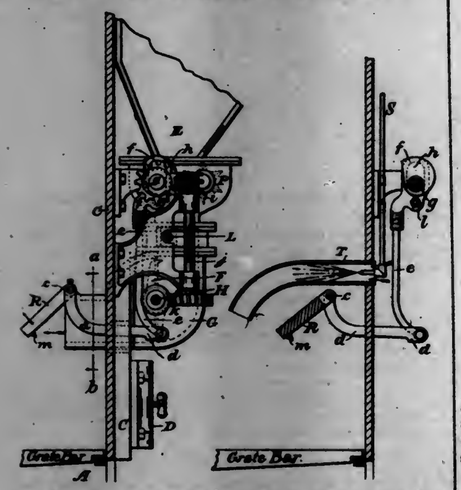
2. A detachable fastener for a neckscarf, consisting of a flat center piece provided with an eyeleted opening in its lower part, arms pivoted to said center piece at its upper part, a looped elastic cord passed through said eyeleted opening and having its ends connected to said arms, and a metallic collar-button loop at the end of said looped cord, substantially as described.



410,783. PROCESS OF MAKING A VIOLET DYE. RUDOLPH GNEHM, Basle, Switzerland, assignor to John R. Geigy & Co., same place. Filed Mar. 5, 1889. Serial No. 301,992. (Specimens.)

Claim.—The process for producing colors consisting of heating twenty kilos of gallamide with thirty kilos of the chlorhydrate of nitroso-dimethylaniline in a solution of acetic acid, substantially as described.

410,784. SHEDDING MECHANISM FOR LOOMS. GEORGE F. HUTCHINS, Worcester, Mass., assignor to the Knowles Loom Works, same place. Filed Apr. 6, 1889. Serial No. 306,203. (No model.)



410,784.

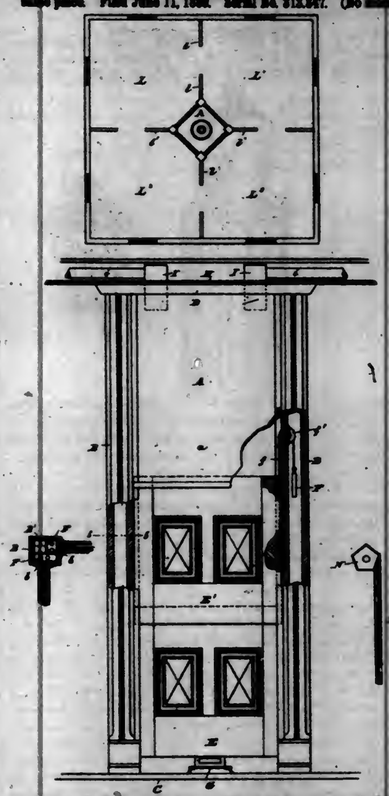
Brief.—By the employment of the irregular-shaped sheaves the harness-frames are so shifted that the warp-threads do not all pass the center at the same time.

Claim.—The combination, with harness-levers, harness-frames, and cords connecting the same, of eccentric or irregular-shaped sheaves over which the cords pass, substantially as and for the purpose stated.

410,785. MECHANICAL STOKER. WILLIAM LEACH, Accrington, County of Lancaster, England. Filed July 2, 1888. Serial No. 316,390. (No model.) Patented in England Nov. 28, 1887, No. 16,096.

Claim.—1. In mechanical stokers, the combination therewith of a deflecting-plate and reciprocating feed-box, arranged in the manner substantially as herein shown and described.

2. In mechanical stokers, the combination therewith of a deflecting-plate, revolving fans, and reciprocatory feed-box, all arranged in the manner substantially as herein shown and described.



3. The combination, with a mechanical stoker, of an inclined deflecting-plate supported in front of the fuel-discharge opening, and lever mechanism for imparting oscillating motion to said plate, whereby the fuel is evenly distributed upon the grate-bars, substantially as set forth.

4. The combination, with a mechanical stoker, of a deflecting-plate oscillating continuously in front of the fuel-discharge opening of said stoker and adapted to distribute the fuel evenly upon the grate-bars, substantially as set forth.

5. The combination, with a mechanical stoker provided with a deflecting-plate oscillating continuously in front of its fuel-discharge outlet for evenly distributing the fuel, of a pipe for injecting steam and air pressed above said fuel-outlet, and having its inner end bent downwardly and adapted to clear the said oscillating plate, substantially as and for the purpose set forth.

6. The combination, in a mechanical stoker, with the central feed-hopper, of the horizontal chamber supported below the hopper and provided with an outlet at each end leading to the fire-box, and the reciprocating feed-box in said chamber provided with chambers for conveying the fuel from the hopper to the said outlets, substantially as set forth.

410,786. HEATING APPARATUS. EDGAR W. OLIN, Pueblo, Colo., assignor of two-thirds to Allen R. Barnum and Joseph W. Johnston, same place. Filed June 11, 1888. Serial No. 312,847. (No model.)

Claim.—1. The combination, with adjoining rooms of a building, of a compartment interposed between said rooms and provided with doors which constitute the sides of said compartment and form an intermediate room for the reception of a heater, as and for the purpose specified.

2. An improved appliance for distributing heat to the apartments of buildings, consisting of a compartment interposed between and communicating with adjacent apartments and provided with adjustable doors which constitute the sides of said compartment and form an inclosed space for the reception of a heater, substantially as described.

3. An improved appliance for heating the apartments of buildings, consisting of an angular apartment for inclosing the heating device set obliquely to the contiguous walls of the adjacent apartment, substantially as and for the purpose described.

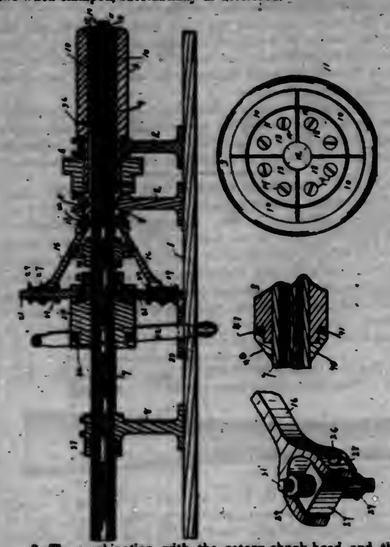
4. An improved appliance for heating the apartments of buildings, consisting of a heater compartment or room interposed between and communicating with adjacent apartments, in combination with several sets of adjustable doors, one set for each apartment, applied to and forming the sides of said heater-compartment, whereby the hot air may be conducted to any or all adjoining apartments, as set forth.

5. The combination, with adjoining apartments of a building, of a compartment interposed between the same and provided with doors which constitute the sides of said compartment and form an intermediate room for the reception of a heater, said heater-compartment and its doors being provided with an interior lining of zinc or equivalent material, substantially as and for the purpose described.

6. An improved appliance for distributing heat to the apartments of buildings, consisting of an interior compartment interposed between, inclosed by, and communicating directly with adjoining apartments on the same floor, and provided with adjustable doors, in combination with a portable heater located within said compartment, all arranged substantially as and for the purpose specified.

7. An improved appliance for distributing heat to the apartments of buildings, consisting of a compartment interposed between and communicating directly with adjoining apartments on the same floor, and provided with adjustable doors which constitute the sides of said compartment and form an intermediate room for the reception of the heater, in combination with hot-air outlets leading from the upper part of said heater-compartment and serving to supply heated air to the upper stories of the building, substantially as described.

410,787. APPARATUS FOR LOADING OR UNLOADING FREIGHT. THOMAS H. ROSS, St. Louis, Mo. Filed Jan. 19, 1888. Serial No. 260,847. (No model.)



Claim.—An apparatus for loading or unloading boats, cars, and the like, the same comprising a movable skid for bridging from the boat to a distant exterior objective point on the shore, an endless cable provided with a set of guide-pulleys on the boat and a set of guide-pulleys removably secured in position near the objective point on the shore, a stand or back for elevating the endless cable at the objective point on the shore, a steam-driven drum or capstan on the boat for driving the endless cable, an adjustable pulley for regulating the reach of the cable, one line of the endless cable disposed above the skid in the direction of the length thereof, and one or more gripping-handles adapted to automatically grip the cable, the entire apparatus being carried by the boat from place to place and constructed to be readily secured in position and easily removed therefrom at a landing, substantially as and for the purpose set forth.

410,788. CHUCK FOR RODS OR TUBES. HENRY ROSS, Rochester, N. Y., assignor of one-half to Frank S. Upton, same place. Filed May 17, 1889. Serial No. 311,265. (No model.)

Claim.—1. The combination, with the chuck-head having the inclined portion and the jaws co-operating with the incline, of a toggle or toggles connecting said head and jaws, moving them relative to each other to cause the clamping, and a stop for limiting the motion of the toggle or toggles across the center and locking the jaws in clamped position, substantially as described

2. The combination, with the chuck-head and the jaws co-operating therewith, of a toggle connecting said head and jaws for moving them relative to each other, causing the clamping, and means for throwing said toggle across the center, causing the locking of the jaws when clamped, substantially as described.

3. The combination, with the rotary chuck-head and the jaws co-operating therewith, of one or more toggles connecting said head and jaws, for moving them relative to each other to cause the clamping, a sliding block rotating with the head, and a lever for operating said block to move the toggle across the center, causing the clamping and locking, substantially as described.

4. The combination of the chuck-head having the two inclines, the spindle, the clamping-jaws thereon co-operating with one of the inclines, the pivoted lever or levers mounted on the spindle and co-operating with the other incline on the head, the sliding block for moving the lever or levers to cause the movement of the head and jaws relative to each other, and the lever for moving said block, substantially as described.

5. The combination of the chuck-head having the differential inclines, the spindle, the clamping-jaws thereon co-operating with one of the inclines, the pivoted lever or levers mounted on the spindle and co-operating with the other incline, and the sliding block for moving the lever or levers to cause the movement of the head and jaws relative to each other, substantially as described.

6. The combination, with the clamping-jaws, the chuck-head, and the spindle arranged to be moved relative to each other to cause the clamping, of the lever forming the connection between them, a sliding block rotating with the head, and a link connecting the block and lever, substantially as described.

7. The combination of a hollow chuck-head having inclines at the ends, a hollow spindle, clamping-jaws carried thereby, levers pivoted on the spindle operating on the incline on the head, a sliding block, links connecting it with the levers, and a shifting-lever connected to the block for operating it, substantially as described.

8. The combination, with the chuck-head, the clamping-jaws, and the spindle, of the lever or levers for moving the head and spindle relatively to cause the clamping, the movable block rotating with the spindle and head, the links connecting levers and block, and means for adjusting their length, substantially as described.

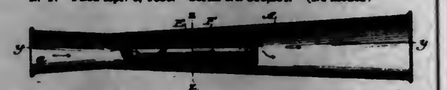
9. The combination, with the chuck-head, the clamping-jaws, and the spindle, of the lever or levers for moving the head and spindle relatively to cause the clamping, the movable block rotating with the spindle and head, the adjustable links connecting the levers and block, and a stop for limiting the movement of the block, substantially as described.

10. The combination of the chuck-head having the inclined portion, the spindle, the sleeve thereon having the spring-arms carrying the clamping-jaws, and the spline-and-groove connection between said sleeve and head, substantially as described.

11. The combination, with the chuck-head and the spring-arms, of the removable clamping-jaws mounted on the arms, and the secur-

ing devices—such as screws—accessible from the front, substantially as described.

12. The combination, with the chuck-head, the spindle, and the spring-arms thereon, of the removable clamping-jaws having the lateral flange passing over the ends of the arms, and the screws for securing them to the arms, substantially as described.



13. The combination, with the chuck-head, the spindle, and the spring-arms thereon, of the removable clamping-jaws having the longitudinal bearing-surfaces on the inside of the arms and the lateral flanges on the outer ends, and the screws for securing the jaws on the arms, substantially as described.

14. The combination of the chuck-head, the spindle, the clamping-jaws, the levers for causing the movement of the head and spindle relatively to each other to cause the clamping, and the adjustable inclined collar on which the lever operates, substantially as described.

410,739. PROCESS OF MAKING AURIN DERIVATIVES. TRAUGOTT SANDMEYER, Basle, Switzerland, assignor to John R. Geigy & Co., same place. Filed Mar. 12, 1889. Serial No. 303,021. (Specimens.)

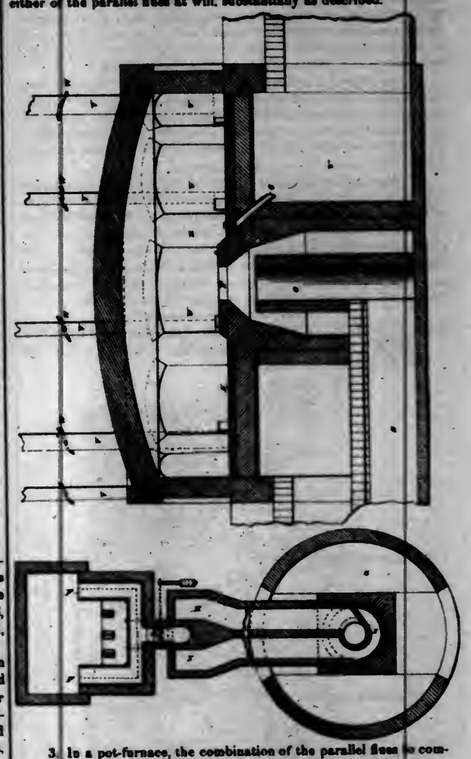
Claim.—The process for the production of colors by first taking two parts of salicylic acid dissolved in fifteen parts of concentrated sulphuric acid and four parts of methyl-alcohol, then heated to about 70° centigrade, after which one and one-half part of nitrite of sodium is added. It is then poured into water, by which the new product is precipitated. It is then washed, after which it is saturated with an alkali and dried, substantially as described.

410,740. WIND-INSTRUMENT. LOUIS SCHMIDEK, New York, N. Y. Filed Apr. 8, 1889. Serial No. 306,291. (No model.)

Claim.—1. The reed for wind-instruments, consisting of a longitudinal cup C, having a tongue B of shorter length resting upon its upper rim to close down upon the front and sides thereof and leave an uncovered opening D at its rear end, and an encircling band E, binding the tongue-strip to the cup at or about the middle of its length, substantially in the manner and for the purpose herein set forth.

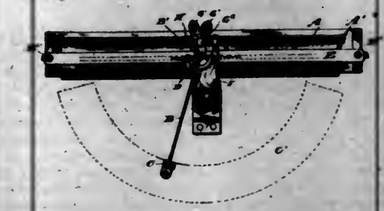
2. The combination, in a wind-instrument, of a trumpet A, an extended reed-cup C, a tongue B, of shorter length than the cup and fitted to cover the same from its front end to a point D near its rear end, and an encircling band E, binding the tongue at about the middle of its length to the cup, and serving as a packing between the reed and trumpet to secure the one within the other with a tight joint, substantially in the manner and for the purpose herein set forth.

410,741. SASH-CORD GUIDE. WILLIAM G. SEEDS, Leadville, Colo. Filed Jan. 28, 1889. Serial No. 297,754. (No model.)



Claim.—A case for sash-pulleys stamped, pressed, or struck from sheet metal and having wings provided with bearings for the pulley-wheel axis, or perforations in which to rivet the pulley-wheel axle, slots, and parting-strips having extensions which enter the slots in the wings, and face areas terminating in eyelets for securing the case to the frame in which the sash moves, substantially as shown.

410,742. POT-FURNACE. MARTIN V. SMITH, Pittsburg, Pa., assignor of one-half to the Calumet Fire Clay Company, Calumet, Ohio. Filed Apr. 15, 1887. Serial No. 234,986. (No model.)



Claim.—1. The combination, with a pot-furnace and a gas-producer, of the parallel flues having outlets at the center of the furnace and communicating with the producer at the other end and the external air, one of said flues terminating at the furnace end in a vertical flue, and the other one of said parallel flues terminating in an annular chamber surrounding the vertical flue, and a reversing-valve constructed and arranged to change the gas and air from one flue to the other, as set forth.

2. The combination, with a pot-furnace and producer, of parallel flues communicating at one end with the producer and having outlets at the center of the furnace, air and gas supply tubes communicating with both of said parallel flues, and a reversing-valve constructed and arranged to cause the current of gas and air to be directed through either of the parallel flues at will, substantially as described.

3. In a pot-furnace, the combination of the parallel flues to communicate with the producer, one of said parallel flues terminating in a vertical flue and the other in an annular chamber surrounding the vertical flue, and said vertical flue and chamber uniting in the nozzle of the combustion-chamber in the center of the working-hearth, the air-flue with its regulating-valve, and the gas-flue with its regulating-valve, and a reversing-valve for changing the air and gas from one flue to the other, substantially as described.

410,743. ALIGNER FOR TYPE-WRITING MACHINES. CHARLES BYRD, New York, N. Y. Filed Jan. 24, 1889. Serial No. 297,247. (No model.)

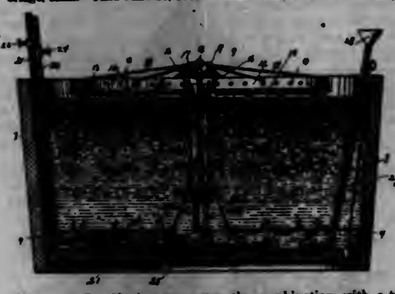
Claim.—1. An aligner for the type of a type-writing machine, consisting of a matrix of the type to be aligned.

2. An aligner for the type of a type-writing machine, consisting of a matrix of the type to be aligned, combined with the matrix-supporting devices, substantially as specified.

3. An aligner for the type of a type-writing machine, consisting of a plate provided with matrices of the type to be aligned, substantially as specified.

4. An aligner for the type of a type-writing machine, consisting of a plate provided with matrices of the several type to be aligned, adapted for connection with the carriage of the machine, substantially as specified.

5. An aligning-bar for type-writing machines, provided with matrices of the printing-surface portions of the type, substantially as specified.



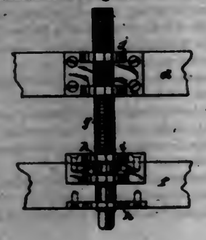
6. The combination, with the carriage of a type-writing machine, of an aligner for the type, consisting of a bar provided with type-matrices, substantially as specified.

7. The combination, with the carriage of a type-writing machine, of an aligner for the type, consisting of a matrix-bar mounted thereon and a type-holding clamp, substantially as specified.

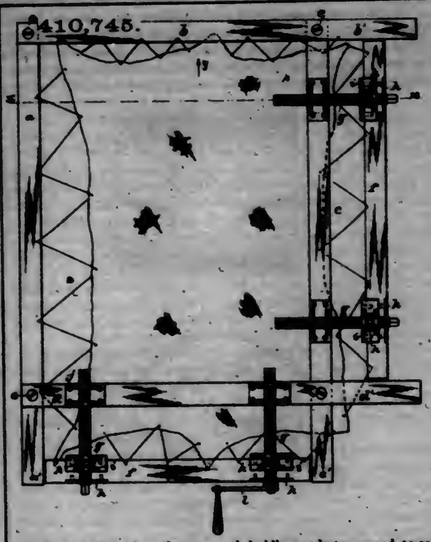
8. The combination, with the carriage of a type-writing machine, of an aligner for the type, consisting of a matrix-bar having type-matrices arranged in a line thereon and spaced in accordance with the step-by-step movement of the carriage, substantially as specified.

9. A type-holding clamp provided with a screw-pivot for binding the jaws of the clamp in position to retain a type, in combination with an aligner consisting of a bar provided with matrices of the type to be aligned, substantially as specified.

410,744. APPARATUS FOR DYEING. ALBERT A. SPRAGUE, Uxbridge, Mass. Filed June 20, 1888. Serial No. 314,947. (No model.)



Claim.—1. In a dyeing apparatus, the combination, with a tub having a false perforated bottom and steam-pipes entering the tub and extending under the false perforated bottom, of a central pipe extending up from the perforated bottom and divided longitudinally into two or more divisions and steam-pipes extending into said divisions, and a removable perforated distributing-pan of less diameter than the diameter of the tub, supported upon the upper part of the central pipe and provided with a deflector extending over the upper open end of the central pipe, and small pipes extending from holes in the bottom of the distributing-pan into the body of the liquid in the tub, for the purpose stated, substantially as set forth.



2. In a dyeing apparatus, the combination, with a tub having a false perforated bottom and a central pipe extending up therefrom, of a distributing-pan supported upon the central pipe above the liquid in the tub and having an upwardly-projecting rim extending around its outer edge and holes in its bottom, and small pipes leading down from some of said holes below the surface of the liquid into the body of the liquid, and a deflector supported above the open end of the central pipe, all substantially as shown and described.

410,745. STRETCHING-FRAME. GEORGE F. STORER, Newark, N. J. Filed Aug. 9, 1887. Serial No. 246,485. (No model.)

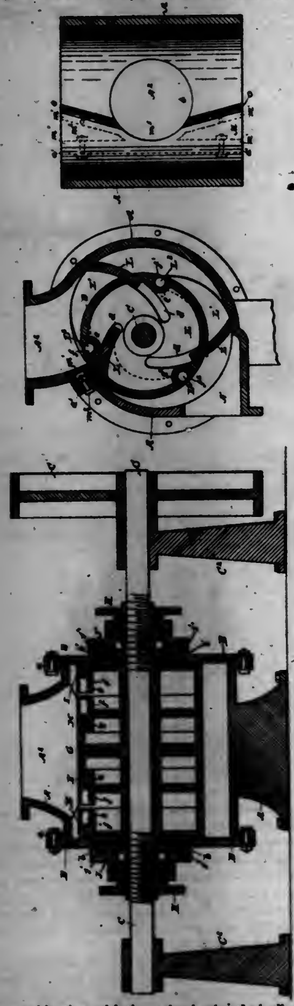
Claim.—1. A leather-stretching frame consisting of frame-pieces *a*, *b*, *c*, and *d*, provided with projecting ends *a'*, *b'*, *c'*, and *d'*, adjustable pieces *f*, arranged on two adjacent sides of said frame-pieces between the projecting ends, and means for adjusting said pieces *f* in relation to the rigid portion of the frame, for the purposes set forth.

2. A stretching-frame consisting of the rigidly-attached frame-pieces *a*, *b*, *c*, and *d*, provided with projecting ends *a'*, *b'*, *c'*, and *d'*, adjustable pieces *f*, arranged on two adjacent sides of said rigid frame-pieces between the projecting ends, threaded adjusting-rods connecting said adjustable pieces with the rigid portion of the frame, threaded sockets secured to said rigid portion of the frame, through

which the adjustable rods pass, and holding-sockets secured to said adjustable pieces, which also receive the said adjustable rods, all of said parts being arranged substantially as and for the purposes set forth.

410,746. DIE-PRESS. NORMAN C. STILES, Middletown, Conn. Filed Jan. 31, 1889. Serial No. 298,230. (No model.)

Claim.—1. In a press of the described kind, the combination, with two parts requiring adjustment relatively toward and from each other, of an intervening adjusting-screw adjustable through an opening in one of said parts, and means, substantially as described, for centering the screw relatively to such opening after its adjustment, such means consisting of a piece movable relatively to the walls of said opening and adapted when forced to place to embrace and seat itself against the screw, whereby such parts are returned to an invariable lateral position after each adjustment.



2. In a press of the described kind, the combination, with two parts requiring adjustment relatively toward and from each other, of an intervening adjusting-screw adjustable through an opening in one of said parts, the said part formed with a seat, and a washer surrounding the screw and entering said seat, the seat and washer being reciprocally tapered at their points of engagement, whereby on forcing the washer into the seat the screw is brought to center.

3. In a press of the described kind, the combination, with two parts requiring adjustment relatively toward and from each other, of an intervening adjusting-screw adjustable through an opening in one of said parts, the said part formed with a seat, and a split or collapsible washer arranged to surround the screw and entering said seat, the seat and washer being reciprocally tapered at their points of engagement, whereby on forcing the washer into the seat it is collapsed upon the screw and the latter is brought to center.

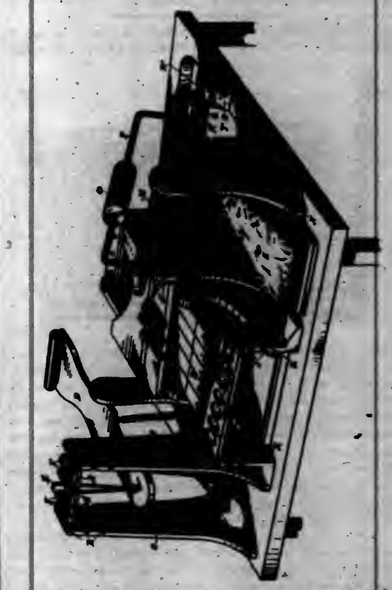
410,747. ROTARY PUMP. CHARLES H. YOUNG, Oil City, Pa. Filed May 7, 1889. Serial No. 309,962. (No model.)

Claim.—1. The combination, with the cylinder, the buckets carried thereby, and the casing surrounding the same, of an interposed seat attached to said casing and provided with the inclined forward edge, and set-screws for adjusting said seat, for the purpose set forth.

2. The combination, with the cylinder, the buckets carried thereby, and the casing thereof provided with the inlet and discharge orifices and with the sediment-grooves, of the false seat attached to said casing and having its forward edge located at or in close proximity to said grooves, substantially as shown and described

3. The combination, with the casing having the inclined sediment-grooves and provided with the adjustable seat having its forward edge inclined to correspond with said grooves, of the cylinder and its buckets, all arranged substantially in the manner shown and described.

4. The combination, with a cylinder composed of sections provided on their adjacent faces with the recessed enlargements, as described, of the buckets L, connected to said cylinder by means of arms L', located at points intermediate the ends of the cylinder, and provided with the trunnions L^2, which enter and engage the recessed enlargements in adjacent sections, as described and shown.



5. The combination, with the screw-threaded shaft, of the cylinder composed of a number of sections, the screw-threaded confining collars or nuts located at opposite ends of said cylinder and inside the casing, and the buckets pivoted to said cylinder in the manner substantially as set forth.

6. The combination, with the shaft, of a cylinder composed of sections provided on their adjacent faces with recessed enlargements on the inside face of their rims for the reception of the piston-trunnions and with the curved slots for the passage of the piston-heads and the buckets pivoted thereto, substantially as described.

7. A cylinder-head for rotary pumps, composed of sections each having a central hub, a flat peripheral rim, and connecting-web, said sections being provided upon adjacent faces inside said rims with recessed enlargements, in combination with the buckets pivoted thereto, substantially as set forth.

8. The combination, in a rotary pump, of the casing A, the head-plates B, having grooves b b', the shaft C, the sectional cylinder D, the pistons connected therewith, and the jam-nuts or collars J and J', all arranged substantially as shown and described.

410,748. EXERCISING DEVICE FOR MUSICIANS. Dominic S. Donelli, San Francisco, Cal. Filed Dec. 19, 1888. Serial No. 294,114. (No model.)

Claim.—1. The combination, with the spring-actuated pivoted lever D and the finger loop connected therewith, of the transverse table having the central opening through which the loop passes, and the supplemental loops F, fixed to the upper surface of said table, substantially as herein described.

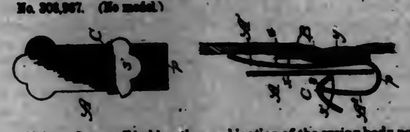
2. The spring-actuated pivoted lever D, having the loop connected therewith and extending upwardly therefrom, in combination with the centrally-perforated table through which the loop passes, the supplemental finger-loops fixed to the upper surface of the table upon each side of the loop which is connected with the lever, and the vertical standard extending upward upon each side of the lever and having the transverse slots wherein the table may be adjusted to different heights with relation to the lever and its loops, substantially as herein described.

3. The combination, with the spring-actuated pivoted lever D and the finger-loops connected therewith, of a transverse table having an opening through which the loop from the lever passes, and slots, depressions, or rests for the ends of the fingers not engaged with the loop, substantially as herein described.

4. The elastic or spring levers H, in combination with the horizontal table I, with the finger-supporting depressions L, said table being arranged with relation to the levers H, substantially as and for the purpose herein described.

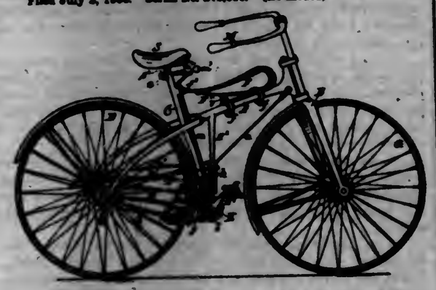
5. The horizontal support or table I, having the depressions L for the fingers, and the vertical standards K, with the transverse slots J, within which the table I may be adjusted, in combination with the spring-levers H, the ends of which are adapted to receive one or more of the fingers while the others are supported upon the table, substantially as herein described.

6. The fulcrum-lever M, with the adjustable weight O, and the roller R, journaled beneath the movable end of the lever, and the arm-support S beneath the fulcrum portion of the lever, in combination with the support U, by which the downward movement of the lever and roller is arrested, substantially as herein described.



7. The weighted fulcrum M, the roller R, journaled beneath its movable end, and the arm-rest S beneath the fulcrum end, in combination with the base or support having the cut-out or open spaces T in front of the arm-rest, and the stops or supports U, whereby the downward movement of the lever and roller is arrested, substantially as herein described.

410,749. POLISHING-WHEEL. Alvin Colburn, Lynn, Mass. Filed May 13, 1889. Serial No. 310,519. (No model.)



Claim.—In a polishing-wheel composed of two circular pieces with beveled edges clamped together and a rim comprising a metallic ring covered with fibrous pieces coated with an abrasive substance and mounted upon and clamped between the beveled edges of the circular pieces, substantially as described, the fibrous pieces I, formed with an angular V-shaped edge I^2, and having holes K and slits L cut therein to receive the metallic ring, said slits being cut at right angles to the polishing-face of the rim and radial to the wheel, so that when clamped between the beveled edges B and B' the slits will be kept closed thereby, substantially as specified.

410,750. CUFF-HOLDER. Henry J. Dale, Lake View, assignor of one-half to Charles J. Dale, Chicago, Ill. Filed Apr. 12, 1889. Serial No. 306,967. (No model.)

Claim.—In a cuff-holder, the combination of the spring body portion A, comprising a long arm A' and a short arm A^2, pivotal clamp C upon the end of the arm A^2, having a thumb portion c' and a jaw c, closing normally against the face of the arm A', and a securing-pin B on the back of the arm A', substantially as and for the purpose set forth.

410,751. VELOCIPEDE. George H. Davis, Worcester, Mass. Filed July 2, 1888. Serial No. 278,810. (No model.)

Claim.—1. In a velocipede, the combination, with the main frame, of an auxiliary yielding frame carrying the seat and pedal-shaft, supported upon and connected with said main frame only by a spring that sustains the parts in position laterally while supporting the weight of said auxiliary frame, together with the pedal mechanism and rider upon the seat, and a guide (or guides) that retains the lower part of said auxiliary frame in proper relation, while it is free to rise and fall with the flexure of said spring.

2. In a velocipede, the seat, pedal-shaft, and chain driving-gear, mounted upon a movable auxiliary frame that maintains them at constant distance apart in relation to each other, in combination with the main frame, the attachment of said auxiliary frame to the main frame being formed by a spring, as F, that sustains the parts in lateral relation, while affording upward and downward yielding action, and braces that sustain the pedal-shaft at constant working position from the driving-wheel axis.

3. The combination, with the main frame A, of the auxiliary frame C, the flat curved spring F, connected by a hinge to the auxiliary frame and fixed on said main frame in the manner described to give vertical yielding support, while sustaining the parts laterally, the pedal-shaft E, carrying the cranks, and drive-chain gears supported in bearings fixed on the lower bifurcated end of said auxiliary frame, the seat S, having an extension-standard S', adjustable in the upper part of said auxiliary frame, and a clamp for retaining the said standard at position of adjustment, all substantially as set forth.

4. The combination, with the yielding auxiliary frame C, guiding-wheel fork B, and the handle-shaft N', supported in a bearing on said auxiliary frame, of the guiding-handles M, fixed to the upper end of said shaft, the cross-head N^2 on the lower end of said shaft, the cross-head N^3 on the guide-wheel fork, and the link-rods n n, connecting the respective arms of said cross-heads, as and for the purposes set forth.

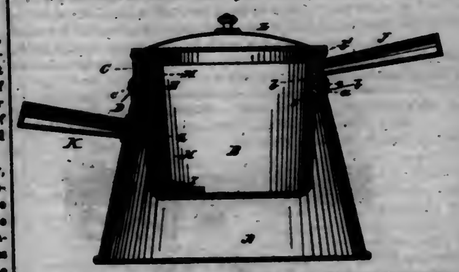
5. The combination, with the yielding frame C, having the forwardly-extended arm C', provided with a clamping-socket C^2 thereon, of the shaft-supporting sleeve N, extending through and longitudinally adjustable in said socket, the guiding-handles mounted on an upright shaft that extends through said sleeve and provided at its lower end with the cross-head N^2, and a binder for clamping said sleeve at position of adjustment, substantially as shown, and for the purpose set forth.

6. The guide-wheel fork B, provided with an operating-head N^3, in combination with guiding-handles mounted on the yielding auxiliary frame, links that connect the parts for operation, and a compensating joint b, for the purpose set forth.

7. The compensating joint b and the joint-supporting spring T, in combination with the top or cross head N^2 of the guide-wheel fork and the guiding-connections, for the purpose set forth.

8. The combination of the driving-wheel D, mounted in bearings on the main frame A, the yielding auxiliary frame C, carrying the pedal-shaft E, the curved flat spring F, connecting said auxiliary frame with the main frame, the braces H, connecting the pedal-shaft and drive-shaft bearings, differential sprocket-wheels and drive-chains for transmitting power and motion from the pedal-shaft to the driving-wheel axis, clutches for connecting and releasing the pedal-shaft sprockets, the sliding clutch-sleeve K, the shipper-rod m, supported in bearings on said auxiliary frame and having a handle m', and a catch m^2, having detents for retaining said shipper-rod at positions of adjustment, all substantially as shown and described.

9. The main frame having the dependent arm A', in combination with the truss-rods a and a', extending from the front and rear ends of said frame and connected with the lower part of said arm.



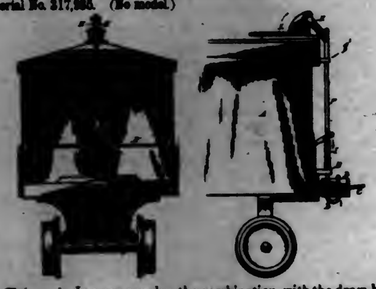
10. The main frame having the dependent arm A', in combination with the auxiliary frame C, its guide A, and yielding supporting-spring F, substantially as set forth, and truss-rods a and a', extending from the front and rear ends of said frame and connected with the lower part of said arm.

11. The spring F, having its main leaf connected to the auxiliary movable frame C, and a second leaf disposed as a brace beneath its main leaf, in combination with the main frame A and auxiliary frame C, substantially as set forth.

12. The spring F, supported upon the main frame A, and having its main leaf connected to the auxiliary movable frame C, and a second leaf F^2, disposed as a brace beneath said main leaf, in combination with an adjusting-support v, for increasing or reducing the tension of said spring, substantially as set forth.

13. In combination, substantially as described, the frame A, guiding-fork B, wheels D and G, yielding frame C, seat S, handle-bar M, with flexible connections for operating said guiding-fork, the pedal-shaft E, with cranks and chain gearing for operating said driving-wheel D, the braces H, spring F, and guide A' A, for the purpose set forth.

410,752. STEAMER. Rees Dimmock, Scranton, Pa. Filed Feb. 2, 1889. Serial No. 298,452. (No model.)



Claim.—1. In a steamer, the combination, with a water-receptacle, of a feed-receptacle constructed of earthenware, porcelain, or the like, fitting within said water-receptacle and having the steam-passage E, and the pipe H, integral with said feed-receptacle, forming

the steam-passage G, communicating with the passage E and an opening M, formed in said pipe H, for the purpose specified.

2. In a steamer, the combination, with a water-receptacle A, provided with a vertical lip *a*, of a food-receptacle B, constructed of earthenware, porcelain, or the like, having an annular shoulder *b*, a bead *b'*, steam-passages E G, formed therein, the packing-ring D, fitted in a recess in the shoulder *b*, and the band C, fitted around the shoulder *b*, and having the annular enlargement *c* and a suitable handle for said receptacle, substantially as described.

410,753. CAR-COUPLING. BETHUEL GHERARDI, Houma, La., assignor of one-half to Henry C. Miner, same place. Filed July 18, 1889. Serial No. 317,980. (No model.)

Claim.—1. In a car-coupler, the combination, with the draw-head, of the vertical U-shaped bar working in openings in the upper and lower sides thereof and in a bracket secured to the end of the car, the bifurcated bar connected thereto and working vertically in a bracket secured to the end of a car, the spiral spring surrounding the long shank of the U-shaped bar and confined under the lower end of the bifurcated bar, and the segment or bell-crank lever fulcrumed at the top of the car, whereby the coupler may be operated, substantially as specified.

2. The combination, with the draw-head, the U-shaped bar, the bifurcated bar, and spiral spring, of the transverse bars bent at their ends and pivoted to the bifurcated bar, their outer ends projecting beyond the sides of the car, whereby the coupling devices may be operated from either side, substantially as specified.

410,754. CAR-COUPLING. BETHUEL GHERARDI, Houma, La., assignor of one-half to Henry C. Miner, same place. Filed July 18, 1889. Serial No. 317,986. (No model.)

Claim.—1. In a car-coupler, the combination, with the draw or coupler head, of the vertical rod having its outer end bent outward and downward and entering the coupling-pin, openings in the coupling-head, the brackets wherein the said rod has its bearings, the spiral spring surrounding said rod and bearing against the lower bracket and a shoulder on said rod, and the segment-lever and connecting-links whereby the coupler may be operated, substantially as specified.

2. The combination, with the draw-head, the vertical rod having its lower end bent to form the coupling-pin, spiral spring, and bell-crank lever, of the cord connected to said lever and passing through guides down each side of the car, whereby the coupler may be operated from either side, substantially as specified.

410,755. CAR-COUPLING. BETHUEL GHERARDI, Houma, La., assignor of one-half to Henry C. Miner, same place. Filed July 18, 1889. Serial No. 317,987. (No model.)

Claim.—In a car-coupler, the combination, with the draw-head and coupling-pin thereof, of the bifurcated bent lever fulcrumed in a hanger secured to the lower part of the platform and having the lower end of the coupling-pin attached to its bifurcated end, the vertical rod pivoted to the opposite end of said lever and extending upward through a bearing in the platform, and the spiral spring bearing against the platform and a pin passing through the rod, whereby the parts are automatically returned and held in normal position, substantially as specified.

410,756. PULVERIZING-MILL. EDWIN C. GRIFFIN, Brooklyn, assignor to the Griffin Manufacturing Company, New York, N. Y. Filed June 1, 1888. Serial No. 275,712. (No model.) Patented in England Jan. 25, 1888, No. 1,162.

Claim.—1. In a pulverizing-mill, the casing or pan, the annular die, and the crushing or pulverizing rollers, in combination with the revolving centrally-arranged carrier provided along its upper portion with a feed receiving and distributing shell having openings arranged to deliver in front of the rollers, and also provided with an annular web or plate arranged beneath said shell and formed with pockets for the rollers, and with a disk or circular shaped lower end provided with inclined elevating-faces and horizontal supporting-surfaces, said carrier and its parts being integrally formed, substantially as described.

2. In a pulverizing-mill, the combination of the casing or pan, the annular die, the crushing or pulverizing rollers rotating within and against said die, the spindles upon which said rollers are closely fitted, the combined hoods and spindle-drivers, the ball-and-socket joints, and the revolving carrier provided with the top frame, said spindles being connected at their upper ends to the top frame of said carrier by said ball-and-socket joints, substantially as described.

3. In a pulverizing-mill, the combination of a casing or pan, an annular die, a central revolving carrier, pulverizing-rollers which are substantially vertically connected to said carrier, spindles to which said rollers are closely fitted, combined hoods and spindle-drivers, and pushing-blocks mounted on said carrier and arranged to engage said combined hoods and spindle-drivers and drive said rollers from the rear, substantially as described.

4. In a pulverizing-mill, the combination of a casing or pan, an annular die, a central revolving carrier having elevating-inclines provided with rests, pushing-blocks, and pulverizing-rollers loosely journaled on said carrier and in front of said pushing-blocks, said rests being arranged below said rollers for supporting them when not in operation, substantially as described.

5. In a pulverizing-mill, the combination of a casing or pan, an annular die, a central revolving carrier, pulverizing-rollers loosely journaled on said carrier, and elastic pushing-blocks mounted upon said carrier and arranged to engage said rollers, substantially as described.

6. In a pulverizing-mill, the combination of the casing or pan, the annular die, the revolving carrier provided with the pushing-blocks, the rollers provided with upward extensions, and the combined hoods and drivers, which freely rotate against said pushing-blocks as the rollers move in and out toward the center of the machine, substantially as described.

7. In a pulverizing-mill, the combination of the casing or pan, the annular die, the crushing or pulverizing rollers, the revolving carrier, the ball-and-socket joints, the spindles secured at their upper ends by said ball-and-socket joints, the elastic pushing-blocks secured to said carrier, and combined hoods and drivers which roll in and out to and from the center of the mill against said pushing-blocks, substantially as described.

8. In a pulverizing-mill, the combination of the casing or pan, the annular die, the rollers, spindles, spindle-drivers, and the revolving carrier provided with the semicircular pockets in which the rollers rotate, with the pushing-blocks arranged in rear of said spindle-drivers, with a feed-directing shell having the discharge-openings, and with a set of inclines by which the material is thrown upward against the face of and across the die, substantially as described.

9. In a pulverizing-mill, the combination of the casing or pan, the annular die, the revolving carrier provided with horizontal supports or rests, as described, and the spindles and rollers arranged at an incline from the perpendicular, whereby when in operation said spindles and rollers rise from said supports or rests and remain in operative position against said die by centrifugal force, substantially as described.

10. In a pulverizing-mill, the combination of the casing or pan, the annular die, the revolving carrier having horizontal supports or rests formed on its lower portion and provided with a horizontal frame at its top, the ball-and-socket joints, the rollers, and the spindles having bosses at their lower ends, and, together with the rollers, arranged at an inclination from the perpendicular and secured to said top frame by said ball-and-socket joints, substantially as described.

11. In a pulverizing-mill, the combination of the casing or pan having downwardly-leading discharge-openings in its body, the annular die, and the rollers rotating within and against the same, with a revolving circular disk or carrier arranged below said die and provided with inclined surfaces arranged in a vertical line falling inside of the interior surface of the die for the purpose of throwing material against the die and above the same, substantially as described.

12. In a pulverizing-mill, the combination of a casing or pan having downwardly-leading discharge-openings in its body, an annular die, pulverizing-rollers, elevating devices arranged below said die and adapted to throw the ground material above the same, and a cover or housing arranged around and above said die and having air ducts or passages for carrying the heavier ground material toward said discharge-openings, substantially as described.

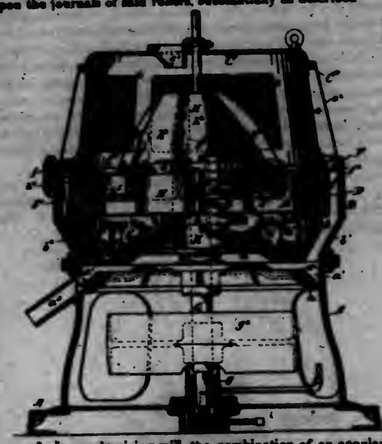
13. In a pulverizing-mill, the combination of a casing or pan having downwardly-leading discharge-openings in its body, an annular die, pulverizing-rolls, feed-elevating devices arranged below said die, and a cover or housing arranged above said die and having tortuous air ducts or passages for carrying the heavier ground material toward said discharge-openings and for permitting the air and fine dust to pass upward within the mill, substantially as described.

14. In a pulverizing-mill, the combination of the casing or pan, crushing or pulverizing mechanism, and an inner revolving part provided with vanes or wings, with an outer stationary cover, an inner cover, and the upwardly-projecting ring, said parts being so arranged by the revolution of said inner part and its vanes or wings that currents of air are caused to circulate within the mill and carry away or discharge the sufficiently-pulverized material without permitting air and fine dust to escape, substantially as described.

15. In a pulverizing-mill, the combination, with the crushing or pulverizing mechanism and the revolving carrier provided with wings or vanes, of the upwardly-projecting ring, the outer cover, the internal cover consisting of an outer hood and an inner ring secured thereto and projecting, respectively, outside and inside of the ring first named, and the casing or pan provided with downwardly-leading openings, substantially as and for the purpose described.

16. In a pulverizing-mill, the combination, with the crushing or pulverizing mechanism and the revolving carrier provided with wings or vanes, of the upwardly-projecting ring, the outer cover, the internal cover consisting of an outer hood and an inner ring secured thereto and projecting, respectively, outside and inside of the ring first named, and formed with an inlet-opening in its top, an adjustable plate or valve arranged over said opening, and the casing or pan provided with downwardly-leading openings, substantially as and for the purpose described.

17. In a pulverizing-mill, the combination, with the crushing or pulverizing mechanism and the revolving carrier provided with wings or vanes, of the upwardly-projecting ring, the outer cover, the internal cover consisting of an outer hood and an inner ring secured thereto and projecting, respectively, outside and inside of the ring first named, and the casing or pan provided with downwardly-leading openings, the trough, and the sweep, substantially as and for the purpose described.



410,757. PULVERIZING-MILL. EDWIN C. GRIFFIN, Brooklyn, assignor to the Griffin Manufacturing Company, New York, N. Y. Filed June 1, 1888. Serial No. 275,713. (No model.)

Claim.—1. In a horizontal pulverizing-mill, the combination of an annular die, vertical pulverizing-rollers having journals on their ends, and a revolving casing or driver having driving-disks mounted thereon and engaging the journals of said rollers, substantially as described.

2. In a horizontal pulverizing-mill, the combination of an annular die, vertical pulverizing-rollers, a revolving casing or driver, revolving shafts mounted thereon, and driving-disks mounted on the ends of said shafts and engaging the journals of said rollers, substantially as described.

3. In a horizontal pulverizing-mill, the combination of the casing or pan, the annular die, the grinding or pulverizing rollers, the central revolving casing or driver, the vertical shafts and their bearings, and driving-disks upon said vertical shafts engaging said rollers at their upper and lower ends and operating to drive the same, substantially as described.

4. In a pulverizing-mill, the combination of the casing or pan, the annular die, the rollers having journals at their upper and lower ends, the revolving casing or driver formed with roller-pockets, the vertical shafts, and the driving-disks at each end thereof for operating upon the journals of said rollers, substantially as described

5. In a pulverizing-mill, the combination of an annular die, pulverizing-rollers having journals on their ends, a revolving casing or driver, and driving-disks mounted thereon and engaging said journals, the upper disks and journals being of smaller diameter than the lower ones, substantially as described.

6. In a pulverizing-mill, the combination of the casing or pan, the annular die, the rollers having journals at their upper and lower ends, the revolving casing or driver formed with roller-pockets, the vertical shafts, and the driving-disks at each end thereof, the upper driving-disks and upper journals of the rollers being of smaller diameter than the lower ones, substantially as described.

7. In a pulverizing-mill, the combination of the casing or pan formed of an inner and outer shell having an intermediate discharge passage or openings, the rollers, the annular die mounted upon the upper part of said inner shell, the perforated ring over said die, and the wedges around its periphery, substantially as described.

8. A pulverizing-mill provided with a casing or pan formed of an inner and outer shell having an intermediate discharge passage or openings, the rollers, the annular die mounted upon the upper part of said inner shell, the screen-frames and screens, and the perforated ring over said die, substantially as described.

9. In a pulverizing-mill, the combination of the casing or pan, the annular die, the rollers, and the revolving casing or driver provided with feed-directing webs having deflecting-flanges, substantially as described.

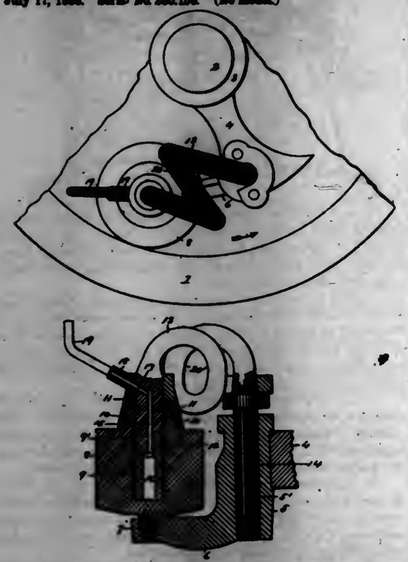
10. In a pulverizing-mill, the combination of a casing or pan, an annular die, pulverizing-rollers, and a vertical revolving casing or driver serving to propel said rollers and provided with feed-directing webs having deflecting-flanges above said die, substantially as described.

11. In a pulverizing-mill, the combination of a casing or pan, an annular die, pulverizing-rollers, and a revolving casing or driver serving to propel said rollers and provided with feed-directing webs above said die and feed-elevating devices below the same, substantially as described.

12. In a pulverizing-mill, the combination of a casing or pan having a feed-discharge passage or openings, an annular die, pulverizing-rollers, and a revolving casing or driver provided with feed-directing webs having deflecting-flanges, which are adapted to project the material against said die, substantially as described.

13. In a pulverizing-mill, the combination of a stationary two-part casing or pan having an annular passage or openings for discharging material from its lower portion, an annular die, pulverizing-rollers, and a cover having screened openings above said die and feed-elevating devices below said die, which are adapted to project the pulverized material toward said openings, substantially as described.

14. In a pulverizing-mill, the combination of an annular die, pulverizing-rollers, a stationary two-part casing or pan having an annular passage or openings between its parts for discharging material from its lower portion, and feed-elevating devices below said die, which are adapted to project the pulverized material toward said passage or opening, substantially as described.



15. In a pulverizing-mill, the combination of an annular die, pul-

verizing-rollers, a stationary two-part casing or pan having an annular passage or openings between its parts for discharging material from its lower portion, the outer casing, the screen-frames above said die, and feed-elevating devices below said die, substantially as described.

16. In a pulverizing-mill, the combination of the casing or pan, the annular die, the rollers, the revolving casting or driver provided with a slotted flange at its lower end, and removable inclines or shoes fitting in said slots at their lower ends, substantially as described.

17. In a pulverizing-mill, the combination of the casing or pan and the grinding or pulverizing mechanism with the integrally-formed two-part cover and screen-frame, one of said parts being removable and the other stationary, the two-part removable casing surrounding said screen-frame, and the swinging bolts and open-topped lugs for removably securing said two-part casing, substantially as and for the purpose described.

410,758. PULVERIZING-MILL. BROWN C. GRIFFIN, Brooklyn, assignor to the Griffin Manufacturing Company, New York, N. Y. Filed July 17, 1888. Serial No. 280,153. (No model.)

Claim.—1. In a pulverizer, the combination, with an annular die and a revolving center or driver, of a roller-support secured to said revolving center or driver and provided with a universally-yielding journal-spindle, and a roller mounted upon said spindle, substantially as described.

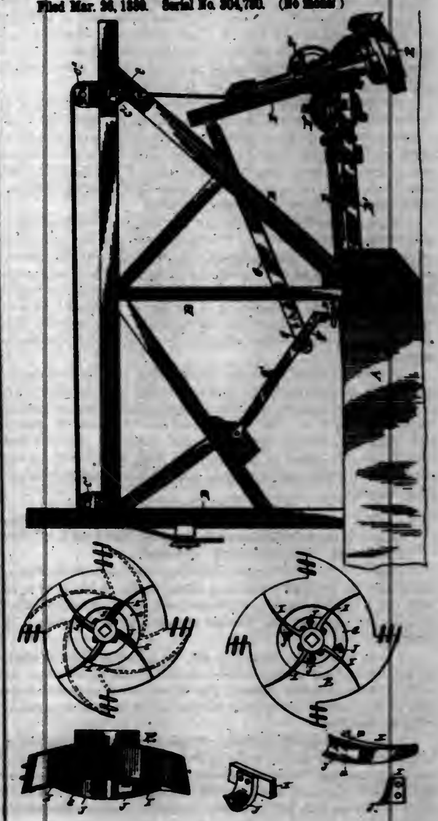
2. In a pulverizer, the combination, with an annular die and a revolving center or driver, of a roller-support provided with a universally-yielding journal-spindle and also with a pivotal spindle arranged parallel to the axis of said revolving center or driver, the pivotal spindle being pivoted to said center or driver and the journal-spindle having a roller mounted thereon, substantially as described.

3. In a pulverizer, the combination, with an annular die and a vertical revolving center or driver provided with brackets having vertical sockets formed therein, of roller-supports provided with vertically arranged spindles at their inner and outer ends, the inner spindles being mounted in said sockets and the outer spindles provided with rollers and means for permitting a universal yield of said outer spindles, substantially as described.

4. In a pulverizer, the combination, with the annular die 1, the drive-shaft 2, the revolving center 3, the brackets 5, formed with vertical sockets 5′ and extensions 6, having the supports 7, of the roller-supports 13, provided with the universally-yielding springs 20, and with the pivotal spindles 14 and journal-spindles 12, and the rollers 8, which are formed with the central bores 9, closed at the lower ends, and which are mounted upon said journal-spindles, substantially as described.

5. In a pulverizer, the combination of the annular die 1, the revolving center or driver 3, provided with the brackets 5, having the sockets 5′ and supports 7, the roller-supports 13, provided with the pivotal spindles 14, which are mounted in said sockets, and with the universally-yielding journal-spindles 12, provided with the hoods 14, and the rollers 8, mounted upon said journal-spindles and formed with the conical necks 10, substantially as described.

6. In a pulverizer, a roller-support provided with a pivotal spindle, a journal-spindle, and intermediate spring-coils, substantially as described.



7. In a pulverizer, the combination of an annular die 1, a revolving center or driver 3, provided with vertical sockets 5′, roller-supports 13, provided with spring-coils 20, pivotal spindles 14 and journal-spindles 12, said pivotal spindles being mounted in said sockets, and rollers 8, mounted upon said journal-spindles, substantially as described.

8. In a pulverizer, the combination of the annular die 1, the revolving center or driver 3, provided with the brackets 5, having the vertical sockets 5′ and the supports 7, the roller-supports 13, provided with the spring-coils 20, the pivotal spindles 14 and the journal-spindles 12, and the rollers 8, having the central bores 9, closed at the lower ends and mounted upon said journal-spindles, substantially as described.

9. In a pulverizer, the combination of the annular die 1, the revolving center or driver 3, provided with the brackets 5, having sockets 5′ and supports 7, the roller-supports 13, formed with the spring-coils 20, the pivotal spindles 14, mounted in said sockets, and the journal-spindles 12, provided with the hoods 14, and the rollers 8, mounted upon said journal-spindles and formed with the conical necks 10 at their upper ends and with closed lower ends, substantially as described.

10. In a pulverizer, the combination of the roller-support 13, provided with the journal-spindle 12, which is formed with the axial channel 15, the enlarged chamber 16, and the lateral duct 17, the apertured hood 11, the metal pipe 18, the flexible pipe 19, and the roller 8, formed with a central closed bore 9 and a conical neck 10, substantially as described.

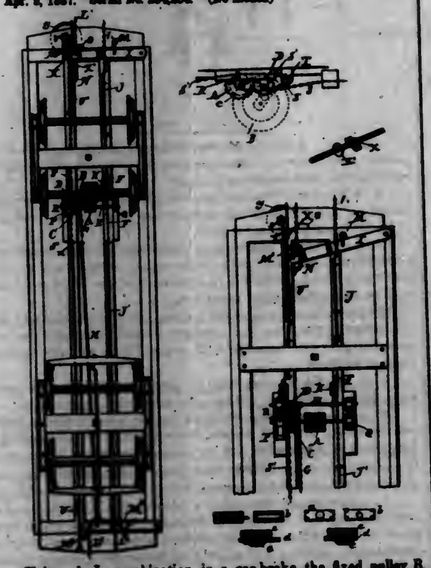
410,759. DREDGING-MACHINE. WILLIAM P. HARRINGTON, San Francisco, Cal., assignor to Charles Dodge, West Washington, D. C. Filed Mar. 26, 1888. Serial No. 304,760. (No model.)

Claim.—1. The combination, with a suction-pipe, an excavator jointed to the suction-pipe, and a pivoted standard by which the excavator is carried, of an arm composed of two parts jointed together attached to the top of the standard at one end and to a fixed portion of the dredge-boat at the other for regulating the inclination of the standard, as set forth.

2. The combination, with a suction-pipe, an excavator jointed to the outer end thereof, and a standard by which the excavator is carried, of an arm composed of two parts pivoted together and to the standard and dredge-boat at their outer ends, and a screw for regulating the elevation of the meeting pivoted ends of the two parts of the arm, as set forth.

3. The combination, with a suction-pipe, an excavator swung therefrom, and a pivoted standard, of a jointed arm composed of two members, one having a slot and the other a pin working therein, and an adjusting-screw attached to the end of one of the members of the arm, as set forth.

4. A rotary excavator having cutting-edges on its sides and spoil-passages leading therefrom to the suction-opening, and a central circular opening in the bottom of equal or greater area than the suction-opening above, the center of said bottom opening being beneath the center of the suction-opening.



5. A rotary excavator having cutting-edges on its sides and helical passages leading inward therefrom and provided with a central opening in the bottom thereof, and cutting-arms extending over said opening, substantially as set forth.

6. A rotary excavator having cutting-edges on its sides and passages leading inward from said edges and provided with a central opening in the bottom, and cutting-arms with scrapers upon them beneath said opening, as set forth.

7. A rotary excavator having cutting-edges on its sides and passages leading inward, and having a central opening in the bottom, and cutting-arms, each having a scraper integral with itself beneath the opening, as set forth.

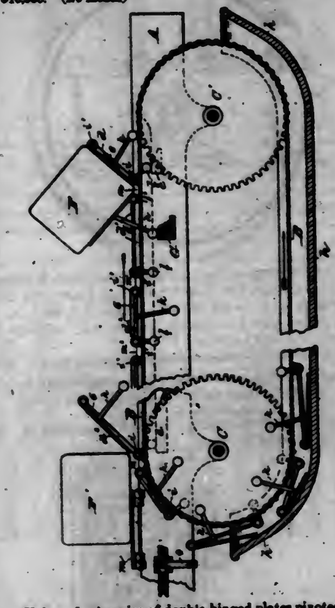
8. A rotary excavator having cutting-edges on its sides and passages leading inward therefrom, and having a central opening in the bottom, and radial arms having their portions which span the opening hollowed on one side and provided with a lower protruding cutting-edge, as set forth.

410,760. CAR-BRAKE. BENJAMIN KELLOGG, Peoria, Ill. Filed Apr. 9, 1887. Serial No. 234,200. (No model.)

Claim.—1. In combination, in a car-brake, the fixed pulley B, attached to car-axle, the friction-pulley A, the cog-wheels C and D, and the reel-shaft E, these parts being combined and operated substantially in the manner and for the uses herein set forth.

2. In combination, in a car-brake, the shaft-boxes P and Q, which allow the shaft passing through them to be drawn toward and away from the friction-pulley A and cog-wheel D without binding, substantially as set forth.

3. In combination, in a car-brake, the levers I I′, the hooks M M′, the stop O, and the chains L L′ L² L³, combined and operated substantially in the manner and for the uses herein set forth.



4. In combination, in a car-brake, the rods U U′, with the chains attached thereto, together with the stop X′ and the guide-block X, combined and operated substantially in the manner and for the uses herein set forth.

5. In combination, in a car-brake, the bifurcated chains S S′, connecting the rods U U′ with the axle-box P, one portion of said chain pulling over a block-pulley T, combined and operated substantially as herein set forth.

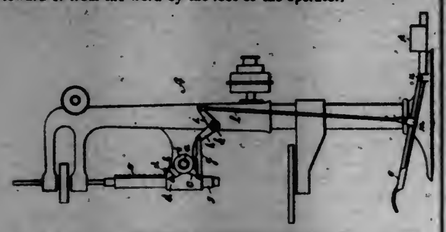
6. In combination, in a car-brake, the bifurcated chain F, connecting the rods J J′ with the reel-shaft E, one portion of said chain pulling over a block-pulley K, combined and operated substantially as herein set forth.

7. In the herein-described car-brake, the spring R, arranged to throw the friction-pulley out of gear when the brakes are released, operated substantially as herein set forth.

410,761. SOLDERING-MACHINE. ANDREW W. LIVINGSTON and GEORGE WILDEY, San Francisco, Cal. Filed May 10, 1889. Serial No. 310,395. (No model.)

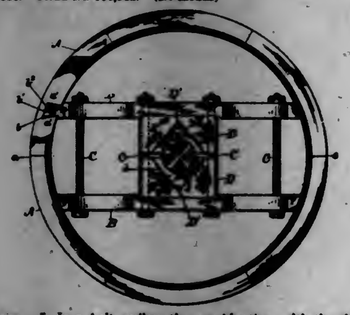
Claim.—1. A series of double-hinged plates pivoted to an endless chain and to each other, each plate having a lifting device secured to it, in combination with means for automatically actuating the lifting devices, substantially as herein described.

2. A series of double-hinged plates pivoted to an endless chain and to each other, each plate having a lifting device secured to it, in combination with the trip-lugs *c* and G, for automatically actuating the lifting devices, substantially as herein described.



3. The single pivoted plate M, adapted to move at right angles to the line of motion of the double plates on the endless chain, and a cam by which said single plate is actuated, in combination with said double plates pivoted to said chain and adapted to deliver the can from the machine, substantially as described.

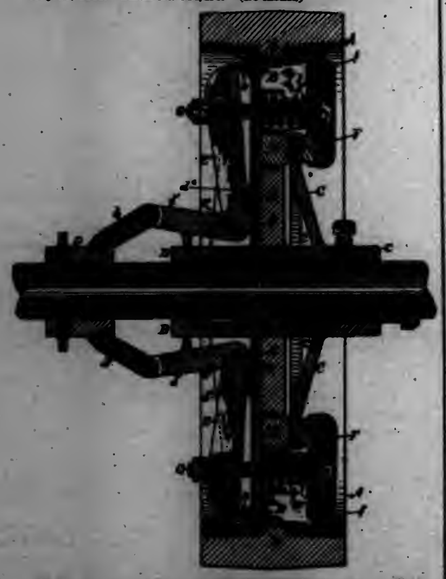
4. In a can-soldering machine, the combination, with an endless carrier for supporting the cans, of a pivoted plate adapted to move at right angles to the line of movement of the carrier and to receive the cans delivered therefrom, and means for actuating said single plate, substantially as described.



410,762. DRILLING-MACHINE. FREDERICK W. LINCOLN and DAVID A. COREY, New Bedford, Mass. Filed July 3, 1889. Serial No. 316,442. (No model.)

Claim.—In combination with the feed-piston and shaft of a drilling-machine, a toothed wheel rigidly mounted on said shaft and having a housing pivoted on said shaft, and provided with two spring-detents to engage with said toothed wheel at the will of the operator, and having a projecting arm connected by suitable mechanism

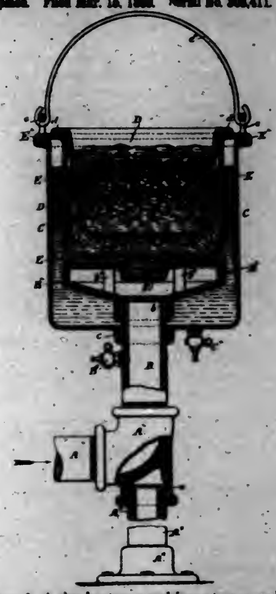
with a foot-lever, whereby the spindle of the drilling-machine is fed toward or from the work by the foot of the operator.



410,763. BELT-PULLEY. JOSEPH G. MOSHY, Erie, Pa. Filed Apr. 8, 1889. Serial No. 306,312. (No model.)

Claim.—1. In a belt-pulley, the combination, with the rim-sections A A, of spoke-bars B B, bolts C C C C, hub-blocks D D, having V-formed notches D' D', and V-shaped bushings E E, fitting in said notches and on the shaft S, and having kerfs or cuts *e* from the shaft toward the apex of said bushings.

2. In a belt-pulley, the combination, with the rim part A, having dovetail notches *a'*, of the spoke-arms B, having dovetail tenons *b* with kerfs *b'*, and the holes *b²* for wedge-pins within said tenon.



410,764. FRICTION-CLUTCH. JOSEPH G. MOSHY, Erie, Pa. Filed May 23, 1889. Serial No. 312,490. (No model.)

Claim.—1. In a friction-clutch, the combination of a pulley or wheel A B, mounted loosely upon the shaft, the clutch ring or disk C, fixed to the shaft, jaws H and H', carried by said pulley and arranged on opposite sides of said clutch-ring, the loose sleeve D on said shaft, and the system of levers *d d'* and E, and the bolt G, mounted on said pulley and serving to operate said jaws.

2. In a friction-clutch, the combination of a clutch ring or disk fixed to the shaft, a loose pulley having bearings on the shaft on each side of the clutch-ring and an opening in its web to receive said clutch-ring, clamping-jaws on opposite sides of said clutch-ring, which jaws are carried by said pulley, a sliding sleeve on said shaft, and a system of levers moved by said sleeve and carried by said pulley for operating said clamping-jaws.

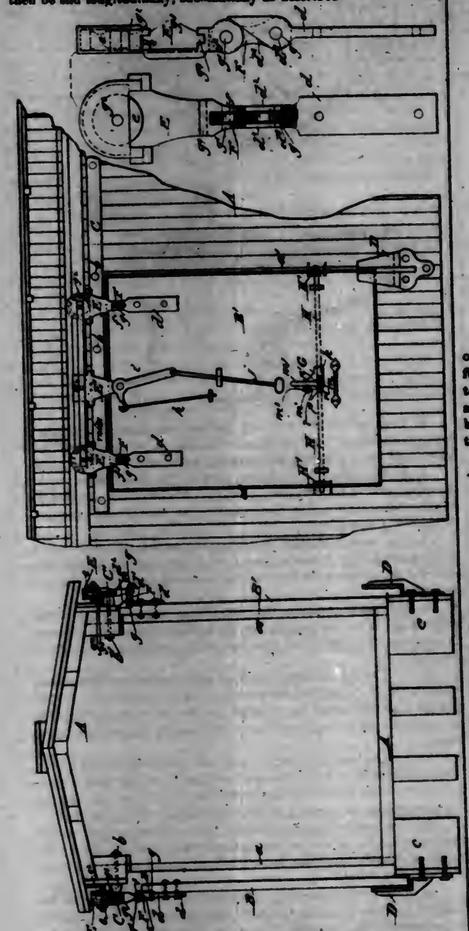
410,765. GLUE-HEATER. SILAS B. MOSHER, Chicago, Ill., assignor to the Mosher Tubular Metallic Packing and Manufacturing Company, same place. Filed Mar. 15, 1889. Serial No. 303,411. (No model.)

Claim.—1. A glue-heater comprising a steam-supply pipe, a water-jacket, and a steam-cap removably secured upon said pipe within the water-jacket, substantially as set forth.

2. A glue-heater comprising a water-jacket, a steam-supply pipe extending into the same, and a steam-cap removably secured upon said pipe, substantially as set forth.

3. A glue-heater comprising a water-jacket, a steam-supply pipe extending into the same, and a steam-cap connected by a screw-joint with the pipe and provided in its top with a depression of other than circular form, substantially as set forth.

4. A glue-heater comprising a water-jacket, a steam-supply pipe extending into the same, and a steam-cap secured upon said pipe, said steam-cap provided internally with integral posts or studs, substantially as set forth.



5. A glue-heater comprising an outside water-jacket, an inside water-jacket, a glue-pot, and a heater, substantially as set forth.

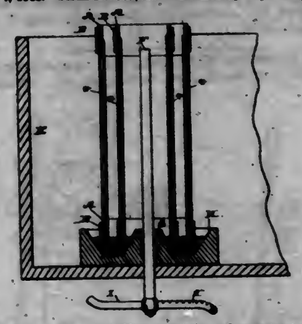
6. A glue-heater comprising an outside water-jacket, a steam-pipe extending into said outside water-jacket, a glue-pot having a flange near its upper edge, and an inside water-jacket resting upon the upper edge of the outside water-jacket and supporting the glue-pot by engagement with the flange thereof, substantially as set forth.

7. A glue-heater comprising a water-jacket, a steam-cap, and a steam-supply pipe secured to said steam-cap, combined with a pipe-elbow, a pipe leading from the source of steam-supply, and the said steam-supply entering said elbow, said pipe-elbow having a tubular extension, a supporting-pipe or bar, the upper end of which enters said tubular extension, and the lower end of which rests on an adjacent supporting-surface, substantially as set forth.

410,766. CAR-DOOR. JOHN H. MATHEWES, Rutland, Vt. Filed May 6, 1889. Serial No. 309,744. (No model.)

Claim.—1. The combination, with a car or other structure, the sliding door thereof, and a suspension-track, of the sliding suspension device comprising hinge-plate *d*, provided with an abutting and stop-extension portion for insuring a vertical position of the link, the housing E, and connecting-link F, pivoted directly to the hinge-plate and to the said housing, whereby the door when closed can be made to occupy a vertical position within the doorway while suspended on the track with its outer surface flush with the outer surface of the car or structure, and when it is to be opened can be bodily swung out and down beyond said outer surface, so as to stand vertically and then be slid longitudinally, substantially as described

2. A door closing from the outside provided with a hinge-plate *d*, having a bevel-surface d^3, in combination with a suspension-housing provided with an abutting end *f* and with the link F, substantially as described.



3. The combination of the jointed suspension means, consisting of the housing E, hinge-plate *d*, provided with an abutting and stop-extension portion for insuring a vertical position of the link, and connecting-link pivoted directly to the hinge-plate and to the housing, door, car-suspending track, and foot-guide, the two latter being in about the same vertical plane, substantially as described.

4. The combination, with the door having jointed suspension means, as described, of the housing E, an elbow-lever pivoted to said housing, a connecting-rod attached to the door and lever, and an operating-handle, substantially as described.

5. The sheave-housings constructed with a chamber for a sheave or roller grooved and open at one side to admit the rail and provided with a hinging end, in combination with the hinge-plate provided with an abutting and stop-extension portion for insuring a vertical position of the link, and the link F, pivoted to said housing and hinge-plate, substantially as described.

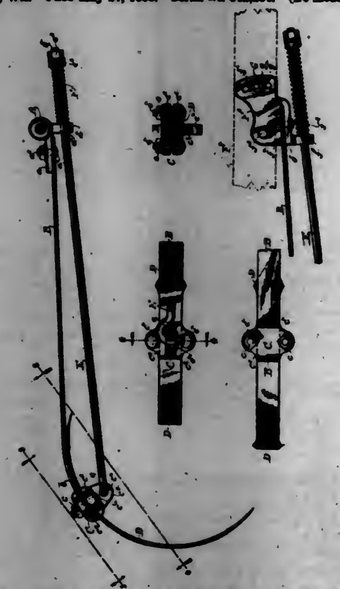
6. The combination, with the car provided with a suspension-track and a lower guide, both in about the same vertical plane, of a door provided with a hinging-plate, a link which is adapted to lie horizontally and stand vertically, and a housing which is pivoted to the link and moves on the suspension-track, substantially as and for the purpose described.

410,767. FILTER. OSBORNE PIERCE, San Francisco, Cal. Filed Mar. 7, 1888. Serial No. 266,309. (No model.)

Claim.—An improved filter consisting of an outer tank, a casting or base-piece having an annular channel with oppositely-inclined walls forming approximately an inner and outer conical surface, vertical filtering-cylinders concentric with each other and removably fitted in said channel, and a discharge-pipe passing through the center of the base-piece and inner filtering-cylinder and discharging near the top of the latter, substantially as herein described.

410,768. CULTIVATOR AND SEEDER. JOHN S. ROWELL, Beaver Dam, Wis. Filed Feb. 4, 1889. Serial No. 298,899. (No model.)

Claim.—1. The combination, with the vertically-movable bar D and a lever and ratchet mechanism at or near one end thereof for raising and lowering said bar, of an upright at or near the opposite end of the bar and a coiled spring connected at one end to the upper end of the upright and at the other end to the bar, substantially as described.



2. The combination of the bar D, mounted on laterally-extended arms D', a lever for raising and lowering the bar D, a spring arranged to exert a lifting force on said bar, and chains severally connecting the

toothed beams with the bar D and passing over the top of the bar to a point of attachment therewith, whereby when said bar D is depressed the chains are enrolled, and vice versa, and thus lengthened or shortened to an extent greater than is directly due to the actual vertical movement of the bar D, substantially as described.

3. The combination, with the toothed beam provided with an adjustable weight, of an adjustable spring arranged to lift the toothed beam, substantially as described.

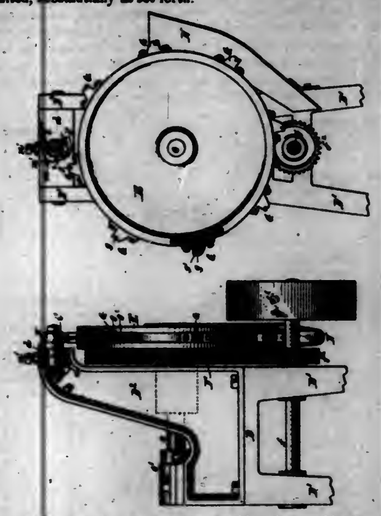
4. The combination, with a drill-shoe and draft-rod, of an adjustable draft-bar K and a vertically-flexible toothed beam I', substantially as described.

410,769. SPRING CULTIVATOR-TOOTH. JOHN S. ROWELL, Beaver Dam, Wis. Filed May 27, 1889. Serial No. 312,231. (No model.)

Claim.—1. In a cultivator, a spring-tooth connected to the cultivator-beam by a flat spring-bar, one end of which bar is rigidly secured to a plate on the said beam, and a longitudinally-movable rod connected to said tooth and said plate, substantially as specified.

2. The combination, with a plate adjustably secured to the beam of a cultivator and a spring-tooth, of a flat spring-bar connecting said tooth with said plate, and a rod connected at one end to the tooth and provided on its other end with an adjustable connection with said plate, whereby a double adjustment of the cultivator-tooth with reference to the beam is possible, substantially as described.

410,770. MACHINE FOR ATTACHING TONGUES TO BUCKLES. ADOLPH SAMUEL, Buffalo, N. Y., assignor to Pratt & Letchworth, same place. Filed Apr. 12, 1888. Serial No. 307,002. (No model.)



Claim.—1. In a machine for tonguing buckles, the combination, with a bending or compressing die, of a traveling die carrying the buckle and co-operating with said compressing-die, substantially as set forth.

2. In a machine for tonguing buckles, the combination, with a movable bending or compressing die, of a traveling die carrying the buckle and co-operating with said compressing-die, substantially as set forth.

3. In a machine for tonguing buckles, the combination, with an oscillating bending or compressing die, of a traveling die carrying the buckle and co-operating with the compressing-die, substantially as set forth.

4. In a buckle-tonguing machine, the combination, with a traveling or carrying die, of an oscillating compressing-die operating in conjunction with said traveling die and a spring whereby the oscillating die is returned to its normal position upon clearing the traveling die, substantially as set forth.

5. In a buckle-tonguing machine, the combination, with a traveling or carrying die, of an oscillating compressing-die operating in conjunction with said traveling die, a spring whereby the oscillating die is returned to its normal position upon clearing the traveling die, and a stop whereby the return movement of the compressing-die is limited, substantially as set forth.

6. In a machine for tonguing buckles, the combination, with a compressing-die, of a die carrying the buckle and a revolving disk to which said die is attached, substantially as set forth.

7. In a machine for tonguing buckles, the combination, with a movable bending or compressing die, of a traveling die carrying the buckle and having a seat for receiving the buckle and its tongue, substantially as set forth.

8. In a buckle-tonguing machine, the combination, with a compressing die having a bending-recess, of a traveling die co-operating with the compressing-die and having a buckle-seat, substantially as set forth.

9. In a buckle-tonguing machine, the combination, with a compressing-die, of a carrying-die having a transverse recess or depression for receiving one of the cross-bars of the buckle, substantially as set forth.

10. In a buckle-tonguing machine, the combination, with a compressing-die, of a carrying-die having a transverse recess or depression for receiving one of the cross-bars of the buckle and a longitudinal recess for receiving the tongue of the buckle, substantially as set forth.

11. In a buckle-tonguing machine, the combination, with a traveling carrying-die, of a pivoted compressing-die provided with a shoulder or projection against which the traveling die strikes and whereby the compressing-die is swung on its pivot, substantially as set forth.

12. In a buckle-tonguing machine, the combination, with a traveling carrying-die, of a compressing-die co-operating with the traveling die and made adjustable toward and from the traveling die, substantially as set forth.

13. In a buckle-tonguing machine, the combination, with the stationary frame having an elongated opening or slot, of an adjustable compressing-die mounted on an arbor clamped in said slot and a set-screw bearing against said arbor, substantially as set forth.

410,771. MACHINE FOR ATTACHING EYEBOLTS TO HAME-RINGS. ADOLPH SAMUEL, Buffalo, N. Y., assignor to Pratt & Letchworth, same place. Filed Apr. 12, 1888. Serial No. 307,003. (No model.)

Claim.—1. The combination, with the dies D D', provided with flat upper faces adapted to support a stud-blank, and a ring suspended

from said blank, of a vertically-movable follower provided with depending fingers engaging over said ring on opposite sides of the blank, substantially as set forth.

2. The combination, with the dies D D', provided with flat upper faces adapted to support a stud-blank, and a ring suspended from said blank, of a vertically-movable follower engaging over said ring on opposite sides of the blank, and mechanism whereby the inner adjacent faces of the two dies are closed against the blank, substantially as set forth.

3. The combination, with the dies D D', provided with flat upper faces adapted to support a stud-blank, and a ring suspended from said blank, of a follower engaging over said ring on opposite sides of the blank, and mechanism whereby the blank is bent between the dies by the movement of the follower, substantially as set forth.

4. The combination, with the dies D D', provided with flat upper faces adapted to support a stud-blank, and a ring suspended from said blank, of a follower engaging over said ring on opposite sides of the blank, mechanism whereby the blank is bent between the dies by the movement of the follower, and mechanism for closing the dies against the bent blank, substantially as set forth.

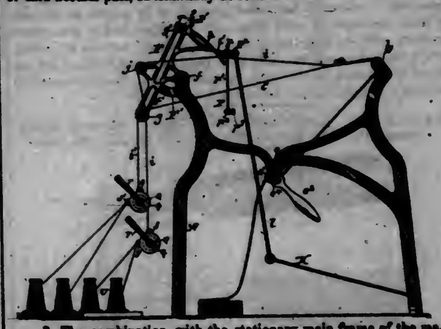
5. The combination, with the rectangular frame, and the dies D D', journaled in said frame, and provided with gear-wheels whereby the dies are geared together, of a rock-arm secured to the journal of one of said dies, and a spring bearing against said arm, whereby both dies are held in an open position to receive a blank, substantially as set forth.

6. The combination, with the rectangular frame C, and the dies D D', journaled in said frame, and provided with suitable gear-wheels, whereby the dies are geared together, of a rock-arm secured to the journal of one of said dies, a spring bearing against said arm for holding the dies in an open position to receive a blank between the dies, and a vertically-movable slide-rod bearing against the opposite side of said arm for compressing said spring and closing the dies against the blank, substantially as set forth.

7. The combination, with the vertical frame A, provided with a crank-shaft J and a vertically-reciprocating follower L, connected with said crank-shaft, of the dies D D', journaled in a frame arranged below the follower, gear-wheels mounted upon the journals of said dies, whereby the dies are geared together, a rock-arm *i*, mounted on the journal of one of said dies, a spring I, bearing against the arm *i*, and a vertically-movable slide-rod bearing against said arm for compressing said spring and operated by the downward movement of the follower, substantially as set forth.

8. The combination, with the vertical frame A, provided with a crank-shaft J and a cross-head K, guided in vertical ways formed on said frame and connected with said crank-shaft, and a follower L, secured to said cross-head and provided with depending fingers *l*, of a pair of rectangular dies D D', having upper flat faces and journaled in a supporting-frame arranged centrally below the follower L, gear-wheels mounted on the journal of said dies, whereby the dies are geared together, a rock-arm mounted on the journal of one of said dies and held in a horizontal position by a spring I, a vertically-movable slide-rod *m*, guided in ways secured to the frame A and resting upon the arm *i*, and a lug or bracket *n*, secured to the cross-head and engaging with the slide-rod upon the downward movement of the cross-head and follower, substantially as set forth.

9. The combination, with the rectangular frame C, provided with shoulders *g*, formed on the front and rear walls of said frame, of the dies D D', journaled in said frame between its front and rear walls, with the rear or back sides of said dies abutting against the shoulders *g*, substantially as set forth.



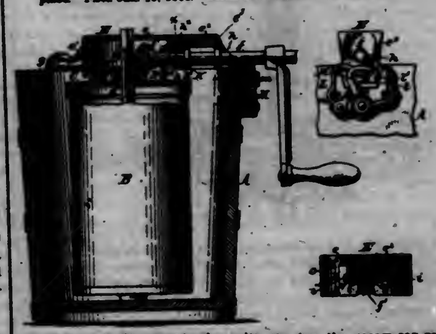
10. The combination, with the supporting-frame, of the rectangular dies D D', journaled in said frame and provided with flat upper faces, and a transverse recess or groove extending across the upper faces of said dies, substantially as set forth.

11. The combination, with the supporting-frame, of the dies D D', journaled in said frame and provided with flat upper faces, a transverse groove or recess extending across the upper faces of said dies, and a semicircular recess or groove formed on the inner or adjacent face of each die, substantially as set forth.

410,772. HAND-LOOM. JOSEPH SCHERER, Buffalo, N. Y. Filed Oct. 20, 1888. Serial No. 288,648. (No model.)

Claim.—1. The combination, with the stationary main frame of the machine, of an oscillating heddle-frame pivoted to the main frame and provided on one side of its pivot with a series of needles which carry one set of warps and at the opposite side of its pivot with a support which carries the other set of warps, substantially as set forth.

2. The combination, with the main supporting-frame of the loom, of an oscillating heddle-frame pivoted at or near its center to the main frame and provided on the front side of its pivot with a series of depending needles which carry one set of warps and on the rear side of its pivot with a roller or support carrying the other set of warps, and a guide roller or support over which the portions of the warps in rear of said needles pass, substantially as set forth.



3. The combination, with the stationary main frame of the machine, of an oscillating heddle-frame pivoted to the main frame and provided on one side of its pivot with a series of needles which carry one set of warps and at the opposite side of its pivot with a support which carries the other set of warps, and a treadle whereby said heddle-frame is operated, substantially as set forth.

4. The combination, with the main supporting-frame of the loom, of an oscillating heddle-frame pivoted at or near its center to the main frame and provided on the front side of its pivot with a series of depending needles which carry one set of warps and on the rear side of its pivot with a roller or support carrying the other set of warps, a guide roller or support over which the portions of the warps in rear of said needles pass, and suspended tension-weights adapted to be applied to the depending portions of the warp-threads passing over said guide-roller and the support or roller at the rear end of the heddle-frame, substantially as set forth.

5. The combination, with the heddle-frame provided with a rectangular needle-supporting bar *g'* of the needles A, provided with rectangular loops fitting over said needle-bar, washers arranged between said loops, and wedges *n*, passing through longitudinal slots in said supporting-bar and bearing against the endmost needles or washers, substantially as set forth.

6. The combination, with the rod Q, of the clamping-disk *q*, provided with perforated lugs or ears, pins or rods passing through said ears, washers *q'*, interposed between said clamping-disks, and springs attached to the rods Q and bearing against the end clamping-disks, substantially as set forth.

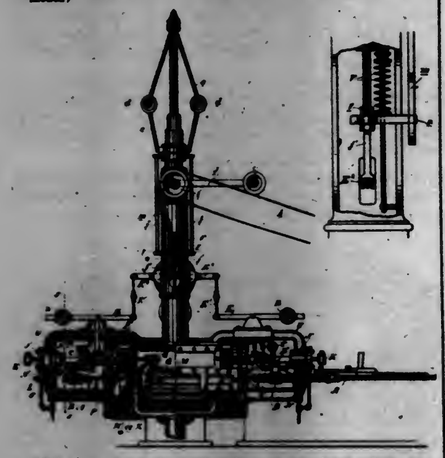
410,773. ICE-CREAM FREEZER. CHARLES G. SHEPARD and PETER ADAMS, Buffalo, N. Y.; said Adams assignor to Walter J. Shepard, same place. Filed Jan. 19, 1888. Serial No. 261,212. (No model.)

Claim.—1. The combination, with the tub, the cream-can provided with a gear-rim, and the actuating-shaft provided with a wheel, of a removable top frame provided with a divided inner bearing and a solid oblique outer bearing, in which the shaft is journaled, whereby the shaft can be tilted and withdrawn from the solid outer bearing upon removing the cap of the inner bearing, substantially as set forth.

2. The combination, with the tub, the cream-can provided with a gear-rim, and the actuating-shaft provided with a gear-wheel, of a removable top frame provided with a divided inner bearing and with an outer bearing having its lower portion arranged outwardly beyond its upper portion, substantially as set forth.

3. The combination, with the tub, the cream-can, and its cover

provided with a gear-rim, of an upwardly-projecting collar secured on the cover within the marginal edge thereof and surrounding said gear-rim, a removable top frame adapted to be secured to the tub, a shaft journaled in said frame and provided with a gear-wheel meshing with the gear-rim of the cream-can and rotating the same, and a depending annular shield arranged on the under side of the top frame above and inside of the marginal edge of the cream-can and around the collar thereof, substantially as set forth.



410,774. HAND GARDEN-CULTIVATOR. JESSE A. SIBSON, Goshen, Ind. Filed Mar. 13, 1889. Serial No. 303,152. (No model.)

Claim.—1. The combination, with the handle having an opening formed in one of its ends, wires B and C, having their free ends bent to form the teeth of the cultivator and their centers formed with a loop, as described, of the transverse pin G and block or wedge H, for securing the said looped portions of the wires within the opening in the handle, substantially as and for the purpose specified.

2. The combination, with the handle having an opening in one of its ends, of two wires, the free ends of which form the teeth of the cultivator, the wires being provided with loops, a wedge or block H inserted in the end of the handle and bearing against said loops, and a transverse pin passed through the handle and through the block and securing the said parts together, substantially as and for the purpose specified.

410,775. CUT-OFF-VALVE GEAR FOR ENGINES. ISAAC F. THOMPSON, San Francisco, Cal. Filed June 6, 1889. Serial No. 313,379. (No model.)

Claim.—1. In a reciprocating-piston engine, independent steam and exhaust valves at each end, a single eccentric-rod having an arm connecting it directly with the exhaust-valve stem, and an independent branch of this arm, in combination with the steam-valve rod or stem having a trigger hinged thereto, so that one end will be engaged by the independent arm from the reciprocating eccentric-rod, a wheel or shoe connected with said trigger, and an inclined or wedge-shaped foot connected with the governor and movable to or from the wheel by the action of the governor, whereby the trigger is raised and disengaged from the arm moved by the eccentric, substantially as described.

2. In a reciprocating engine having a steam-chamber with a separate slide-valve at each end independent of each other, each valve having a rod connecting with it and extending out through the end of the steam-chamber and forming a piston upon which the steam within the chest acts so as to force it outward when released and close the steam-ports, in combination with the cylinder of said engine having a separate exhaust-chamber at each end with slide-valve to each, all of said steam and exhaust valves actuated by one or more eccentric-rods, substantially as described.

3. The sliding steam-valve with its steam-actuated piston or rod, the trigger hinged to said rod outside the steam-chest, a spring by which said trigger is drawn down, an arm projecting from the eccentric-rod, so as to engage the depressed end of the trigger, a wedge-shaped foot, and a bell-crank lever, whereby the foot is advanced or retracted by the action of the governor, and a wheel or shoe connected with the trigger, so as to move upward on the wedge-shaped foot and raise the trigger and disengage it from the arm, substantially as described.

4. The combination, with steam-valve, the reciprocating rod extending outward through the end of the steam-chest, having its inner end formed to be acted upon by steam-pressure, a trigger hinged to said rod, and an arm projecting from the eccentric-rod, so as to engage said trigger, of a bell-crank lever and inclined wedge-shaped foot adapted to ride under a projection on said trigger, whereby the latter is lifted and disengaged from the actuating-arm, and the air-cushion chamber, and the piston reciprocating within said chamber and connected with the steam-valve rod, substantially as described.

5. The combination, with the sliding steam and exhaust valves of a reciprocating engine and an eccentric-rod by which they are moved, of a trigger connected with the steam-valve stem and actuated by the rod, a governor, and intermediate connecting mechanism comprising a wedge-shaped foot and projection on the trigger, whereby the trigger is lifted and disengaged from the actuating-rod and the admission of steam to the cylinder is cut off, substantially as described.

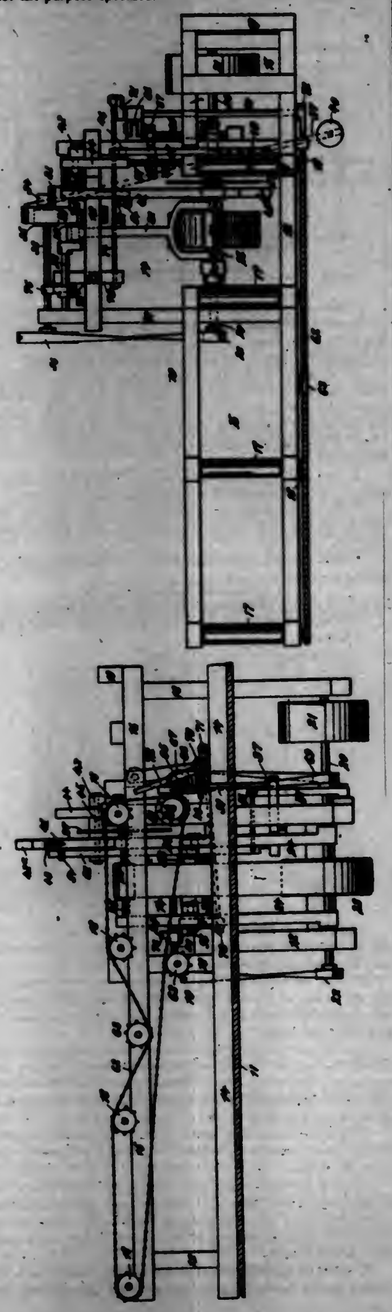
6. The combination, with the valve-actuating mechanism, of the governor, the inclined foot, the bell-crank lever, the rods and levers, as shown, and the spring V, whereby the vibrations of the governor are modified, substantially as described.

7. The bell-crank lever, the inclined tripping-foot, the governor, and rods connecting it with the bell-crank lever, in combination with the cross-bar having the pin *n*, the pulley *k*, the lever *j*, and rod *m*, having its lower end slotted, substantially as herein described.

410,776. GRAIN-SEPARATOR. HERMIAN G. THIPLENT, Orland, Cal. Filed May 15, 1889. Serial No. 310,998. (No model.)

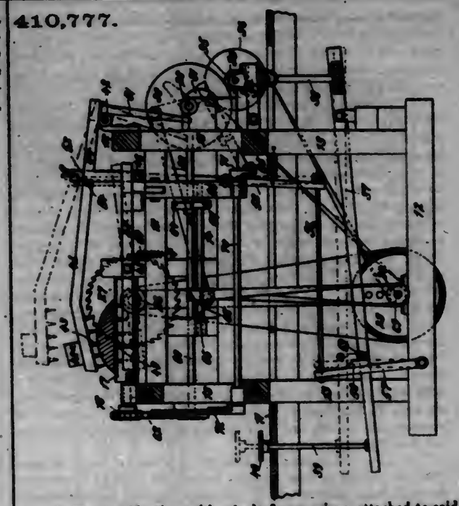
Claim.—1. A single fan-case and fan having the discharge-passages F and H, in combination with the carriers A and C, the fingers I and J, arranged with relation to each other, as shown, to receive an air-blast from the passage H, the inclined board K, and the oscillating screen G, substantially as herein described.

2. The improvement in separators for threshing-machines, consisting in the combination, with the carriers A and C and the return-board L, of the double series of fingers I and J, arranged with relation to each other and the carriers, as shown, an oscillating screen G, and the inclined board K, together with fan, and the fan-case having the blast-openings F and H discharging independently through the screen and the fingers, as herein described.



3. The single independent screen having its central portion suspended upon links N, and an eccentric or crank O, connected with one end of the screen, substantially as herein described.

4. The stationary inclined grain-board M, arranged beneath the screen and extending between the auger-cases P and P', as shown, the independent screen G, having its central portion suspended by links or hangers and the end connected with an eccentric, whereby a rotary motion is imparted to the opposite ends of the screen and a horizontal swinging motion to the central portion, substantially as herein described.



5. A grain-cleaning device consisting of a centrally-suspended screen, a crank connected with one end, a screen-bottom with segmental downwardly-bent tongues cut in its surface, and a fixed inclined grain-board beneath, an inclined chute discharging upon the screen, a fan and a fan-casing with blast-openings above and below the chute, and superposed straw-separating fingers fixed above and behind the upper blast-opening, so that both receive the single blast, substantially as herein described.

410,777. SLAB-SAWING MACHINE. DAVID S. ARNOT, Olean, N. Y. Filed Oct. 18, 1888. Serial No. 288,488. (No model.)

Claim.—1. The combination, with a body-frame, wings attached to the said frame, and carrying-rollers journaled in said wings, of a pivoted frame, a shaft journaled in the same, carrying a saw, a crank-shaft parallel with the saw-shaft, a pitman connecting the saw-frame and crank-shaft, an upper and lower toothed dog fulcrumed upon the body-frame, and means, substantially as shown and described, for rotating the crank-shaft and actuating the dogs from said crank-shaft, as and for the purpose specified.

410,777.

2. The combination, with a body-frame, wings attached to said frame, carrying-rollers journaled in said wings, a pivoted frame, and a shaft journaled in the pivoted frame, carrying a saw, of a crank-shaft parallel with the saw-shaft, a pitman connecting the saw-frame and crank-shaft, an upper toothed dog fulcrumed upon the body-frame, provided with a finger at the extremity, a lower toothed dog actuated by the upper dog, and an essentially hooked-shaped cam secured to the crank-shaft capable of contact with the said finger, substantially as shown and described.

3. The combination, with the body-frame and the drive-shaft, a rocking frame, a shaft journaled in the rocking frame, carrying a saw, a crank-shaft parallel with the saw-shaft, provided with a friction-roller, and a pitman connecting the crank-shaft and rocking frame, of a shaft parallel with and beneath the crank-shaft, said shaft journaled at one end in a fixed bearing and in a swinging bearing at its other end, provided with a friction-roller aligning the friction-roller of the crank-shaft, said shaft belted to the drive-shaft, a lever fulcrumed in the body-frame, and a link connecting the swinging bearing and the lever, all arranged substantially as and for the purpose described.

4. The combination, with a body-frame and the drive-shaft thereof, a rocking frame, a shaft journaled in the rocking frame, carrying a saw, a crank-shaft parallel with the saw-shaft provided with a friction-roller and a cam, and an adjustable shaft beneath the crank-shaft belted to the drive-shaft provided with a friction-roller aligning the friction-roller of the crank-shaft, of a lever linked to the adjustable shaft, an upper dog fulcrumed upon the body-frame provided with a downwardly-projecting finger, and a lower dog actuated from the upper dog, substantially as shown and described.

5. The combination, with a body-frame and the drive-shaft thereof, a saw-frame rocking on the drive-shaft, a crank-shaft connected with the rocking frame, an adjustable shaft parallel with the crank-shaft, having frictional contact therewith, and a lever controlling the adjustable shaft, of a cam secured to the crank-shaft, an upper and lower dog actuated by said cam, and a latch-bar controlling the dogs and connected with the said lever, substantially as shown and described.

6. The combination, with a body-frame and the drive-shaft thereof, wings projected from the body-frame, carrying-rollers journaled in said wings, a saw-frame rocking upon the drive-shaft, a crank-shaft connected with the saw-frame, an adjustable shaft having frictional contact with the crank-shaft, and a foot-lever controlling the adjustable shaft, of a cam secured to the crank-shaft, upper and lower dogs actuated by said cam, a latch-bar controlling the dogs and connected with the said lever, and means for actuating the carrying-rollers, substantially as shown and described, whereby the material is fed to the saw, the saw automatically fed to the material, and the material held from binding while being cut, as set forth.

7. The combination, with a body-frame and the drive-shaft thereof, wings projected from the body-frame, carrying-rollers journaled in said wings, a saw-frame rocking upon the drive-shaft, a crank-shaft connected with the saw-frame and provided with a fixed finger, and a connection between the crank-shaft and drive-shaft, substantially as described, of a shaft 60 at a right angle to the crank-shaft, an adjustable shaft 65 parallel with the shaft 60, having

frictional contact therewith, a chain belt connecting shaft 60 and the carrying-rollers of the wings, an adjusting-shaft 70, provided with a crank-arm 71, a lever 73, engaging the finger of the crank-shaft, and a rod 74, connecting the lever and adjusting-shaft, all combined for operation substantially as shown and described.

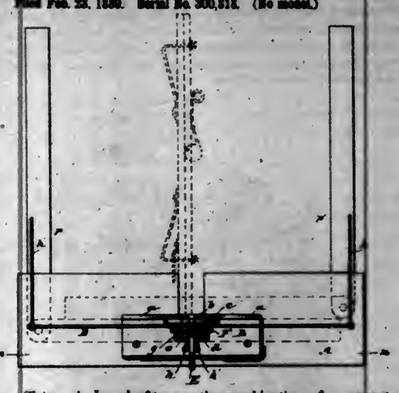
8. In a slab-sawing machine, the combination, with the crank-shaft 28, journaled on the frame, the cam 31, mounted thereon, the pivotal frame having a saw journaled therein, and a pitman-connection between crank-shaft and saw-frame, of the dog 41, pivotally secured to the frame, its forward end projected over the slab to be cut and having at said end teeth 43, for engaging the slab, pin 54, projected laterally from the dog, and a finger 51, depending therefrom, adapted to engage the cam 31, the pivoted dog 47, having teeth 49, adapted to engage the lower surface of the slab, the angle-arm 44, having the pin 46, for engaging the dog 47, the latch-lever 52, for engaging the pin 54, a lever 57, having a lug 58, a rod 56, connecting said lever and the latch-lever 52, and the lever 37, having a pin 59, for engaging the lug 58, all arranged substantially as and for the purpose described.

9. In a slab-sawing machine, the combination, with the main shaft, the rocking frame 24, pivoted upon said shaft, a saw journaled in said frame, the crank-shaft 28, having a friction-pulley 30, and a pitman 32, connecting the saw-frame and crank-shaft, of the shaft 33, having a fixed bearing at one end and a swinging bearing 34 at its opposite end, the lever 37, fulcrumed in the main frame, and a link-connection 38 between said bearing and lever, all arranged substantially as shown and described.

10. In a slab-sawing machine, the combination, with the main frame, the carrying-rollers mounted thereon, the shaft 60, journaled in the main frame and geared with the carrying-rollers, and the friction-pulley 64, mounted on the said shaft, of the shaft 65, the friction-pulley 67, mounted thereon, the beam 66, pivoted to the main frame and carrying one end of the shaft 65, the shaft 70, journaled in the main frame, having a crank-arm 71 and a handle 72, the shaft 28, provided with a cam 76, the lever 73, adapted to engage the cam 76, and a rod connecting the lever 73 and crank-arm 71, all arranged substantially as and for the purpose described.

410,778. HAND-EXERCISER. GEORGE H. BIDWELL, New York, N.Y.

Filed Mar. 30, 1889. Serial No. 305,354. (No model.)



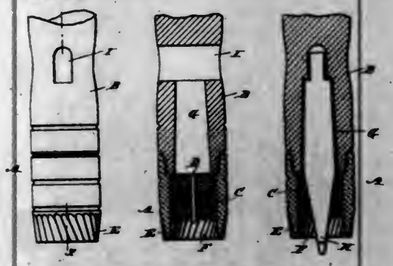
Claim.—1. In a hand-exercising attachment, the combination, with a support provided with a snap-hook, of a series of elastic bands provided with rings, a cap, and a means for connecting the cap with the rings of the bands, substantially as described.

2. In a hand-exercising attachment, the combination, with a stirrup, of a snap-hook connected therewith, an elastic band provided with rings arranged for engagement with the snap-hook, a padded cross-bar connected to the band, and an elastic band connected with the cross-bar, substantially as described.

410,779. LEAF-TURNER. CYRIL P. BROWN, Spring Lake, Mich.

Filed Feb. 23, 1889. Serial No. 300,818. (No model.)

Claim.—1. In a leaf-turner, the combination of a support and guide, a series of arms placed on the support and guide, a spring-pressed key-lever, and a double hook carried by the key-lever and adapted to engage the arms in succession, substantially as specified.



2. In a leaf-turner, the combination of the supporting-plate B, disk *c*, the grooved U-shaped guide attached to the said disk, the arms D, provided with L-shaped loops *g*, the key-lever E, the springs *k k'*, the curved arm F, pivoted to the key-lever E and provided with hooks *l l'* and projections *m m'*, and the double-acting spring *n*, substantially as specified.

3. In a leaf-turner, the combination of the clamping-bars *q q'*, the springs *t*, wires *r*, and eccentric H, substantially as specified.

4. In a leaf-turner, the combination of the clamp G, provided with the dowel *u* and wire *w*, and the back piece A, substantially as specified.

5. In a leaf-turner, the combination, with the back piece A, of the folding arms *p p'*, substantially as specified.

410,780. DEVICE FOR REMOVING BROKEN SCREWS, &c. MAURICE CARR, Weatherford, Tex. Filed May 28, 1889. Serial No. 312,426. (No model.)

Claim.—1. A bit for extracting broken screws, &c., provided with an internal spiral cutting-thread and external cutters, substantially as shown and described.

2. A bit for extracting broken screws, &c., comprising a hollow cylinder having an internal spiral cutting-thread and oblique cutters formed externally on one end of the said cylinder, substantially as shown and described.

3. A bit for extracting broken screws, &c., comprising a hollow cylinder having an internal spiral cutting-thread, oblique cutters formed externally on one end of the said cylinder, and beveled oblique cutters formed internally on one end of the said cylinder, substantially as shown and described.

4. A bit for extracting broken screws, &c., formed of a hollow cylinder having an internal spiral cutting-thread, and grooves formed across the ridges of said thread, substantially as shown and described.

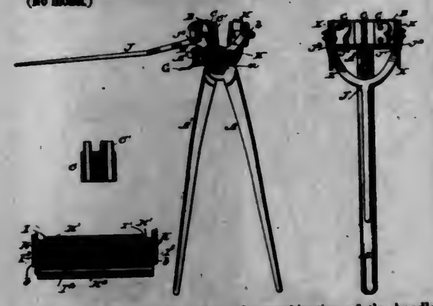
5. A bit for extracting broken screws, &c., comprising a hollow cylinder having internal spiral cutting-thread, and grooves formed across the ridges of the said thread, and beveled oblique cutters formed externally on one end of the said cylinder, substantially as shown and described.

6. A bit for extracting broken screws, &c., comprising a hollow cylinder having internal spiral cutting-thread, and grooves formed across the ridges of the said thread, beveled oblique cutters formed externally on one end of the said cylinder, and beveled oblique cutters formed internally on one end of the said cylinder, substantially as shown and described.

7. The combination, with a shank, of a bit held on the said shank and comprising a hollow cylinder having internal spiral cutting-thread, and grooves formed across the ridges of the said thread, and beveled oblique cutters formed externally on one end of the said cylinder, substantially as shown and described.

8. The combination, with a shank, of a bit held on the said shank and comprising a hollow cylinder having an internal spiral cutting-thread, and grooves formed across the ridges of the said thread, beveled oblique cutters formed externally on one end of the said cylinder, and a drill held in a socket on the said shank and projecting below the end of the said bit, substantially as shown and described.

410,781. HORSESHOE. WILLIAM R. GARMONT, Catford, London, County of Kent, England. Filed July 24, 1888. Serial No. 280,900. (No model.) Patented in England July 28, 1886, No. 9,717.

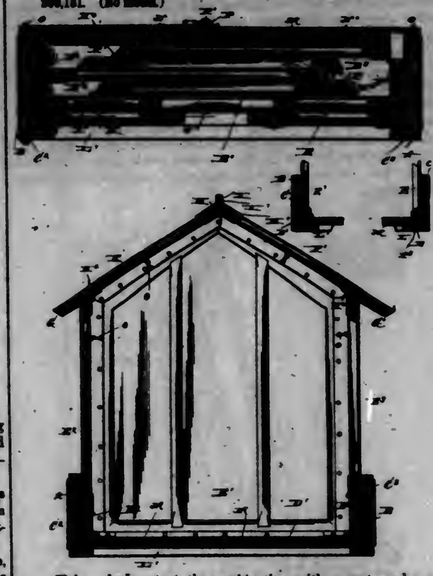


Claim.—1. In horseshoes, the combination, with the shoe having a recess upon its under side, of an elastic pad or cushion fitting and seated in said recess, and resilient pins or wires embedded in and projecting from said pad, substantially as set forth.

2. In horseshoes, the combination, with the shoe having a recess upon its under side, of an elastic pad or cushion fitting and seated in said recess, and bent resilient pins or wires embedded in and projecting from said pad, substantially as set forth.

3. The combination, with the shoe recessed upon its under side, of an elastic pad or cushion in the upper part of said recess, a metallic plate beneath said cushion, a second cushion beneath said plate, and resilient pins embedded in the second cushion projecting therefrom and abutting at their upper or inner ends against said plate, substantially as set forth.

410,782. LIVE-STOCK MARKER. ANDREW CARTER, Argo, and ANDREW JACOBSEN, Omaha, Nebr. Filed Apr. 12, 1888. Serial No. 270,496. (No model.)



Claim.—1. In a stock-marker, the combination of the handle having a rectangular frame at its end, the shouldered blocks formed with the cutting-dies and the bottom recess, and the spring-actuated locking-plate, substantially as set forth.

2. In a stock-marker, the combination of the handle having the rectangular frame at its end and the cylindrical casing, the shouldered cutting-die blocks having the bottom recess, the locking-plate having the sleeve D', the spiral spring, and the hinged thumb-piece connected by the rod to the locking-plate, substantially as set forth.

3. In a stock-marker, the combination, with a handle having cutting-dies at its upper end, of a handle having the frame H at its upper end, and the block I, formed with the end recesses and the longitudinal rear recess and adapted to fit in said frame, substantially as set forth.

4. In a stock-marker, the combination, with the pivoted handle A', carrying the block at its end, and the pivoted handle A, having at its end the frame B, containing the removable cutting-dies and formed with the ears *b*, of the curved pivoted S-shaped links K, the pivoted lever J, having the bifurcated upper end formed with the arms J' and J², and the pivots J³, passing through the ears *b b* and both arms J' J², substantially as set forth.

410,788. TENT. WILLIAM CRAIG, Wilkes-Barre, Pa., assignor of one-half to George Shalley, same place. Filed Feb. 8, 1888. Serial No. 263,181. (No model.)

Claim.—1. In a tent, the combination, with a rectangular casing, the front, rear, and side walls of which are provided on their inner sides with steps of gradually-increasing height, of the wall-frames hinged to said steps and adapted to fold within said casing, substantially as set forth.

2. In a tent, the combination, with a rectangular casing, of the wall-frames hinged and adapted to fold within said casing, the front and rear walls being provided with gable tops, and the roof-frames hinged to the upper edges of the side walls and adapted to rest upon the tops of the front and rear frames, substantially as set forth.

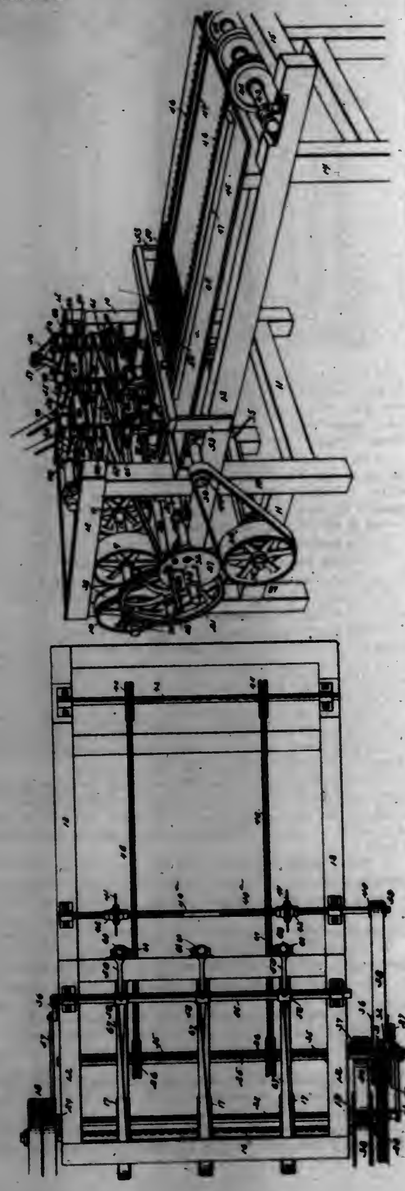
3. The combination of the casing, the hinged wall-frames, and the roof-frames hinged to the upper edges of the side-wall frames and provided along their adjoining edges with ridge-plates bent so as to form, respectively, a groove and a flange, combined to form a water-tight lock-joint, substantially as set forth.

4. The combination of the casing, the hinged side walls, the roof-frames hinged to the upper edges of the latter and projecting so as to form eaves, and the ridge-plates along the adjoining edges of the roof-frames, bent so as to form, respectively, a groove and a flange, combining to form a water-tight lock-joint, as set forth.

5. In a tent, the combination, with the rectangular frame, of the wall-frames hinged and adapted to fold therein, the front frame being provided with a door, and the front wall of the casing having a recess corresponding with said door, substantially as set forth.

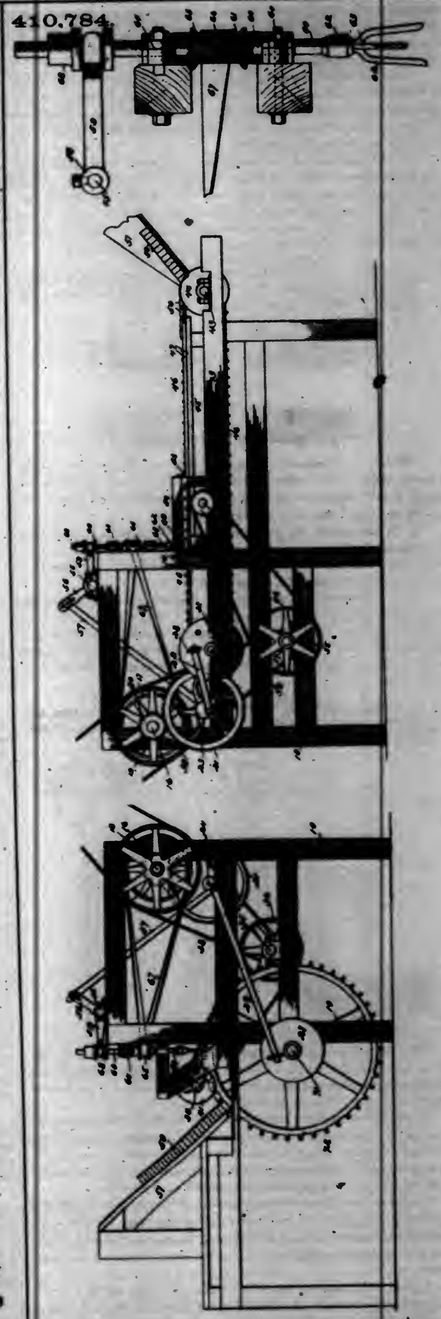
6. The combination of the rectangular casing, the frames hinged to steps upon the inner sides of the walls thereof, cleats upon the inner sides of the steps secured upon the front and rear walls of said casing, and floor-sections adjustable upon said cleats, substantially as set forth.

7. The combination of the rectangular casing having the floor-supporting cleats, the wall-frames hinged and adapted to fold within said casing, the roof-frames hinged to the side-wall frames and having interlocking ridge-plates, the floor-sections, and hooks and staples along the edges of the wall and roof frames, substantially as set forth.



8. The combination of the casing having staples at its sides, the frames hinged and adapted to fold within said casing, the floor-sections adapted to be packed in the top of the casing, and the straps or keepers adapted to engage the staples in the sides of the casing and having slot and staple, whereby they may be connected so as to secure the tent when folded within its casing, substantially as set forth.

410,784. MACHINE FOR BORING AND TRIMMING SLATE. JOHN COLVILLE, Brunswick, Ga. Filed Dec. 31, 1888. Serial No. 295,036. (No model.)

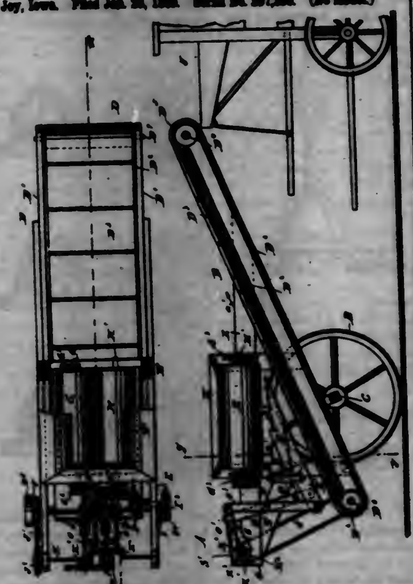


Claim.—1. The combination, with a feed mechanism, of a series of bit-stocks, a rock-shaft carrying bifurcated arms embracing the

bit-stocks, gage-bars attached to the said arms at the upper end, extending parallel with the bit-stocks and having a forked lower end, a shaft carrying the feed mechanism, and a drive-shaft provided with cranks adapted to alternately actuate the rock-shaft and the feed-shaft, substantially as shown and described.

2. The combination, with a drive-shaft provided with cranks, one at each end, a feed-shaft, and a carrying mechanism attached to the said feed-shaft, of a rock-shaft, bit-stocks connected with the rock-shaft, a lever-arm attached to one end of the said rock-shaft, a disk loosely mounted upon the feed-shaft carrying dogs, ratchet-wheels secured to the said feed-shaft having contact with the said dogs, and a pitman-connection between the respective cranks of the drive-shaft and the disk and lever-arm of the rock-shaft, substantially as shown and described.

410,784.



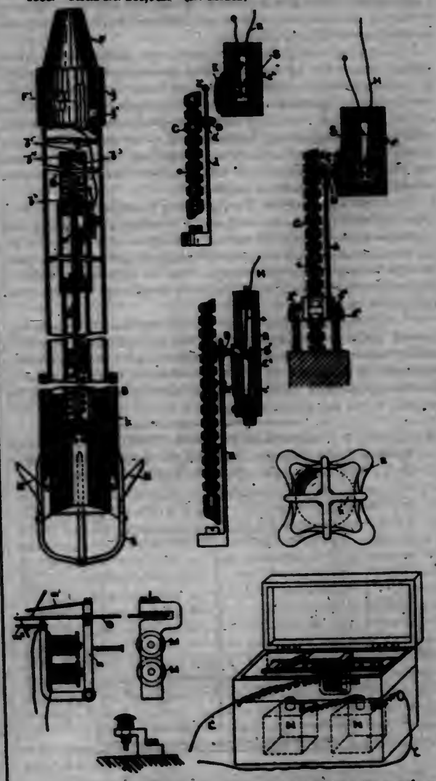
3. The combination, with a drive-shaft provided with cranks, one at each end, a feed-shaft, and a feed mechanism carried by said shaft, of a rock-shaft provided with a lever-arm at one end, bit-stocks attached to the rock-shaft, a slotted disk loosely mounted upon the feed-shaft carrying spring-actuated dogs, ratchet-wheels secured to

the said feed-shaft for contact with the said dogs, a pitman adjustably connecting one crank of the drive-shaft and the slotted disk, and a second pitman adjustably connecting the opposite crank of the drive-shaft and the lever-arm of the rock-shaft, all combined for operation substantially as shown and described.

4. The combination, with a feed mechanism, a series of bit-stocks having a pulley splined thereon, a rock-shaft connected with the bit-stocks, and the main drive-shaft belted to said pulleys, of a shaft carrying a feed mechanism, a second drive-shaft driven from the main shaft and provided with cranks adapted to alternately actuate the rock-shaft and the feed-shaft, a threaded saw-shaft in advance of the drill-stocks, and saws laterally adjustable upon the latter shaft, substantially as shown and described.

5. The combination, with a feed mechanism, substantially as described, a rock-shaft, a series of clutch-arms projected from the rock-shaft, bit-stocks having a pulley splined thereon and embraced by the said clutch-arms, and a gage-rod attached to the extremity of the clutch-arms, provided with a forked lower end, of a main shaft belted to the pulleys of the bit-stocks, a shaft carrying the feed mechanism, a second drive-shaft driven from the main shaft, provided with cranks adapted to alternately actuate the rock-shaft and the feed-shaft, a saw-shaft in advance of the bit-stocks, and saws laterally adjustable upon the latter shaft, all combined for operation, as and for the purpose specified.

410,785. BAND-CUTTER AND FEEDER. HENRY C. COOK, Mount Joy, Iowa. Filed Jan. 23, 1888. Serial No. 297,288. (No model.)



Claim.—1. In a band-cutter and feeder, the combination, with feed-rollers, of shakers suspended under the rollers, knives suspended between the shakers, and means for alternately swinging the shakers and knives backward and forward, substantially as herein shown and described.

2. In a band-cutter and feeder, the combination, with feed-rollers, of tapered shakers having their upper faces notched suspended under the rollers, knives having knife-edged teeth suspended between the shakers, and means for alternately moving the shakers and knives backward and forward, substantially as described.

3. In a band-cutter and feeder, the combination, with a supporting-frame and feed-rollers mounted therein, of a crank-shaft journaled in the frame at right angles to the feed-rollers, shakers suspended under the feed-rollers, knives also suspended under the said rollers between the shakers, pivoted levers having their lower ends connected to the shakers and knives, and links connecting the upper ends of the levers with the cranks of the said shaft, substantially as herein shown and described.

4. In a band-cutter and feeder, the combination, with an elevator and feed-rollers journaled above the elevator, of shakers suspended between the rollers and elevator, knives suspended between the shakers, a crank-shaft in front of the rollers, pivoted levers having their lower ends connected to the shakers and knives, links connecting the levers with the crank-shaft, and means for operating the crank-shaft and feed-rollers from the elevator, substantially as herein shown and described.

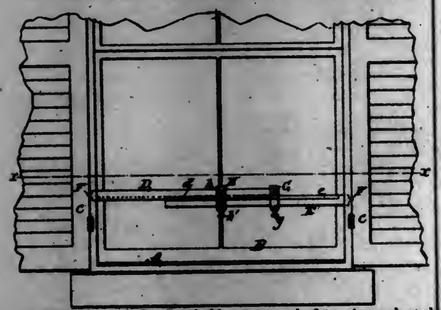
410,786. ELECTRIC REGISTERING DEEP-SEA SOUNDER. ALFRED J. COOPER and BENJAMIN F. WHEELL, London, England. Filed Oct. 24, 1882. Serial No. 208,062. (No model.)

Claim.—1. In a registering deep-sea sounder, the submerged portion having a spring-pressed piston in communication with the sea and moved by hydrostatic pressure and an electrical make-and-break device contained in a special sealed or water-tight chamber operated by the upward movement of the serrated rod of said piston against an elastically-supported sliding bead opposite to said electrical contacts, the said bead falling out of position on return-stroke, in combination with an upper portion provided with electrical registering mechanism fitted with an electro-magnet making a registering-pulsation for every make and break in the current from the submerged portion of the sounder, and with electrical conductors connecting said make-and-break device with the said registering mechanism, substantially as hereinbefore specified.

2. In a submerged portion of a registering deep-sea sounder, the combination of a spring-pressed piston moved by hydrostatic pressure and an electrical make-and-break device consisting of an indented or serrated stem of the said piston, producing on the upward stroke intermittent pressure through an elastically-supported sliding bead upon spring-electrical contact-points inclosed in a sealed or water-tight chamber, the bead falling out of operation on the return-stroke, substantially as hereinbefore specified.

3. In a submerged portion of a registering deep-sea sounder, the combination of a hydrostatically-moved piston, spring-pressed or pulled by two springs, one re-enforcing the other during the travel, having a piston-rod grooved at suitable intervals, with a bead supported and sliding on an elastic rod and pressing upon the said piston-rod, the upward movement of the piston raising the said bead to the highest position on the rod, and thus producing intermittent pressure upon the electrical contacts within an adjoining sealed or water-tight

chamber, the said bead falling out of operation on the return-stroke, substantially as and for the purposes described.



4. In the submerged portion of a registering deep-sea sounder, the combination of a cap to which the connecting-wires are attached, the cap being secured to the case by a locking bayonet-joint, and an internal projecting plunger making electrical contact with the continued internal insulated wire, the said plunger being surrounded by a cup-leather working in a chamber of insulating material to prevent contact of the sea-water with the said insulated internal current, substantially as hereinbefore specified.

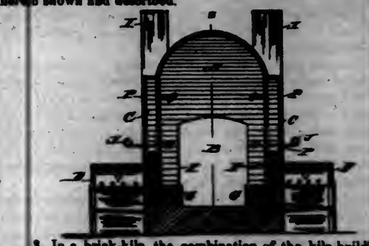
5. In a registering deep-sea sounder, the combination of a submerged portion having a spring-pressed piston moved by hydrostatic pressure operating an electrical make-and-break device, a winch provided with one specially-insulated bearing conducting an insulated current, and wires connecting said submerged portion and said winch with electrical registering mechanism, so as to maintain complete circuit between the said sounder and battery and registering mechanism while the connecting-wire is being unrolled from the said winch, substantially as hereinbefore specified.

6. In the upper portion of a registering deep-sea sounder, an electrical registering mechanism comprising a sliding card provided with a suitable scale whereon the register of depth is maintained by it being fed uniformly forward by an electro-magnet and driving-pin operated by the said intermittent current from the submerged portion of the sounder, and a punch which regulates the distance traveled by the said sliding card.

7. In a registering deep-sea sounder, the combination of the spring-pressed piston in communication with the sea and moved by hydrostatic pressure, serrations carried by said piston, and an electrical make-and-break device contained in a closed chamber and having one of its contacts operated by said serrations as the piston moves under the pressure of the sea, substantially as set forth.

410,787. CLOTHES-LINE HOLDER FOR WINDOWS. HENRY A. DEHMAN, Newburg, assignor to himself and Samuel Dunlap, Brooklyn, N. Y. Filed Aug. 9, 1888. Serial No. 282,262. (No model.)

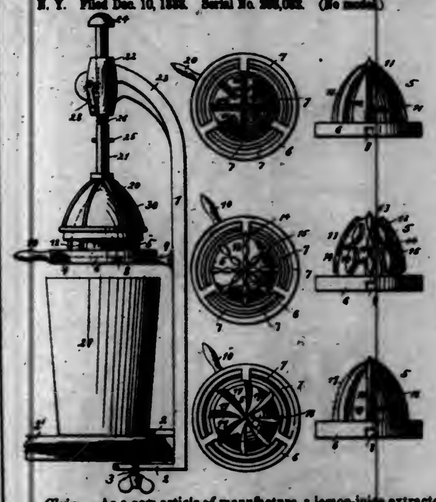
Claim.—1. A clothes-line holder composed of two bars adapted to slide upon each other and carrying a hook adapted to receive the clothes-line pulley, a clamp for locking the bars when extended, and the spars F, attached to the free ends of the bars to prevent the displacement of the same, substantially as shown and described.



2. The combination, with two bars sliding over each other, of a locking-clamp secured to one bar and working over the other to lock the same when in position, and a clamp working over both bars and carrying a hook for attachment of the clothes-line pulley, substantially as shown and described.

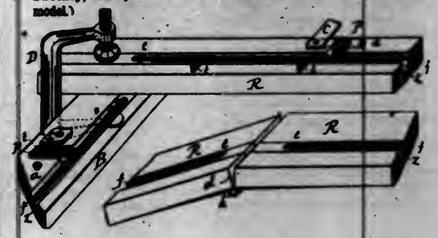
3. The combination, with bar E, provided with a tongue *e*, of the bar D, having a groove *d* to receive the tongue *e*, the clamp G, and the clamp H, provided with a hook A, substantially as shown and described.

410,788. BRICK-KILN. SIMON DEWEESE, Veris, Mo. Filed Jan. 22, 1889. Serial No. 297,141. (No model.)



Claim.—1. A brick-kiln provided in its side walls with a series of combustion-chambers having channels leading therefrom into the interior of the kiln above the floor thereof, and with a series of chimneys between the combustion-chambers and communicating with the interior of the kiln at or near the bottom, in combination with a series of furnaces on the outside of the kiln, each furnace communicating with a combustion-chamber, substantially as described.

2. A brick-kiln provided in its side walls with chambers C, combustion-chambers F, having channels G leading therefrom into the interior of the kiln, along the floor of the same, and a series of chimneys I between the combustion-chambers, provided with dampers J and communicating with the interior of the kiln just above the floor, as at H, in combination with the furnace D outside of the kiln, and each communicating with a combustion-chamber, substantially as herein shown and described.



3. In a brick-kiln, the combination of the kiln-building A, provided in its side walls with the chambers C, the combustion-chambers F, having channels G leading into the interior of the kiln, the chimneys I between the combustion-chambers, provided with the dampers J and communicating with the interior of the kiln at H, the furnaces D on the outside of the kiln and communicating with the combustion-chambers, and the auxiliary chimneys K at the side of the chimneys I, communicating with the interior of the kiln through the top and provided with dampers L, substantially as herein shown and described.

410,789. LEMON-JUICE EXTRACTOR. JOHN L. RAMLEY, New York, N. Y. Filed Dec. 10, 1888. Serial No. 293,082. (No model.)

Claim.—As a new article of manufacture, a lemon-juice extractor consisting of a standard with a bracket extending laterally from the standard to support an abrading-cone, and a sleeve at the upper end of the standard with a pinion and crank-handle, the pinion projecting into the bore of the sleeve, a rotary shaft mounted in the sleeve, vertically movable therein, and formed with a circular rack meshing with the pinion, and a lemon-holder mounted on the lower end of the rotary shaft, which may be raised and lowered by means of the circular rack and pinion and rotated with the rotary shaft to disintegrate the pulp of a lemon and extract the juice, substantially as shown and described.

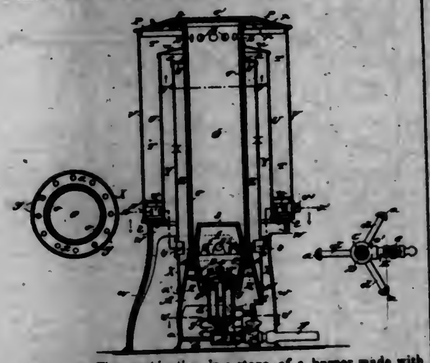
410,790. DEVICE FOR STRETCHING AND DRYING LACE CURTAINS. DAVID RASEMAS, Detroit, Mich., assignor of one-half to Frank Sweeney, same place. Filed June 17, 1889. Serial No. 314,617. (No model.)

Claim.—1. A frame consisting of crossing rails, and means for locking the rails at the crossing points, said rails having a channel in their upper faces and a pocket communicating therewith, a rod suspended over the channels, and a series of hooks loosely mounted on said rod, as and for the purposes specified.

2. A frame consisting of the crossing rails R R, and means for locking said rails at the crossing point, the channels and pockets formed in the upper face of the rails, the rods suspended over the channels, the hooks on said rods, and plates covering said pockets, substantially as specified.

410,791. ACOUSTIC TELEPHONE. LARKIN V. ELLIOTT, Mooresville, Ind. Filed Feb. 5, 1889. Serial No. 298,767. (No model.)

Claim.—1. In an acoustic telephone, a base-piece having a central transverse opening flared toward the front of the base, a mouth-piece mounted over the base and provided with a ball-shaped bore agreeing in diameter at its front end with the front or large end of the opening in the base and at its rear end with the smaller or rear end of the opening, and a diaphragm interposed between the front face of the base and the rear face of the mouth-piece, and having contact with the latter face at all points except opposite its bore, substantially as specified.



2. The diaphragm for acoustic telephones, consisting of parallel sheets of rawhide, which are held out of contact by an interposed filling or layer of soft fibrous material, substantially as specified.

3. The diaphragm for acoustic telephones, having an inner tightly-stretched sheet of rawhide, an outer loosely-stretched sheet of rawhide, and an interposed filling or layer of soft fibrous material, substantially as specified.

4. The diaphragm for acoustic telephones, consisting of the sheets E G of rawhide, the filling or layer of soft fibrous material interposed between the said sheets, and the covering H of fabric, substantially as specified.

5. In an acoustic telephone, the combination, with the receiver, of the diaphragm consisting of the rawhide members E G, the filling or layer of soft fibrous material, and the covering C of velveteen or fabric, and the line-wire extending through a central opening in the diaphragm and provided with a button which bears on the said covering, substantially as specified.

410,792. GAS-STOVE. JAMES GIBBONS, Jersey City, N. J. Filed Mar. 30, 1887. Serial No. 233,018. (No model.)

Claim.—1. The combination, in a stove, of a burner made with a gas and air mixing tube C, apertured at *c* at its inner part, and a casing G, having an open outer end admitting air and fitted at its closed inner end to the mixing-tube beyond or outside of its apertures *c*, and a fire-chamber receiving products of combustion from the burner and provided at its walls with an air-passage which opens at one end to an air-supply and ranges along or next the fire-chamber, into which it opens at or near the point of ignition of the burner, substantially as shown and described, whereby products of combustion from fluid fuel and superheated air commingled in advance of the point of ignition of the burner and flaming at the burner will be met thereat by a volume of air superheated in the passage at the fire-chamber walls to maintain combustion at a very high temperature in the stove, as herein set forth.

2. The combination, in a stove, of a burner made with a gas and air mixing tube C, apertured at *c* at its inner part, a flame-cup held to the outer end or part of the mixing-tube, a casing, as G H, surrounding the tube and cup and providing air-superheating passage J and chamber G', said casing fitted at its closed inner part to the mixing-tube beyond or outside of its apertures *c*, and a fire-chamber receiving the products of combustion from the burner and provided at its walls with an air-passage which opens at one end to an air-supply and ranges along or next the fire-chamber, into which it opens at or near the point of ignition of the burner, substantially as described, for the purposes set forth.

3. The combination, in a stove, of a burner made with a gas and air mixing tube C, apertured at *c* at its inner part, and a casing, as G, having an air-inlet at its outer part and fitted at its closed inner part to the mixing-tube beyond or outside of its apertures *c*, a fire-chamber receiving the products of combustion from the burner and provided at its walls with a passage which opens at one end to an air-supply and ranges along or next the fire-chamber and opens at the other end to the fire-chamber at or near the point of ignition of the burner to maintain combustion of commingled fluid fuel and superheated air at the burner by a supply of air superheated by the fire-chamber of the stove, and a drum or wall providing an air-passage outside of and communicating with the inlet of the air-passage at the fire-chamber walls and opening to the outer air nearer the burner of the stove to cause the air which maintains combustion at the burner to traverse the fire-chamber twice in its passage to the burner for highly superheating said air, all arranged and combined for operation substantially as herein set forth.

4. The combination, in a stove, of a burner made with a gas and air mixing tube C, apertured at *c* at its inner part, and a casing, as G, having an air-inlet at its outer part and fitted at its closed inner part to the mixing-tube beyond or outside of its apertures *c*, a fire-chamber receiving the products of combustion from the burner and provided at its walls with a passage which opens at one end to an air-supply and ranges along or next the fire-chamber and opens at the other end to the interior of the fire-chamber at or near the point of ignition of the burner to maintain combustion of commingled fluid fuel and superheated air at the burner by a supply of air superheated by the fire-chamber of the stove, and said fire-chamber provided with outlets for delivery of hot products, a drum or wall providing an air passage outside of and communicating with the inlet of the air-passage at the fire-chamber wall and opening to the outer air nearer to the burner of the stove to cause the air which maintains combustion at the burner to traverse the fire-chamber twice in its passage to the burner for highly superheating said air, and an outside drum forming an outer chamber receiving the hot products from the outlets of the fire-chamber and serving to radiate or distribute the heat of the stove, all arranged and combined for operation substantially as herein set forth.

5. The combination, in a stove, of a fire-chamber, a burner delivering hot products thereto, and said chamber provided with a passage at its walls which opens at one end to an air-supply and ranges along or next the fire-chamber and opens at its other end to the interior of the fire-chamber at or near the point of ignition of the burner to maintain combustion at the burner by a supply of air superheated by the fire-chamber of the stove, a drum or wall providing an air-passage outside of and communicating with the inlet of the air-passage at the fire-chamber walls and opening to the air nearer the burner of the stove to cause the air-supply maintaining combustion at the burner to traverse the fire-chamber twice in its passage to the burner in a superheated condition, said fire-chamber provided with outlets delivering hot products, and an outer drum, forming an outer chamber, receiving the hot products from the outlets of the fire-chamber and serving to radiate or distribute the heat of the stove, all substantially as described, for the purposes set forth.

6. A stove constructed with a body having a main fire-chamber and three drums forming three passages for air and products of combustion outside the fire-chamber, the center of the three passages opening at the bottom or inner part of the air, which has an updraft or outdraft through it, the inner of the three passages communicating with the outer part of the center passage and the inner part of the fire-chamber, and the outer passage or flue communicating with the outer part of the fire-chamber and serving as a heat receiving and distributing chamber, substantially as herein set forth.

7. In a stove, the combination, with a burner or fire-pot, of a fire-chamber provided with lower or inner air-inlet, and outer passages, as at S, for hot products, a drum X, fitted at its outer part to the fire-chamber and having air-inlet at *y*, and drums U V, supported outside of the drum X, said drum U fitting the fire-chamber inside of its pas-

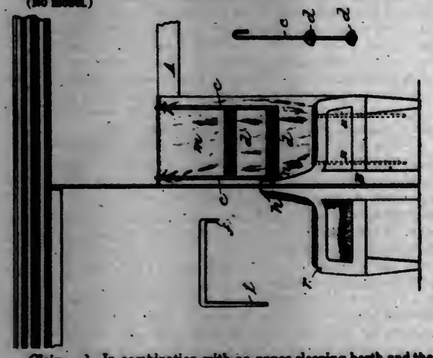
sages S, and a cover fitted to the fire-chamber and outer drum V, substantially as shown and described, whereby passages Y Z T are formed for circulation and heating of air in the stove-body, as and for the purposes set forth.

8. In a stove, the combination, with a burner or fire-pot, of a fire-chamber provided with lower or inner air-inlet, and outer passages, as S, for hot products, a drum X, fitted at its outer part to the fire-chamber and provided with air-inlet at *y*, and drums U V, supported outside of the drum X, said drum U fitting the fire-chamber inside of its passages S, and a cover fitted to the fire-chamber and outer drum V, whereby passages Y Z T are formed in the stove-body for circulation and heating of air, said stove-body having passages at its outer wall for exit of hot products, and one or more dampers fitted to these hot-product exits, substantially as herein set forth.

9. A stove constructed with a body having a main fire-chamber and three drums forming three passages Y T Z for air and products of combustion outside the fire-chamber, and said fire-chamber fitted with a removable cover or plate at its outer end, substantially as herein set forth.

10. A stove constructed with a body having a main fire-chamber and three drums forming three passages Y Z T for air and products of combustion outside the fire-chamber, said body having a top or outer end provided with openings *y'*, and a damper *p*, controlling said openings, substantially as herein set forth.

11. A stove constructed with a body having a main fire-chamber and three drums forming three passages Y Z T for air and products of combustion outside the fire-chamber, said body having a top or outer end formed with a removable cover for the fire-chamber, and with openings *y'* from the outer passage T, and a damper *p*, controlling said openings, substantially as herein set forth.



12. In a stove, the combination, with a burner or fire-pot, a fire-chamber having inner air-inlet and outer passages for hot products, and drums relatively arranged to provide passages Y T Z for establishing circulation of air and hot products through the stove-body, of a damper fitted over hot-product passages in the outer drum, and one of said hot-product passages and the damper relatively arranged to always leave an opening for escape of hot products from the stove-body, substantially as herein set forth.

13. A stove made with a burner or fire-pot, a fire-chamber having air-inlet R and hot-product outlet S, a drum X, fitted to the fire-chamber and resting on the burner or fire-pot shell, and drums U V, connected at the top with the fire-chamber and resting on a base or support, as W *w*, substantially as shown and described, whereby passages Y Z T are provided in the stove-body for air-circulation and the entire body may be removed from the burner or fire-pot, as and for the purposes set forth.

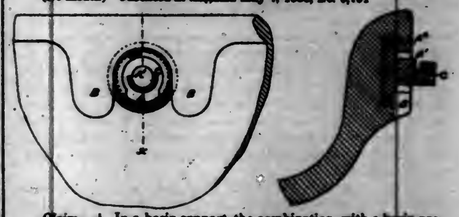
14. In a stove, the combination, with a burner, a fire-chamber, and a drum fitted around the fire-chamber and burner and provided with mica or translucent plates 4, of a body capable of incandescence and made in the form of an inverted cup, placed in the fire-chamber and providing an air and light passage at its rim, substantially as herein set forth.

15. In a stove, the combination, with a burner, a fire-chamber, and a drum fitted around the fire-chamber and burner and provided with mica or translucent plates 4, of a body capable of incandescence and made in the form of an inverted cup, placed in the fire-chamber, and provided with a passage 3 at its top or outer part and providing an air and light passage at its rim, substantially as herein set forth.

410,793. STEP FOR SLEEPING-CAR BERTH. JOHN J. GRIMSON, Fort Warren, Boston, Mass. Filed Mar. 23, 1889. Serial No. 304,262. (No model.)

Claim.—1. In combination with an upper sleeping-berth and the arm connected with the seat below, a removable step interposed between said arm and the berth above so as to form in connection with said arm a series of steps by which to enter the upper berth, substantially as herein specified.

2. In combination with a sleeping-berth and a removable step, as described, a bolt, stud, or hook connecting the same with the dividing-partition between the sections, as described.



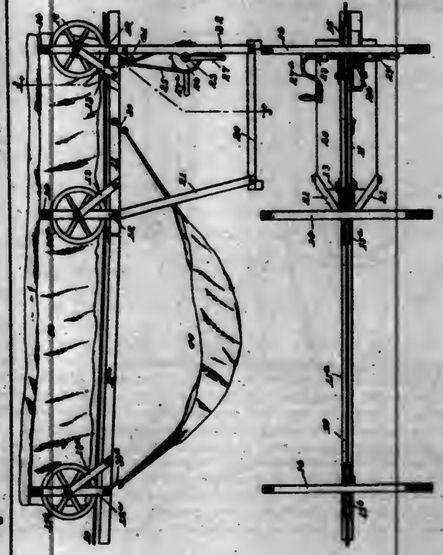
3. In combination with the upper sleeping-berth and step, substantially as described, the inner curtain *m*, as and for the purpose specified.

410,794. ANTISEPTIC TOOTH-PICK. KARL M. HELMUTH, Berlin, Germany. Filed Dec. 6, 1888. Serial No. 292,594. (No specimens.)

Claim.—1. As an improved article of manufacture, a tooth-pick saturated with a spirituous aromatic solution and impregnated with an antiseptic liquid, substantially as and for the purpose herein described.

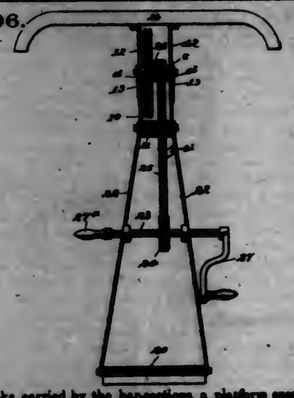
2. As an improved article of manufacture, a tooth-pick saturated with eucalyptol, substantially as and for the purposes described.

410,795. DEVICE OR HOOK FOR FIXING THE THREE LEGS OF BASINS USED IN TIP-UP LAVATORIES, &c. SIDNEY JOHNSON, Stanstead, County of Surrey, England. Filed Jan. 4, 1889. Serial No. 295,304. (No model.) Patented in England May 7, 1888, No. 6,791.



Claim.—1. In a basin-support, the combination, with a basin provided with a trunnion and with a partially-surrounding flange having an opening smaller than its internal diameter, of a trunnion-bearing having a horizontal dimension a little less than the width of said opening, substantially as set forth.

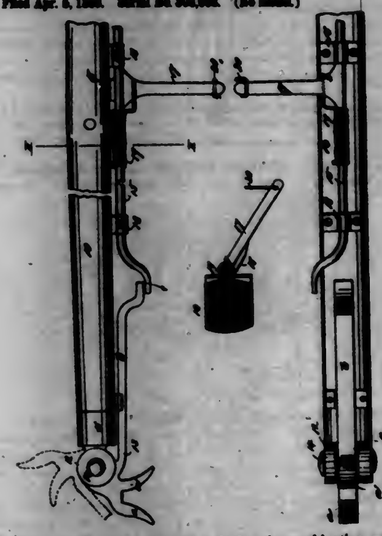
2. The herein-described trunnion-bush A, provided with a trunnion A' and a surrounding flange A^2, of more than a half-circle, having an opening on its under side, substantially as set forth.



410,796. HAMMOCK AND SEAT SUPPORT. JAMES J. JOHNSON, Dayton, Ohio, assignor to McIntire, Slaght & Johnson. Filed May 1, 1889. Serial No. 309,166. (No model.)

Claim.—1. The combination, with a sectional supporting-bar, of wheels arranged above the bar and hooks carried by the bar-sections, substantially as described.

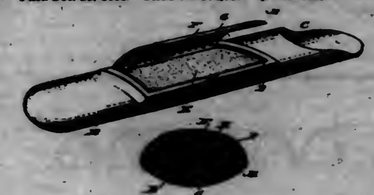
2. In a hammock-support, the combination, with a sectional bar, of wheels journaled above the bar, cross-bars extending over the



410,796.

wheels, hooks carried by the bar-sections, a platform suspended beneath the bar, and a means, substantially as described, for driving one of the wheels, as and for the purpose stated.

410,797. HORSE-DETACHER. HENRY J. KIMBERLY, Bristol, Pa. Filed Apr. 5, 1889. Serial No. 306,008. (No model.)



Claim.—1. In a horse-detaching device, the combination, with a horizontally-turning trace-receiver 13, provided with rearward-projecting horns *a a'*, and a lever-arm *b* to extend along the rear side of the singletree, of the rocking bar 15, having bearings 16 on the rear side of the singletree, and provided with an outward bend at its inner end to engage a similar bend on the lever-arm *b*, a spring 19, holding said ends in engagement, and an operating-arm 17, projecting from the bar 15, substantially as set forth.

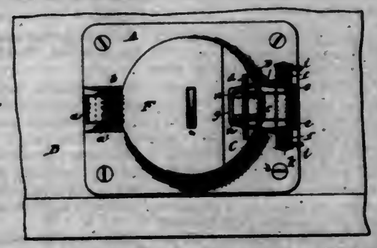
2. The combination, with the trace-receivers 13, having lever-arms *b*, projecting toward each other, and vertically-rocking bars or rods 15, having outward bends at their opposite ends engaging similar bends on arms *b*, springs holding said ends in engagement, and the operating-arms 17, projecting from rods or bars 15, of a vertically-rocking rod or bar 21, having crank-arms 22 at its ends engaging the arms 17, substantially as set forth.

3. The combination, with a singletree having trace-receivers pivoted at its ends and provided with lever-arms extending toward each other along the rear side of the singletree and having their inner extremities bent rearwardly and inwardly, of bearings 16 on the rear side of the singletree, a vertically rocking or turning rod 15, mounted in said bearings, provided with rearward and outward bent ends overlapping the inner extremities of the lever-arms *b*, a spring 19, holding said ends in engagement, and an operating-arm 17, substantially as set forth.

410,798. SPRINGALE-GAME. CHARLES B. LOUD, Louisville, Ky. Filed Dec. 20, 1888. Serial No. 294,019. (No model.)

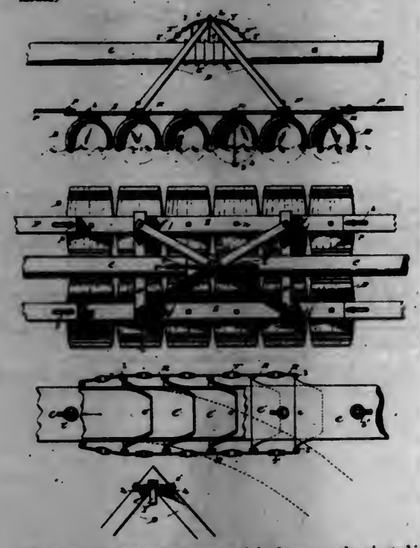
Claim.—1. As an improved article of manufacture, a case for spectacles or eyeglasses formed on one face with an integral hollow enlargement forming a second compartment, and a cover therefor flush with the surface of said second compartment, substantially as set forth.

2. As a new article of manufacture, a spectacle-case comprising a shell having a compartment for the reception of the spectacles or eyeglasses, a second compartment formed on top of the shell for the reception of a wiper, and a lid for closing the second compartment, substantially as shown and described.



410,799. WAGON-TONGUE SUPPORT. REUBEN LUSH, Sr., Brighton, Iowa. Filed July 2, 1888. Serial No. 316,268. (No model.)

Claim.—1. The improved tongue-support herein described, consisting of the spring formed with arms *c*, coils c^1, and rods c^2, and the plates F, having sockets or openings adapted to receive the free ends or extremities of rods c^2, all constructed and adapted for use, substantially as set forth.



2. The combination, substantially as described, of the axle, the bounds, the tongue, the bolt D, the plates F, having sockets or openings *f*, and the spring coiled around the bolt D, having an arm extended forward from said coils and bearing under the tongue, and having rods extended rearwardly from said coils and fitted at their ends in the sockets of plates F, substantially as set forth.

410,800. SELF-SEALING BUNG FOR ICE-CREAM FREEZERS. BENJAMIN R. HARRIS, Zanesville, Ohio. Filed June 13, 1889. Serial No. 314,047. (No model.)

Claim.—In a self-sealing bung, the combination, with a bung-plate provided with a thimble, a gate hinged to the bung-plate so as to close the hole in the thimble, and a hinged clamping-plate which bears upon the gate when these parts are in closed adjustment, of a wire spring having spiral coils which engage the pintle of the clamp-plate hinge, and a loop which bears upon the clamping-plate, whereby the said clamping-plate is normally held closed, substantially as set forth.

410,801. HYDRAULIC DREDGING APPARATUS. JAMES M. MILLER, Washington, D. C. Filed Apr. 15, 1889. Serial No. 307,267. (No model.)

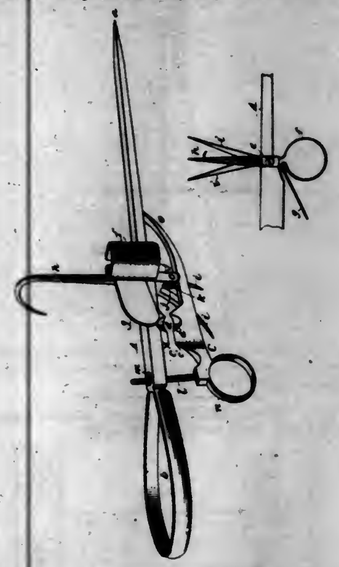
Claim.—1. A pontoon having an upright frame, a yoke pivoted in the upper portion of said frame, a flexibly-jointed conduit provided on its upper side with lugs, and suitable links connecting the ends of the yoke with said lugs, substantially as described.

2. A pontoon having a centrally-located upright frame, a yoke pivoted in the upper portion of said frame, a conduit flexibly jointed beneath said yoke, and suitable links connecting the ends of the yoke with the conduit on each side of the joint, all combined substantially as described.

3. A pontoon having an upright frame whose top portion is over the central part of the pontoon, a yoke pivoted in said frame longitudinally of the pontoon, a flexibly-jointed conduit provided on its upper side with lugs, and turn-buckles connecting the ends of the yoke with said lugs, whereby the conduit is suspended and its joint may be tightened, substantially as described.

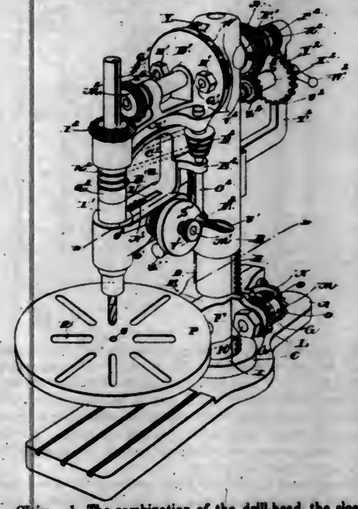
4. A flexibly-jointed conduit made of sections of pipe, each section being inwardly bent or curved at one end to reduce its diameter and outwardly-curved or bell-mouthed at its other end, the reduced or male end of one section fitted within the bell-mouth or female end of another section, in combination with a pontoon having an upright frame, a yoke pivoted in the upper part of said frame, and means for connecting the sections with the yoke, for the purposes stated.

5. A flexibly-jointed conduit made of sections of pipe each having a male and a female end, as described, the male end of one section fitted within the female end of another section, and rods carrying turn-buckles connecting the sections, substantially as described, and for the purpose stated.



410,802. MINER'S CANDLESTICK. HENRY M. MEYER, Empire, Nevada, assignor of one-half to Alexander A. Higo, same place. Filed Feb. 9, 1889. Serial No. 299,346. (No model.)

Claim.—1. In a miner's candlestick, the combination, with a pointed bar provided with a handle, of a head detachably secured on the bar a short distance from the handle and provided with the spring-loop *f*, the hook *h*, and the claws *i*, substantially as described.



2. In a miner's candlestick, the combination, with a pointed bar provided with a handle at one end and a jaw on its under side, of a head detachably secured on the bar and provided with a candle-loop and a hook and claws, and a nipper-lever pivoted to the head, substantially as herein shown and described.

3. In a miner's candlestick, the combination, with the pointed bar A, provided with the loop-handle *b*, the mortise *m*, and the jaw *c*, of the head B, provided with the spring-loop *f*, the hook *h*, the claws *i* and ears *j*, and the nipper-lever C, furnished with the jaw *c'* and stud *l*, substantially as specified.

4. In a miner's candlestick, the combination, with the pointed bar A, provided with the loop-handle *b*, the mortise *m*, and the jaw *c*, of the head B, provided with the spring-loop *f*, the hook *h*, the claws *i* and ears *j*, and the nipper-lever C, furnished with the jaw *c'*, the stud *l*, and ring *n*, substantially as specified.

410,803. DRILLING-MACHINE. CHARLES W. MCDANIEL, Lake Village, N. H. Filed June 21, 1883. Serial No. 277,707. (No model.)

Claim.—1. The combination of the drill-head, the sleeves journaled therein, one of said sleeves having the pulleys and being geared to the driving-shaft and the other sleeve having the rack-bar, the drill-shaft feathered in the upper sleeve and swiveled in the lower sleeve, the shaft M', having the pinion engaging the rack, the worm-wheel loose on the said shaft, the worm engaging said worm-wheel, the shaft O', geared to the worm and having the pulley connected to the pulley on the upper sleeve by an endless belt, the disk S', feathered on shaft M', and the nut V' on said shaft to compress the disk S' against the worm-wheel and to release the latter from the disk, whereby the drill may be fed either automatically or by hand, substantially as described.

2. In a drilling-machine, the drill-head F, the sleeves journaled thereon, the upper sleeve having the pulley K², the driving-shaft L², geared to the upper sleeve, the lower sleeve having the rack-bar, the drill-shaft F², feathered in the upper sleeve and swiveled in the lower sleeve, the shaft O', having the pulley D², the belt-connections between the pulleys D² and K², the pinion N', engaging the rack-bar on the lower sleeve, the shaft M', carrying the pinion, the shaft Y', geared to shaft M', and the gearing connecting the shafts Y' and O', as set forth.

3. In a drilling-machine, the drill-head Z, the sleeves H² F, journaled therein, the upper sleeve H² having the gear I² and the pulley K², and the lower sleeve F having the rack K', the drill-shaft F², feathered to the sleeve H² and swiveled in the lower sleeve F, the driving-shaft L², having a gear meshing with the gear I², the shaft O', having a pulley D², connected to the pulley K², the pinion N', meshing with the rack K', the shaft M', for the pinion, worm-wheel O', on the shaft, worm Z', engaging the worm-wheel, the shaft Y', for the worm, and the gears A² B², connecting shafts Y' and O', as set forth.

4. In a drilling-machine, the drill-head Z, having disk D', the standard B, having the face W, the diameter of which is equal to the diameter of the disk D', the sleeve E, projecting from the disk and journaled in a horizontal opening V of the standard, the clamping-nut F for the sleeve E, the concentric annular groove X, made in the face W, the vertical slot Y', also made in the face and communicating with the groove X, the bolts G', having their heads in the groove X, the nuts H' for the bolts, and the drill mechanism carried by the drill-head, whereby drilling at an angle can be performed, as set forth.

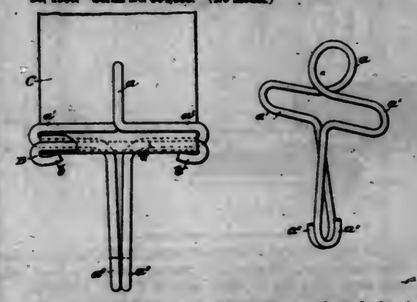
5. The combination, in a drilling-machine, of the vertically-movable sleeve F, having rack K', the drill-shaft swiveled in said sleeve, the sleeve H², having pulley K², the shaft M', having the pinion engaging rack K', the worm-wheel O', loose on said shaft, the shaft having the worm engaging the worm-wheel, the shaft O', geared to the worm-shaft and having the pulley D², connected to pulley K², the disk S', feathered on the shaft M' and having the crank U', and the nut V' on said shaft, adapted to engage the said disk with the worm-wheel and to disengage the same therefrom, substantially as described.

410,804. BABY-CARRIAGE. RUDOLPH MCILHAGH, New Albany, Ind., assignor to himself and Eli T. Ogle, same place. Filed Mar. 12, 1889. Serial No. 302,905. (No model.)

Claim.—1. The combination, with a baby-carriage having its front axle centrally pivoted to turn horizontally, of a guiding and propelling bar extending from a point behind the carriage in reach of the user downwardly and forwardly under the carriage to a point near the front thereof and there forked, the ends of which fork are secured to the front axle, the fork being rigidly and immovably connected with or formed upon the said bar to move as an integral part thereof, substantially as set forth.

2. In a baby-carriage, the combination, with the carriage-body, of a rear axle rigidly connected with the said carriage-body and provided with a horizontal longitudinally-extending slot, rear wheels mounted to turn on the said rear axle, a bolster held on the front end of the said carriage-body, a front axle carrying the front wheels and pivotally connected with the said bolster, a propelling and guiding bar extending rearward from the said front axle and provided with a handle for pushing and directing the carriage, said propelling and guiding bar passing through said slot in the rear axle and having a free horizontal oscillating movement therein, substantially as shown and described.

3. In a baby-carriage, the combination, with the carriage-body, of a rear axle rigidly connected with the said carriage-body, rear wheels mounted to turn on the said rear axle, a bolster held on the front end of the said carriage-body, a front axle carrying the front wheels and pivotally connected with the said bolster, a propelling and guiding bar extending rearward from the said front axle and provided with a handle for pushing and directing the carriage, said horizontally-oscillating propelling and guiding bar passing through a slot extending transversely in the said rear axle, and a friction-wheel held on the said propelling and guiding bar in the said slot, substantially as shown and described.



4. In a baby-carriage, the combination, with the carriage-body, of side bars connected by springs with the said carriage body, a rear axle rigidly connected with the said side bars and carrying the rear wheels, a bolster rigidly connected with the front ends of the said side bars, a front axle pivotally connected by a king-bolt with the said bolster, a fifth-wheel located between the said bolster and said front axle on the king-bolt, front wheels held on the said front axle, and a rearwardly-extending propelling and guiding bar guided in the rear axle and provided with an upwardly-extending handle for pushing and directing the carriage, substantially as shown and described.

410,805. MEANS FOR PREVENTING THE SLIPPING OF BELTS. FREDERICK W. HUMMEL, Adrian, Mich., assignor of one-half to Jonathan B. Ingersoll, same place. Filed Feb. 27, 1889. Serial No. 301,503. (No model.)

Claim.—A means for preventing the slipping of belts, consisting of two belts placed one above the other on the pulleys, so as to form a double belt, both belts mounted loosely on the pulleys, so that the inner belt will sag as the belts pass over the pulleys and the outer belt will sag as the belts pass under the pulleys, substantially as described.

410,806. BACK-BAND HOOK. DAVID D. HALLET, Wilson, N. C., assignor of two-thirds to George D. Green & Co., same place. Filed Mar. 26, 1889. Serial No. 304,893. (No model.)

Claim.—1. An improved back-band fastener formed of a single piece of wire bent to form the rein-guide *a*, the laterally-extending skeleton arms *a'* below the guide, and the hooks *a²*, depending from the skeleton arms *a'*, substantially as herein shown and described.

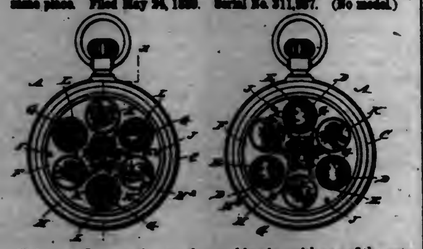
2. The combination, with the fastener provided with the rein-guide *a*, the lateral-extending skeleton arms *a'* below the guide, and the hooks *a²*, depending from the skeleton arms, of the keeper B, having its ends *b* bent over to adapt them to embrace the back-band, substantially as herein shown and described.

410,807. CAR-DOOR FASTENER. THOMAS G. RUTTENBAR, Renovo, Pa. Filed July 12, 1888. Serial No. 279,780. (No model.)

Claim.—1. In a car-door fastener, the screw-threaded bolt having a projection at its inner end, the faces of which are oblique to its length, in combination with a socket the walls of which are inclined or tapered, substantially as set forth.

2. In a car-door fastening, the latch consisting of a lever the pivot of which is a screw having a cam arm or projection, in combination with a plate or bracket having an internally-screw-threaded sleeve or barrel and curved bolt or screw receiving slots, and an oblique door-jamb socket, substantially as specified.

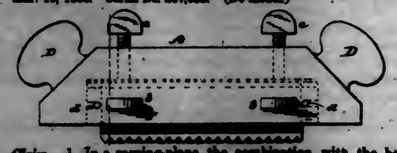
3. A fastener for locking car-doors in a fully-closed or partially-open position, comprising the screw-threaded socket, the rotary screw turning therein and having an inclined projection at its inner end, the jamb-plate G, having an oblique slot, and the plate H, for the side of the car, having a tapering cavity d^4, spirally flanged, as at d^5, substantially as set forth.



4. In a car-door fastening, the latch consisting of the lever the pivot of which is a screw having a cam arm or projection, in combination with a plate or bracket having an internally-screw-threaded sleeve or barrel and provided with a hook taking into or engaging with a keeper or eye upon the latch-lever and adapted to be sealed, and an oblique socket, substantially as specified.

5. The combination of the latch consisting of the lever the pivot of which is a screw carrying a cam arm or projection, the plate or bracket provided with curved slots which receive screws or bolts and

with an offset or projection, the hook pivoted to said offset or projection and engaging with an eye or keeper upon the latch-lever, and the oblique door-jamb socket receiving said cam arm or projection, substantially as set forth.

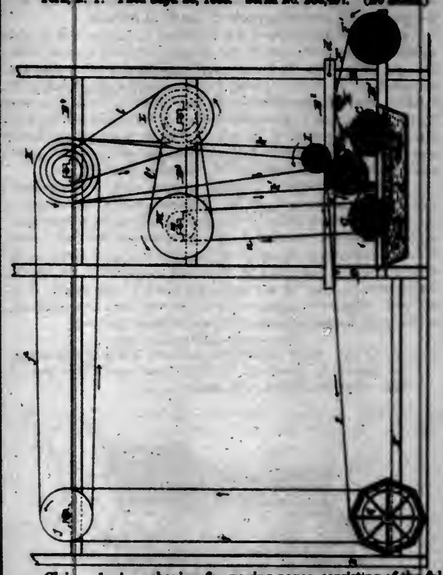


410,808. PICTURE-HOLDER ATTACHMENT FOR WATCH-CASES. GASPARD SCHLAGER, Brooklyn, N. Y., assignor of one-half to Henry Goll, same place. Filed May 24, 1889. Serial No. 311,987. (No model.)

Claim.—1. In a watch-case, the combination, with one of the outer covers or lids provided with a circular offset I, of a bezel H' H², sprung upon said offset, and a revolubly apertured disk F, resting over the outer face of said cover, under the bezel, substantially as set forth.

2. In a watch-case, the combination, with one of the outer lids or covers having a circular offset I and a concentrically-arranged series of picture-receiving recesses, of the bezel H' H², sprung upon said offset, and the revolubly disk F, resting over the recessed face of the lid or cover, under the bezel, and having an aperture and a pin or projection J, substantially as set forth.

410,809. RASPING-PLANE. CHARLES S. BROWNE, Mossleasy, Fla.; Thomas W. Lakin administrator of said Browne, deceased. Filed Mar. 19, 1888. Serial No. 267,665. (No model.)

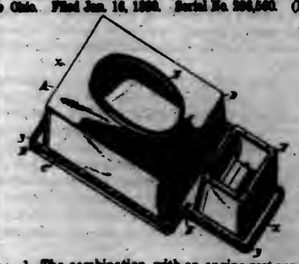


Claim.—1. In a rasping-plane, the combination, with the body A, provided with the mortise a, of a series of saws C and means, substantially as described, for clamping the saws in the stock.

2. The combination, with the body A, provided with the mortise a, of the cross-wires d, the slotted spacing-plates B, and the saws C, substantially as described.

3. As an improved article of manufacture, a rasping-plane formed of the body A, provided with the mortise a and with handle D, the thumb-screws b c, inserted in the body, the transverse wires d, the spacing-plates B, the plate e, and the saws C, combined and arranged substantially as herein shown and described.

410,810. MANUFACTURE OF WAXED PAPER. EDWARD S. SPARR, Brooklyn, assignor to the Sparr Manufacturing Company, New York, N. Y. Filed Sept. 26, 1888. Serial No. 286,497. (No model.)



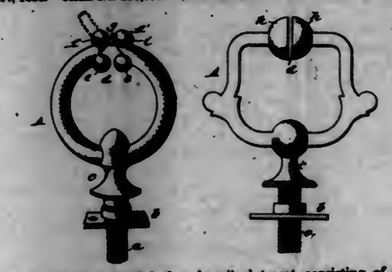
Claim.—1. A mechanism for waxing paper, consisting of the following elements, operated in combination, as herein described, namely: a tank or holder for the wax, a take-up device moving in contact with the wax, a delivering-roller moving in contact with the take-up device, and means for imparting independent velocities respectively to the take-up device and to the delivering-roller, as set forth.

2. In machines for waxing paper, the combination, with the take-up device and the paper web, of a delivery-roll speeded to move at a higher velocity than the paper web, as herein set forth.

3. In machines for waxing paper, the combination, with the take-up device and the paper web, of a delivering-roll arranged to move in contact with both the take-up device and the paper web at a higher velocity than either of them, as and for the purposes set forth.

4. In machines for waxing paper, the combination of the following instrumentalities, operated as described, namely: a take-up device and means for independently driving the same, a delivering-roll and means for independently driving the same, and a winding-reel and means for independently driving the same, as herein set forth.

410,811. BASE-FRAME FOR ENGINES. BENJAMIN A. BEEVER, Toledo, Ohio. Filed Jan. 16, 1889. Serial No. 296,601. (No model.)



Claim.—1. The combination, with an engine-rest supported upon a suitable bottom portion, of a curved plate formed within the engine-rest and adapted to conduct the oil to an opening formed in the side of the same, substantially as and for the purpose specified.

2. A base-frame for engines, formed of a bottom portion having a flange upon its outer edges and the upper surface sloping toward the center of the same, a hollow rectangular boiler-rest having an opening in its upper face surrounded by an annular flange to which the boiler is attached, an engine-rest formed upon the opposite end of the same, and a vertical web-plate connecting the rests and the bottom portion, all of said parts being cast integral, substantially as shown and described.

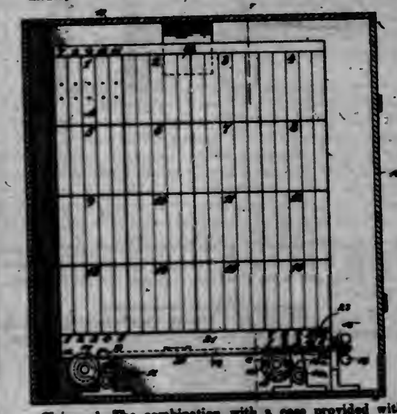
3. A base-frame for engines, comprising a bottom portion, an elevated rest having an annular flange to which the boiler is secured, and an elevated rest to which the engine is secured, the two rests being connected by a vertical web-plate G, perforated at the base for the escape of condensation and oil, the bottom portion, rests, and web-plate all formed integral, as and for the purposes set forth.

410,812. TERRET. JOHN T. STULL, Sacramento, Cal. Filed Oct. 17, 1888. Serial No. 288,202. (No model.)

Claim.—1. The hereinbefore-described terret, consisting of the screw-shank a, the body portion A, said body portion formed of outwardly and upwardly extending side arms the ends of which extend inwardly toward each other, the proximate ends provided with ball-like enlargements, said proximate ends disposed to form a narrow vertical slot d, to admit of the driving-rein being passed edgewise therethrough, said body portion being of a height slightly greater than the width of the ordinary driving-rein, substantially as and for the purpose described.

2. The hereinbefore-described terret, consisting of the screw-shank a, the ring A, having a slot d, the adjacent ends thereof formed with opposite inner guards e e and two outer opposite balls f f', the ball f' provided with rib or notch i, and a hasp or keeper pivoted at one end in the ball f, its opposite end adapted to extend over the ball f' and engage the notch i, all arranged substantially as and for the purpose described.

410,813. EARTH-CLOSET COMMODE. JOHN W. BROWNE, Putney, Vt. Filed June 20, 1888. Serial No. 278,005. (No model.)



Claim.—1. An earth-closet commode made with a case, a structure fitted thereto and adapted for withdrawal therefrom, and provided with an earth-closet attachment opening at the inside of said structure and with an ordinary chamber-vessel receptacle, the latter having an opening at or through the outside or front of the structure, substantially as herein set forth.

2. In an earth-closet commode, the combination of a case, a structure hinged thereto and provided with two compartments F G, the one G forming an earth-closet-vessel receptacle and opening at the inside of the structure and the case F forming an ordinary chamber-vessel receptacle and opening at or through the outside of the structure, and an earth-box or deodorizer-vessel hinged to the seat-board of the closet, so as to stop against the commode-case when the closet is adjusted for use, substantially as herein set forth.

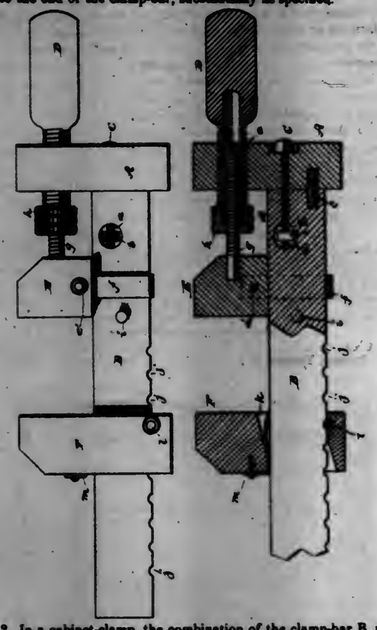
3. An earth-closet commode constructed with a case A and a structure B, hinged thereto and provided with a box F, opening at the front or outside of the structure, an earth-closet box G, opening at the inside of the structure, and a valved earth-receptacle hinged to the top or seat board of the box G and adapted to discharge earth therein, substantially as herein shown and described.

4. An earth-closet commode constructed with a case A, having a drawer C, and a structure B, hinged to the case and provided with a box F, opening at the front or outside of the structure, an earth-closet box G, opening at the inside of the structure, and a valved earth-receptacle hinged to the top or seat board of the box G and adapted to discharge earth therein, substantially as herein set forth.

410,814. CHECKING AND RECORDING DEVICE. FREDERIC SOLMER, Yonkers, N. Y. Filed Jan. 10, 1889. Serial No. 296,916. (No model.)

Claim.—1. The combination, with a case provided with apertures and hooks, of a chart mounted within the case, dogs mounted in front of the chart, and checks B, provided with rearwardly-extending tongues, substantially as described.

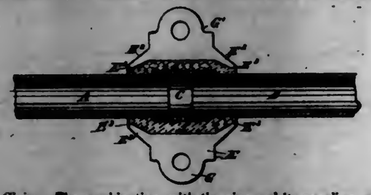
2. The combination, with a case provided with hooks and apertures in its face, of a frame arranged to receive a chart mounted within the case, dogs pivotally mounted within the case, and checks arranged to be placed upon the hooks, said checks being provided with tongues which bear against the dogs, substantially as described.



3. The combination, with a case having an apertured front, of hooks arranged in connection with the apertures, checks arranged to be placed upon the hooks, a vertically-adjustable frame mounted within the case, a chart carried by the frame, and dogs mounted in front of the chart and arranged in connection with the case-apertures, substantially as described.

4. The combination, with a case formed with apertures c, and provided with hooks 20, and checks B, of dogs 31, a frame 30, a chart carried by the frame, and a means, substantially as described, for raising and lowering the frame and for moving it laterally, as and for the purpose stated.

5. The combination, with a case formed with apertures c, and provided with hooks 20, of dogs mounted within the case, rock-shafts 11 and 11ª, a roller 17, a gear 18, arms 12 and 12ª, that are carried by said shafts and supporting said roller and gear, a rod 14, arms 13 and 13ª, carried by said shafts and pivotally connected to said rod, a winged nut arranged to engage a threaded section of the rod, a frame provided with a rack 23, with which the gear 18 engages, a chart divided into sections A, said chart being carried by the frame, and a means, substantially as described, for turning the gear 18, as and for the purpose stated.



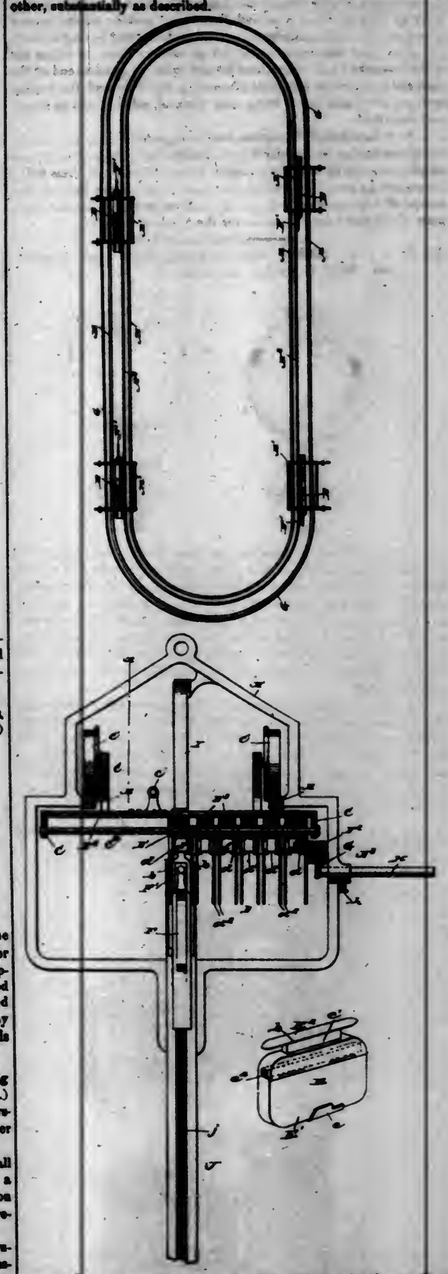
410,815. GARMENT-CLAMP. WILHELM P. TAUSSIG, Hilford, Ill. Filed Sept. 19, 1888. Serial No. 286,781. (No model.)

Claim.—1. In a cabinet-clamp, the combination of the head A, the clamping-bar B, the joint-bolt C, passing through the head and into the clamp-bar, and the dowel *c*, inserted in the head and extending into the end of the clamp-bar, substantially as specified.

2. In a cabinet-clamp, the combination of the clamp-bar B, provided with the head A, the axially-bored screw D, inserted in the said head, the sliding jaw E, the threaded rod *g*, and the nut *h*, substantially as specified.

410,816. PIPE-CLAMP. WILLIAM WALKER and JOHN R. DAVIS, Lackawanna, Pa. Filed Mar. 14, 1889. Serial No. 303,344. (No model.)

Claim.—The combination, with the pipe and its coupling, of the clamp D, formed of two semi-cylindrical sections E E', bolted together around the coupling and having semi-annular flanges E² at their opposite ends projecting beyond the ends of the coupling and chamfered at E³ to form flaring openings of greater diameter than the pipes, and the packing J, filling the space within the clamp from one extremity to the other, and calked therein and against the outer chamfered ends E³, substantially as set forth.



410,817. CARRYING APPARATUS. HIRAM WHEEL, Jr., Long Island City, N. Y. Filed Feb. 9, 1889. Serial No. 299,574. (No model.)

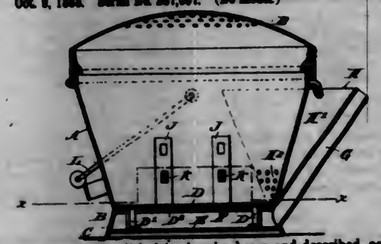
Claim.—1. The combination, with a track, of a carriage traversing the same, a carrier thereon, and a guide for moving the carrier transversely on the carriage, substantially as described.

2. The combination, with the track, of a trip at each station, all arranged in line with each other, a carriage traversing the track, a carrier thereon, and a guide for moving the carrier transversely on the carriage to bring a different section thereof in line with the respective trips, substantially as described.

3. The combination, in a carrier apparatus, of a track, a continuously-movable carriage, a carrier on the latter adapted to move transversely thereon, and a guide-rail with which the carrier engages, the guide-rail being laterally adjustable, substantially as described.

4. The combination, in a carrier apparatus, of a track and a carriage, a transversely-movable carrier thereon, chutes arranged at intervals throughout the track and projecting into the path of the carrier, and arms for holding the cash-pockets to be taken up by the carrier, the said chutes and arms of all stations being arranged in line with each other, substantially as described.

5. In a carrier apparatus, a carriage and a carrier thereon fitted for independent transverse movement, in combination with trips at each station arranged in the same line throughout the track, arms in line with the chutes for holding the cash-pockets, and a guide for guiding the movable carrier to present a different section thereof to the various chutes and arms, substantially as described.



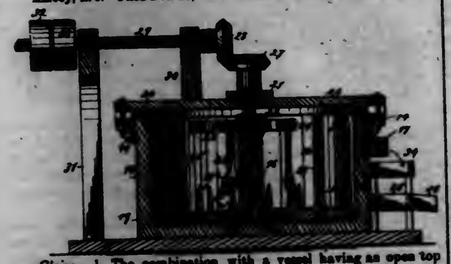
6. A carrier apparatus comprising the following elements: a continuous track, a carriage traveling thereon, a comparted carrier hung on the carriage and transversely movable thereon, the compartments of the carrier being closed at one end by latches, cash-pockets receivable by said compartments, chutes at each station projecting into the path of the carriage for dislodging and receiving the cash-pockets from the carrier, the said chutes being in line throughout the track, arms at each station for holding the cash-pockets until taken up by the carrier, the said arms being vertically movable to be projected into the path of the carriage or withdrawn therefrom, and a laterally-adjustable guide-rail for the carrier extending around the track and lying at varying distances from the chutes of the different stations to present a different compartment of the carrier to the different chutes, and a magnet at each station for lifting the latches of the carrier, substantially as described.

7. In a cash-carrier, the vertically-movable staff or head F, having a pocket-holding arm projecting therefrom and provided with an outward-bowed longitudinally-extending spring *f*, substantially as set forth.

8. In a cash-carrier, the staff or head F, having a pocket-holding arm F', provided with an outward-bowed longitudinally-extending spring, the guide-rib *f'*, and the stop-lug *f''*, substantially as set forth.

9. In a cash-carrier, the combination, with the carriage provided with a transversely-movable carrier having a series of cash-pocket holders and means for automatically shifting the said series, of a series of cash-pocket supports or arms arranged at proper intervals, the said series of cash-pocket holders being automatically shifted transversely to bring said holders successively in line with the said arms or supports, substantially as set forth.

410,818. DISH-DRIER. ALBERT J. WILSON, Abilene, Tex. Filed Oct. 9, 1888. Serial No. 287,697. (No model.)



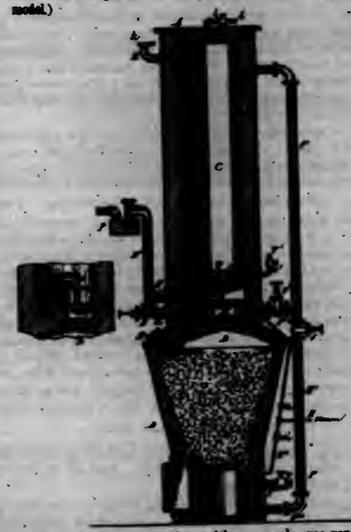
Claim.—1. The dish-drier herein shown and described, comprising the body A, cover B, false bottom D, side chamber H', and spout G, substantially as described.

2. The false bottom supported a short distance above the main bottom of the drier and provided with the opposite uprights J J, in combination with the straight parallel cross-pieces K, held by the uprights J, substantially as shown and described.

3. The body A, having perforations H², and having side projection H and spout G, in combination with the cover B, false bottom D, supported from the main bottom of the drier, and having the uprights J and cross-pieces K, substantially as described.

410,819. CLAY-WASHING MACHINE. HENRY WOODCOCK, Perth Amboy, N. J. Filed Dec. 21, 1888. Serial No. 294,269. (No model.)

Claim.—1. The combination, with a vessel having an open top and a detachable auxiliary bottom provided with a series of upwardly-extending pins, of a vertical shaft held to revolve within said vessel, arms horizontally attached to the said shaft, and stirrer-arms projected downward from the horizontal arms, adapted for movement between the pins of the auxiliary bottom, and means for rotating the said shaft, all combined for operation substantially as shown and described.



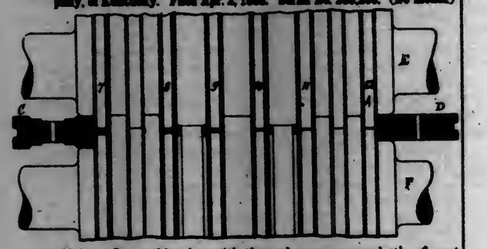
2. The combination, with a vessel having an open top and provided with a series of interior vertical ribs, a detachable auxiliary bottom held in said receptacle by contact with the said ribs, and a series of concentrically-arranged pins projected upward from the said auxiliary bottom, of a vertical shaft capable of rotation within the vessel, horizontal arms attached to the said shaft, and a series of downwardly-extending stirrer-arms attached to the horizontal arms and adapted for movement between the pins of the auxiliary bottom, substantially as shown and described.

3. The combination, with a vessel having an open top and provided with a series of interior perpendicular ribs, an auxiliary bottom having peripheral recesses to receive the said ribs, and teeth projected upward at intervals from the said auxiliary bottom, of a perpendicular shaft capable of revolving within the said vessel, horizontal arms attached to the said shaft, stirrer-arms projected downward from the horizontal arms, adapted to pass between the teeth of the auxiliary bottom, and a ring attached to the upper portion of the vessel, extending a distance inward, all combined for operation as and for the purpose specified.

4. The combination, with a vessel having an open top and provided with a series of interior perpendicular ribs, a detachable auxiliary bottom provided with peripheral recesses to receive the said ribs, and a series of pins concentrically arranged projecting upward from the said auxiliary bottom, of a perpendicular shaft held to rotate within the vessel, a polygonal casting secured to the said shaft, horizontal arms attached to the sides of the said casting, a series of stirrer-arms projected downward from the said horizontal arms, adapted to pass between the said pins, a guard-ring attached to the upper surface of the vessel projecting inward, and means, substantially as shown and described, for rotating the said shaft, as and for the purpose specified.

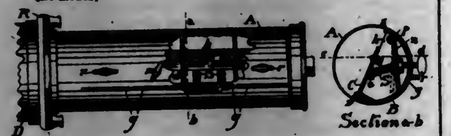
5. The combination, with a vessel having an open top and provided with a series of interior perpendicular ribs, an auxiliary bottom provided with peripheral recesses adapted to receive the said ribs, and a series of concentrically-arranged pins attached to the upper surface of the bottom, of a perpendicular shaft capable of revolving within the vessel, a polygonal casting secured to the said shaft, horizontal arms attached to the sides of the said casting, braces connecting the said arms, and a series of stirrer-arms projected from the horizontal arms, all combined for operation substantially as shown and described.

410,820. APPARATUS FOR MANUFACTURING GAS. HENRY S. BAYER, Chicago, Ill. Filed Apr. 2, 1889. Serial No. 305,863. (No model.)



Claim.—1. In combination with a cupola gas-generating furnace having a fuel-chamber at the base and a fixing-chamber above, a valved water-gas pipe leading from the base of the fuel-chamber to the upper portion of the fixing-chamber, a valved branch pipe connecting the top of the fuel-chamber with each water-gas pipe, a valved pipe for gaseous products, connecting the top of the fuel-chamber with the bottom of the fixing-chamber, and valved steam-supply pipes connecting with both the bottom and top of the fuel-chamber, as and for the purpose described.

2. In combination with the fuel-chamber of a cupola gas-generator, the perforated arch E, the solid horizontal division-plate *m*, forming gas-chamber M, and the pipes F F, having valves *f f*, connecting with the base of the fuel-chamber, gas-chamber M, and the upper portion of the fixing-chamber, as and for the purpose described.



3. In combination with the fuel-chamber and fixing-chamber of the cupola, the gas-distributing chamber N, having ports *n*, air-distributing chamber O, having ports *o*, and the connecting-pipes, as and for the purpose described.

410,821. MACHINE FOR ROLLING GIRDER-RAILS. FREDERICK OELLY, Johnstown, Pa., assignor to the Johnson Steel Street Rail Company, of Kentucky. Filed Apr. 2, 1888. Serial No. 269,260. (No model.)

Claim.—In combination with the end passes, one or both, of a set of main rolls, a horizontal side roll set in vertical bearings, said main rolls having passes cut away on one side to permit of the entry of said side roll, substantially as set forth.

410,822. MACHINE FOR SPREADING VISCOUS SUBSTANCES. JOHN H. DAY, Albany, N. Y. Filed July 13, 1888. Serial No. 317,323. (No model.)

Claim.—1. In a spreading-machine, the combination of a cylindrical vessel having a longitudinal slot along its side, a valve-holding receptacle placed within said cylinder, a valve hinged at one side to a bolt in the interior of said valve-holding receptacle and having a spring pressing against one side thereof, and a thumb-screw passing through said cylinder in contact with the opposite side of said valve, substantially as described.

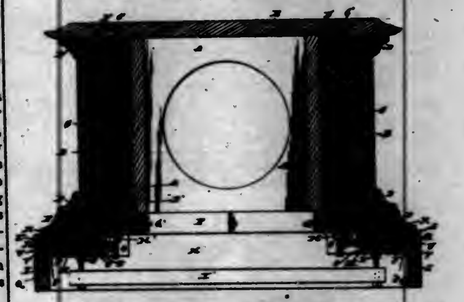
2. In a spreading-machine, the combination of a valve-holding receptacle L, placed within a cylinder A, provided with a valve *n*, operated by a spring S, pressing against the back plate C of the valve-holding receptacle and against one side of said valve *n*, the opposite side of said valve *n* being in contact with a thumb-screw *r*, a longitudinal slot along the side of said valve-holding receptacle, and a corresponding slot *g* in said cylinder, all substantially as described.

3. In a spreading-machine, the combination of the cylinder D, provided with a feeding-hopper H, a propeller J, placed longitudinally in said cylinder, a knife K, attached to the said propeller near its point, and the perforated plate T at the end of said cylinder near the knife K, with the cylinder A, attached to said cylinder D by coupling R, said cylinder A having a series of longitudinal slots *g* along its side, and having a valve-holding receptacle L placed within it, containing a valve *n*, spring S, attached to the back plate C of the valve-holding receptacle and to the valve *n*, and a screw *r*, passing through the said cylinder and in contact with said valve *n*, all substantially as described.

410,823. CARDING-MACHINE FOR MAKING MOTTLED ROVINGS. WESTLEY DENTON, Centreville, Mich. Filed Feb. 2, 1889. Serial No. 298,530. (No model.)

Claim.—1. The combination, with the frame F, of the main cylinder A, the worker B, the standards *b*, rigidly secured to said frame, the supplemental worker C, mounted in said standards and arranged in close proximity to the worker B, the pins *c* on one end of the worker C, the feed-rolls D D', the ratchet-wheel *a*, secured to feed-roll D', the spring-actuated lever *l*, pivoted to one of the standards *b* and having one end in the path of the aforesaid pins *c*, and the pawl *p*, pivoted to the outer end of the said lever and engaging the ratchet-wheel, substantially as set forth.

2. The combination, with the main frame F and the standards *b*, of the main cylinder A, the two workers B C, the pins *c* on the end of worker C, a stripper E', arranged in the relation to the worker B, as shown, the two feed-rolls, one of which is provided with a ratchet-wheel, and a pawl and spring-actuated lever *l*, all arranged and adapted to operate as specified.



410,824. CHECKREIN-HOOK. CHARLES H. DOW, Hyde Park, Mass. Filed Feb. 9, 1888. Serial No. 263,315. (No model.)

Claim.—A checkrein-holder consisting of the hook A, having its outer surface continuously convex and having the downwardly-inclined end *c*, and a spring clip or lever bearing against said end and extending beyond the same, substantially as and for the purpose set forth.

410,825. CLOCK-CASE. JOHN M. DENWARD, Bristol, Conn., assignor to the Bristol Clock Case Company, same place. Filed Nov. 27, 1888. Serial No. 291,779. (No model.)

Claim.—1. In a sectional stone clock-case, the combination, with a section provided with a blind pocket formed in its inner face and with an opening intersecting the said pocket at an angle, of a bolt having one end perforated and inserted into the said blind pocket and a pin located in the said opening and passing through the perforation in the bolt, substantially as set forth.

2. In a sectional stone clock-case, the combination, with a stone section provided with a blind pocket formed in its inner face and with an opening intersecting the said pocket at an angle, of a bolt having one end perforated and inserted into the blind pocket, a pin located in the said opening and passing through the perforation in the bolt, and a filling located in the opening and keying the pin in place, substantially as set forth.

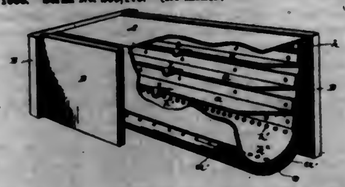
3. In a base for a stone clock-case the combination, with a front piece, a back piece, and two end pieces, of two binding-blocks located within and at opposite ends of the shell formed by the said pieces, and each having its inner face cut away to form three bearing-faces, and three bolts carried by each block, having their inner ends embedded and pinned in the respective adjacent base-pieces and their outer ends provided with nuts screwed against the bearing-faces of the block carrying them, substantially as set forth.

4. A sectional stone clock-case having its several parts keyed together by metallic keys, consisting of binders angling to each other and formed by pouring molten metal into pockets formed in adjacent parts of the case, so as to communicate with each other in angles when such parts are properly assembled, substantially as set forth.

5. A stone clock case having two of its parts each provided with intersecting vertical and horizontal pockets arranged so that when the parts are properly assembled their corresponding horizontal pockets will communicate, so as to permit the formation of a key, binding the two parts together, by pouring metal into the vertical pockets of one of them, substantially as set forth.

410,826. APPARATUS FOR BURNING HYDROCARBON OILS. ELLIS F. EDGAR, Woodbridge, N. J. Filed Feb. 11, 1888. Serial No. 263,682. (No model.)

Claim.—1. A combined oil and vapor burner and oil-vaporizer, consisting of a closed vessel or retort of non-combustible porous material, said vessel or retort having openings in one or more of its side walls for the escape of vapor and provided with an oil-supply aperture, substantially as described, and for the purpose specified.



2. In a hydrocarbon-burner, the combination, with an open rectangular frame provided on its inner face with flanges forming supports, of an incombustible porous vessel provided with an oil-supply orifice and having openings in its side walls, said vessel being of a smaller diameter than the frame and adapted to rest upon the flanges thereof, whereby an air-passage is formed between its walls and the said frame, substantially as described.

3. In a hydrocarbon-burner, the combination, with an open rectangular frame provided on its inner face with flanges forming supports, of an incombustible porous vessel provided with an oil-supply pipe and having openings in its side walls near the top, said vessel being of a smaller diameter than the frame and adapted to rest upon the flanges thereof, whereby an air-passage is formed between its walls and the said frame, substantially as described.

4. In a hydrocarbon-burner, the combination, with an open rectangular frame provided on its inner face with flanges forming supports, of an incombustible porous vessel provided with an oil-supply pipe and having openings in its side walls, said side walls inclining inward toward the bottom and of a much smaller diameter than the frame, said vessel adapted to rest upon the flanges of the frame, whereby a wedge-shaped air-passage is formed between the walls of the vessel and the frame, substantially as described.

5. In a hydrocarbon-burner, the combination, with an open rectangular frame provided on its inner face with flanges forming supports, of an incombustible porous vessel provided with an oil-supply pipe and having openings in its side walls near the top, said side walls inclining inward toward the bottom and of a much smaller diameter than the frame, said vessel adapted to rest upon the flanges of the frame, whereby a wedge-shaped air-passage is formed between the walls of the vessel and the frame, substantially as set forth.

410,827. APPARATUS FOR VAPORIZING AND BURNING HYDROCARBON OILS. ELLIS F. EDGAR, Woodbridge, N. J. Filed Mar. 31, 1888. Serial No. 269,178. (No model.)

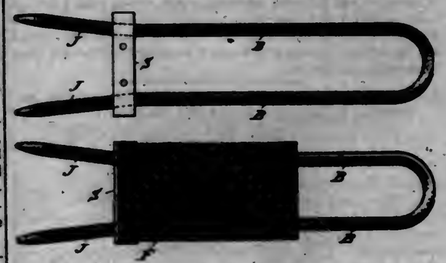
Claim.—1. In a heating apparatus for vaporizing and burning hydrocarbon oils, the combination, with a closed vaporizing-retort provided with vapor-openings through its walls, of an oil-holding vessel or pan supported within said retort, said retort being provided with an oil-supply opening through which oil is supplied into said pan or vessel, substantially as described.

2. The combination, with a closed oil-vaporizing chamber provided with vapor-eduction openings in its upper and lower portions, of a liquid-holding pan within said chamber, located below the upper vapor-eduction openings and above the lower eduction-openings, and means for supplying oil to said pan, substantially as described.

3. The combination of a closed vaporizing-chamber provided with an oil-supply opening and with vapor-eduction openings, an oil-holding pan within said chamber, and a surrounding casing forming a combustion-chamber between itself and the outer wall of said chamber, as set forth.

4. The combination, with a closed vaporizing-chamber provided with means for supplying oil thereto and having vapor-eduction openings, of a shield secured to the exterior of said chamber and forming a space between itself and the bottom of said chamber, open on one side, and non-combustible absorbent material filling said space, said chamber being provided with openings through its bottom leading to the said material, substantially as described.

410,828. FERRULE. SAMUEL W. EVANS, Jr., Philadelphia, Pa. Filed July 11, 1888. Serial No. 317,159. (No model.)



Claim.—1. A ferrule and point connected by a dovetailed joint, substantially as described.

2. A ferrule, in combination with a point, the latter having an inverted tapering neck, and the former embracing said neck, substantially as described.

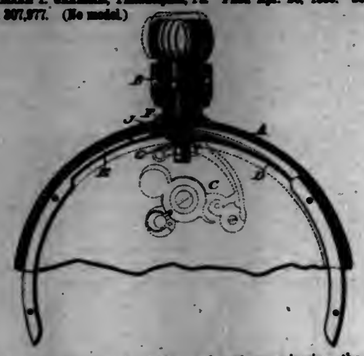
3. A ferrule, in combination with a point, the latter having an inverted tapering neck and a shoulder at the narrow part thereof, the lower end of the ferrule resting against the neck, and the adjacent portion thereof bent upon said neck, substantially as described.

410,829. BOOT-JACK. HENRY W. FARLEY, Urbana, Ill. Filed Apr. 15, 1889. Serial No. 307,262. (No model.)

Claim.—1. In a boot-jack, the combination, with a prop-block having two perforations or holes at or near its upper edge diverging toward the forward face of said block-prop, of two rods inserted with their disconnected ends through said perforations for forming the heel-receiving jaws of said boot-jack, substantially as described.

2. In a boot-jack, the combination, with a block or prop having two diverging perforations near its upper edge, of two jaws or rods inserted with their forward portions through said diverging perforations, and a plate or foot-rest secured with its forward end upon the upper edge of said block or prop, and having its rear end resting upon the jaw-forming rods, substantially as described.

3. In a boot-jack, the combination, with a prop-block apertured at or near its upper edge, of a doubled rod having its disconnected ends inserted through said apertures and held thereby in flaring relation to said block for forming the heel-receiving jaws of said boot-jack, substantially as described.



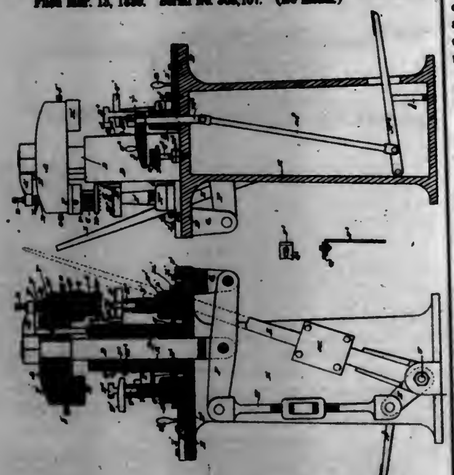
410,830. BACKING COMPOUND FOR STEREOTYPE-MATRICES. J. FREMONT FEST, Indianapolis, Ind. Filed Mar. 26, 1888. Serial No. 268,171. (No specimens.)

Brief.—The compound claimed is applied in the form of a dry powder, to absorb moisture from the matrix and beast by said moisture.

Claim.—1. As a new article of manufacture, a filling or backing compound for matrices, composed of plaster-of-paris, lime, flour, and alum, substantially as and for the purpose set forth.

2. As a new article of manufacture, a filling or backing compound for matrices, composed of finely-pulverized plaster-of-paris, lime, and flour, substantially as and for the purpose set forth.

410,881. WATCH-PENDANT WINDING AND SETTING DEVICE. WILLIAM T. CRAMER, Philadelphia, Pa. Filed Apr. 20, 1889. Serial No. 307,977. (No model.)



Claim.—1. In a watch winding and setting mechanism, the case of the watch having two springs, one spring being connected with the stem and having its connected end freely engaging with the end of the other spring, so that it may be moved to the opposite faces of the latter, said parts being combined substantially as described.

2. In watch winding and setting mechanism, two springs having their ends in engagement, one spring being connected with the stem, so that its end may be placed on opposite sides of the end of the other spring for holding said stem in either of its adjusted positions, substantially as described.

3. The springs D E, in combination with the stem, the ends of said springs being adapted to engage and one pass the other, one of the springs being connected with said stem, and the other spring having its place of contact with the other spring beveled or chamfered, as stated.

4. In a watch winding and setting mechanism, the combination of springs D and E, having overlapping ends, a stem passing through a slot in the spring D and being provided with collars on opposite sides of the said springs, the spring E having beveled faces, as at J, and the spring D having a lip adapted to engage said beveled faces, substantially as described.

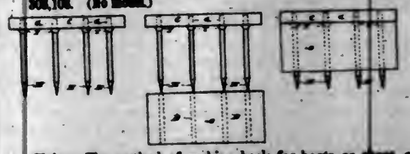
410,882. HEELING-MACHINE. HUBERT C. HAHN, Unionville, Conn. Filed Mar. 13, 1889. Serial No. 303,107. (No model.)

Claim.—1. A heel-machine having an awl-head provided with awls, a reciprocating carrier for the said head, a movable stripper through which the awls play, adapted to retire to permit them to pass into the heel, and a stationary stop independent of the carrier, adapted to arrest and hold the stripper, against which the heel is drawn, while the awls are being pulled out of it by the movement of the said carrier, substantially as set forth.

2. A heel-machine having an awl-head provided with awls and with a hollow shank, a stripper through which the awls play, having a stem projecting through and beyond the shank of the awl-head, a carrier for such head and stripper, and a stop for engagement with the stem of the stripper which it holds while the awl-head is retired by the carrier, substantially as set forth.

3. A heel-machine having a reciprocating cross-head or carrier, an awl-head applied thereto and provided with awls, a movable stripper through which the awls play, having a stem extending through the head and carrier and projecting above the latter, and an adjustable stop for engagement by the said stem, whereby the stripper is held to be pulled against by the head in drawing the awls from the heels, substantially as set forth.

4. A heel-machine having a reciprocating cross-head or carrier, an awl-head applied thereto and provided with awls, a stripper through which the awls play, having a stem extending through the head and carrier and projecting above the latter, a set-screw for engagement by the said end of the stem, a stop-arm carrying the said screw, and a stationary rod supporting the said arm and passing through a vertical opening formed in the carrier, substantially as set forth.



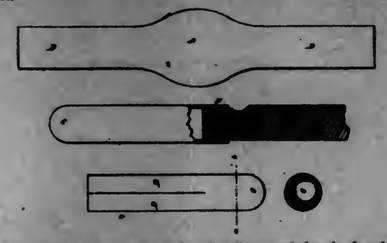
5. A heel-machine having a nailing-block, a reciprocating carrier therefor, a last for co-operation with the said block, provided with a shank, a vertically-adjustable post adapted at its upper end to receive the shank of the last and threaded and vertically slotted at its lower end, a longitudinally-movable carriage receiving the threaded lower end of the said post, and screws mounted in the carriage for holding the post against rotation and regulating the play of the carriage, one of the said screws entering the vertical slot in the post, substantially as set forth.

6. A heel-machine having a nail-holder consisting of a solid block provided with sockets adapted to receive the points of the nails and arranged to correspond to the arrangement of nails in a finished heel and shaped to prevent them from passing through it and adapted to support the nails so that their heads will project beyond its face, and a presser for forcing a top lift down upon the said projecting ends of the nails, whereby the top lift and nails are rigidly assembled together, substantially as set forth.

7. A heel-machine having a nail-holder consisting of a solid block provided with sockets adapted to receive the points of the nails, arranged to correspond to the arrangement of nails in a finished heel and shaped to prevent them from passing through it and adapted to support the nails so that their heads will project beyond its face, a presser adapted to be swung over and away from such nail-holder, and means for operating the same, substantially as set forth.

8. A heel-machine having a cross-head or carrier provided with an awl-head and nailing-block, a shaft for the said carrier, a manual operating-lever, an adjustable connection between the shaft and lever, an adjustable sliding weight mounted upon the lever between the fulcrum and the handle end thereof, and an adjustable stop for the lever mounted upon the bed of the machine, substantially as set forth.

410,883. METHOD OF MAKING HEELS FOR BOOTS OR SHOES. HUBERT C. HAHN, Unionville, Conn. Filed Mar. 13, 1889. Serial No. 303,108. (No model.)

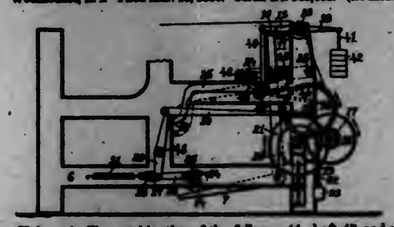


Claim.—The method of making heels for boots or shoes, consisting in grouping and supporting the nails in the relative positions which they will occupy in the completed heel, then placing a top lift upon their outer ends and applying pressure to force the said ends into the inner face of the lift, whereby all of the nails are simultaneously assembled with the top lift and held in place by their outer ends, with their shanks projecting from the inner face thereof, taking a heel-blank and piercing holes therein, and, by grasping the lift, simultaneously inserting the points of all the nails into the holes thereof and drawing the blank and lift together under pressure and simultaneously forcing the shanks of all of the nails through the heel-blank.

410,884. MANUFACTURE OF CUTLERY-HANDLES. HUBERT C. HAHN, Unionville, Conn. Filed Mar. 13, 1889. Serial No. 303,109. (No model.)

Claim.—1. A sheet-metal blank for cutlery-handles, consisting of an enlarged central portion having outwardly-curved side edges adapted to be drawn into a cup to form a seamless butt-end for the handles, and two corresponding leaves extending in opposite directions from the said central portion, having straight edges and of uniform width throughout and adapted to be folded to form the upper part of the handle, substantially as set forth.

2. A method of making cutlery-handles, consisting in part in drawing the central portion of a suitable blank into a cup forming a seamless butt-end for the handle, and transversely and longitudinally folding the two ends of the blank to conform them to the exterior curvature of the cup and to bring them into line with the length thereof.



3. A method of making cutlery-handles, consisting in drawing the central portion of a blank into a cup and transversely and longitudinally folding the two ends of the blank and uniting the edges of the said folded ends.

4. A method of making cutlery-handles, consisting in drawing the central portion of a suitable blank into a cup and transversely and longitudinally folding the two ends of the blank and coupling the said folded edges by a transverse rivet.

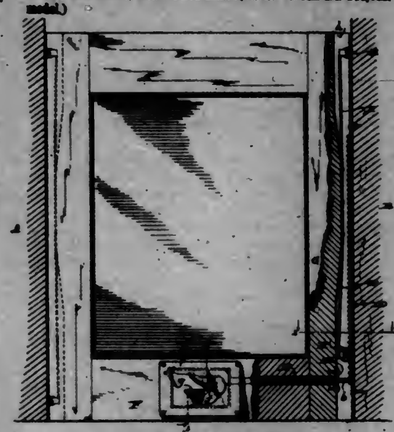
5. A method of making cutlery-handles, consisting in drawing the central portion of a suitable blank into a cup and transversely and longitudinally folding the two ends of the blank, coupling the said folded ends by a transverse rivet, hot-welding their edges together in dies, and finally finishing the handle.

410,885. LET-OFF MECHANISM FOR LOOMS. CHARLES RISDE, Woonsocket, R. I. Filed Mar. 18, 1889. Serial No. 303,662. (No model.)

Claim.—1. The combination of the follower 44, shaft 43, and arm 45 with the levers 32 35 29, link 26, operated by the picker-shaft 24 to oscillate the lever 29, the shaft 24, crank-arm 25, rack-arm 30, ratchet-gear 20, pinion 19, intermediate pinion 17, and the gear 16, all substantially as herein shown and described.

2. The combination of the L-shaped lever 7, provided with the stud 10, the spring 9, arm 11, whip-roll 12, provided with the arm 13, link 40, balance-lever 39, weight-holder 41, and weights 42, with the follower 44, shaft 43, arm 45, levers 32 35 29, shaft 24, cam 14, crank-arm 25, link 26, rack-arm 30, ratchet-gear 20, pinion 19, intermediate gear 18, intermediate pinion 17, and the gear 16, all substantially as herein shown and described.

3. The cam 14, secured to the shaft 24, the L-shaped lever 7, provided with the stud 10, the spring 9, the arm 11, and the whip-roll 12, provided with the arm 13, in combination with the follower 44, the shaft 43, carrying the arm 45, provided with the stud 46, the lever 32, pivoted to the side frame and provided with the slot 34, in which the stud 46 works, the bent lever 35, connected to the lever 32 and provided with the stop 37, the lever 29, carrying the weight-holder 41 and weights 42, supported on the whip-roll shaft 38 and connected to the bent lever 35 by the arm 13 and link 40, the rack-arm 30, the lever 29, provided with the slot 28, the spring 31, the link 26, connected to the crank-arm 25 and carrying the stud 27, the crank-arm 25, the gears 16, 18, and 20, the pinions 17 and 19, and the friction-pulley 21, strap 22, and weight 23, all arranged and operating substantially as herein shown and described.



410,886. LAWN-MOWER ATTACHMENT. DANIEL JOHNSON, Kansas City, Mo. Filed Sept. 16, 1887. Serial No. 249,542. (No model.)

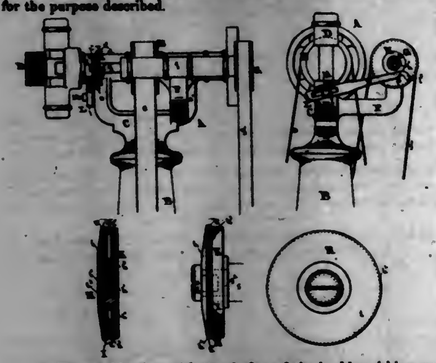
Claim.—1. In lawn-mowers, the combination, with the handle having forked ends, of a grass-receiver frame consisting of separate U-shaped strips having longitudinal slots in the respective end portions, one horizontal strip being secured to the forked ends of said handle by means of suitable securing and adjusting bolts, another U-shaped strip secured at its end portions, by means of securing and adjusting bolts, to the parallel portions of said horizontal strip, and a transverse U-shaped supporting-strip upon said handle, also having longitudinally-slotted end portions secured to the slotted sides of said horizontal strip by means of securing and adjusting bolts, for the purpose described.

2. In lawn-mowers, the combination, with the frame of the mower having feed-roller brackets, of grass-receiver pivots upon the side of said feed-roller brackets and arms connected with said pivots, a rod attached to said arms and also connected with and supporting the lower front end portion of said grass-receiver, and means for adjusting the rod-carrying arms on said pivots, for the purpose described.

410,887. SASH-FASTENER. HENRY S. KLEIN and HENRY B. KLEIN, Milwaukee, Wis. Filed Mar. 1, 1889. Serial No. 301,703. (No model.)

Claim.—1. In a window, the combination, with the frame and sash, of a rack secured to a side piece of said frame, a sliding rod arranged in said sash to engage the rack and having a screw-threaded inner end, a rack-bar provided with a socket to engage said screw-threaded end of the sliding rod, and a pivotal toothed segment arranged to mesh with said rack-bar, substantially as set forth.

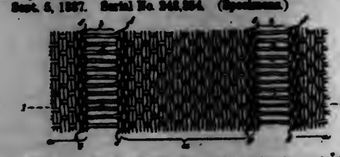
2. In a window, the combination, with the frame and sash, of a rack secured to a side piece of said frame, a sliding rod arranged in said sash, a casing mortised in the lower sash-rail and provided with a detachable face-plate having a finger-rest projecting therefrom, a rack-bar arranged within the casing and detachably connected to the sliding rod, a stem having its bearings in said casing and face-plate and terminated in a thumb-piece, a toothed segment arranged on the stem to engage the rack-bar, and a spring arranged to exert its force against said rack-bar, substantially as set forth.



410,888. HEEL-BURNISHING MACHINE. JAMES KNOWY and SAMUEL POPE, Philadelphia, Pa., assignors of one-third to Thomas Beatty, same place. Filed May 1, 1889. Serial No. 309,288. (No model.)

Claim.—1. The combination, with the seat-wheel of a heel-burnishing machine, of an arm or rest longitudinally slotted through the sides of its inner end, a bolt passing through the slot and into the side of the machine, its head impinging the side of the rest and securing it in position, the outer end of the arm being rounded and hook-shaped and presented edgewise at the side of the seat-wheel, substantially as shown and described.

2. The combination, with the seat-wheel of a heel-burnishing machine, of the arm or rest L, having the enlarged inner end *l*, the slot *l'*, passing through the sides of the inner end, the outer rounded end *P*, presented edgewise at the side of the seat-wheel and having the notch *P* in its under side, the bolt *m*, passing through the slot and into the side of the machine, and the head of the bolt impinging the side of the inner end of the rest, substantially as shown and described.



3. The combination, with the shaft of a heel-burnishing machine,

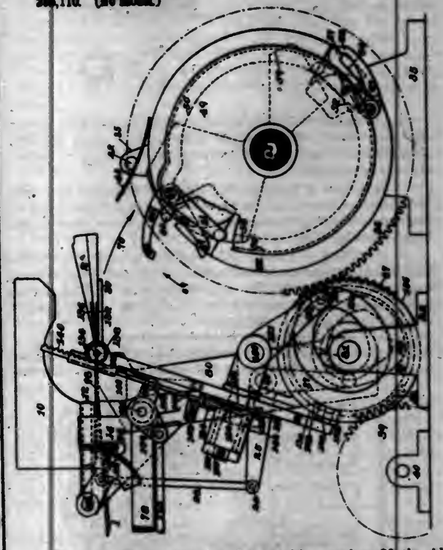
of a seat-wheel secured thereon, consisting of an outer and inner disk having annular flanges or rings on their inner surfaces, said outer disk having a sharp circumferential rim and having in its inner face a central recess for the reception of the end of a stepped bem on the inner face of the inner disk, on which bem is loosely journaled an interposed flat beading-disk whose surfaces bear against said rings and the shoulder of the stepped bem, and its flat edge projects slightly beyond the flat or square edges of the other disks, substantially as and for the purpose described.

4. The combination, with the shaft *g* of the heel-burnishing machine A, of a seat-wheel H, secured to the end of said shaft through the medium of the screw *k'*, said wheel consisting of the disk *h*, having the sharp rim h^3, with the face h^3 at right angles with the square edge h^4 of said disk, which has also the rings h^2 h^2, the central opening h', and the concentric recess h^5, receiving the end of the bem *k* on the inner face of the disk K, and having the central opening *k'*, said disk also having the ring k^2 and the square edge k^3 and abutting against the washer g^5 on the shaft, the beading-disk I, with the milled square edge, being loosely journaled on said bem and its flat sides bearing against said rings and the shoulder k^4 of the bem *k*, said edge *i* projecting slightly beyond the aligned flat edges h^4 k^3, substantially as and for the purpose described.

410,839. ELASTIC WEBBING. ELIJAH LAMB, Camden, N. J. Filed Sept. 5, 1887. Serial No. 248,894. (Specimens.)

Claim.—1. A strip of elastic webbing having a body composed of warp-threads and disconnected weft-threads, longitudinal elastic strands embedded in the fabric, and doup-threads tying the edge warps to the weft-threads, substantially as described.

2. A strip of elastic webbing having a body composed of interwoven warps and wefts, elastic strands embedded therein, doup-threads tying the edge warps of the strips, and fringed edges formed by projecting ends of the wefts, all substantially as described.



410,840. BROOM-CORN-SEWING MACHINE. CHARLES H. LEPE, Syracuse, N. Y., assignor to the Hand Stitch Broom Sewing Machine Company, Pittsburg, Pa. Filed May 6, 1889. Serial No. 309,714. (No model.)

Claim.—1. In combination with the table A, formed with the successively-enlarged openings O O, conveyers C C over said table, chutes D D under the said openings, and bins B B beneath the respective chutes, the gates *a a*, interposed between the chutes and bins and inclined in opposite direction from the delivery sides of the chutes, substantially as described and shown.

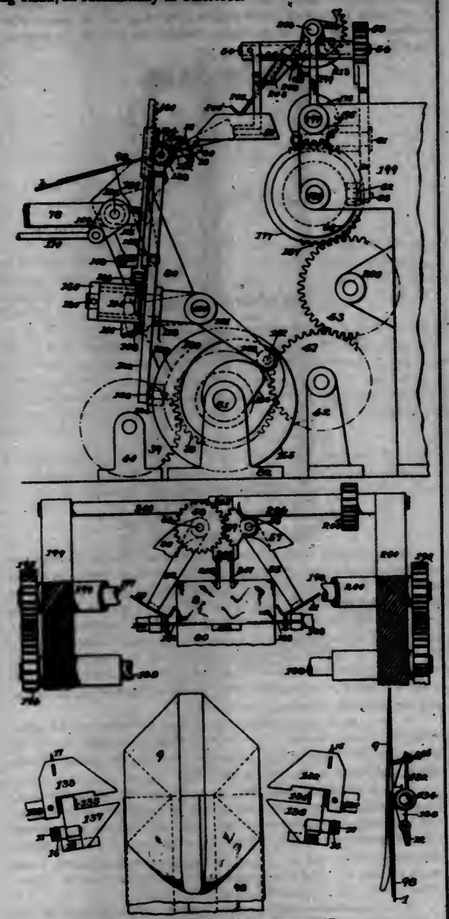
2. In combination with the table A, formed with the successively-enlarged openings O O, conveyers C C over said table, chutes D D, each composed of two plates *d d'*, inclined toward each other and having the bottom edge of the plate *d'* extending beneath that of the plate *d*, and bins B B beneath the said chutes, the gates *a a*, hinged at one edge under the plates *d d*, and their free edges adapted to swing toward the bottom edges of the plates *d' d'*, the rod *c*, connected to the gates, and the lever *l*, connected to the said rod, substantially as described and shown.

410,841. PAPER-BAG MACHINE. WILLIAM A. LORENZ and EDWARD R. GLASSER, Hartford, Conn., assignors to Felix W. Lobenstein and Clarence A. Wolle, Bethlehem, Pa. Filed Dec. 10, 1888. Serial No. 293,110. (No model.)

Claim.—1. The combination of the rocking carriage 30, the side plates 10 and 11, rocking toward each other above that carriage and at right angles to the rocking thereof, and the cam 29, and mechanism, substantially as described, between that cam and those side plates and operating to work the latter, all substantially as described.

2. The combination, in a bag-machine, of the folding-bed thereof, and a pair of grippers pivoted in a recess in the surface of that bed and rising from that surface to clasp a bag-blank some distance above it, and then falling to that surface to carry that blank thereon, all substantially as described and shown.

3. The combination of the cylinder 32, the pair of grippers 55 and 66, rocking in a recess in the periphery of that cylinder upon the shafts 53 and 64, the arms 51 and 60, rocking those shafts, and the cams 49 and 48 and the spring 62, working those arms, all substantially as described.

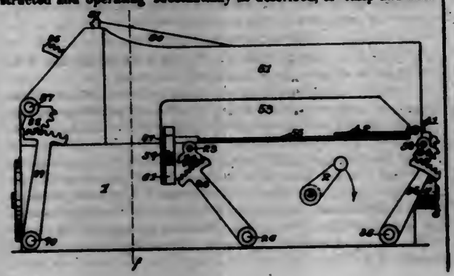


4. The combination of the cylinder 32, the pair of grippers 55 and 66, rocking in a recess in the periphery of that cylinder upon the shafts 53 and 64, the arms 51 and 60, rocking those shafts, the cams 49 and 48 and the spring 62, working those arms, and the plates 43 and 44, co-operating with the grippers 55 and 66 to draw and hold a bag-blank down upon the periphery of the cylinder, all substantially as described.

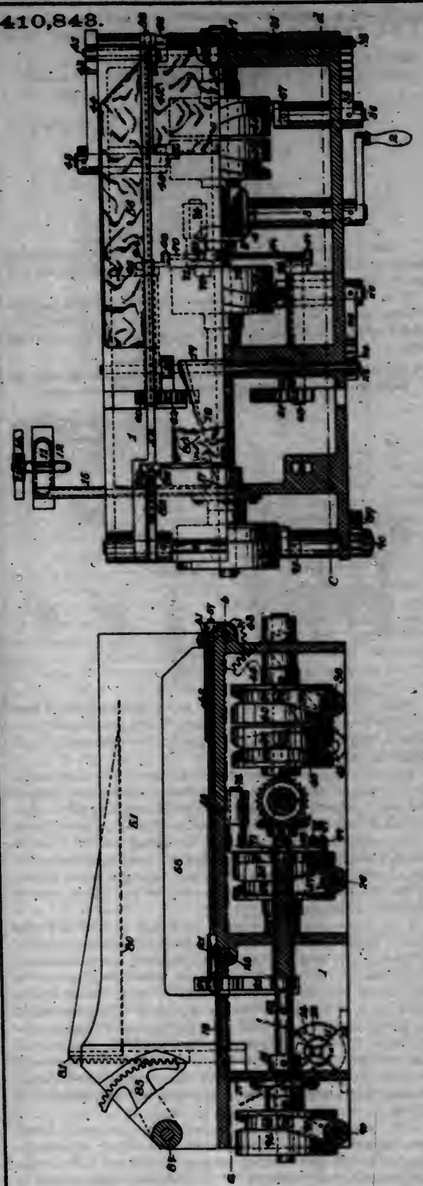
410,842. PAPER-BAG MACHINE. WILLIAM A. LORENZ and WILLIAM H. HOMES, Hartford, Conn., assignors to Felix W. Lobenstein and Clarence A. Wolle, Bethlehem, Pa. Filed Jan. 18, 1889. Serial No. 296,734. (No model.)

Claim.—1. The combination of the tack-blades 132 and 133, the studs 16 and 17, the box-blades 136 and 137, provided with the studs 10 and 11, respectively, and the grippers 12 and 13, provided with the springs 14 and 15, respectively, all combined and operating together substantially as described.

2. The combination of the swinging side plates 50 and 51, attached by means of the arms 52 and 53 to the shafts 54 and 55, respectively, the gear 58, and the sector 59, respectively fixed to the shafts 54 and 55, the sector-lever 60, meshing with the gear 58, and the cam 65, working that lever, all substantially as described.



3. The combination of the side plates 50 and 51, reciprocating toward and from each other crosswise of the bag-blank, with the two sweeper-shafts 206 and 207, reciprocating side by side lengthwise of the bag-blank, all substantially as described.



410,848. PAPER-BAG MACHINE. WILLIAM A. LORENZ, Hartford, Conn., assignor to Felix W. Lobenstein and Clarence A. Wolle, Bethlehem, Pa. Filed Jan. 18, 1889. Serial No. 296,740. (No model.)

Claim.—1. The combination of the grippers 21 and 22, 31 and 32, constructed and operating substantially as described, to clasp and hold a paper bag, with pneumatic apparatus, constructed and operating substantially as described, to inflate the bag thus held, all substantially as described.

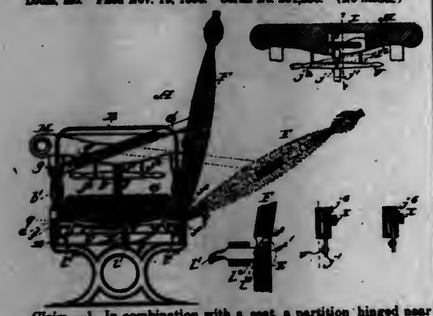
2. The combination of the grippers 21 and 22, 31 and 32, constructed and operating substantially as described, to clasp and hold

410,848.

a paper bag or blank, with the side plates 55 and 56, constructed and operating to make bellows folds in the sides of the bag or blank thus held, all substantially as described.

3. The combination of the side plates 55 and 56, the bottom plate 42, and the presser-plate 80, all constructed and arranged to work together to collapse a rectangular paper bag into a bellows-sided square-bottom paper bag, all substantially as described.

4. The combination of the side plates 55 and 56, the bottom plate 42, the presser-plate 80, and pneumatic apparatus, substantially as described, all constructed and arranged to work together to collapse a rectangular paper bag into a bellows-sided square-bottom paper bag, all substantially as described.



410,844. HEATING APPARATUS. ARMIER H. MARTIN, Summit, N. J. Filed Feb. 25, 1889. Serial No. 301,093. (No model.)

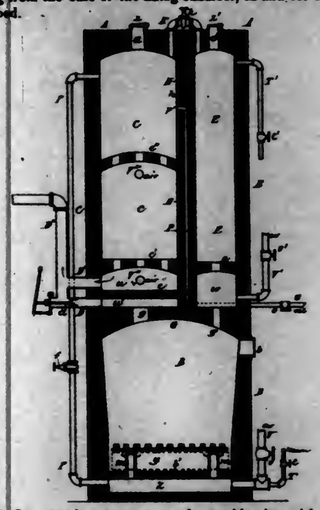
Claim.—1. A radiator composed of a coil or series of connected pipes incased in tubes of terra-cotta, substantially as and for the purpose set forth.

2. A radiator composed of a series of pipes connected together by a box common to all the pipes, the said pipes and box being surrounded by casings of terra-cotta conforming in shape thereto, as set forth.

410,845. CAR OR OTHER CHAIR. OSBORNE R. MICHAUD, St. Louis, Mo. Filed Nov. 19, 1888. Serial No. 291,203. (No model.)

Claim.—1. In combination with a seat, a partition hinged near the middle of the length of said seat and folding down laterally, arranged to divide said seat into two compartments when upright, substantially as set forth.

2. In combination with a chair-frame and a chair-back hinged thereto, a tie-rod extending from said back to said frame and provided with perforations arranged in series for adjusting the inclination of said chair-back, a bolt which passes through one or another of said perforations at will, and means for shifting said bolt from one to another of said perforations, consisting of a lever, toggle-arms, and links connecting said lever to said bolt, and a spring arranged to force said bolt into one of said perforations when left free thus to operate, substantially as set forth.



3. In combination with a chair-frame and chair-back hinged thereto, a tie-rod extending from said back to said frame and provided with perforations arranged in series for adjusting the inclination of said chair-back, a bolt passing through one or another of said perforations at will to complete the connection, a spring bearing against an attachment of said bolt to force it into one of said perforations, a lever having two handles, one at each end, and two fulcra, one near each handle, a bar vertically movable and jointed to said lever between said fulcra, in order that it may move with the vibration of said lever, a pivoted arm on which said bolt is mounted, and a toggle connecting said bar to said arm for operating said bolt, substantially as set forth.

4. In combination with a seat-frame and a seat-back hinged thereto, a partition hinged near the middle of the length of said seat, folding laterally, bolts for locking said partition and said back in their bearings, and a shaft connected to said bolts to withdraw them at will, substantially as set forth.

410,846. CUPOLA GAS-GENERATING FURNACE. MARCELLUS A. HOBART, Chicago, Ill. Filed Apr. 2, 1889. Serial No. 305,927. (No model.)

Claim.—1. In a cupola gas-generator, the combination of the fuel and decomposing chamber, the gas-fixing chamber and the steam-superheating chamber separated one from the other by a vertical partition and connecting at the bottom with such fuel-chamber, a steam-supply pipe connecting with the top of the superheating-chamber, supply-pipes for gas and oil vapor, and a gas-outlet pipe connecting with the fixing-chamber, as and for the purpose described.

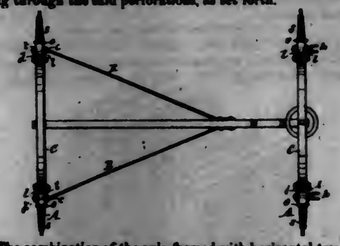
2. In combination with the fuel and decomposing chamber placed in the base of the cupola, the superheating and fixing chambers placed above, the arch at the top of the fuel-chamber, having openings for gaseous products leading into such superheating and fixing chambers, a valve-pipe connecting the chambers at the top, and an escape-pipe leading from the base of the fixing-chamber, as and for the purpose described.

3. In a cupola gas-generator, the combination, with the fuel and decomposing chamber, of the regenerative portion of the cupola placed above and divided by a vertical partition into a gas-fixing chamber and a steam-superheating chamber, each connecting at the bottom with the fuel-chamber and having at the top an escape-opening for products of combustion, and a closing lid and pipes for supplying air, steam, and oil or vapor to the chambers, and a gas-eduction pipe, whereby the heat of the gaseous products arising from the bed of fuel while it is being heated may be better stored and utilized for fixing gas and superheating steam, as described.

4. In a cupola gas-generator, the hollow partition-wall for separating the fixing-chamber from the superheating-chamber having its space filled with dry sand or equivalent material for closing cracks which may occur in the wall, as described.

5. In a cupola gas-generator, the combination, with the fuel and decomposing chamber placed in the base of the cupola, of the regenerative portion of the cupola placed above and divided by a hollow vertical partition-wall into a gas-fixing chamber and a steam-superheating chamber, and an oil-vaporizing pipe or coil arranged in the space of such wall, and a vapor-pipe leading therefrom into the fixing-chamber, for the purpose described.

6. In combination with the fuel-chamber, the fixing-chamber and superheating-chamber arranged and connecting, as described, a distributing-chamber *z*, arranged below the ash-pit, having air and steam supply pipes, a pipe for water-gas leading from chamber *z* to the top of the fixing-chamber, a valved pipe connecting the tops of the fixing and superheating chambers, and a steam-supply pipe connecting with the top of the superheating-chamber, as and for the purpose described.



7. In combination with the fuel-chamber of the cupola, the supply and distributing chamber *z*, arranged below the ash-pit, perforated channels *m*, communicating with such chamber and extending into the ash-pit, the steam and air supply pipes connecting with chamber *z*, and an escape-pipe for water-gas leading from such chamber to the fixing-chamber of the cupola, for the purpose described.

410,847. SPRING-VEHICLE. HARVEY A. MOYER, Syracuse, N. Y. Filed Dec. 5, 1888. Serial No. 292,704. (No model.)

Claim.—1. The combination of the axle formed with horizontal transverse perforations, reach-brace attachments extending through said perforations, and a cross-spring hung on said attachments, substantially as specified and shown.

2. The combination of the axle formed with the downward offsets A″ A″ and with the perforations *a a* between the inner faces of said offsets and spindles of the axle, the reach-braces B B, extending through the said perforations, the cross-spring C in the same vertical plane with the axle, and links *l l*, connecting the cross-spring with the reach-braces at opposite sides of the axle, substantially as described and shown.

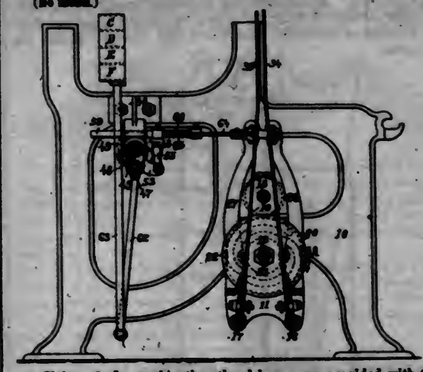
3. The combination of the axle formed with horizontal transverse perforations and shaft-shackles provided with attaching bolts or shanks extending through the said perforations, as set forth.

4. The combination of the axle formed with horizontal transverse perforations, shaft-shackles provided with attaching-shanks extending through said perforations, and a cross-spring over the axle in the same vertical plane therewith and hung on the attaching-shanks of the shaft-shackles, as set forth.

5. The combination of the axle formed with the downward offsets A″ A″ and with the perforations *a a* between the inner faces of said offsets and spindles of the axle, the shaft-shackles *b b*, formed with the attaching-shanks *b′*, extending through the perforations *a a*, the cross-spring in the same vertical plane with the axle, and links *l l*, connecting said spring with the shanks *b′*, substantially as described and shown.

410,848. COUPLING FOR WATER-CLOSET BOWLS. TRESSNY McILVAIN, Wakefield, assignor of one-half to the Smith & Anthony Stove Company, Boston, Mass. Filed May 31, 1889. Serial No. 312,715. (No model.)

Claim.—The combination of the socketed boss *b*, having the inwardly-projecting flange *b″*, the flanged threaded nipple *c*, having the flange *c′*, the elastic ring *d*, the annular wedge *e*, and the nut *f*, engaged with the threaded nipple and formed to bear against the outer end of the boss, whereby, when said nut is turned against the boss, the wedge is forced into the ring and the nipple is drawn outwardly, as and for the purpose specified.



410,849. THILL-COUPLING. ANDREW J. CORBIN, Toledo, Ohio. Filed Apr. 22, 1889. Serial No. 308,152. (No model.)

Claim.—1. In a thill-coupling, the combination, with a draw-iron formed with a transverse circular recess having a longitudinal slot communicating therewith and provided with a circumferential groove within the side of said recess, of a cylinder working in said recess and formed with a recess corresponding in width to the slot of the draw-iron, said cylinder being provided with a lug upon its exterior adapted to enter the circumferential groove in the circular recess, and a thill-iron having a cross-bar adapted to rest within the recess of the cylinder, substantially as shown and described.

2. In a thill-coupling, the combination, with a draw-iron formed with a transverse circular recess having a longitudinal slot opening into the same, said recess being provided with a circumferential groove within the sides of the same, of a cylinder working in said recess and formed with a recess corresponding in width to the slot in the draw-iron, and provided on its exterior with a lug adapted to engage the circumferential groove of the draw-iron, a thill-iron having a cross-bar reduced on its front side, said cross-bar adapted to be inserted within the recess of the cylinder, and an elastic packing placed between said cross-bar and the bottom of the recess, substantially as and for the purpose described.

410,850. SHUTTLE-BOX-OPERATING DEVICE FOR LOOMS. EPHRAIM E. ORDELL, Ware, Mass. Filed July 14, 1888. Serial No. 280,035. (No model.)

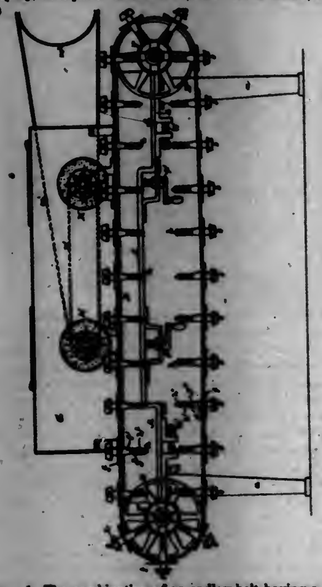
Claim.—1. In combination, the driven gear provided with the hub, the two cams mounted upon said hub, the pivoted arms or levers provided with movable bolts, and the bell-cranks for moving the bolts out of connection with one cam and into connection with the other cam, substantially as and for the purpose herein shown and described.

2. In a shuttle-box-lifting device, the arms or levers provided with the bolts, the cams, and the bell-cranks for operating the said bolts, in combination with the racks, the shaft having the disk provided with the gear mounted at one end and the gear mounted on the other end of said shaft and operating the gear carrying the arm provided with the crank-pin through the intermediate gear, the crank-arm, the gear, the crank-pin, and the intermediate gear or pinion, the said crank-arm being provided with a sleeve upon which is mounted the disk provided with a gear, the shuttle-boxes, and connections from the crank-pin to the shuttle-boxes, substantially as described.

3. In a shuttle-box-lifting device, the combination, with the arms 26 and 27, provided with the bolts 28 29, the cams 22 and 23, provided with the ways 24 38 39 25, and the bell-cranks 32 33, connected with the bolts 28 29 and operated by the pattern-chain through the rods 34 35, of the racks 59 60, the crank 46, (and the gears 45, 48, 49, 52, and 44, the shaft 50, the sleeve 41, the arm 42, and the pin 66,) the shuttle-boxes, and connections from the crank-pin 47 to the shuttle-boxes, as described.

4. In combination, the racks 59 60, the shaft 50, the gear 52, the gear 45, having the crank-pin 47, the intermediate gear 48, the gear 49, and the crank-arm 42, provided with the gear 44, the shuttle-boxes, and connections from crank-pin 47 to the shuttle-boxes, substantially as described.

5. In a shuttle-box-lifting device, the arms or levers 26 27, pivoted to the frame-piece and provided with the bolts 28 29 and the bell-cranks 32 33, having the springs 36 37, for holding one arm of each of said bell-cranks depressed, the said bell-cranks being pivoted on said arms and connected to and operating the bolts 28 29, in combination with the racks 59 60, the shaft 50, the disk 51, having the depressions 57 and the gear 52, the gear 45, having the arm 46, carrying the crank-pin 47, attached thereto, the intermediate gear 48, the gear 49, the crank-arm 42, provided with the sleeve 41, having the disk 43, provided with the depressions 57, and the gear 44, mounted on said disk, and the pivoted arms 55, carrying the rolls 56 and provided with the springs 58, for holding said rolls in contact with the said disks 43 and 51, the shuttle-boxes, and connections from crank-pin 47 to the shuttle-boxes, substantially as described.



6. In a shuttle-box-lifting device, the combination, with the shuttle-boxes and connections to the pin 47, the sleeve 41, and arm 42, the racks 59 and 60, and the gears 44 and 52, of the shaft 50, provided with the gear 49, the intermediate gear 48, the stud-pin 67, the gear 45, connected to and adjustable with the crank 46, the crank 46, the crank-pin 47, and the stud-pin 66, constructed to adjust the throw of the crank to the shuttle-boxes, as described.

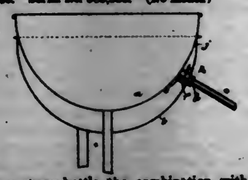
7. In a shuttle-box-operating device for drop-box looms, the combination, with the two racks for operating the drop-box mechanism, of the skipper mechanism consisting of the bell-crank levers 32 33, the cams 22 23, the bolts 28 29, and the arms 26 27, as described.

8. A device for controlling the drop-boxes of a loom, consisting of the bell-crank levers 32 33, operated from the pattern-chain, the

cams 23 23, and the bolts 28 29, the arms 26 and 27, the racks 59 and 60, the cranks 42 and 46, the mechanism intermediate the racks and the cranks, and the connection between the crank 46 and the drop-boxes, as described.

410,851. MACHINERY FOR POLISHING SHEET-METAL ARTICLES. FRANK. W. PERRY, Philadelphia, Pa., assignor to the Have Fruit Jar Company, same place. Filed Feb. 15, 1889. Serial No. 300,022. (No model.)

Claim.—1. The combination of an endless belt having a series of independent work-holding chucks, means for traversing said belt, and rotating brushes for acting on the articles on the chucks as the latter are carried past the brushes by the belt, substantially as specified.



2. The combination of the rotating brushes, the endless belt having a series of chucks with rotatable work-holding heads, and means for traversing said belt, substantially as specified.

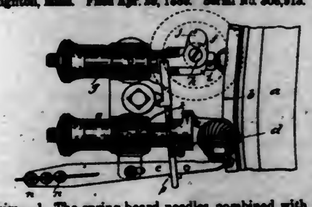
3. The combination of the endless belt, the drums therefor, the chucks having spring-holding pins, a rod having an expander for said pins, and a presser for operating the said rod as it passes around the opposite belt-drums, substantially as specified.

4. The combination of the endless belt and its work-holding chucks with the vertical and horizontal rotary brushes and adjustable bearings for the shafts of said brushes, substantially as specified.

5. The combination of the two sets of rotating brushes with the endless belt carrying the work-holding chucks, means for traversing the belt, and a frame having guides for vertically supporting and laterally confining said belt, substantially as specified.

410,852. STEAM-KETTLE. JOHN PEPPERER, New York, N. Y. Filed Apr. 1, 1889. Serial No. 306,005. (No model.)

Claim.—1. In a steam-kettle, the combination, with the jacket and steam-inlet pipe, of the combined pipe-connecting bush and laterally-distributing nozzle, consisting of an ordinary pipe-connecting bush having the chambered nozzle *e* on the inner end and the lateral issues *f* through the sides and being secured in the jacket, substantially as described.



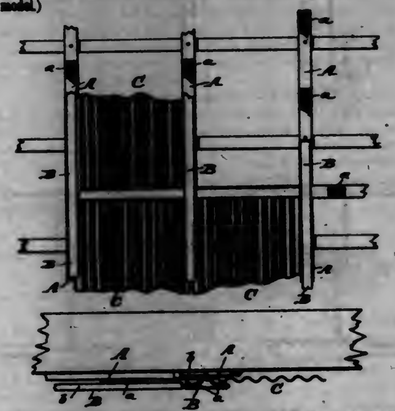
2. The combination, with a steam-kettle, of a distributing-nozzle located within the steam-space connected with the steam-pipe, and having laterally-directed issues distributing the steam laterally to the contiguous portion of the kettle, except in the direction of the junction of the kettle and jacket above the pipe-connection, and said nozzle being located in one side of the jacket near said junction, substantially as described.

410,853. KING-BOLT SOCKET. WILLIAM S. REDDEN, St. Louis, Mo., assignor to the Kingsland & Douglas Manufacturing Company, same place. Filed June 21, 1888. Serial No. 315,092. (No model.)

Claim.—As a means for re-enforcing the king-bolt of a vehicle to prevent breakage of the same, a ball-joint 11, formed upon a plate 14, secured to the axle and surrounding the king-bolt, and having a hole in its apex which fits the king-bolt snugly, about which hole the king-bolt swings as a center, the interior of the said ball-joint being cut away taperingly from the apex to the plate 14 in the direction of the length of the axle, the curved downward extensions 23 upon the plate 14, over which the head of the king-bolt rides, and the ball-socket 12, formed upon the plates 27 and embracing said ball-joint and secured to the timbers 7 and 8, that support the vehicle, the said ball-socket 12 being cut away taperingly from the apex of the ball-joint 11 to its own top in the direction of the length of the axle, and having a curved top over which the pin 26, which secures the king-bolt in place, may ride, the said plates 14 and 27 being constructed to permit play between them, substantially as and for the purpose set forth.

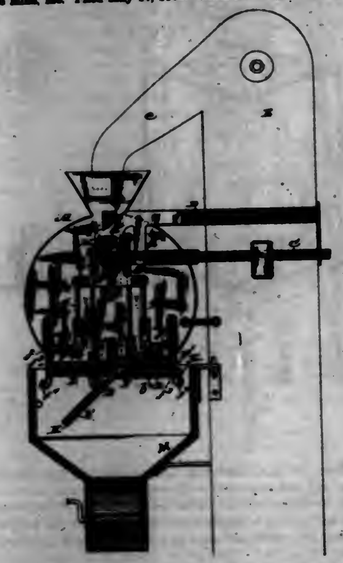
410,854. CIRCULAR-KNITTING MACHINE. JAMES POLLITOWT, Stoughton, Mass. Filed Apr. 20, 1889. Serial No. 308,913. (No model.)

Claim.—1. The spring-beard needles, combined with the presser-wheel and the stud or spindle on which it turns, a crank arm or lever to which said stud is affixed, a rod connected with said arm, the yarn-guide, and a fulcrumed drop-wire provided with a latch-pin co-operating with said yarn-guide, as set forth.



2. The spring-beard needles, combined with the presser-wheel and its stud and movable stud-support, a rod connected with said support, a yarn-guide, a fulcrumed drop-wire provided with a latch-pin, said drop-wire being constructed as a compound lever, and means for adjusting one part of the drop-wire with respect to the other, as set forth.

410,855. SUSPENDERS. MAYER REISS, Chicago, Ill. Filed Feb. 19, 1889. Serial No. 300,423. (No model.)

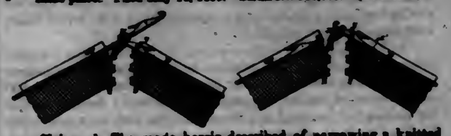


Claim.—Suspenders having, in combination, the web-straps A, grippers C, consisting of two jaws, one having two side slots *j* and a tang *l* adjoining each slot and provided with a turn-button, and the other having an offset *m* and two right angles and two slots *n* in the offset, and a tongue *o* between the said two offset slots, a portion of each end of the said offset on one jaw occupying one of said side slots on the other jaw, and a hook connecting the grippers to the web-straps, as shown and described.

410,856. METALLIC CEILING AND SHEETING STRIP. LOUIS LEE L. HAGEMEYER, Cincinnati, Ohio, assignor of one-half to Charles H. Harder, Fishkill, N. Y. Filed Mar. 14, 1889. Serial No. 303,288. (No model.)

Claim.—In combination with the combined ceiling and sheeting strips for retaining the sides of the ceiling-plates, the short strips constructed the same as said side strips for retaining the ends of adjacent plates, said short strips fitting in said side strips in a manner substantially as set forth, and for the purpose specified.

410,857. AUTOMATIC GRAIN-SCALE. KASPER H. SCHAFER, Linn's Mills, Mo. Filed May 17, 1889. Serial No. 311,169. (No model.)

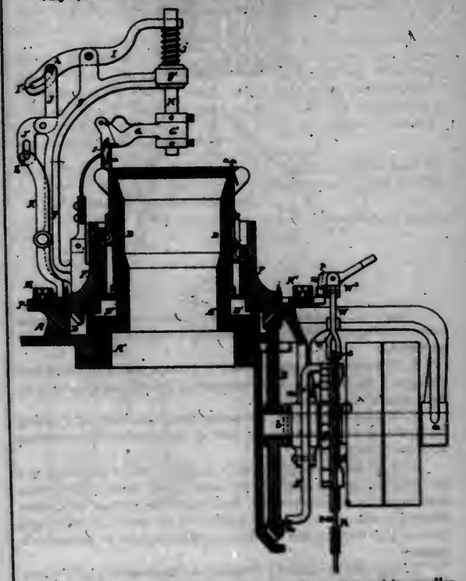


Claim.—1. The combination of the weighing-hopper, the scale-beam, the arm D, the bell-crank levers, the rods G G', the cross-bar *d'*, and the pivoted door B, substantially as described.

2. The combination of the weighing-hopper, the pivoted two-part door, the bell-crank levers, the spring-catches, and the guards, substantially as described.

3. The combination of the weighing-hopper, the arm D, the scale-beam, the pivoted two-part bottom, the spring-catches, the bell-crank levers, the rods G G', the cross-bar *d'*, and the guards, substantially as described.

4. The combination of the weighing-hopper, the arm D, the scale-beam, the pivoted two-part bottom, the spring-catches, the bell-cranks, the rods G G', the cross-bar *d'*, the guards, the bars H I, the rods J J' and the valve d^4, substantially as described.



410,858. ART OF NARROWING KNITTED WEBS. ROBERT W. SCOTT, Philadelphia, Pa., assignor of one-half to Louis H. D. Williams, same place. Filed May 16, 1889. Serial No. 310,965. (No model.)

Claim.—1. The mode herein described of narrowing a knitted web, said mode consisting in transferring a stitch directly from one needle to another by bringing the receiving-needle into position to take the stitch from the needle on which it was formed, and then operating the latter needle so as to cast the stitch, substantially as specified.

2. The mode described of effecting the narrowing of a knitted web, said mode consisting in raising the stitch to be transferred, bringing forward the receiving-needle into position to take said stitch, and then operating the needle on which the stitch was formed, so as to cast said stitch, substantially as specified.

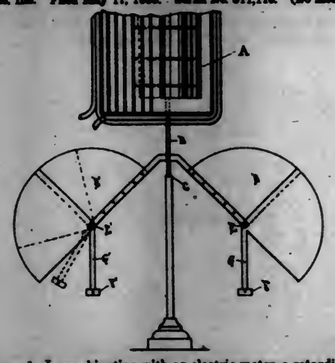
410,859. KNITTING-MACHINE. ROBERT W. SCOTT, Philadelphia, Pa., assignor of one-half to Louis H. D. Williams, same place. Filed July 8, 1889. Serial No. 316,894. (No model.)

Claim.—1. The combination of the needle-carrier and its needles, means for operating the latter, and a needle-picking tool projecting into the line of the needles, whereby its movement may be arrested by contact with a projecting needle of the carrier, and the picker thus brought into position for acting on said needle, substantially as specified.

2. The combination of the needle-carrier and its needles, the needle-picking tool arranged to be stopped by a projecting needle, and a tool-carrier having a yielding connection with the picking-tool, whereby one may have movement independently of the other, substantially as specified.

3. The combination of the needle-carrier and its needles, the needle-picking tool occupying such relation to the needles as to be stopped by a projecting needle of the set, and a tool-carrier having a frictional connection with the picking-tool, substantially as specified.

4. The combination of the needle-carrier and its needles, a needle-picking tool projecting into the line of the needles, whereby its movement may be arrested by contact with a projecting needle of the car-



rier, means for moving the picking-tool so as to cause such contact of the same with the needles, and means for moving the picking-tool in line with the movement of the needles, so as to move the engaged needle into operative or inoperative position, substantially as specified.

5. The combination of the needle-carrier and its needles, the cam-box and its needle-operating cams, a needle-picking tool occupying such relation to the needles as to be stopped by a projecting needle of the set, and a tool-carrier having a yielding connection with the picking-tool and connected to the cam-box so as to be moved therewith, substantially as specified.

6. The combination of the needle-carrier and its needles, a needle-picking tool occupying such relation to the needles as to be stopped by a projecting needle of the set, means for moving the picking-tool across the set of needles, and cams and intervening devices whereby the picking-tool is moved in a direction in line with the needles after reaching the limit of its transverse movement, substantially as specified.

7. The combination of the needle-carrier and its needles, a needle-picking tool occupying such relation to the needles as to be stopped by a projecting needle of the set, means for moving the picking-tool across the set of needles, two sets of cams and intervening devices whereby the picking-tool is moved in a direction in line with the needles after reaching the limit of its transverse movement, and means for throwing said sets of cams into operation alternately, substantially as specified.

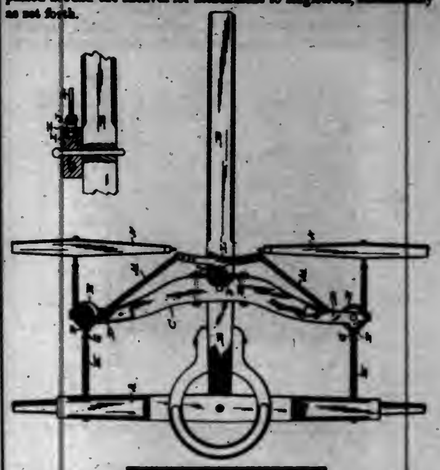
410,860. ELECTRIC METER. MASSAMBRES H. M. SLATTERY, Fort Wayne, Ind. Filed May 17, 1889. Serial No. 311,116. (No model.)

Claim.—1. In combination with an electric motor, a retarding device consisting of a folding fan presenting a variable surface to the atmosphere.

2. In combination with an electric motor, a retarding device consisting of a fan revolving in the atmosphere and folding upon itself by the action of centrifugal force.

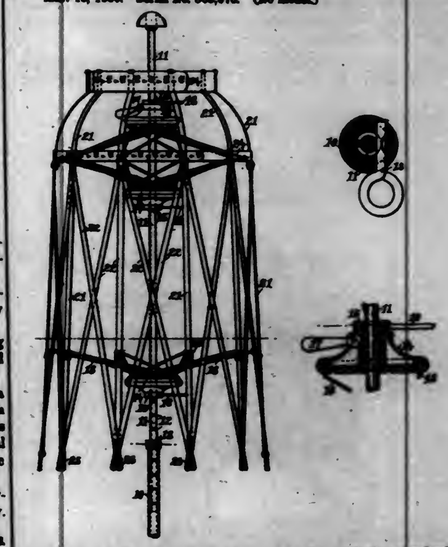
3. In an electric motor, a retarding device consisting of a folding fan revolving in the atmosphere, with an adjustable weight attached to its movable portion.

4. In an electric-motor meter, a retarding device consisting of a fan revolving against atmospheric pressure and having one portion fixed rigidly to the motor-shaft, with a movable portion or portions adapted to slide over the fixed portion by the action of centrifugal force at high velocity, and so reduce the area exposed to atmospheric pressure.



5. In an electric motor, a retarding device consisting of a revolving fan divided into sections adapted to slide together at high velocity.

410,861. WHIFFLETREE. LEVI W. SMITH, East Troy, Wis. Filed May 7, 1889. Serial No. 309,995. (No model.)



Claim.—1. A whiffletree provided with means for attachment to the stay-chains of a wagon, sheaves journaled to the whiffletree, a swivel connected to said whiffletree, a plate pivoted to the swivel, and chains or analogous means connected to the plate and passed around the sheaves for attachment to singletrees, substantially as set forth.

2. A wooden whiffletree, castings fitted on the ends thereof and provided with rearwardly-extended guard-loops having eyes for connection with the stay-chains of a wagon, sheaves having their bearings in the castings, a plate pivotally connected to said whiffletree, and chains or analogous devices passed around the sheaves within the guard-loops for attachment to singletrees, substantially as set forth.

3. A whiffletree provided with means for attachment to the stay-chains of a wagon and having its front edge provided with a central recess, sheaves journaled to the whiffletree, a swivel having a head fitted in said recess, a stay-plate secured to said whiffletree and provided with a bearing for said swivel, a plate pivotally connected to the swivel, and chains or analogous means connected to the plate and passed around the sheaves for attachment to singletrees, substantially as set forth.

410,862. DRESS-FORM. JOHN R. STONE, Providence, R. I. Filed Mar. 18, 1889. Serial No. 303,670. (No model.)

Claim.—1. In a dress-form, the combination, with the standard 11, provided with the grooves 12, of the tube 10, and the locking device 13, consisting of a cylindrical portion, part of which is cut away, and a loop forming a handle constructed to adjust the height of the dress-form and secure the same by turning the locking device, as described.

2. In a dress-form, the combination, with the vertical ribs forming the skirt of the dress-form and the standard, of two or more disks constructed to be turned horizontally, and provided with mechanism for securing the same in the desired position, and braces pivotally connected with the disks and with the vertical ribs, the whole constructed so that by turning the disks the tangential position of the braces is changed to the radial position, or vice versa, and the vertical ribs are expanded or contracted, as described.

3. The combination, in a dress-form, with the vertical ribs and tangential braces pivotally connected with the vertical ribs and with a disk supported on the standard at the lower part of the dress-form, of ribs pivotally connected with the vertical ribs near the upper part and secured to the lower part of the next rib, as described.

4. In a dress-form, the combination, with the standard 11, of two or more disks 14, constructed to turn horizontally, the braces 16, pivotally connected with the disk or disks and with the vertical ribs, and the ribs 21 and 22, and the cam-levers 17, constructed to secure the dress-form in the expanded condition, as described.

5. In a dress-form, the combination, with the standard 11, the vertical ribs 21 and 22, and the bands 24, of the disks 14, braces 16, pivotally connected with the disks 14 and the vertical ribs 21, and the cam-levers 17, constructed to expand the dress-form to the adjustment of the bands, as described.

6. In a dress-form, the combination, with the standard 11, of the sleeve 15, provided with the cam-lever 16, the disk 14, and cam-lever 17, and the braces 16, pivotally connected with the vertical ribs of the dress-form, and with the disk 14, constructed to expand or contract the dress-form by partial rotation of the disk 14, as described.

410,863. RUNG-BORER. JAMES SWAN, SEYMOUR, CONN. Filed Jan. 2, 1889. Serial No. 295,163. (No model.)

Claim.—1. A bung-borer consisting of a body, shank, and leading-screw cast in a single piece, the body being hollow and tapered and having a slot 6 through it, said slot being highest upon one side to form a reaming cutting-edge and the bottom being closed, with the exception of an opening 8, which is made highest upon one side to form a curved cutting-edge extending from the base of the leading-screw to the outer edge.

2. In a bung-borer, a hollow body having a closed rounded bottom, a leading-screw, and an opening through said bottom, one edge of which is made highest to form a cutting-edge, which extends from the base of the leading-screw to the outer edge of the opening, the smallest diameter of the body being at a distance above said cutting-edge.

3. A bung-borer consisting of a tapering hollow body having a slot with a cutting-edge, the bottom of said body being closed and rounded, as shown, and provided with a leading-screw and an opening leading from said screw to the outer edge, said opening being highest upon one side and having a cutting-edge, the smallest diameter of said body being at a distance above said cutting-edge, so that a barrel may be bored through without friction upon the side of the hole.

410,864. CARDING-MACHINE. CYRUS A. TAFT, Whittinsville, Mass., and EDWARD S. CLARK, Providence, R. I., executors of GUSTAVUS B. TAFT, deceased. Filed Jan. 4, 1889. Serial No. 295,469. (No model.)

Claim.—1. The combination, with the frame of a carding-engine, the main carding-cylinder, and a shield or escutcheon, substantially as described, of a fastening and adjusting device consisting of a threaded sleeve adjustably secured in the frame and a bolt constructed to hold the shield against the sleeve, as described.

2. The combination, with the frame of a carding-engine and the carding-cylinder, of the threaded sleeve *m*, the shield *d*, and screw-bolt *l*, constructed to secure and adjust the shield, as described.

410,865. PROCESS OF MAKING ZIRCONIUM NITRATE. FELIX THIELE, New York, N. Y., assignor of one-half to William C. Conrad, same place. Filed July 19, 1889. Serial No. 318,049. (No specimens.)

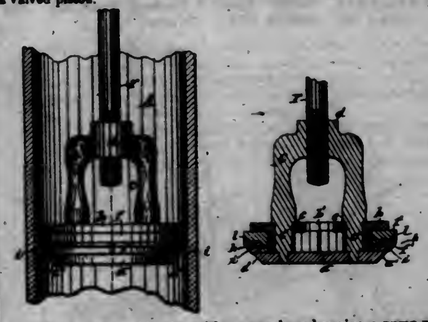
Claim.—The process herein described of making water-soluble nitrate of zirconium, which consists, first, in subjecting the zirconium ores to the action of hydrochloric acid, then heating it with sulphuric acid, so as to form sulphate of zirconium, and, finally, mixing it with a solution of nitrate of barium, so as to form by reaction therewith pure nitrate of zirconium, substantially as set forth.

410,866. STEAM-ENGINE. JAMES T. WARREN, Hanson, assignor to himself and JOHN T. WARREN, Boston, Mass. Filed Apr. 13, 1889. Serial No. 306,987. (No model.)

Claim.—1. The combination of the cylinders, the steam-valve, the butterfly-valve, the rectangular frame provided with the piston-rods, and mechanism, substantially as herein shown and described, for operating the valves.

2. The combination of the cylinders, the butterfly-valve, the steam-valve provided with the cam, the cut-off rod provided with the tappets, the levers, and the rectangular frame carrying the piston-rods, substantially as herein shown and described.

3. The combination of the cylinders 6 6, the butterfly-valve 8, provided with the arm 20, the steam-valve 12, having the cam 21 secured to the stem thereof, and the rectangular frame 16 16, carrying the piston-rods 14 14, substantially as herein shown and described.



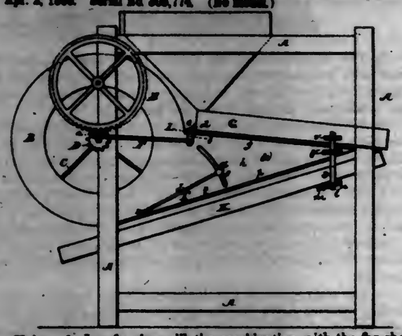
4. The combination of the cylinders 6 6, the butterfly-valve 8, provided with the arm 20, the steam-valve 12, having the cam 21 secured to its stem, the rectangular frame 16 16, carrying the piston-rods 14 14 and the finger 19, the cut-off rod 23, the tappets 25 25, and the levers 29 29, arranged and operating substantially as herein shown and described.

5. The combination of the cylinders 6 6, the butterfly-valve 8, provided with the arm 20, the steam-valve 12, having the cam 21 secured to its stem, the rectangular frame 16 16, carrying the piston-rods 14 14, the finger 19, and the uprights 22 22, supporting the slotted way 26, the cut-off rod 23, carrying the tappets 25 25 and supported on the uprights 22, and the levers 29 29, substantially as herein shown and described.

6. The combination of the cylinders 6 6, the butterfly-valve 8, provided with the arm 20, the steam-valve 12, having the cam 21, secured to its stem, the rectangular frame 16 16, carrying the piston-rods 14 14, the finger 19, and the uprights 22 22, supporting the slotted way 26, the cut-off rod 23, carrying the tappets 25 25 and supported on the uprights 22, the levers 29 29, and the locking-plate 32, substantially as herein shown and described.

410,867. PUMP-PISTON. BENJAMIN H. WELLS, Oneida, N. Y., assignor of one-half to Edward B. French, same place. Filed Mar. 30, 1889. Serial No. 304,982. (No model.)

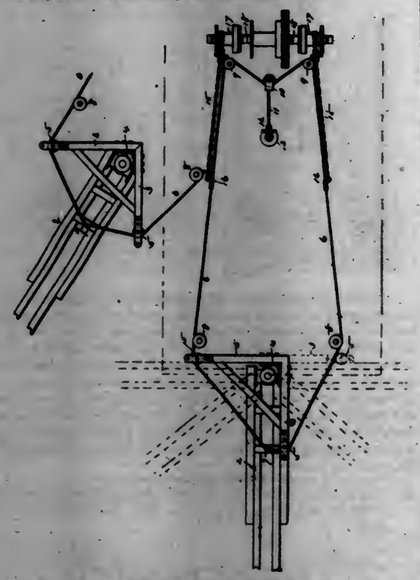
Brief.—The movable packing acts as a valve, making the piston a valved piston.



Claim.—In combination with a pump barrel or pipe, a pump-piston composed of a solid piston-head formed with a water-passage between its periphery and inside of said barrel or pipe and having the edge of its under side beveled, a follower secured to said piston-head and formed with a similar water-passage at its periphery and with an opening in its center, a ring formed with a circumferential rabbet and divided into segments seated movably radially between the piston-head and follower, and a ring also divided into segments seated movably radially in the aforesaid rabbet and breaking joints with the same, the lower of said rings having its bottom edge beveled, substantially as described and shown.

410,868. LOCOMOTIVE-SPRING. JOHN A. WHEELOCK and PETER LYDEN, St. Paul, Minn. Filed July 12, 1889. Serial No. 317,457. (No model.)

Claim.—As an improved article of manufacture, a locomotive-spring having its upper or supporting leaf formed at the ends by means of dies to receive suitable hangers or links, whereby the central portion of the body of the leaf is given the desired shaping or curvature, while the edges of the leaf are left straight or in alignment with the main body of the leaf, substantially as described.



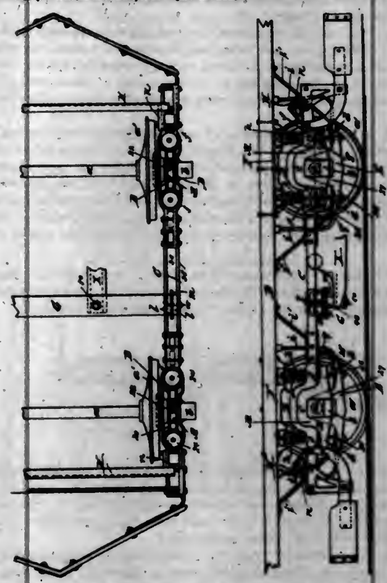
410,869. FANNING-MILL. THOMAS M. RALEY, Dublin, Ind. Filed Apr. 2, 1889. Serial No. 305,774. (No model.)

Claim.—1. In a fanning-mill, the combination, with the fan-shaft and its pinion, of the pitman and the transverse lever connected by its middle portion to the upper shoe, the lower shoe having the notched brackets on its under side near its upper end, and the pivoted swinging levers connected to the upper shoe by their shorter arms, and engaging by lugs at the ends of their longer arms the notched brackets of the lower shoe, substantially as specified.

2. In a fanning-mill, the combination of the fan-shaft, having a pinion on its end provided with a wrist-pin, a transverse lever pivoted at one end to the casing, a pitman connected to the downwardly-bent end of said lever, the upper shoe pivoted to the middle portion of said lever, notched bracket *m*, and swinging levers pivoted at their upper ends to the upper shoe and having at their lower ends lugs adjustably engaging notches of the brackets *m* of the lower shoe, substantially as specified.

410,870. CRANE. HENRY M. BARNHART, Marion, Ohio. Filed June 3, 1889. Serial No. 313,011. (No model.)

Claim.—1. The combination, with a mast and swinging crane, of a cable attached to the latter, and arms loosely supported so as to be moved by and in advance of the crane, for the support of the cable outside of the line between the point of attachment to the crane and the axis around which the latter swings, substantially as set forth.



2. The combination, with a mast and a swinging crane mounted thereon, of an endless cable attached to the crane, and arms loosely supported on the mast on opposite sides of the crane, so as to be moved by the crane for retaining the cable outside of the line between the point of attachment to the crane and the axis around which the latter swings, substantially as set forth.

3. The combination, with a mast and a swinging crane mounted thereon, of an endless cable secured to the crane and strung over sheaves, and movable arms loosely supported on the mast for retaining the cable outside of the line between the point of attachment to the crane and the axis around which the latter swings, the said arms adapted to be moved by the derrick, substantially as set forth.

4. The combination, with a support, a mast, and a swinging crane mounted thereon, of an endless cable secured to the crane and strung over sheaves, movable arms loosely supported on the mast for retaining the cable outside of the line between the point of attachment to the crane and the axis around which the latter swings, a snatch-block for keeping the cable taut, and winding-drums for moving the cable, substantially as set forth.

5. The combination, with a support, a mast thereon, and a swinging crane supported by the latter, of a pair of swinging arms loosely supported in the mast and extending at right angles to each other, said arms having sheaves in their ends, an endless cable secured to the crane and strung over the sheaves in the arms and the other sheaves, a snatch-block for keeping the cable taut, winding-drums, and flexible devices connecting the cable to said drums, substantially as set forth.

410,871. ELECTRIC AND CABLE RAILWAY CARS. FREDERICK A. BROWN, Springfield, and LOUIS PFINDER, Boston, Mass. Filed May 23, 1888. Serial No. 311,751. (No model.)

Claim.—1. The combination, with the car-body and the journal-boxes for the car-wheel axles, of braces secured to and pending from said car-body, and the shoe and brace connections E E below the journal-boxes, comprising risers engaging said boxes and extensions to which said braces are connected, step-extensions *d* for said journal-boxes, beam-connected yokes B B, having extensions *f f*, cushions between said step and yoke extensions, and springs between and supporting the car-body from the said yokes, substantially as described.

2. The combination, with the sill of a car-body, of a sill-plate comprising a main plate 28, adapted to be secured to the sill, and one or more supplemental plates 30, supported from and below said main plate and adapted to receive the connection therewith of the upper ends of the spring-bolts, substantially as described.

3. The combination, with the journal-boxes for the car-wheel axles, the sill of the car-body, and sill-plates, each comprising a main plate 28, adapted to be secured to the sill, and the supplemental perforated plates 30, supported from and below said main plate, of the braces secured to and pending from the car-body, and shoe and brace connections E, having risers 27, engaging the journal-boxes, and the extensions 26, to which said braces are connected, and having the perforations 34, the steps *d d*, supported from the journal-boxes, having the perforations 33, the beam-connected yokes B B, comprising the extensions *f f*, having the perforated webs 24, cushions *g* between and supporting said yoke-extensions from said steps *d*, springs between and supporting said car-sills from said yoke-extensions, and the spring-bolts *j* between and connected to said supplemental portions 32 of the sill-plates and said brace-connections, passing through the perforations of said yoke-webs and step and through the said cushions *g* and springs A, substantially as described.

4. In a truck, the combination, with a longitudinal beam, as the yoke-beam C, of separable blocks having grooves 38 therein, the clevis *m*, and means for confining the said blocks together upon said beam and to embrace the middle portion of said clevis.

5. In a truck, the combination, with the beam comprising double bars 35 35, of the separable blocks *l l*, having the grooves 38 and flanges 46, the clevis *m*, and the bolt 45, passing through said double-barred beam and said blocks, substantially as and for the purpose described.

6. In a truck, the combination, with a beam C, of the separable blocks *l l*, having the grooves 38 and matching tongue and groove 47, the clevis *m*, and means for confining the said blocks together and upon the said beam, substantially as and for the purpose described

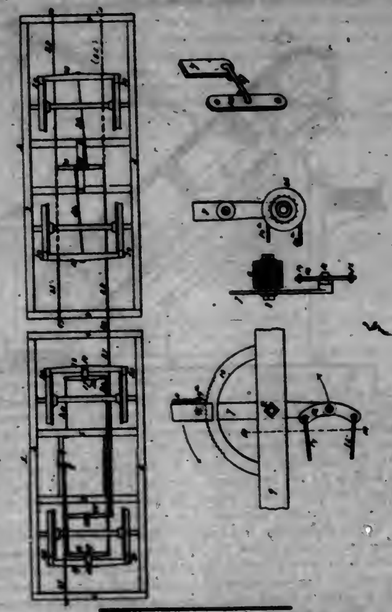
7. The combination, with the outer extension of a yoke B, of a bracket-plate *n*, provided with the laterally-extending angular flange 50, formed to fit and be connected with one end portion of a brake-supporting angle-iron, substantially as described.

410,872. PROCESS OF MAKING WEISS-BEER EXTRACT. CHRISTIAN L. BOSTON and CHARLES C. KERNS, Kansas City, Mo. Filed Nov. 24, 1888. Serial No. 291,781. (Specimens.)

Claim.—1. The described process of producing weiss-beer extract—namely, by mixing wheat and barley malt in about the proportions of two parts of wheat-malt to one part of barley-malt, subjecting them to mashing, in the manner stated, then extracting the wort from the mash, then mixing the wort with a decoction of hops, and boiling the whole for the evaporation of the water.

2. The process of manufacturing weiss-beer extract, which consists in intimately mixing ground wheat-malt and barley-malt in the proportion of about sixty-seven to thirty-three, respectively, adding water at a temperature of about 40° Reaumur, and allowing the mixture to soak, adding a further quantity of water and maintaining the temperature at about 70° Reaumur until the saccharine matter has been produced from the amylaceous matter, adding a decoction of hops, and subsequently evaporating until the desired consistency is reached, as set forth.

410,873. COMBINED ROLLER AND SEED-SOWER. THOMAS A. BUTLER, Oliver Springs, Tenn. Filed May 18, 1889. Serial No. 311,571. (No model.)



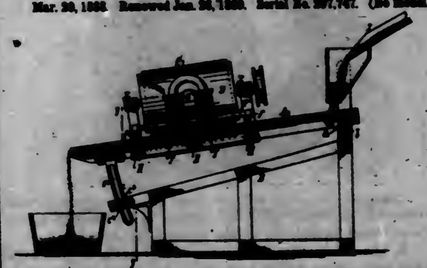
Claim.—1. In a combined roller and seeder, the combination, with the side beams B and transverse braces *c*, of the end-frame sections A, having standards *a* and flanges *b*, supports *d* upon the inner sides thereof, and the hopper-sections D E, substantially as and for the purpose specified.

2. The frame consisting of the end sections A, having standards *a* with flanges *b*, the side beams B, and transverse braces *c*, in combination with the hopper-sections D E, the former being adjustable, and the distributing-roller F, and the rollers G H, substantially as and for the purpose described.

410,874. CAR-BRAKE. HIRAM A. BUTTERFIELD, St. Louis, Mo. Filed June 18, 1888. Serial No. 314,606. (No model.)

Claim.—1. The combination, in a car-brake, of a hand-lever and an equalizer carried thereby and connected with the brake systems of two cars, substantially as and for the purpose set forth.

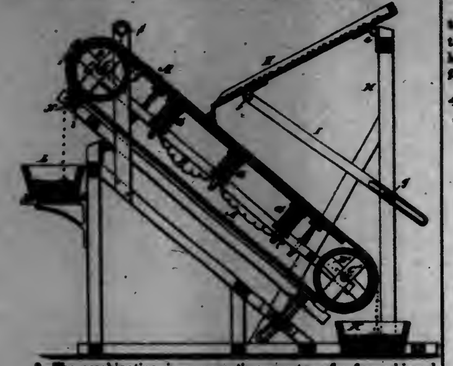
2. The combination of the brake systems upon two cars, each system being substantially alike at both ends of the cars and the two systems adapted to couple together, and a hand-lever with an equalizer connected thereto, the equalizer being connected with the systems of the two cars, respectively, substantially as and for the purpose set forth.



410,875. PROCESS OF MAKING BARRELS OF MUSICAL INSTRUMENTS. CHARLES C. CARPENTER, Jr., and LOUIS A. BOOTT, Groton, N. Y., assignors to I. A. Barter & Co., same place. Filed Feb. 13, 1889. Serial No. 299,765. (No model.)

Claim.—The process herein described of forming cylinders for musical instruments and other machines, consisting in forming a flat pattern, then making a thin electrotype therefrom, and then bending this electrotype into a cylinder, substantially as shown and described.

410,876. PROCESS OF SEPARATING MAGNETIC FROM NON-MAGNETIC PARTICLES. GORDON CORELISS, Glens Falls, N. Y. Filed Mar. 20, 1888. Renewed Jan. 30, 1889. Serial No. 297,747. (No model.)

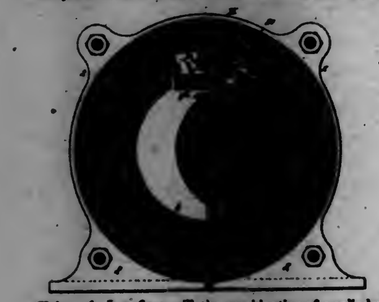


Claim.—The within-described process for separating magnetic from non-magnetic particles, which consists in exposing a running stream of liquid containing the substances to be separated to the action of a magnet, lifting the magnetic particles carried by said stream up from and out of contact with the stream, and finally conducting the particles which have followed the attraction of the magnet into a suitable receptacle.

410,877. MAGNETIC SEPARATOR. GORDON CORELISS, Glens Falls, assignor to the Cooking Ore Dephosphorizing Company, New York, N. Y. Filed Jan. 31, 1889. Serial No. 298,044. (No model.)

Claim.—1. The combination, in a magnetic separator, of an endless belt A, a magnet F, situated within said belt close to its upper strand and extending in the direction of the belt up to the highest

point of said upper strand, or nearly so, a frame constructed to retain said belt and magnet in an inclined position, and a trough situated above the belt and the magnet, substantially as described.



2. The combination, in a magnetic separator, of a frame hinged at one end and movable into different positions to vary its angle of inclination, an endless belt supported and retained by said frame, a magnet located within said belt and secured to and movable with the frame, whereby the magnet preserves its position relative to the belt when the inclination of the frame is changed, means for adjusting and holding the belt and magnet carrying frame, and a trough arranged over said frame to deposit the mass to be separated on the belt over the magnet, substantially as described.

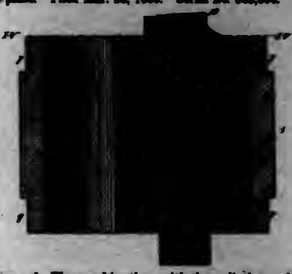
3. The combination, in a magnetic separator, of an inclined frame having two opposite rollers, one of which is provided with annular grooves in its external surface, the endless belt passing round the pulleys, and the magnets supported by the frame within the belt and made to extend into said annular grooves, substantially as described.

4. The combination, in a magnetic separator, of an endless belt A, a magnet situated within said belt close to its upper strand and extending in the direction of the belt, a frame constructed to retain said belt and magnet in an inclined position, a trough situated above the belt and the magnet, and a spray-pipe S, extended across the highest portion of the belt, substantially as described.

410,878. FLOUR-MILL. NICHOLAS CRESSLING, St. Louis, Mo., assignor of two-thirds to Henry Stanley and Emil C. Teuscher, both of same place. Filed May 28, 1888. Serial No. 275,096. (No model.)

Claim.—1. In a flour-mill, the combination of a cylinder, a roller eccentrically arranged within the cylinder, and feed-trough and discharge-trough located side by side, substantially as set forth.

2. The combination of a cylinder, a roller eccentrically arranged within the cylinder, feed-trough and discharge-trough located side by side, and a diaphragm 22, substantially as and for the purpose set forth.



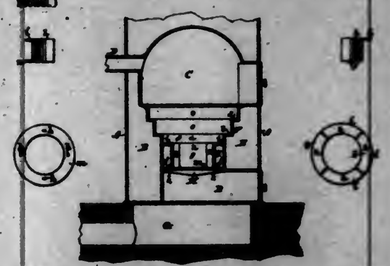
3. In a flour-mill, the combination of a cylinder, a roller eccentrically arranged within the cylinder, feed-trough and discharge-trough located side by side, a chute 15 on the delivery side of the feed-trough, and a diaphragm 22 on the discharge side of the mill, substantially as and for the purpose set forth.

4. In a flour-mill, the combination of a cylinder, a roller eccentrically arranged within the cylinder, a trough for discharging the ground stuff located at the top of the cylinder, and a diaphragm 22, substantially as and for the purpose set forth.

5. In a flour-mill, the combination of a cylinder, a roller eccentrically arranged within the cylinder, feed-trough and discharge-trough located side by side having a partition between them, the diaphragm 22, and brushes 26 and 26 on the partition and diaphragm, respectively, substantially as and for the purpose set forth.

6. In a flour-mill, the combination of a cylinder, a roller eccentrically arranged within the cylinder, and feed-trough for delivering the material and discharge-trough for discharging the ground stuff, located side by side at the top of the cylinder, substantially as and for the purpose set forth.

410,879. FLOUR-MILL. NICHOLAS CRESSLING, St. Louis, Mo., assignor of two-thirds to Henry Stanley and Emil C. Teuscher, both of same place. Filed Mar. 28, 1888. Serial No. 268,096. (No model.)



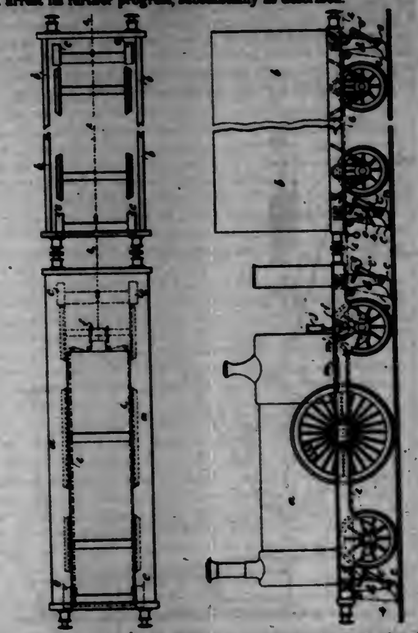
Claim.—1. The combination, with the cylinder and eccentrically-arranged roller, of a feeding device delivering the material at different heights between the grinding-surfaces, substantially as described.

2. The combination, with the cylinder and eccentrically-arranged roller, of a feeding device delivering the material at different heights between the grinding-surfaces, consisting of a casing 21, narrowed down to a point at its forward end, having a number of inclined ways or partitions 24 25 26, extending rearwardly from top to bottom, the lower beyond the one above, substantially as described.

3. A feeding device for delivering material to an eccentric roller-mill, consisting of the casing 21, having a chute 23 and inclined bottom 27, and narrowed down to a point 22, and the inclined ways 24 25 26, the ways extending farther back from the top toward the bottom, substantially as described.

410,880. FIRE-POT FOR HOT-AIR FURNACES. SAMUEL DARLING, Providence, R. I. Filed May 18, 1888. Serial No. 311,307. (No model.)

Claim.—1. A hot-air-furnace fire-pot having a chamber at its lower part provided with a grate and one or more enlarged offset chambers in its upper part, the lower chamber above the grate being adapted for holding and burning the coal required for heating the room in mild weather, and the lower chamber, together with the upper offset chamber or chambers and the same grate, being adapted for the cold and coldest weather, substantially as described.



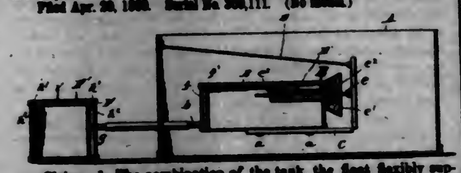
2. A hot-air-furnace fire-pot provided with a grate and having within its chamber a smaller removable fire-pot wall which forms an offset central chamber of less depth than the original chamber and of less area than the grate, substantially as described.

3. A hot-air-furnace fire-pot provided with a grate and one or more enlarged offset chambers in its upper part, and having within its lower chamber an additional offset chamber formed by a removable surrounding wall which forms a central chamber of less depth than the said lower chamber and of less area than the grate, substantially as described.

410,881. CAR-BRAKE. PIETRO F. DE FERRARA, Florence, Italy. Filed July 16, 1888. Serial No. 317,572. (No model.)

Claim.—1. The improved brake apparatus, which consists of spring-impelled brake-blocks adapted to descend upon and hug the rails of a railway, and suitable mechanism for withdrawing said brake-blocks, substantially as described.

2. The frictionally-fixed brake-blocks c, having flanges c' and projecting arms c', in combination with springs g, tending to forcibly press said brake-blocks onto the rails and so elevate the train or tram-car and arrest its further progress, substantially as described.



3. In combination with friction brake-blocks, the mechanism for applying said brake-blocks to the rails, consisting of a winding-drum f, carrying a ratchet-wheel l, and upon which chains c, leading from the brake-blocks, are wound to raise said blocks, a pawl l', having a hand-lever l', engaging with said ratchet-wheel, and means actuating such mechanism, substantially as described.

4. The combination, with the friction brake-blocks, the winding-drum f, and a chain connecting said blocks and drum, of an anti-concussive spring m, one end of which is connected, by means of a chain m', to said winding-drum and the other end to the under framing of the locomotive, substantially as described.

5. In combination with the brake-blocks, the means for retaining said brake-blocks in their raised position when the vehicles are to be uncoupled, consisting of the ratchet-wheel n, pawl o, and spring-catch o', for keeping said pawl out of the teeth of the ratchet-wheel when the vehicles are running, substantially as described.

410,882. STOCK-WATERER. JOHN H. DEWEY, Shell Rock, Iowa. Filed Apr. 20, 1888. Serial No. 308,111. (No model.)

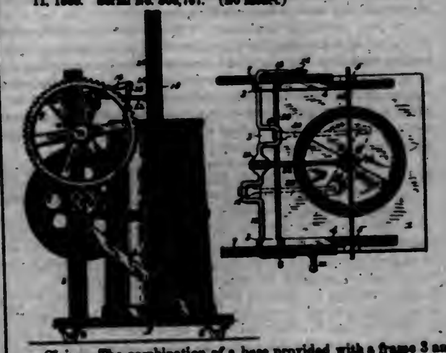
Claim.—1. The combination of the tank, the float flexibly supported therein, its valve and operating mechanism therefor, and the watering-trough having pipe-connection with the float, substantially as set forth.

2. The combination of the tank, the float flexibly supported therein, its valve, and operating-lever composed of two hinged or pivoted together arms, one having a sliding connection with the float and the other arm being connected to the valve-stem and having connection with the tank, and means to effect the withdrawal of more or less of the contents of the float, substantially as specified.

3. The combination of the tank, the float, its valve, and operating mechanism, said float having a discharge-tube and a vent-tube connecting with a vent-chamber having a narrow air-passage near the top of the float, substantially as set forth.

4. The combination of the tank, the float, its valve, and operating mechanism therefor, the discharge-pipe of said float, and the trough having connection with the discharge-pipe of the float, said trough having a slotted cover having one end held by means of a cross-bar of said trough and let into the upper end of the trough, the opposite end of said cover being retained in position by a cross-bar or other means inserted through staples or keepers at that end of the trough, substantially as set forth.

410,883. APPARATUS FOR UNLOADING BOATS. JAMES M. DODGE, Philadelphia, Pa., assignor to the Dodge Coal Storage Company, same place. Filed Dec. 3, 1888. Serial No. 292,513. (No model.)

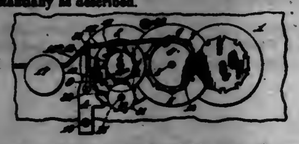


Claim.—1. In an apparatus or contrivance for discharging coal or other material from vessels or barges to a given point or locality on shore while the said vessels or barges may be at variable distances from and at different levels relatively to the point of discharge of the material, the combination of the following instrumentalities, arranged and operating together in substantially the manner hereinbefore specified, viz: first, a stationary conveyer-trough extending from the point of discharge of the material down into the water; second, a movable conveyer-trough extension having its inner end movably supported within the said stationary conveyer-trough; third, a suitable float for supporting the highermost portion of said trough-extension in close proximity to and parallel with the deck of the barge or vessel to be unloaded, and, fourth, an endless chain provided with flights which travel within and convey the material shoveled from the hold of the vessel into the extension-trough, along through the latter, and also thence upwardly through the stationary conveyer-trough.

2. In combination with the stationary conveyer-trough extending down into the water, a conveyer-trough extension bearing at one end on and both longitudinally and pivotally movable relatively to the stationary trough, and a conveyer-chain having its flights arranged and operating within said stationary trough, and also within said movable trough-extension, substantially in the manner and for the purposes hereinbefore set forth.

3. In combination with the stationary inclined conveyer-trough, a horizontal branch or extension thereof bearing at one end thereon and longitudinally and pivotally movable relatively thereto, and a conveyer-chain operating in conjunction with said extension of said stationary trough, means for vertically supporting the outer end of said extension, substantially as and for the purpose hereinbefore set forth.

410,884. CHURN. JAMES P. FREEBURNS, Hope, Ind. Filed Apr. 11, 1888. Serial No. 269,767. (No model.)



Claim.—The combination of a base provided with a frame 3 and slotted uprights 5, a rock-shaft 12, journaled upon the said frame, suitable mechanism for operating this shaft, a churn and dasher, an arm 22, rigidly connected to the said rock-shaft, rods secured to the churn-dasher and working in the slots in the said uprights, and pivotal links connecting the forward end of the arm 22 to one of the rods secured to the dasher, as and for the purpose set forth.

410,885. REGISTERING MECHANISM. PIERCE FORD, Tucson, Ariz., assignor of one-half to William W. Flewelling, same place. Filed Apr. 9, 1888. Serial No. 269,665. (No model.)

Claim.—1. In a registering mechanism for fluid-meters, the com-

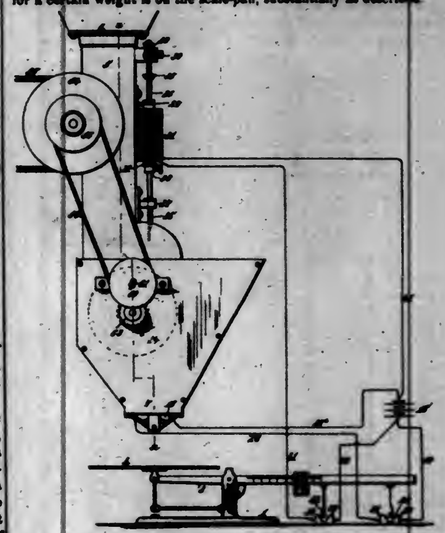
bination, with a series of disks connected together and having the shaft of the units-disk provided with a ratchet, of a drop-lever having a pawl to engage the ratchet, a train of gearing, a lift actuated by said gearing for raising the lever and permitting it to drop, and a rotary shaft for connecting with the measuring-wheel of a meter geared to and continuously driving the train of gearing which rotates the lift, substantially as described.

2. In a registering mechanism for fluid-meters, the combination of a series of connected registering-disks mounted on separate shafts, and the shaft of the units-wheel having a ratchet-wheel, a pivoted drop-lever having a pawl engaging the ratchet-wheel, a shaft having a revolving lift for raising the drop-lever, a shaft for connecting with the measuring-wheel of a meter, and a train of gearing driven by the measuring-wheel shaft and connected with the lift to continuously rotate the latter, substantially as described.

3. In a registering mechanism for fluid-meters, the combination of a series of connected registering-disks mounted on separate shafts, and the shaft of the units-disk having a ratchet-wheel, a pivoted drop-lever having a weight and a pawl which engages the ratchet-wheel, a bell-crank lever having one arm connected with the drop-lever, a shaft having a revolving toothed lift acting on the other arm of the bell-crank lever, a shaft for connecting with the measuring-wheel of a meter, and a train of gearing driven by the measuring-wheel shaft and connecting with the lift to continuously rotate the latter, substantially as described.

4. In a registering mechanism for fluid-meters, the combination of a series of connected registering-disks mounted on separate shafts, and a shaft of the units-disk having a ratchet-wheel and a pinion, a pivoted weighted drop-lever having a pawl engaging the ratchet-wheel, a bell-crank lever having one arm engaging the drop-lever, a shaft having a revolving lift provided with teeth which engage the bell-crank lever and the pinion on the shaft of the units-disk, a shaft for connecting with the measuring-wheel of a meter, and a train of gearing driven by the measuring-wheel shaft and connecting with the lift to continuously rotate the latter, substantially as described.

5. In a registering mechanism for fluid-meters, the combination of a series of registering-disks mounted on separate shafts connected by the stop-plates 5 and circular plates 8, and the shaft of the units-disk having a ratchet-wheel 14, a pivoted drop-lever 15, having a pawl 16, engaging the ratchet-wheel, a bell-crank lever 32, having one arm engaging the drop-lever, a shaft having a revolving toothed lift 30, engaging the other arm of the bell-crank lever, a shaft 29, for connecting with the measuring-wheel of a meter, and a train of gearing driven by the measuring-wheel shaft and connecting with the lift to continuously rotate the latter, substantially as described.



6. In a registering mechanism for fluid-meters, the combination of a series of registering-disks, each mounted on a separate or independent shaft, the stop-plates and circular plates for connecting the shafts of the registering-disks, a drop-lever for operating the units-registering disk, a revolving lift which raises the drop-lever and permits it to drop to rotate the units-registering disk, and a shaft for connecting with the measuring-wheel of a meter, geared to and rotating the lift, substantially as described.

410,886. APPARATUS FOR WEIGHING AND PUTTING UP PACKAGE-TEA, &c. OWEN A. GILL, Baltimore, Md. Filed May 6, 1889. Serial No. 309,972. (No model.)

Claim.—1. In an apparatus for weighing package-tea and other material, the combination of a scale, a conduit for conveying a stream of material to the scale, a gate having an armature and arranged for the purpose of reducing the said stream to a smaller stream immediately preceding the time the required quantity for a certain weight is on the scale, an electro-magnet for holding the gate and releasing it to partially close to reduce the size of the stream, as stated, an electrical generator, a circuit including the electro-magnet, and a circuit-closer operated by the scale-beam, substantially as described.

2. In an apparatus for weighing package-tea and other material, the combination of a weighing-scale, a conduit for conveying the material, a force-feed for advancing the material in a stream to the scale, a gate having an armature and electro-magnetic gate mechanism operated by the scale-beam to release the gate for the latter to partially close and diminish the stream of material advanced by the force-feed to a smaller stream immediately preceding the time the required quantity for a certain weight is on the scale, substantially as described.

3. In an apparatus for weighing package-tea and other material, the combination of a weighing-scale, a conduit for the material, a rotating force-feed arranged in the conduit for advancing the material in a stream to the scale, a cut-off valve having an armature and located beneath the force-feed, electro-magnetic valve mechanism operated by the scale-beam for releasing the cut-off valve to permit it to entirely close, a sliding gate located above the force-feed for diminishing the stream advanced by the force-feed to a smaller stream, and means whereby the gate is partially closed to diminish the size of the stream advanced by the force-feed before the required quantity for a certain weight is on the scale-pan, substantially as described.

4. The combination, with a weighing-scale, of a conduit for conducting the material to the scale-pan, a driven force-feed for advancing the material to the scale-pan, a movable gate, and electro-magnet and armature devices which hold the gate open and release it to partially close and diminish the flow of material immediately preceding the time the required quantity for a certain weight is on the scale-pan, substantially as described.

5. The combination, with a weighing-scale, of a conduit for conducting the material to the scale-pan, a driven force-feed arranged to force the material through a passage-way toward the scale-pan, a vertically-movable gate for governing the passage-way, a rod carrying the gate and having an armature, an electro-magnet for holding the gate raised, an electric circuit including the magnet and a battery, and a circuit-closer operated by the scale-beam to break the circuit and drop the valve immediately preceding the time the required quantity for a certain weight is on the scale-pan, substantially as described.

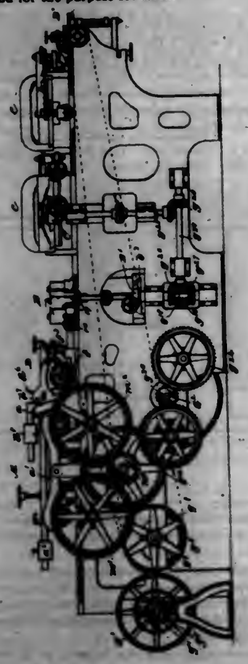
6. The combination, with a weighing-scale, of a conduit having a delivery-mouth, a cut-off valve which governs the flow of material through said mouth, a driven force-feed for advancing the material to the delivery-mouth, a gate adjacent to the force-feed, and electro-magnetic mechanisms, including two circuits, and each operated by the scale-beam for first partially closing the gate to diminish the quantity of material advanced by the force-feed and subsequently to close the cut-off valve, substantially as described.

7. The combination, with a conduit for conducting the material to a weighing-scale, of a force-feed in the conduit, a vertically-movable gate adjacent to the force-feed, a rod having an armature and carrying the gate, a cut-off valve for governing the flow of material through the delivery-mouth, an electro-magnet in an electric circuit, and devices for raising the gate-carrying rod by the opening of the cut-off valve to place the armature in the field of the magnet, substantially as described.

8. The combination, with a conduit for conducting the material to a weighing-scale, of a force-feed for advancing the material to the scale-pan, a cut-off valve for governing the delivery-mouth of the conduit, a gate for governing the quantity of material advanced by the force-feed, means for opening the gate by the opening movement of the cut-off valve, electro-magnets for respectively holding the gate and valve open, electric circuits, and circuit-closing devices operated by the scale-beam to first break the circuit of the gate-holding magnet and to subsequently break the circuit of the valve-holding magnet, substantially as described.

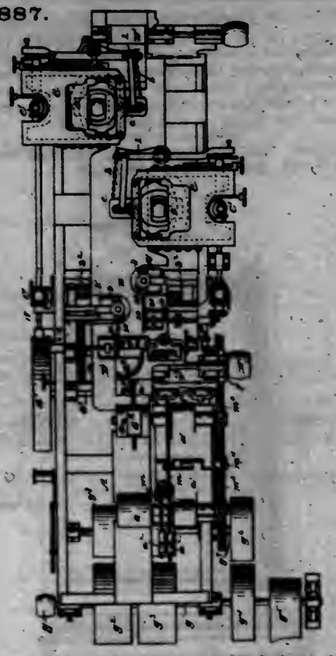
9. The combination, with a conduit for conducting the material to a weighing-scale, of the sliding cut-off valve having a tripping-dog, a pivoted lever arranged in the path of the dog, a vertically-moving rod carrying a gate, a lever pivotally connected with the gate-rod, a flexible connection between the two levers, and electro-magnets for respectively holding the valve and gate in their open positions, substantially as described.

10. The combination, with a conduit for conducting the material to a weighing-scale, of the sliding cut-off valve having a tripping-dog a pivoted lever in the path of the dog, a vertically-movable rod carrying a gate, an extensible and contractible lever pivotally connected with the gate-rod, a flexible connection between the two levers, and means for holding the valve and gate open and automatically releasing them at different times, substantially as described.



11. The combination, with a conduit for conducting material to a weighing-scale, of a force-feed in the conduit, a vertically-movable rod carrying a gate, an electro-magnet, an adjustable armature on the rod below the magnet, and an adjustable stop on the rod to limit the ascent and descent of the gate, substantially as described.

12. The combination, with a conduit for conducting the material to a weighing-scale, of a force-feed in the conduit, a driven wheel for moving the force-feed, a cut-off valve below the force-feed for closing the delivery-mouth of the conduit, and a slip-pulley which permits the force-feed to cease rotating under resistance of accumulated material between the cut-off valve and force-feed when the valve is closed, while permitting the driven wheel to continuously revolve, substantially as described.



410,887. MOLDING-MACHINE. CHARLES L. GOEHRING, Allegheny, Pa. Filed Mar. 2, 1889. Serial No. 301,760. (No model.)

Claim.—1. In combination with a rotating cutter-head mounted in bearings and reciprocated laterally toward and from the material, a reciprocating chip-breaker moving transversely to the line of reciprocation of the cutter-head, with mechanism for automatically actuating both the chip-breaker and cutter-head to cause them to move in unison and proportionally, substantially as and for the purpose set forth.

2. In combination with a feeding mechanism for advancing the material and a rotating cutter-head movable transversely of the material in a plane intersecting the latter, a chip-breaker supported to reciprocate in unison with the cutter-head and in a direction substantially parallel with the line of feed of the material and transverse to the plane of the motion of the cutter-head, with devices for automatically controlling the movements of both the cutter-head and the chip-breaker, as and for the purpose set forth.

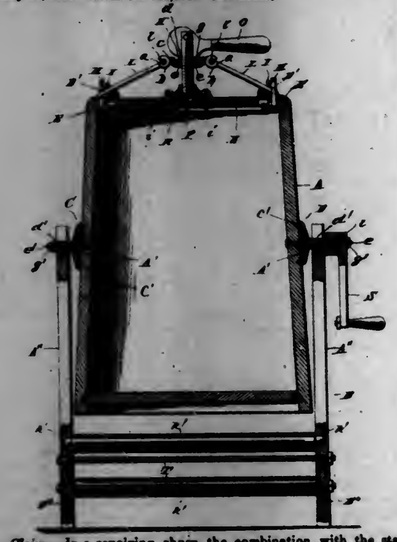
410,887.

3. In a molding-machine such as described, the combination, with a feeding mechanism for advancing the material and a laterally-reciprocating rotating cutter-head, of a pattern-cam for controlling the movements of said cutter-head, an automatically-reciprocating chip-breaker comprising a spring-bar attached to a slide movable in guides substantially parallel with the face or edge of the material, the end of said bar engaging the surface of the material in advance of the cutter-head, and a pattern-cam driven in unison with the reciprocating support of the cutter-head and operating upon the slide carrying the bar to reciprocate the latter, substantially as set forth.

4. In combination with a rotating cutter-head movable transversely of the material, an automatically-adjustable chip-breaker comprising an elastic bar mounted on a slide reciprocating longitudinally in ways, the latter adjustably secured to the frame, as and for the purpose set forth.

5. In combination with the feeding mechanism and the laterally-reciprocating cutter-head, a chip-breaker mounted to reciprocate longitudinally of the material and transversely of the line of movement of the cutter-head, and a driving mechanism uniting the feeding mechanism and the actuating devices for reciprocating the cutter-head and chip-breaker, substantially as set forth.

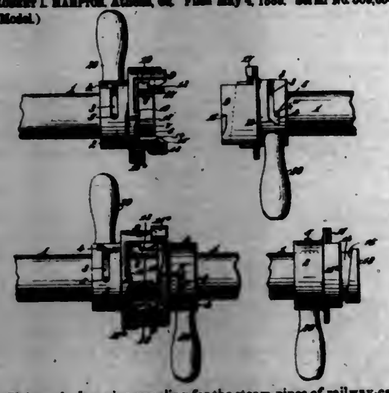
6. In a machine such as described, the combination, with a reciprocating slide, such as that carrying the cutter-head, and a pattern-cam controlling the movements of said slide, of a sectional driving-shaft united by collars and bolts to permit of rotary adjustment, the said pattern-cam being secured to one section of the shaft, substantially as described, and for the purpose set forth.



7. In a molding-machine such as described, the combination, with the pattern-cam for controlling the motion of the cutting mechanism, of a driving-shaft formed in sections united by adjustable collars, and a box keyed to one of said sections and formed or provided with guides upon which the pattern-cam is secured for radial adjustment, as set forth.

8. In combination with a driving-shaft, as g^{12}, formed in sections and united by collars and bolts, as described, the hub or box secured to one section of the shaft, a driving mechanism connected to the other section of the shaft, and a pattern-cam fitted to said hub or box and radially adjustable thereon, substantially as and for the purpose specified.

9. In a molding-machine such as described, and in combination with the two oscillatory reciprocating cutting mechanisms and their actuating devices, a pattern-cam controlling the motion of each cutting mechanism, a sectional driving-shaft for each of the cams, said sections being united by an adjustable coupling, and the two shafts connected by intermediate gearing to rotate in unison, as set forth.

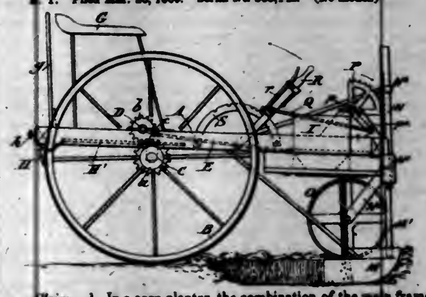


10. In a molding-machine such as described, the combination of a reciprocating slide, an oscillating arbor-frame pivotally connected to and reciprocated by said slide and carrying a rotating cutter, actuating devices controlling the oscillatory reciprocating movements of the arbor-frame, and a spring flexibly attached to the arbor-frame to vibrate in a frame substantially parallel with the movement of the arbor-frame about its axis, substantially as described.

410,888. CHURN. FREDERICK H. HAMAN, Wapakoneta, Ohio. Filed May 29, 1889. Serial No. 312,502. (No model.)

Claim.—In a revolving churn, the combination, with the stave and the hollow-journal casting having a base fitting the outer surface of the stave and provided with inner spurs to engage said stave, of the bolt extending outwardly through the stave and journal-casting and provided with a nut in its outer end, substantially as specified.

410,889. COUPLING FOR STEAM-PIPES OF RAILWAY-CARS. ROBERT I. HAMPTON, Athens, Ga. Filed May 4, 1889. Serial No. 309,650. (Model.)

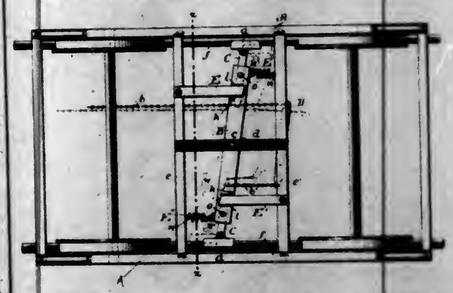


Claim.—1. In a pipe-coupling for the steam-pipes of railway-cars, a coupling-section provided with segmental shoulders on opposite sides, a sleeve having recesses or pockets permitting the entrance of said shoulders, each section having a pin running in a slot in its sleeve, the latter having a bayonet-recess at one end with an inclined wall to direct the pin therein, and each sleeve being provided with an outer and inner flange projecting from the flat face of the sleeve, said flanges having interior and exterior channels, the forward walls thereof cut upon the same pitch, substantially as described.

2. In a pipe-coupling for the steam-pipes of railway-cars, the combination, with each coupling-section provided with segmental shoulders, one having a guide-lug and the other a pocket or seat, of a sleeve having a limited rotary movement on said section by a pin running in a slot in the sleeve and having a bayonet-recess at one end provided with an inclined wall to guide the pin therein, each sleeve having two flanges located at different distances from the center, the outer flange having an interior and the inner flange an exterior channel, with the outer walls cut at a similar pitch, and a catch-lug being formed on the flat face of the sleeve between said flanges, adapted to engage a notch on the exterior flange, substantially as described.

3. In a coupling for the steam-pipes of railway-cars, a coupling-pipe section having an interior divided steamway wholly surrounded by an insulating-space packed with any non-conducting material, an air-passage being provided on each side of the dual steamway, substantially as described.

410,890. CORN-PLANTER. JAMES C. HARE, Rondout-on-the-Hudson, N. Y. Filed Mar. 23, 1889. Serial No. 305,142. (No model.)



Claim.—1. In a corn-planter, the combination of the main frame, the driving-wheels, the shaft D, the clutch *d*, and lever *g*, for operating it, the seed-hoppers, the slides therefor, the center slide connected to the hopper-slides, and the connecting-rod between said center slide and the shaft D, all arranged substantially as described.

2. In a corn-planter, the combination of axle C, having wheels B B, the center slide F, movable in ways F' F' in the main frame, the seed-boxes I I, having perforated bottoms K, the seed-slides J, having openings J', said center slide being connected to the seed-slides by the cross-bars *i i*, the connecting-rod E, the shaft D, having a crank *c*, pivoted to the connecting-rod E, and the clutch *d*, whereby the shaft D is connected or disconnected with the driving-wheels, substantially as described.

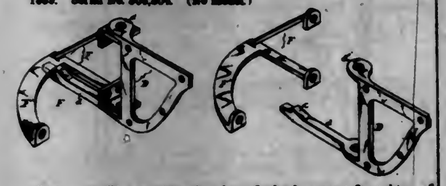
3. In a corn-planter, the combination of the main frame A, the axle C, having wheels B B, the horizontal shaft D, the clutch *d* thereon, gear *a* on wheel B, and the gear on shaft D, meshing with gear *a*, the center slide F, movable in ways F' F' in the main frame, the connecting-rod E, connecting the shaft D with said slide, and the seed-slides J J, connected by cross-bars *i i* with the center slide F, all substantially as described.

410,891. CAR-BRAKE. JOHN W. HARVEY, Kansas City, Mo. Filed Jan. 17, 1889. Serial No. 296,565. (No model.)

Claim.—1. In a car-brake, the combination, with a car-truck frame and bolsters, of the lever B, carrying a supplemental lever provided with a brake-shoe adapted to bind against the rail, and a chain or rod for operating said levers, substantially as shown and described.

2. In a car-brake, the combination, with a car-truck frame and bolsters, of a lever carrying supplemental levers upon either end, said levers being provided with brake-shoes adapted to bear against the rail, the lever D, and chain *b b'*, for operating the levers, substantially as shown and described.

3. The combination, with the bolsters, of the lever B, provided with inclined faces near either end, and the arms E E', secured to the bolsters and beveled at their inner ends and adapted to bear upon the inclined faces of the lever B, substantially as shown and described.



4. The combination, with the bolsters, of the lever B, provided with inclined faces near either end, the inwardly-extending arms E E', beveled at their inner ends, the spring *k*, and the cross-piece *d'*, all arranged and adapted to operate substantially as shown and described.

5. The combination, with the bolsters, of the lever B, second lever D, and supplemental levers C, carrying the brake-shoes on their outer ends, the chains for operating the levers, and the springs for throwing them back when released, substantially as shown and described.

6. The combination, with the bolsters, of the lever B, second lever D, and supplemental levers C, carrying the brake-shoes at their outer ends, the chains *b b'* and arms E E', and the springs for throwing the levers and shoes to their normal positions, substantially as shown and described.

7. In a car-brake, the combination, with the bolsters, of the levers B and D, chains operating said levers, the supplemental levers carrying the brake-shoes and attached to the ends of the main lever B, the arms E E', the springs E', the spring *k*, and the cross-piece *d'*, all arranged and adapted to operate substantially as shown and described.

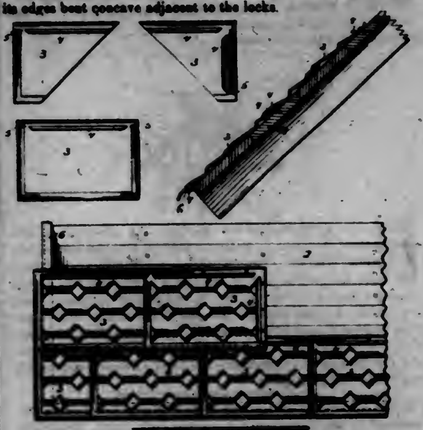
410,892. TABLE-LEAF SUPPORT. REINERT HEIM, Philadelphia, Pa., assignor of one-half to Theodore Heim, same place. Filed Apr. 8, 1889. Serial No. 306,304. (No model.)

Claim.—1. The combination, in a fly-leaf support for tables, of the pivoted frame with a stationary frame having a segment at the rear of the pivot-point of the pivoted frame, with an extension of the pivoted frame passing under said segment, substantially as described.

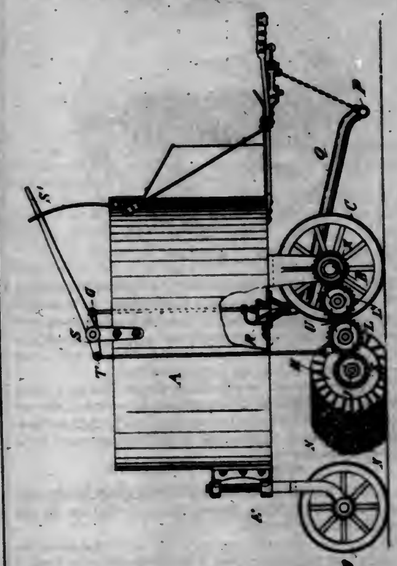
2. The combination, in a fly-leaf support for tables, of the pivoted frame D, with a frame F, having a segment F', with an extension *d* of the pivoted frame bearing against the under side and the inner edge of the segment, so that the segment will relieve the pivots from the downward strain, substantially as described.

3. The combination of the frame D, having pivot projections *d d'*, with a frame F, having a segment, and pivot projections *f f'*, with pivot-pins which pass through said projections, and an extension of the pivoted frame adapted to bear against the segment, substantially as described.

410,893. SINKER FOR BUTTER-JARS. LARSS S. HEDBERG, Gardner, Mass. Filed May 31, 1889. Serial No. 311,908. (No model.)



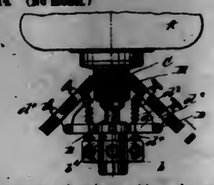
Claim.—In a butter-jar, the combined sinker and compresser provided with a vertically-projecting rim having strips interspaced upon and projecting from the rim, and with a knob interiorly of said rim, the sinker having in its bottom a series of apertures or perforations, substantially as set forth.



410,894. METALLIC SHINGLE. JULIUS HERRING, Minneapolis, Minn. Filed May 9, 1889. Serial No. 310,203. (No model.)

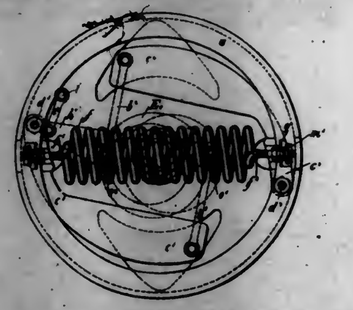
Claim.—1. A metallic shingle provided with interwed locks along adjacent edges on opposite sides, the edges being concave next the locks, and slits in the ends parallel with the sides of the shingle at the diagonally-opposite corners extending to the ends of the locks.

2. A reversible metallic shingle having the locks 4 arranged along its adjacent edges on one side and along the other edges on its opposite side, the slits 5 next to the outer ends of said locks, and having its edges bent concave adjacent to the locks.



410,895. APPARATUS FOR REMOVING SNOW AND CLEANING ROADWAYS. AUGUSTE HERSCHER, Berlin, Germany. Filed Mar. 14, 1889. Serial No. 303,393. (No model.)

Claim.—1. A machine for washing and scrubbing pavements, consisting of a wheeled axle, a water-tank having an opening and closing valve in its bottom for the discharge of water, a water-pipe leading from the valved part of the tank toward the front of the machine, and provided at its forward extremity with a jet-pipe, a vertically-swinging frame pivotally connected with the wheeled axle, a cylinder having helical rubbers and journaled in said frame, gearing for revolving the cylinder from the wheeled axle, and means for raising the cylinder-frame and opening and closing the tank-valve, substantially as described.



2. The combination of a water-tank with a vehicle for transporting the same, and for imparting motion from the wheels thereof to an obliquely-arranged helically-clothed cylinder, with a jet-tube arranged to deliver water in advance of the cylinder, and a valve regulating the flow of water of such jet-tubes, controlled by a three-armed rock-shaft, one arm of which closes the valve leading to the jet-tube simultaneously with the other arm lifting a frame supporting the cylinder, substantially as and for the purposes set forth.

410,896. COMMUTATOR-BRUSH FOR DYNAMO-ELECTRIC MACHINES OR MOTORS. RUDOLF HOFFMANN, Zurich, assignor to the Maschinenfabrik Oerlikon, near Zurich, Switzerland. Filed June 20, 1888. Serial No. 278,614. (No model.)

Claim.—In a dynamo-electric machine, the combination, with the commutator, the yoke D, seated on the hub *b'* of the bearing-box *b* and provided with the arms *d' d'*, the clamps d^3, hinged or pivoted at their outer ends to the ends of the arms *d'* of the yoke, the springs d^5, directly connected at one end to the free ends of the brush-clamps d^3 and at the other end directly connected to the arms *d'* of the yoke, and the brushes E, held in the clamps by suitable screws, of the hand-lever G, pivoted on the switch-board, and the rod F, connecting the arm *d'* and the hand-lever, all constructed and arranged substantially as and for the purpose specified.

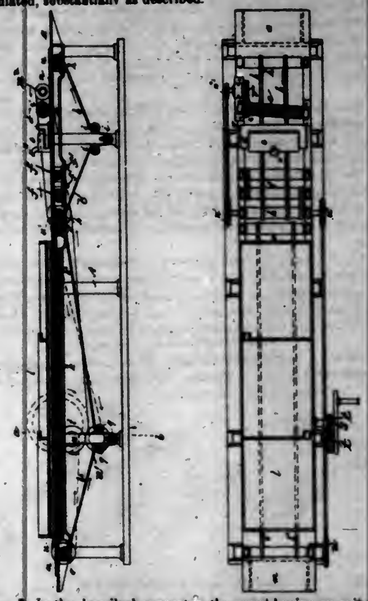
410,897. STEAM-ENGINE GOVERNOR. RUDOLF HOFFMANN, Zurich, assignor to the Maschinenfabrik Oerlikon, near Zurich, Switzerland. Filed Sept. 28, 1888. Serial No. 286,695. (No model.)

Claim.—1. The governor herein described, consisting of a casing, the spiral spring arranged diametrically in said casing, the levers pivoted at one of their ends in said casing and connected near said ends with the ends of the said spring, the rods having their outer ends connected to said levers, and the disks connected to the inner end of said levers, substantially as and for the purpose described.

2. The governor herein described, consisting of a casing, a spring arranged diametrically therein, levers pivoted at one end to the casing and near said ends connected to the ends of the springs, and concentric disks connected to the free ends of said levers, substantially as and for the purpose described.

410,898. MACHINE FOR CASTING PHOTOGRAPHIC DRY-PLATES. MARIUS KATTENTIDT, Hamelin, Prussia, Germany. Filed Apr. 22, 1889. Serial No. 308,122. (No model.)

Claim.—1. In combination, the frame, the conveying-bands, the vessel *c*, containing the mixture, and a brushing-roller *e* in front of said vessel, whereby the plates are cleaned for the reception of the mixture, substantially as described.



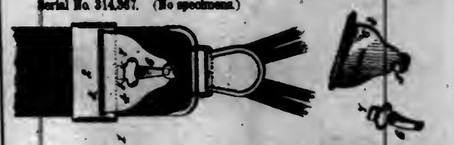
2. In combination, the frame, the band-conveyers, the vessel *c*, the rollers *f*, located beneath the bands to operate upon the under side of the plates, and the doctors *f' f'*, operating to scrape the rolls, substantially as described.

3. In combination, the frame, the conveyer-bands, the vessel *c*, and a suitable support therefor, the said vessel having an exit-slit *c'* and being pivotally connected to its support, whereby the escape of the mixture may be prevented by tilting the vessel, substantially as described.

4. In combination, the frame, the conveyer-bands, the vessel *c*, and the heating-chamber *d*, the said vessel *c* being pivotally supported by said heating-chamber, substantially as described.

5. In combination, the frame, the vessel *c*, and a suitable support therefor, said vessel having an exit-slit *c'* and being pivotally connected to its support, and having also an inlet-opening extending upwardly in an inclined direction, substantially as described.

6. In combination, the frame, the vessel *c*, said vessel having an exit-slit *c'* and an air-cock, by which the flow of the mixture may be regulated, substantially as described.



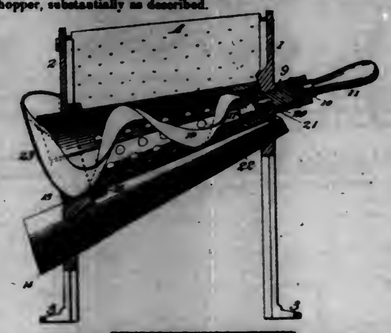
7. In the described apparatus, the vessel having an exit-opening *c'*, the movable piece *l'*, the cord packing, and the screw-bottom, substantially as described.

8. In combination, the frame, the vessel *c*, and the means for drying the plates, consisting of the warming-plates below the plates and the water-reservoir above the same, substantially as described.

9. In combination, the frame, the vessel *c*, the bands, and the cooling-reservoir above the bands, said reservoir having its bottom inclined to the edge, substantially as described.

10. In combination, the frame, the conveyer-bands, the vessel *c*, and the cooling-reservoir, said reservoir having compartments arranged to allow the water to overflow from one to another, substantially as described.

410,899. BUCKLE. JOHN KENNEDY, Birmingham, assignor to the Osborne & Cheesman Company, Ansonia, Conn. Filed June 15, 1889. Serial No. 314,367. (No specimens.)



Claim.—1. As an improved article of manufacture, a sheet-metal suspender-buckle comprising a box-frame and having a swinging clamping-lever, a hook and a spring-hook guard composed of a separate piece of metal superior to the metal of the frame and lever and attached by a fastening, substantially as shown and described.

2. In a suspender-buckle, a buckle-plate provided with a hook at its lower extremity and having a guard-strip formed of a separate piece of spring metal provided at one end with a tang or leg adapted to be inserted in a slot formed in the buckle-plate between the hook and the journaled or pivoted end of said plate, substantially as described.

410,900. FRUIT OR ICE CUTTER. HENRY T. KIRK, Rushville, Mo., assignor of one-half to John P. Antes, same place. Filed Sept. 24, 1888. Serial No. 286,267. (No model.)

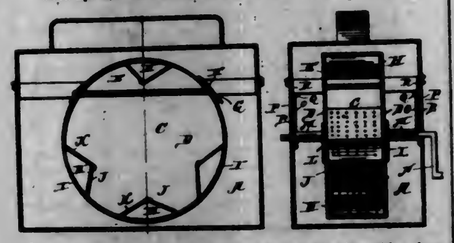
Claim.—1. In a fruit or ice cutter, the combination, with the frame and hopper and a rotating cylinder provided with integral cutting-knives on its surface and openings in front of said knives, of a spirally-formed scraper fitting the interior of said cylinder and adapted to discharge the material cut by the knives, substantially as described.

2. In a fruit or ice cutter, the combination, with the grooved and apertured front and rear parts 1 2 and the side portions 5 and rods 6, forming the frame and hopper, of the rotating cylinder mounted in the frame, the inclined contoured chute or spout below the cylinder, the spirally-formed scraper, and the spring-actuating pressure-lid hinged to one side of the hopper and normally pressing upon the material in the hopper, substantially as described.

410,901. CENTER-REST FOR LATHES. JOSEPH KLINGENSMITH, Springfield, Ill. Filed June 13, 1889. Serial No. 314,131. (No model.)

Claim.—1. In a center-rest for lathes, the combination of the tapering shank B with the head A, pierced by a transverse hole C, having a longitudinal slit D and spring-jaws *a'*, substantially as shown and described, and for the purpose stated.

2. In a center-rest for lathes, the combination of the shank B, the split head A, and the jaws *a'*, forming a tool-rest, substantially as shown and described, and for the purpose stated.

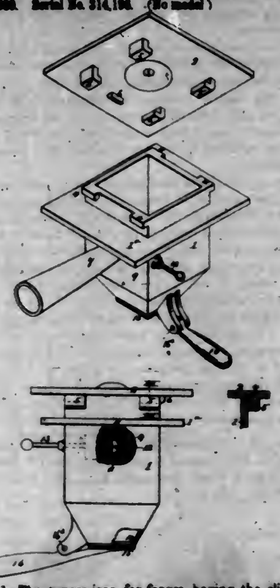


3. In a center-rest for lathes, the combination of the shank B with the split head A, having its upper edge a^4 rounded, substantially as shown and described, and for the purpose stated.

4. In a center-rest for lathes, the combination of the shank B, the head A, pierced by the transverse hole C, and the spring-jaws *a'*, having inclined upper faces, substantially as shown and described, and for the purpose stated.

5. In a center-rest for lathes, the combination of the shank B with the split head A, having spring-jaws *a'*, supporting lugs a^6, pierced by an axial hole a^5, substantially as shown and described, and for the purpose stated.

6. In a center-rest for lathes, the combination of the shank B the split head A, pierced by a transverse hole C, the spring-jaws *a'*, having inclined edges, and the end lugs a^6, pierced by an axial hole a^5, substantially as shown and described, and for the purpose stated.

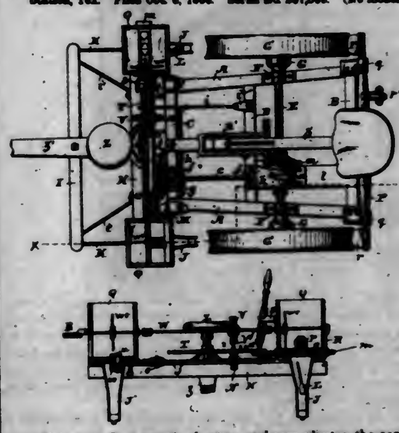


410,902. WASHING-MACHINE. JOHN KNOBLE, Wilmot, Ohio. Filed Apr. 8, 1889. Serial No. 306,368. (No model.)

Claim.—1. In a washing-machine, the combination, with a drum or cylinder having a series of circumferentially-arranged V-shaped buckets, of metallic straining-plates connecting the inner edges of said buckets with the periphery of the drum or cylinder, substantially as and for the purpose set forth.

2. The combination, with a boiler the sides of which are provided with suitable notches or bearings, of the herein-described revolving drum or cylinder, the sides of which are connected by V-shaped buckets, and metallic straining-plates extending from the inner edge of each of said buckets to the bottom of the next adjoining bucket, said drum or cylinder being provided with a suitable hinged cover, pintles or journals, and a crank or handle, substantially as set forth.

410,903. TUYERE-IRON. FRANK G. KOEHLER, St. Louis, Mo. Filed June 14, 1889. Serial No. 314,196. (No model.)



Claim.—1. The tuyere-iron for forges, having the slide-valve 8 and gate 15, with weighted handle, substantially as and for the purpose set forth.

2. The tuyere-iron for forges, having the removable top 2, secured to the body by means of the lugs 4 and angle-lugs 5, substantially as set forth.

3. The tuyere-iron for forges, having the removable top 2, secured to the body 1 by lugs 4 and 5, the slide-valve 8 and gate 15, with weighted handle or counter-balance 16, all substantially as set forth.

410,904. COTTON AND CORN PLANTER. CLEMENT LEVOT, Latexo Station, Tex. Filed Oct. 8, 1888. Serial No. 287,569. (No model.)

Claim.—1. In a combined cotton and corn planter, the combination of the frame, the axle mounted therein, the shifting bevel-gear *a*, the lever *x*, for shifting said gear, the pinion *b*, meshing with said gear, the driving-shaft *c*, carrying said pinion, the gear-wheel *d* on said shaft, the pinion *e*, meshing with said gear-wheel, the shaft *j*, carrying the said pinion and also toothed wheel *w*, the sprocket-wheel N on said shaft, the shaft W, carrying the agitators w^2 and sprocket-

wheel V, the sprocket-chain V', passing over said sprocket-wheels N V, the eccentric *g* on the driving-shaft, the rod *h*, connected to said eccentric, the lever *i*, connected to said rods, and the plate T, carrying the slide *m*, adapted to be reciprocated by said lever *i*, all of said parts being arranged and operating substantially as and for the purpose described.

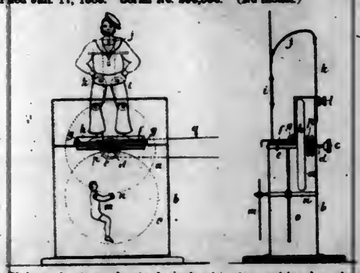
2. In a combined cotton and corn planter, the combination of the driving-gear *a*, the shaft *c*, carrying the gear-wheels *b* and *d*, operated by the gear *a*, the shafts *j*, carrying the pinion *e* and toothed wheel *w*, the shaft W, carrying the agitators w^3, the sprocket-wheels N and V on said shafts, the eccentric *g* on the driving-shaft, the rod *h*, connected to said eccentrics, the lever *i*, connected to said rod, and the slide *m*, operated by said lever, substantially as and for the purpose described.

3. In a planter, the combination of the frame, the cross-bars H and I, hinged thereto, the hoppers Q, mounted on said bars, the transverse shaft W, carrying the agitators w^3, mounted in the hoppers, the transverse shaft *j*, carrying the toothed wheel *w* and pinion *e*, the shaft *c*, carrying the gear-wheel *d*, meshing with said pinion, and the gear-wheel *d*, meshing with the driving-gear, the driving-gear *a*, the sprocket-wheels N and V, and the sprocket-chain V', passing over said sprocket-wheels, substantially as and for the purpose described.

4. In a planter, the combination of the driving-gear *a*, the driving-shaft *c*, having the gear *b*, meshing therewith, the eccentric *g* on the driving-shaft, the rod *h*, connected to said eccentric, the lever *i*, connected to the rod, the plate T, adapted to be engaged by said lever, the slide *m*, connected to said plate T, the plate *o*, fitting in said slide *m*, and the cut-offs resting on the plate *o*, all arranged and operating substantially as and for the purpose described.

410,905. ATTACHMENT FOR MAIL-BOXES. ROBERT B. LEWIS, New York, N. Y., assignor of two-thirds to Harry V. Snead, same place, and William B. Fonda, Morristown, N. J. Filed Feb. 14, 1889. Serial No. 299,838. (No model.)

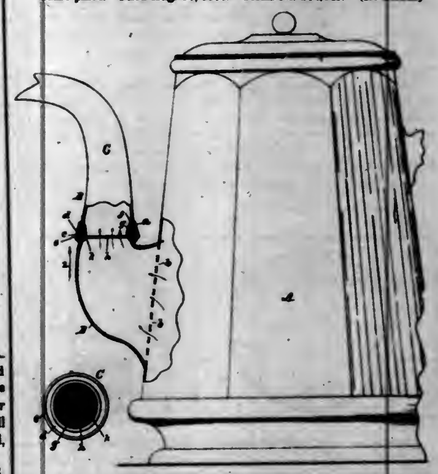
Claim.—1. An attachment for mail-boxes, consisting of a receptacle 3, having its back formed with a curved top 6, adapted to shed water rearwardly, a cover 7, hinged in rear of the front edge of the curved top, and a stop arranged to arrest the cover before the center of gravity of the latter passes over its hinge, so that the cover will fall automatically to closed position when released after being raised, substantially as described.



2. An attachment for mail-boxes, consisting of a receptacle 3, having its back formed with a curved top 6, adapted to shed water rearwardly, a cover 7, formed with shoulders 11 at its ends and hinged in rear of the front edge of the curved top, and the stops 10 on the ends of the receptacle, to which the cover is hinged and against which the shoulders abut to arrest the cover before the center of gravity of the latter passes over its hinge, so that the cover will fall automatically to closed position when released after being raised, substantially as described.

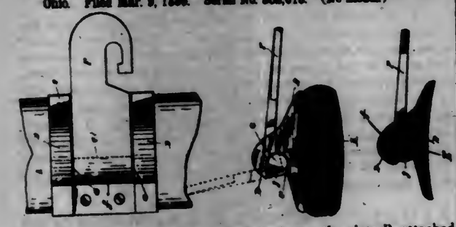
410,906. PISTON-VALVE. ALVAH LOOMIS, St. Albans, Vt., assignor of one-half to John W. Brough, same place. Filed Nov. 23, 1888. Serial No. 291,630. (No model.)

Claim.—The combination of the rod, the tubular body applied thereto and provided with the flanges E, the disks placed upon the ends of the body, the packing-rings, shaped as shown, and the springs for forcing the rings outward, substantially as shown.



410,907. MECHANISM FOR OPERATING DANCING, ACROBATIC, AND OTHER TOY FIGURES. GEORGE F. LOTTICKS, London, England. Filed Jan. 17, 1889. Serial No. 296,598. (No model.)

Claim.—1. A mechanical toy having, in combination, the following elements, namely: a shaft carrying thereon both a fly-wheel and a cam-piece adapted to impart an intermittent action to a plate or platform, a plate resting on such piece and vibrated by it, and a dancing figure upheld by means of a spring and operated by the cam-piece acting on said plate, all substantially as set forth.



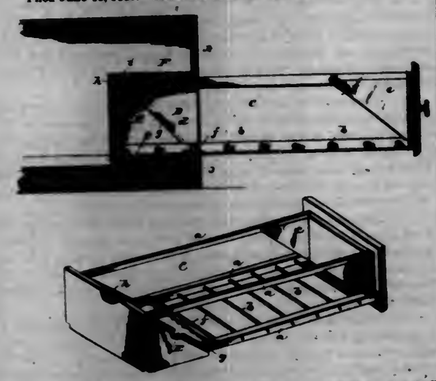
2. The combination, in a mechanical toy, of a shaft carrying a fly-wheel, a triangular piece or, its described equivalent on said shaft, a hinged platform vibrated by such piece, an adjustable spring-support, and a dancing figure suspended on such spring above said platform, all substantially as set forth.

410,908. SPOUT FOR VESSELS. PATRICK MALONEY and GEORGE ROBERTSON, Red Creek, N. Y., assignors of one-third to Gabriel A. Jacobs, same place. Filed Aug. 30, 1888. Serial No. 284,145. (No model.)

Claim.—A vessel-spout consisting of an upper and a lower section joined to each other and the lower section joined to the vessel, the lower section being formed with an internal thread and the upper section formed with an extended threaded part to enter said threaded lower section, and a strainer having its periphery made conical and inserted in a conical seat in said extended threaded part, so as to keep its place on account of the friction at its tapered periphery, substantially as described.

410,909. HAME ATTACHMENT. DAVID J. MARTIN, Covington, Ohio. Filed Mar. 9, 1889. Serial No. 302,615. (No model.)

Claim.—1. The combination of the hame, the plate B, attached thereto, having curved lugs D D, formed with enlarged recesses *c c*, with the hame-hook F, having studs G G flattened at one side and removably engaging lugs D, substantially as and for the purpose specified.

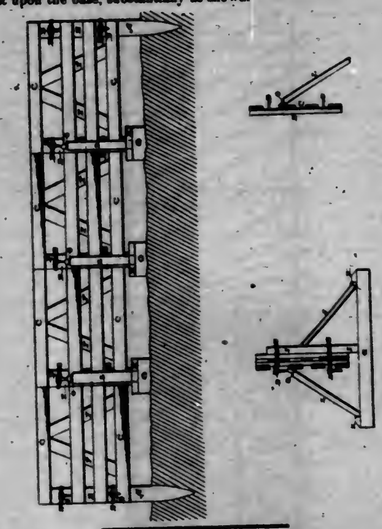


2. The combination of the hame and the plate B, secured thereto, having curved lugs D D, shoulder C, and depression E, with the hook F, having enlargement *f*, and flattened cylindrical studs G G, all substantially as specified.

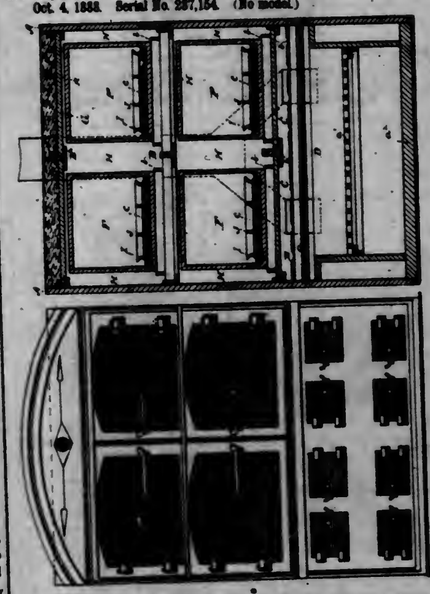
410,910. DOUBLETREE ATTACHMENT. STEPHEN MARTIN, Peoria, Ill. Filed Apr. 26, 1889. Serial No. 308,671. (No model.)

Claim.—The socket-cap C, closed at its outer end to protect the end of the doubletree over which it is secured, said cap having a yoke D, the sides of which join the sides of the cap, and the grooved seat *b*, in combination with the plates *d e*, connected to the singletree, the former having an annular flange to engage with the grooved seat, and a central bolt to secure the socket-cap upon the doubletree and the single-tree thereto, substantially as and for the purpose described.

410,911. REFRIGERATOR. NATHANIEL D. MERTZ, Plum River, Ill. Filed June 15, 1889. Serial No. 314,346. (No model.)



Claim.—1. The combination, with the box and the strips D F, secured within the same, of the drawer, the strips E, secured thereto at the rear end, the piece *c* at the rear bottom end of the drawer, and the transverse strip *f* on the forward end of the piece *c*, substantially as shown and described, and for the purpose specified.

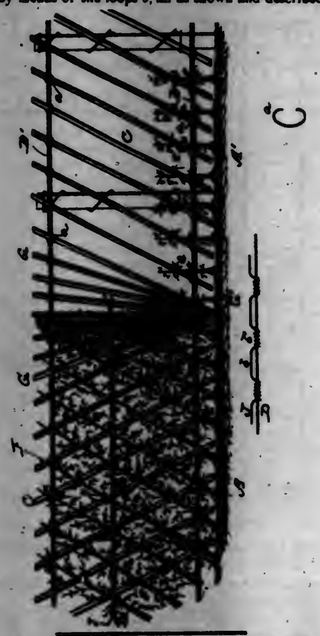


2. The combination, with the box, the strips D, the piece F, and the rabbeted piece *i* on the under side of the piece F, of the drawer, the piece *c* at the rear bottom end thereof, the strips E, secured to the rear end of the drawer, and the rabbeted piece *h* on the rear end of the drawer, substantially as shown and described.

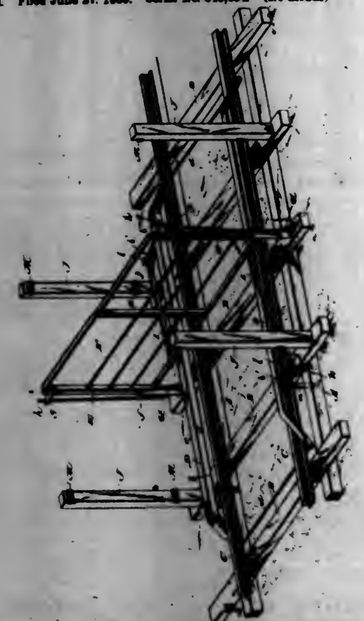
410,912. FENCE. JOHN D. MILLER, Ottoville, Ohio. Filed Apr. 5, 1889. Serial No. 306,378. (No model.)

Claim.—The combination of the end posts A, which are to be driven into the ground, the base-pieces G, the posts I, rigidly secured thereto, the stationary brace J, the panels of the fence attached by wire loops to the posts I, and the loose braces L, which are attached at their upper ends to the panels, and which have their lower ends to rest upon the base, substantially as shown.

410,913. BAKING-OVEN. JOHN H. MILLER, Newark, Ohio. Filed Oct. 4, 1888. Serial No. 287,154. (No model.)



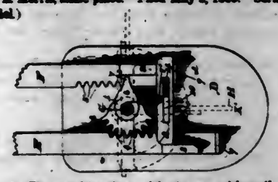
Claim.—The baking-oven consisting of the furnace having the lower air-chamber containing air-receiving pipes provided with air-outlet apertures or openings intermediately of their ends, said air-receiving apertured pipes being arranged in proximity with the fire or combustion chamber, substantially as and for the purpose set forth.



410,914. HEDGE. PHARES M. MIELLER, Hagerstown, Md. Filed June 20, 1889. Serial No. 316,018. (No model.)

Claim.—A hedge fence comprising in combination, first, a series of posts and horizontal wires secured thereto; second, series of poles inclined as shown and secured to the top and bottom horizontal wires by means of clamps, said poles arranged at certain points to form compound angular braces, and, third, a series of oppositely-inclined

growing stalks planted in the ground and secured to the central horizontal wire by means of the loops *b*, all as shown and described.



410,915. RAILWAY-GATE. FREDERICK M. MORTELIUS, West Perry, Pa. Filed June 27, 1889. Serial No. 315,834. (No model.)

Claim.—1. The combination, with the vertical posts arranged on each side of the track or way and provided with torsional springs secured at their base, of a horizontally-swinging gate-section hung on each post and provided with a projecting arm engaging said torsional spring, horizontal pivoted strips longitudinally movable, as described, and carrying offsets, and a rod connecting the offset of each strip with the adjacent gate-section, substantially as set forth.

2. The combination, with the vertical posts arranged on each side of the track or way and each provided with a torsional spring secured at its base, of a horizontally-swinging gate-section hung on each post and provided with a projecting arm engaging said torsional spring, horizontal pivoted strips extending on either side of the closing-point of the gates, longitudinally movable, as described, and each provided with an offset located oppositely relative to the offset of the other strip, and oppositely-extending rods, each connecting its offset to the adjacent gate-section, whereby said strips move in unison and when the springs are inoperative will hold the gate-sections in an open position, substantially as set forth.

410,916. MECHANISM FOR OPERATING THREE-THROW SWITCHES. HENRY M. HOBSON, Louisville, Ky., assignor of one-half to Edward R. Morris, same place. Filed May 8, 1889. Serial No. 309,992. (No model.)

Claim.—1. The combination, with the movable rail-points, of the switch-rods connected to said points and having the teeth on their opposing edges and a revolvable casting located between said rods and adapted to reciprocate either rod, according to the direction in which said casting is turned, substantially as and for the purpose described.

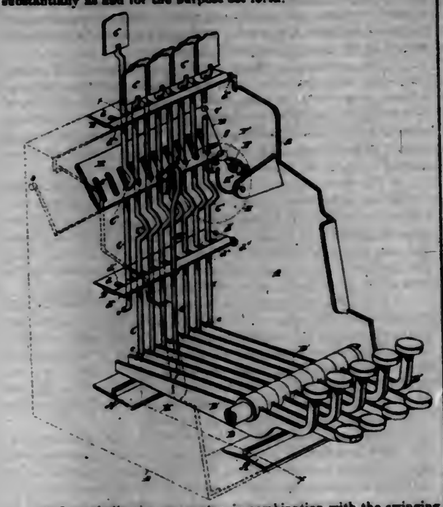
2. The combination, with a reciprocating switch-rod, of a revolvable casting for moving said rod endwise and a locking device arranged to be operated by the casting to normally engage the switch-rod and to release the same when the rod is moved, substantially as and for the purpose described.

3. The combination, with a pair of reciprocating switch-rods, of a locking device normally engaging with said rods to lock them against movement and a revolvable casting adapted to move one of said rods and at the same time disengage said locking device from said rod without releasing the locking device from the other rod, substantially as and for the purpose described.

4. The combination, with a pair of reciprocating switch-rods, of a revolvable casting for moving either of said rods and a locking device arranged to travel in a line transversely across the path of said switch-rods and adapted to be operated by said casting to lock one rod against movement when the other rod is actuated by said casting, substantially as and for the purpose described.

5. The combination of the reciprocating switch-rods, a revolvable casting for moving either of said rods at will, and a locking-slide connected with said casting and limited to movement at right angles to the line of movement of said rods, said slide being normally engaged with the rods and adapted to be withdrawn from engagement with one rod when it is moved without releasing the other rod, substantially as and for the purpose described.

6. The combination of the reciprocating switch-rods having the fixed stops, a revolvable casting adapted to operate either of said rods and having a projection or arm, and a locking-slide movably fitted at one side of the stops on the rods and having the arm or projection of the casting engaging therewith, substantially as and for the purpose described.



7. The combination of the switch-rods having the fixed stops, a longitudinally-slotted locking-slide fitted between the stops on each side, a stationary guide fitted in the slot of the slide, and a revolvable casting adapted to engage the locking-slide when it is turned in either direction to operate one or the other of the switch-rods, substantially as and for the purpose described.

410,917. CASH REGISTER AND INDICATOR. JOHN F. PFEIFER, Cincinnati, Ohio. Filed June 13, 1889. Serial No. 314,104. (No model.)

Claim.—1. In an indicating apparatus, in combination with a movable indicating device provided with a shoulder, the locking-wing provided with a slot whose outer end is adapted to be engaged by the rod-shoulder, substantially as and for the purpose specified.

2. In an indicating apparatus, in combination with the swinging wing provided with a series of slots, a series of movable indicator-rods passing through such slots, and each provided with a locking-shoulder, substantially as and for the purpose shown.

3. In an indicating apparatus, in combination with the swinging wing provided with a series of slots, the series of indicator-rods passing through such slots, and each provided with a locking-shoulder having an inclined face to engage the end of the respective slot in the wing to swing the latter as the rod is moved into indicating position, substantially as and for the purpose set forth.

4. In an indicating apparatus, in combination with the swinging wing provided with a series of slots, the series of rods passing through such slots and provided with shoulders situated below the outer ends of the respective slots when the rods are down, substantially as and for the purpose described.

5. In an indicating apparatus, in combination with the swinging locking-wing provided with the series of slots extending in planes at right angles to the axis of its motion, the series of indicator-tablet-bearing rods projecting up through such slots and each having a shoulder with oppositely-inclined upper and lower sides situated on the rod, so as to stand below the respective slot end when the rod is down, substantially as and for the purpose specified.

6. In an indicating apparatus, in combination with the swinging locking-wing provided with the series of slots extending in planes at right angles to the axis of its motion, the series of indicator-rods passing up through the slots, and each provided with a locking-shoulder adapted to stand below the outer end of the respective slot in the wing when the rod is down, and having its upper side inclined and its lower side curved, substantially as and for the purpose shown.

7. In combination with the series of reciprocating indicator-rods, each provided with a locking-shoulder having its upper side inclined downward away from the rod, the swinging locking-wing provided with the series of slots at right angles to its axis, through which the rods pass, and pivoted at the side of the series of rods opposite to the locking-shoulders and above the level of the shoulders when the rods are down in their normal positions, substantially as and for the purpose set forth.

8. In an indicating apparatus, in combination with a series of movable keys and the series of indicator-rods adapted to be actuated by the keys and each provided with a locking-shoulder, the swinging locking-wing provided with slots at right angles to its axis, through which the indicator-rods pass, substantially as and for the purpose described.

9. In combination with a series of movable keys, the series of shouldered indicator-rods, each adapted to be raised by one of the keys, and the swinging locking-wing hinged at a point above the shoulders on the rods, and having a series of slots through which the rods pass, substantially as and for the purpose specified.

10. In combination with the series of key-levers and the swinging locking-wing provided with a series of slots, the series of vertically-movable indicator-rods adapted to be raised by the key-levers passing up through the slots in the wing, and each provided with a locking-shoulder with inclined upper side situated so as to stand below the wing when the respective rod is down, substantially as and for the purpose shown.

11. In combination with the series of keys and the swinging locking-wing provided with the series of slots, the series of indicator-tablet-bearing rods passing up through the slots in the wing, each adapted to be raised by one of the key-levers, and provided with a wing-engaging shoulder with oppositely-inclined rounded surfaces on its upper and lower sides, substantially as and for the purpose set forth.

12. In combination with the series of shouldered movable rods and the slotted wing, an alarm mechanism adapted to be operated by the wing, substantially as and for the purpose described.

13. In combination with a series of keys and the series of shouldered rods to be actuated thereby, the slotted locking-wing and an alarm mechanism adapted to be operated by the movement of the wing, substantially as and for the purpose specified.

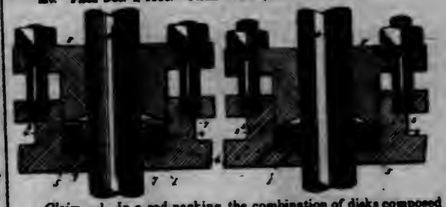
14. In combination with the swinging slotted locking-wing, the series of movable indicator-rods, each having a shoulder with its under side in position to be engaged by the wing when the rod has been raised into locking position and its upper side adapted to engage the wing and swing it out of locking position as the rod is being raised, an alarm-sounding device, and means carried by the wing for actuating such device to sound an alarm as the wing is raised by the movement of an indicator-rod, substantially as and for the purpose shown.

15. In combination with the shouldered indicator-rods and the slotted locking-wing, a pawl or trip carried by the latter and alarm-sounding mechanism engaged by such trip or pawl, substantially as and for the purpose set forth.

16. In combination with the series of shouldered indicator-rods and the swinging locking-wing, alarm-sounding mechanism and an adjustable trip on the wing for actuating such mechanism, substantially as and for the purpose described.

17. In combination with the shouldered indicator-rods and the swinging locking-wing, a spring-retracted bell-striking lever, a pivoted pawl on the wing for engaging the striking-lever, and the set-screw on the wing for adjusting the pawl, substantially as and for the purpose specified.

18. In combination with the series of shouldered rods and the locking-wing therefor, the draw or till lock adapted to be tripped by the wing, substantially as and for the purpose shown.



19. In combination with the series of shouldered indicator-rods and the slotted swinging locking-wing, a movable bolt or latch adapted to be tripped by the wing, substantially as and for the purpose set forth.

20. In combination with the series of shouldered indicator-rods and the swinging slotted locking-wing therefor, a bolt or latch having an adjustable bearing to be engaged by the wing, substantially as and for the purpose described.

21. In combination with the swinging wing and the bolt or latch adapted to be tripped thereby, an alarm-striking mechanism, and means carried by the wing for actuating the same, substantially as and for the purpose specified.

22. In combination with the shouldered indicator-rods and the swinging locking-wing therefor, the bolt or latch adapted to be tripped by the wing and an alarm mechanism actuated by the movement of the wing to sound an alarm, substantially as and for the purpose shown.

410,918. PISTON-ROD PACKING. HARRY H. PHILPER, St. Louis, Mo. Filed Dec. 4, 1888. Serial No. 292,617. (No model.)

Claim.—1. In a rod-packing, the combination of disks composed of layers of textile fabric and rubber, and a surrounding covering lapping past the body 1 at each end, substantially as and for the purpose set forth.

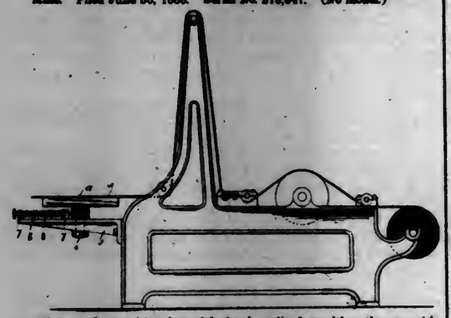
2. The combination, in a rod-packing, of disks laid flat together, each disk composed of layers of textile substance and india-rubber, and a surrounding rubber covering stuck fast to the circumference of the body, composed of said disks and lapping past said body, substantially as set forth.

410,919. PEN-CLEANER. RALPH W. POPE, Elizabeth, N. J. Filed Oct. 12, 1886. Serial No. 215,909. (No model.) Patented in England Nov. 2, 1886, No. 14,052.

Claim.—1. A pen-cleaner consisting of the combination of strips

of fibrous material placed side by side, and an external binding material covering opposite ends and binding the strips together, substantially as described.

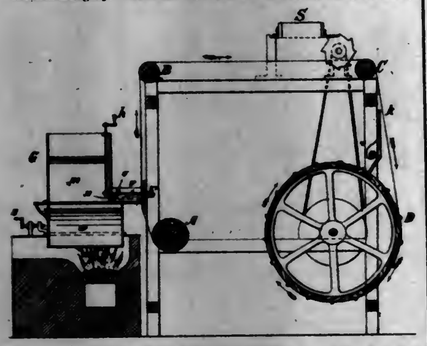
2. A pen-cleaner consisting of strips of paper or other similar material formed into a block, as shown, and a holder for the same having sides converging from the upper edges.



3. A pen-cleaner consisting of strips of paper, in combination with a base or holder having vertical ends and sides converging inwardly from the upper edge.

4. A pen-cleaner consisting of laminæ of paper and a base carrying the same having side walls converging through the upper portions and vertical through the lower portions.

5. A holder consisting of a metal base, having side walls projecting from said base, the inner surfaces of a portion of which walls converge through their upper portions.



6. A pen-cleaner consisting of a block formed of flat strips of paper or other material placed side by side, and a holder for the same pressing against the sides of the block and thereby holding the strips in position.

410,920. BOX-COVERING MACHINE. ALBERT G. POTTER, Lynn, Mass. Filed June 30, 1888. Serial No. 278,647. (No model.)

Claim.—In combination with the described machine, the movable form arranged to receive the blanks from the machine, and an automatic locking device arranged to automatically stop the movement of the former when it has reached a certain position, and to hold it against movement until released, substantially as described.

410,921. MACHINE FOR COATING PAPER. JOSEF PRASCH, Vienna, Austria-Hungary. Filed June 15, 1889. Serial No. 314,391. (No model.)

Claim.—1. The combination, with a vessel containing liquefied substance, of a frame, an axle journaled in one end thereof and carrying the paper to be coated, guide-rollers journaled in opposite upper portions of said frame over which the paper is passed, a shaft carrying a suitable drum, said drum also having the paper secured thereto and the shaft further provided on one end with a band-pulley and on the opposite end with a grooved wheel, a sieve mounted in standards in the upper portion of the frame, a shaft having mounted upon its inner end a toothed wheel and on its outer end a pulley-wheel, an endless pulley-band passing around the upper and lower pulleys, and a fixed screen secured to the frame, substantially as set forth.

2. The combination, with a vessel containing a liquefied substance, of a frame, an axle journaled at one end thereof and carrying the paper to be coated, guide-rollers journaled in opposite upper portions of said frame and over which the paper passes, a shaft carrying a suitable drum, to which the paper is secured, said drum provided with a series of radial projections or fingers, a bar pivoted in the frame-work adapted to engage said projections, a sieve arranged upon the upper portion of the frame, means for actuating said sieve, and a fixed screen secured to the frame, substantially as set forth.

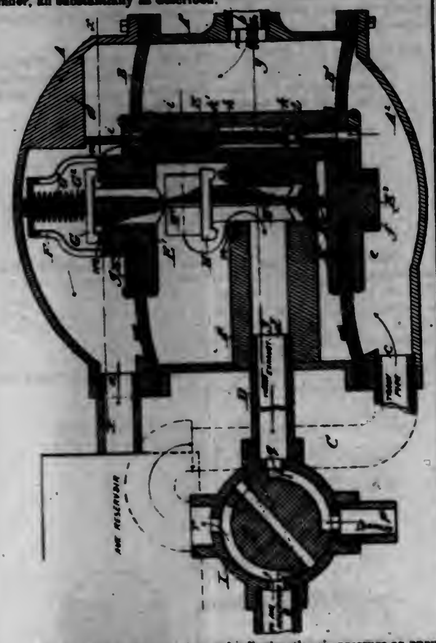
3. The combination, with a frame provided with suitable rollers, over which the paper to be coated is passed, of a vessel consisting of a lower compartment or water-containing receptacle, an upper reservoir or liquid-containing receptacle, and a communicating laterally-extending open-ended vessel, into which the liquid passes and comes in contact with the paper as it moves over the rollers, and a fixed screen secured to the frame, substantially as set forth.

4. The combination, with a frame provided with suitable rollers, over which the paper to be coated is passed, and also provided with a fixed screen, of a vessel consisting of a lower compartment or water-containing receptacle, an upper reservoir or liquid-containing receptacle, and a communicating laterally-extending and open-ended vessel, the paper to be coated passing between this open-ended vessel and the fixed screen, substantially as set forth.

5. The combination, with the frame provided with suitable rollers, over which the paper to be coated is passed, and also provided with a fixed screen, of a vessel consisting of a lower compartment or water-containing receptacle, and an upper reservoir or liquid-containing receptacle, said latter receptacle having an open side, so that the liquid will come in contact with the paper as the same is moved, and also provided with an orifice for regulating the level of the substance in the compartments, substantially as set forth.

6. The combination, with a frame provided with suitable rollers, over which the paper to be coated is passed, and also provided with a fixed screen, of a vessel consisting of a lower compartment or water-containing receptacle, an upper reservoir or liquid-containing receptacle, and a communicating open-ended laterally-extending vessel in which the liquid passes and comes in contact with the paper as it moves over its rollers, and a slide or valve for closing communication between the reservoir and laterally-extending vessel, substantially as set forth.

7. The combination, with a frame provided with suitable rollers, over which the paper to be coated is passed, and also provided with a fixed screen, of a vessel consisting of a lower compartment or water-containing receptacle, an upper reservoir or liquid-containing receptacle, and a communicating laterally-extended open-ended vessel in which the liquid passes and comes in contact with the paper as it moves over its rollers, and means for adjusting the vessel, so that the open side of the laterally-extending portion thereof presses to the requisite degree against the paper, substantially as set forth.



410,922. AIR-BRAKE. NATHANIEL J. PRITCHARD, Roanoke, Va., assignor to the Pritchard Brake Company, same place. Filed Oct. 20, 1883. Serial No. 288,618. (No model.)

Claim.—1. In a pneumatic brake system, the herein-described device for applying and relieving the pressure on the brakes, consisting, essentially, in the combination, with an inclosing-case, of two flexible diaphragms arranged transversely within the case to divide it into three chambers, the ports in said chambers leading to the auxiliary reservoir, brake-cylinder, main supply-pipe, and the exhaust-port, an air-passage between the upper and lower chambers, a valve in said passage, an exhaust-valve in the middle chamber, and an outlet-valve between the upper and middle chambers, all substantially as described.

2. In a pneumatic brake system, a device for applying and relieving the pressure on the brakes, consisting in the combination of an inclosing-case, two flexible diaphragms arranged therein, so as to divide said casing into three chambers, the ports in said chambers leading to the auxiliary reservoir, the brake-cylinder, the main supply or train pipe, and the exhaust-port, a valve for controlling the air communication between the end chambers of the casing, the valve for controlling communication between the upper and middle chambers, and the exhaust-valve in the middle chamber, all arranged in the manner and for the purpose set forth.

3. The herein-described device for applying and relieving the pressure on railway-brakes, consisting in the combination of an inclosing-case, two flexible diaphragms arranged within the same to divide it into three chambers, the upper of said chambers having a port leading into the auxiliary reservoir, the middle chamber having a port leading into the brake-cylinder and an exhaust-port, and the lower chamber having a port where the main supply-pipe enters, the air-passage between the upper and lower chambers containing a valve, the exhaust-valve in the middle chamber, and the outlet-valve between the upper and middle chambers, all arranged substantially as described.

4. In a device for applying and relieving the air-pressure in pneumatic railway-brakes, the combination of an inclosing-case, two flexible elastic diaphragms arranged therein to make a triple chamber, suitable ports in the inclosing-case leading to the auxiliary reservoir, the main pipe, the brake-cylinder, and the exhaust, a valve for permitting the passage of air between the upper and lower chambers, an exhaust-valve in the middle chamber for controlling the exhaust, and an outlet-valve between the upper and middle chambers for permitting the flow of air from the auxiliary reservoir to the brake-cylinder, all substantially as described.

5. In a device for applying and relieving the air-pressure on pneumatic railway-brakes, the combination of the engineer's valve, the main air-supply pipe, and the device for applying and relieving the pneumatic pressure on the brakes, consisting, essentially, of an inclosing-casing, two flexible diaphragms arranged within the same to divide it into three chambers, the upper of said chambers having a port leading into the auxiliary reservoir, the middle chamber having a port leading into the brake-cylinder and an exhaust-port, and the lower chamber having a port where the main supply-pipe enters, the air-passage between the upper and lower chambers containing a valve, the exhaust-valve in the middle chamber, and the outlet-valve between the upper and middle chambers, all substantially as described.

6. In a device for applying and relieving the pressure to air-brakes, the combination of an inclosing-case made in three parts, two flexible diaphragms secured between the junctions of these parts to divide the casing into three chambers, the upper of said chambers having a port leading into the auxiliary reservoir, the middle chamber having a port leading into the brake-cylinder and an exhaust-port, and the lower chamber having a port where the main supply-pipe enters, a central casting attached to and supported by the flexible diaphragms, a valve arranged in said casting for controlling the communication between the two end chambers, a valve likewise arranged in connection with the casting for controlling communication between the upper and middle chambers, and an exhaust-valve in the middle chamber, all substantially as described.

7. The combination of the inclosing-case having suitable ports leading to the auxiliary reservoir, brake-cylinder, main supply-pipe and exhaust, the two flexible diaphragms secured within said case, a central casting attached to and supported by said diaphragms, and having an air-passage which affords a connection between the chamber below the lower diaphragm and that above the upper diaphragm, a valve within said passage, an outlet-valve carried by the upper end of said casting to afford communication between the air-drum and the brake-cylinder, and an exhaust-valve, all arranged substantially as described.

8. The combination of the inclosing-case, consisting of the main cylindrical portion A′ and the end portions A and A², flexible elastic diaphragms B and B′, secured within the casing, the central casting attached to and supported by said diaphragms, the air-passage through said casting, the exhaust-valve H, and the outlet-valve G, all arranged substantially as described.

9. The combination, with the inclosing-case having suitably-arranged ports and the diaphragms within said case, of the central casting attached to and supported by said diaphragms, and consisting of the eccentric vertical stem E, having the air-passage through it containing a valve, the upper flat portions E′, having a sleeve E², and the lower flat portion E′, connected to the lower diaphragm, the valve G, arranged in connection with the sleeve E², and the exhaust-valve H, arranged in connection with the tubular extension A³ on the casing, substantially as described.

10. The combination of the inclosing-case, the two flexible diaphragms, the central casting attached to and supported by said diaphragms, the slotted valve-cover F, secured to the upper end of said casting, the valve G, having a stem G′, enveloped by a spring G³, and also having downwardly-projecting wings G⁴, and the exhaust-valve H, arranged in connection with the tubular extension A³ of the casing, and having upper wings H′ and lower wings H³, carrying a stem H⁴, all substantially as described.

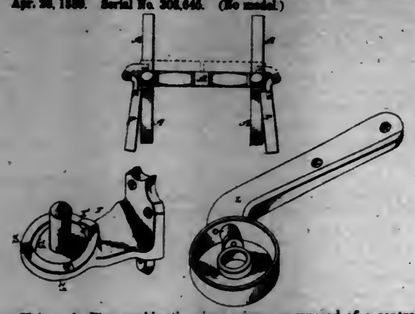
11. The combination of the casing, the two diaphragms B and B′, secured within it, the air-passage running through said casting between the chamber below the lower diaphragm and that above the upper diaphragm, the valve within said passage consisting of a rod *i*, whose upper end is adapted to come into contact with an enlargement *a′* on the casing, collars *k* and *k′* on the two parts of said rod, which is divided near its lower end, and enveloping spring *j* between said collars, and a ball *l*, all substantially as described.

12. The combination of the inclosing-case, two diaphragms B and B′, arranged within it, the central casting consisting of the eccentric vertical stem E, having flat portions E′ and E², that are secured to said diaphragms, and having an air-passage that affords connection between the two ends of the casing, a valve within said air-passage having a projecting rod *i*, adapted to come into contact with an enlargement *a′* on the casing, an outlet-valve G on the upper end of the central casting, and an exhaust-valve H, for controlling the exhaust-port, substantially as described.

13. The combination of the inclosing-casing, two diaphragms B and B′, arranged within it, suitable ports leading to the main parts of the brake system, an exhaust-valve controlling the exhaust-port, and a central casting supported and carried by the two diaphragms, and having a valve that controls the flow of air from the auxiliary reservoir to the brake-cylinder, substantially as described.

14. The combination of the diaphragms and the casing having an internal projecting extension A³ at the point where the exhaust-port is located, suitably-arranged ports, a valve for regulating the flow of air from the lower end to the upper end of the casing, and the valve for regulating the flow of air from the air-drum to the brake-cylinder, and an exhaust-valve H, having upper wings H′ and lower wings H³, terminating in a stem H⁴, substantially as described.

410,923. MEANS FOR SECURING STEREOTYPE-PLATES. DAVID REID, Melbourne, Victoria. Filed Aug. 13, 1888. Serial No. 282,601. (No model.) Patented in Victoria July 6, 1888, No. 5,803; in New South Wales July 9, 1888, No. 768; in New Zealand July 26, 1888, No. 3,134, and in England Aug. 11, 1888, No. 11,631.



Claim.—1. An adjustable double-dovetail key B, consisting of an upper and a lower part suitably connected together, substantially as herein described and explained.

2. An adjustable double-dovetail key consisting of an upper and lower section, in combination with adjusting-screws E, having an annular shoulder or flange upon which the upper section rests, said screws working in threaded bearings formed in the lower sections, substantially as and for the purposes specified.

3. An adjustable dovetail key for securing stereotype-plates to their base-blocks, composed of two sections, one of which is formed of a plurality of longitudinal strips, and means, substantially as described, for adjusting one of said sections, substantially as and for the purposes specified.

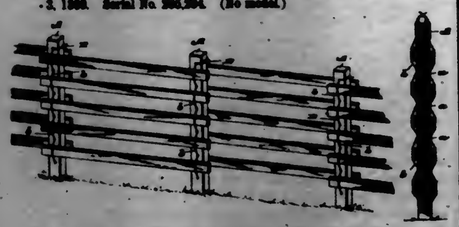
4. The combination, substantially as herein described, with a base-block and stereotype-plate, of an adjustable double-dovetail key for securing the plate to the block, said key being composed of a lower section provided with screw-threaded openings, and an upper section formed of a plurality of longitudinal strips provided with unthreaded openings of less diameter than those in the lower section, in combination with adjusting-screws having a threaded portion of the same diameter as the threaded bearings in the lower key-section, and a head of less diameter than the openings in the upper section to form a shoulder upon which the strips of said upper section rest, substantially as and for the purposes specified.

410,924. MIRROR. JOSEPH H. RICHARDSON, Jersey City, N. J. Filed Apr. 26, 1889. Serial No. 308,645. (No model.)

Claim.—1. The combination, in a mirror composed of a central mirror and two side mirrors which fold back of it, whereby two mirrors are formed, one front and one back of the supporting central frame, the mirror supported therein, and the two side mirrors, of projecting hinges secured to the edges of the supporting-frame, and projecting arms secured to the side mirrors, having their inner ends pivoted to said hinges and curved outward when they are opened, whereby when they are closed the curve is reversed, thus allowing the side mirrors to close back of the central mirror, substantially as shown and described.

2. The combination, with the supporting-frame, the large mirror supported therein, and the side mirrors, of projecting hinges secured to the frame and the side mirrors, one of said hinges provided with two inclines in a line with and extending toward the supporting-frame, and the other with a roller, whereby the side mirrors will automatically move either forward or backward from a vertical line with the central mirror, thus opening or closing, substantially as specified.

3. The combination, with the supporting-frame, the large mirror supported therein, and the side mirrors, of hinges secured to the said frame, having a rise or projection on its outer side in a line with the length of the central mirror, and inclines extending therefrom toward the supporting-frame, arms secured to the side mirrors, having their inner pivoted ends curved outward when they are open, and a roller journaled therein, whereby the side mirrors automatically close and open and fold at the back of the central mirror, for the purpose described.



4. The combination, with the supporting-frame, the large mirror supported therein, the side mirrors, and hinges secured to the said frame, having projections on their outer and inner sides in a line with the length of the central mirror and with inclines connecting them, of arms secured to the side mirrors, and a roller journaled thereon in such relation to the projections and inclines as to cause the side mirrors to automatically open, close, and assume the proper angle to the central mirror when open, for the purpose shown and described.

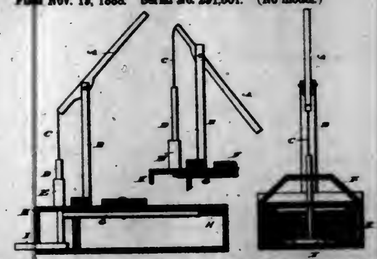
410,925. COMPOSITION FOR KINDLING FIRES. ARNOLD RIMPAU, Brunswick, Germany. Filed Apr. 13, 1889. Serial No. 307,168. (No specimens.)

Claim.—1. The herein-described composition for kindling fires, composed of dried and pulverized peat impregnated with a mixture of resin, naphtha, and mineral black, in about the proportions stated, solidified and broken up into lumps of suitable size, substantially as set forth.

2. The herein-described fuel composed, consisting of peat, resin, naphtha, and mineral black solidified and broken into lumps.

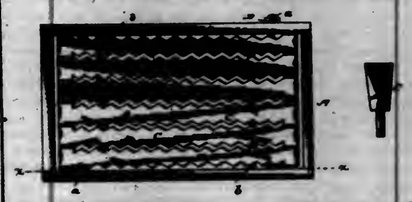
410,926. FENCE. PETER H. ROSBURG, Farwell, Mich. Filed Jan. 3, 1889. Serial No. 295,304. (No model.)

Claim.—1. A fence consisting of vertical posts provided with a longitudinal series of transverse perforations, a length of wire seated centrally in the bottom perforation, with its ends crossing each other in the succeeding ones to form loops between the perforations on each side of a post, and the rails having the ends of one panel seated in the loops at the opposite side of a post from the loops in which the rail ends in the next adjacent panel are seated, substantially as described.



2. A fence consisting of vertical posts provided with transverse perforations inclined from the horizontal, a wire seated in the said perforations, with its ends crossing in each succeeding one, and the rails having their ends in adjacent panels seated in the loops at opposite sides of a post, substantially as described.

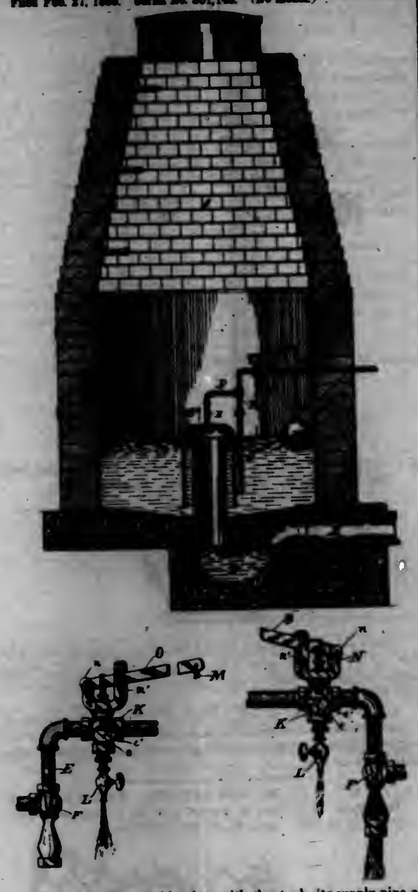
410,927. MACHINE FOR UNITING SOLES AND UPPERS OF BOOTS OR SHOES. STILLMAN W. ROBINSON and SIBLE P. WATT, Columbus, Ohio, assignors to the Wire Grip Fastening Company, Boston, Mass. Filed Oct. 26, 1888. Serial No. 289,217. (No model.)



Claim.—The combination, with the spindle-piece A, constructed as described and having internally-located spring-actuated grippers B, of the gripper-carriers C, thread-ring E, having prongs *e*, pronged coupling D, adapted to be made to interlock with the prongs of said thread-ring, the grippers G, grip-ring F, and ring I, arranged, connected, and adapted to be operated substantially as described.

410,928. CAR-COUPLING. ARISTIDE ROMAIN, New Orleans, La. Filed Nov. 19, 1888. Serial No. 291,301. (No model.)

Claim.—In a car-coupling, the combination, with the draw-head constructed as described and provided with the longitudinal slot L in the roof thereof, of the slide-bar G, arranged within the draw-head and having a front vertical portion, as shown, the slide-block F on the outside of the head and secured to the bar G by a bolt passing through the slot, the standard B, the hand-lever pivoted thereto, the pin secured to the lever, the frame E, secured to the forward upper end of the head and having an aperture for the passage of the pin, and the springs backing the slide-bar, substantially as secified.



410,929. GRATE-BAR FOR FIRE-ENGINES. ROBERT ROSS, Calliope, Iowa. Filed Oct. 17, 1888. Serial No. 288,410. (No model.)

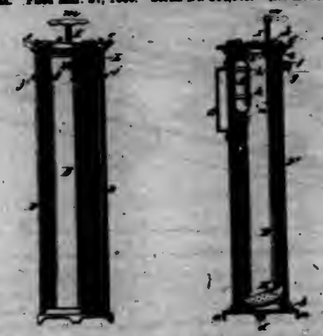
Claim.—1. A furnace grate-bar having its opposite sides of serpentine or corrugated form, and the projected and cut-out portions both tapering from above downwardly the depth of the bar, whereby, when two bars are placed in position and reciprocated in opposite directions, a grinding action will be caused on clinkers or the like coming between them, substantially as specified.

2. A furnace grate-bar having its opposite sides of serpentine or corrugated form, and the projected and cut-out portions both tapering from above downwardly the depth of the bar, in combination with a furnace, the rock-shafts having bearings for said bars, the bar connecting the rock-shafts, and a lever for rocking one of the shafts, substantially as specified.

410,930. FLUSHING-TANK. ANDREW ROSEWATER, Omaha, Nebr. Filed Feb. 27, 1889. Serial No. 301,169. (No model.)

Claim.—1. The combination, with the tank, its supply-pipe and outlet siphon-pipe, of the vertical pipe S, connected with the supply-pipe and having its lower end terminating at a point above the lower end of the short leg of the siphon, the valve, and the float connected with said valve, substantially as and for the purpose specified.

2. The combination, with the tank, its supply-pipe and siphon outlet-pipe, of the ejector or jet F in said supply-pipe, the cock L, and the vertical pipe S, connected with the ejector or jet, and having its lower end terminating at a point above the lower end of the short leg of the siphon, the valve, and the float connected with said valve, substantially as and for the purpose specified.



3. The combination, with the tank, the supply-pipe, and the siphon outlet-pipe, of the vertical pipe S, the ejector or jet F in the supply-pipe and connected with the pipe S, the valve, and the float in the tank connected with said valve, substantially as and for the purpose specified.

4. The combination, with the tank, its supply-pipe and its siphon outlet-pipe, of the ejector or jet F in the supply-pipe, the pipe D, connecting the supply-pipe with the siphon, the vertical pipe S, connected with the ejector or jet and having its lower end terminating at a point above the lower end of the short leg of the siphon, the valve K, the cock L, and the float connected with the valve, all arranged and operating substantially as and for the purpose specified.

5. In a flushing-tank, the combination, with the supply-pipe provided with a partition having a valve-opening therein, and siphon exhaust-pipe, of the vertical pipe connected with the supply-pipe, the cock, the U-shaped bracket secured to the supply-pipe, having its shorter arm bifurcated and its longer arm slotted longitudinally, the valve-rod carrying on its lower end the valve and having its upper end slotted, the lever hinged in the bifurcated arm of the U-shaped bracket and passing through the slots of the valve-rod and longer arm, and the float connected to the free end of the lever by means of a chain, substantially as set forth.

6. In a flushing-tank, the combination, with an air-exhaust pipe from the siphon, of an ejector or jet connected therewith, a supply-pipe connected to the ejector or jet and provided with a depending cock for filling the tank, a valve for automatically causing an intermittent flow of a portion of the inflowing water to the jet or ejector supply-pipe, whereby a consequent intermittent exhaustion of the air from the siphon-pipe is attained, and a pipe connected to the jet or ejector for discharging the water admitted thereto, substantially as set forth.

410,931. FIRE-EXTINGUISHER. THOMAS B. ROMER, Sioux Falls, Dak. Filed Mar. 27, 1889. Serial No. 304,972. (No model.)

Claim.—The combination, with the upper and lower castings and the tube seated at its ends in grooves therein, of the rods D, holding said parts together, and the transverse bolts passed through said rods and engaging said tube near its upper end, substantially as shown and described.

410,932. HEEL-BURNISHING MACHINE. SIMON ROSS, Jr., Linwood, Ohio. Filed Dec. 10, 1888. Serial No. 294,066. (No model.)

Claim.—1. In a heel-burnishing machine, the combination, with the oscillating arm or standard 1, having a stock A, of a burnisher 6 and a clamping-screw 10, passing through the burnisher and the stock, and by which screw the burnisher is adjustable in the arc of a circle on the stock to different angles relative thereto, substantially as described.

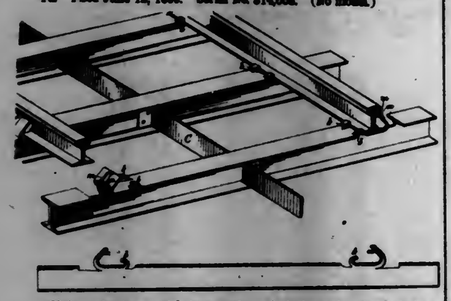
2. The combination, with a stock A, of the burnishing-tool composed of a series of rigid plates clamped immovably and rigidly together and adjustably secured to said stock to constitute an inflexible burnishing-face, substantially as described.

3. The combination, with a stock A, of the burnishing-tool composed of a series of rigid plates rigidly clamped together by a clamping-screw, and by the same screw said tool secured on and bodily adjustable at different angles to the stock, substantially as described.

4. In a heel-burnishing machine, the combination, with the oscillating arm or standard 1, having the stock A, of the burnisher 6, comprising a series of plates having a rigid concave burnishing-face, and the clamping-screw 10, passing through the plates and the stock, and by which screw the burnisher is adjustable in the arc of a circle on the stock to different angles relative thereto, substantially as described.

5. In combination with the reciprocating stock 3, reversible burnisher 6, provided with a concave and convex edge, whereby the tool may be reversed for use, substantially as described.

6. The combination, with a tool-carrier, of a clamping-screw extending through and supported by the carrier, and a burnisher journaled on the screw and adjustable to different positions in the arc of a circle by said clamping-screw, substantially as described.



7. The burnisher 6, composed of a series of plates 7, arranged side

by side, and the pin or rivet 8, passing through the plates at one end, in combination with a tool-carrier and a clamping-screw 10, extending through the carrier, and on which the other ends of the plates are hung for adjusting the burnisher to different positions in the arc of a circle, substantially as described.

8. The burnisher-tool 6, comprised of a series of plates 7 and adjustably attached to the shank A, provided with slots *a* and tongues *b*, substantially as herein specified.

9. In combination with a burnisher 6, the top-piece burnisher C, supported on the stock 3, and held to its work by the spring 16, substantially as described.

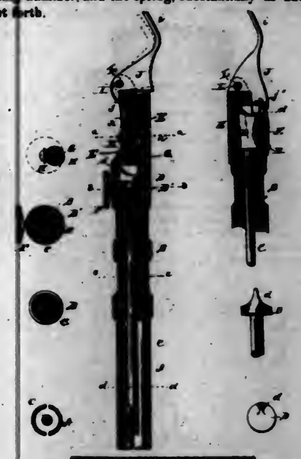
410,933. RAILWAY CROSS-TIE. EDWARD SAMUEL, Philadelphia, Pa. Filed June 12, 1889. Serial No. 314,033. (No model.)

Claim.—1. A combined cross-tie and chair made of rolled-shape or beam iron or steel, having a web and top plate, and having the web partly severed, and that portion of the top plate thus freed bent in the direction of the length of the beam, so as to form a rail-retaining lip, substantially as set forth.

2. A combined cross-tie and chair made of rolled-shape iron or steel, having bent portions forming retaining-lips for the inner flanges of the rails, and having other bent portions forming outer retaining-lips for the rails, said outer bent portions being composed of the top flanges of the beam and portions of the web, substantially as described.

3. The combination of a combined cross-tie and chair made from rolled-shape or beam iron or steel, and having bent portions forming pockets for the rails, with angle-pieces secured to the web of the rail and serving to prevent its lateral movement, substantially as specified.

410,934. GATE-LATCH. CALVIN M. SANDERS and JOHNSON H. SANDERS, Woodland Mills, Tenn. Filed May 4, 1889. Serial No. 309,567. (No model.)



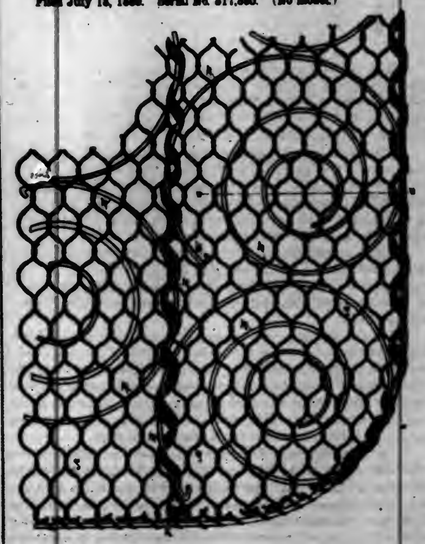
Claim.—1. A reversible gate-latch consisting of a shell or case having a removable side 2 and the longitudinal slots 7 in its opposite sides, a reciprocating bolt fitted in the shell, the brackets fitted snugly around said shell and its removable side near the ends thereof to confine the shell and its removable side in place, a knob detachably connected to the bolt and operating in one of the slots in one side of the case, and a keeper, all arranged and combined for service substantially as herein shown and described.

2. A reversible gate-latch consisting of a shell or case having an open side and longitudinal recesses 7 formed in the edges of the walls thereof adjoining said open sides and the recesses 12 in the solid angles or corners thereof and forming the shoulders 13, a removable side 2, provided with the ribs or flanges 8, arranged to fit in the recesses 7, and with the recesses 14, the angular brackets fitted in the recesses 12 14 to confine the shell and its removable side securely in place, a reciprocating bolt, a knob detachably connected to said bolt, and a keeper, all arranged and combined for service substantially in the manner and for the purpose herein shown and described.

410,935. DENTAL PLUGGER. FERDINAND SCHMIDT, Dennels, Prussia, Germany. Filed Apr. 13, 1889. Serial No. 307,116. (No model.) Patented in Germany Apr. 4, 1888, No. 46,379.

Claim.—1. In a dental plugger of the described class, the combination of the revolving shaft and cam, the pivoted oscillating hammer or plugger-head formed on its end with the point or striker, and the spring, substantially as set forth.

2. In a dental plugger of the described class, the combination of the revolving shaft and cam, the reciprocating slide-bar, the pivoted oscillating hammer, and the spring, substantially as and for the purpose set forth.



410,936. BAKING-PAN. JOHN J. SEIFERT, Gilmore City, Iowa. Filed Mar. 30, 1889. Serial No. 305,422. (No model.)

Claim.—1. A baking-pan having plates or gutters secured to its sides and the shield or section having lower inclined sides entering said gutters and inclosing the upper portions of said sides, substantially as set forth.

2. The baking-pan having V-shaped plates or gutters secured to its sides, the shield or section having an upper flat portion and lower inclined sides and forward flanged portions, and a ring-handle, substantially as set forth.

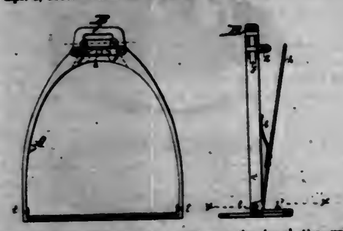
410,937. WOVEN-WIRE MATTRESS. WILLIAM S. SEYMOUR, Philadelphia, Pa., assignor of one-half to Elmer E. Gray, same place. Filed July 18, 1889. Serial No. 317,995. (No model.)

Claim.—1. In a woven-wire mattress, the combination, with a woven-wire fabric, of perpendicular springs, the terminal coils of said springs being connected with said fabric and being under lateral tension, whereby the tendency of the coils to expand keeps the fabric taut.

2. In a woven-wire mattress, the combination, with a woven-wire fabric, of extra wire cables intertwined therewith and perpendicular springs whose terminal coils are held in a state of lateral tension between adjacent cables, the distance between the cables being less than the diameter of the terminal coils when not under tension.

3. In a woven-wire mattress, the combination, with perpendicular springs, of a woven-wire fabric for the top of the mattress and a woven-wire fabric for the bottom of the mattress, the terminal coils of said springs at top and bottom being connected with said fabrics under a state of lateral tension, whereby both sides of the mattress are kept taut and the mattress is reversible.

4. In a woven-wire mattress, the combination, with a woven-wire fabric, of extra wire cables intertwined therewith, said cables being located beneath the surface of the fabric, and perpendicular springs whose terminal coils are held in a state of lateral tension between adjacent cables, the distance between the cables being less than the diameter of the terminal coils when not under tension.



410,938. OIL-CAN. AZ B. SHAW, Boston, Mass. Filed Apr. 4, 1888. Renewed Mar. 12, 1889. Serial No. 303,063. (Model.)

Claim.—1. The described oil-can, having body A, spring-bottom B, and discharge-pipe C, in combination with the false bottom E, with opening *c*, but otherwise imperforated, and with the vertical tube F, leading therefrom to the discharge-pipe, substantially as set forth.

2. The combination of the body A, elastic bottom B, and discharge-pipe C with the false bottom E, opening *c*, vertical tube F, and inlet and outlet valves, substantially as set forth.

410,939. STIRRUP. HENRY G. SELLON, Dülmen, Prussia, Germany. Filed Apr. 1, 1889. Serial No. 305,696. (No model.)

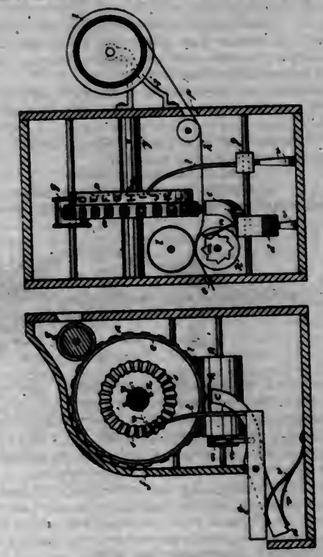
Claim.—1. In combination, the stirrup, the head, the gripping and supporting dogs pivoted to the head and engaging with the stirrup to detachably connect them, means for holding said dogs in position, and means, substantially as described, on the stirrup and operating independently of the other parts for releasing the dogs, substantially as described.

2. In combination, the stirrup, the head, the gripping and supporting dogs pivoted to the head and engaging with the stirrup to detachably connect them, a movable holding-wedge for the dogs, and means for moving said wedge to engrip the dogs, substantially as described.

3. In combination, the stirrup, the head, independently-movable detachable connections between the head and stirrup, and a frame pivoted to the stirrup and normally disengaged from the detachable connection and arranged to bear upon the said connection when moved, substantially as described.

4. In combination, the stirrup, the head, the detachable connections between, and a pivoted frame acting upon said detachable connections, said frame having a tread portion *h'*, by which it is held normally out of action, substantially as described.

5. In combination, the stirrup, the head, the detachable connection between, comprising a wedge, a spring for holding said wedge in normal position, and means for automatically forcing said wedge aside against the spring-pressure, substantially as described.



6. In combination, the stirrup, the head, independently-movable detachable connections between the head and stirrup, a frame arranged to bear upon said connections when moved, and a spring for keeping said frame normally out of contact with the connections, substantially as described.

7. In combination, the stirrup having the dovetailed chamber the head, the dogs pivoted thereto and extending into said chamber, and the wedge between the dogs, substantially as described.

410,940. SOLUTION OF BENZOIC SULPHIMIDE IN OILS, &c. ADOLPH SEMMER, Berkeley, Cal. Filed Apr. 24, 1888. Serial No. 309,080. (No specimens.)

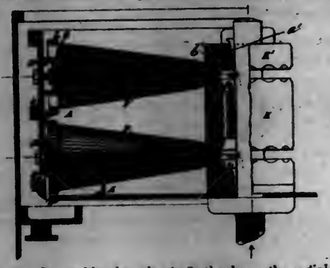
Claim.—As a new composition, the solution of benzoic sulphimide, in that class of ingestible carbon compounds which is insoluble in water, but soluble in bisulphide of carbon.

410,941. TYPE-WRITING MACHINE. WILLIAM G. SPIDER, New York, N. Y., assignor of one-half to George H. Clarkson, Philadelphia, Pa. Filed Nov. 3, 1888. Serial No. 289,870. (No model.)

Claim.—1. The combination of the stationary shaft, the wheel fitted to turn loosely on the shaft, duplex ratchet in the disk of the wheel, and the opposing impelling and holding pawls acting on respective sides of the ratchet, substantially as described.

2. The combination of the stationary shaft, the wheel fitted to turn loosely on the shaft, duplex ratchet in the disk of the wheel, the impelling spring-pawl rigidly attached to a key, the spring holding-pawl inserted in the shaft with relation to the wheel-hub for a controlling-pin thereto and acting on the duplex ratchet opposite to the impelling-pawl, and the controlling-pin in the shaft on the opposite side of the wheel, substantially as described.

3. The type-wheel and indicator-wheel made in one structure of stamped sheet metal, comprising the hub *w*, disk *x*, and the wheel-rims *a* and *c*, and having the duplex ratchet in the disk, substantially as described.



4. A letter-wheel provided with an integral hub, ratchet, and letter-rim, the whole being stamped up out of a single piece of sheet metal, as set forth.

5. The combination, with a suitable casing having a sight-opening, of a stationary shaft provided with a type-wheel *a* and indicator-wheel *c*, having a ratchet *s*, a key-lever *g*, and a spring-pawl *t*, for operating said ratchet and letter-wheel, the paper-feed rollers *l k*, the latter having a ratchet *m*, and a printing-key *d*, provided with hammer *e* and pawl *n*, whereby said key *d* will simultaneously operate the feed-rollers *l k* and press the paper against the letter-wheel *c*, substantially as and for the purpose set forth.

6. A letter-wheel provided with an integral hub and ratchet, the whole being stamped up out of a single piece of sheet metal, as set forth.

7. A letter-wheel provided with an integral hub, ratchet, and type and indicator rims, the whole being stamped up out of a single piece of sheet metal, as set forth.

410,942. CENTRIFUGAL MACHINE. CARL STEFFEN, Vienna, Austria-Hungary. Filed Nov. 23, 1887. Serial No. 255,900. (No model.)

Claim.—1. In combination, the shaft, the drum, the radial forms, and the rings K K' on said shaft, having seats for the forms and arranged upon each side of the same, with means for securing said rings to the shaft, substantially as described.

2. In combination, the shaft, the drum, the radially-arranged forms, having open inner ends, the rings, having seats for said forms, said rings being upon each side of the forms and at a slight distance apart, and the hollow shaft having outlets opening into the spaces between the rings, substantially as described.

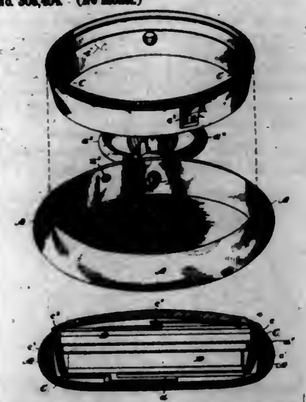
410,943. LANTERN. WILLIAM C. STEWART and JAMES A. BLAKELEY, Bellaire, Ohio. Filed July 2, 1888. Serial No. 278,745. (No model.)

Claim.—1. In a tubular lantern, the combination, with the base, side tubes, central tube, globe, and globe-supporting disk, of a lever pivoted to said base and provided with loop N, surrounding the burner-cones and hinged to said globe-supporting disk, and with a locking-hook L, engaging with the flange of said globe-supporting disk, substantially as described, and for the purposes mentioned.

2. In a tubular lantern, the combination, with the base, side tubes, central tube, globe, and globe-supporting disk provided with a hinge O thereon, of a lever pivoted to said base and secured to said disk by means of said hinge and provided with a locking-hook L, for the purpose mentioned, substantially as set forth.

3. As an improvement in lanterns, a globe connected to the central tube at its upper end, a base, a supporting-disk for said globe, and a lever pivoted on the base and connected to said disk, and having an integral latch-arm engaging with said disk, substantially as set forth.

410,944. GAS GENERATOR AND BURNER. JOSEPH G. STRENT, Dallas, Tex. Filed Apr. 11, 1889. Serial No. 306,775. (No model.)



Claim.—1. An oil-vapor generator and burner, consisting of a casing containing a filling of porous incombustible substance and provided at its upper portion with a plurality of burner-tips, an oil-supply pipe extending in the filling lengthwise of the casing and having perforations, and an air-supply pipe extending through the filling and provided with a plurality of air-jet tubes arranged in a plane above the oil-supply pipe, projecting upward through the packing to a point above the same and registering with the burner-tips at the upper portion of the casing, for inducing the flow of vaporized oil through the filling to the burner-tips and producing a blow-pipe action, substantially as described.

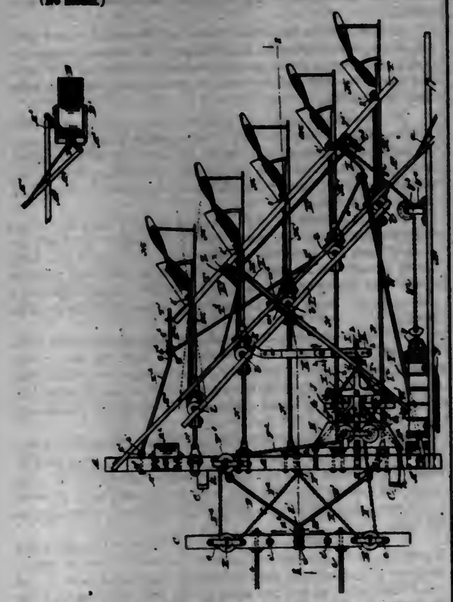
2. An oil-vapor generator and burner, consisting of a casing containing a filling of porous incombustible substance and provided at its upper portion with a plurality of burner-tips, a perforated oil-supply pipe extending through the filling, and an air-supply pipe extending through the filling and opposite ends of the casing, having at its opposite external ends the valves for the admission of air at either end of the pipe and provided with a plurality of air-jet tubes arranged in a plane above the oil-supply pipe, projecting upward through the packing to a point above the same and registering with the burner-tips at the upper portion of the casing, substantially as and for the purposes described.

3. An oil-vapor generator and burner, consisting of a casing containing a filling of porous incombustible substance and provided at its upper portion with a plurality of burner-tips, a perforated oil-supply pipe extending through the filling, and a coiled air-supply pipe located in and heated by the filling, and having portions of its coils provided with air-jet tubes located in a plane above the oil-supply pipe, extending through the filling to a point above the same, and registering with the burner-tips at the upper portion of the casing, substantially as and for the purposes described.

4. An oil-vapor generator and burner, consisting of a casing containing a filling of porous incombustible substance and provided at its upper portion with a plurality of burner-tips, a perforated oil-supply pipe extending through the filling, and a coiled air-supply pipe located in the filling, extending through opposite ends of the casing, provided with valves at its ends for receiving air at either end, and having portions of its coils provided with air-jet tubes located in a plane above the oil-supply pipe, extending through the filling, and registering with the burner-tips at the upper portion of the casing, substantially as and for the purposes described.

410,945. WATCH-CASE. WILLIAM C. TAFT and PAUL J. MORAND, Chicago, Ill.; said Morand assignor to said Taft. Filed Apr. 24, 1889. Serial No. 308,404. (No model.)

Claim.—1. A watch-case in which the center and back are integral and are combined with a movement-ring that is adapted to be fitted into and automatically locked within said center, substantially as and for the purpose specified.



2. A watch-case in which are combined an integral center and back, a movement-ring that is adapted to fit within said ring, and a spring-latch which operates to lock said ring in place, substantially as and for the purpose shown.

3. A watch-case in which the center and back are integral and are combined with a removable movement-holding ring, which, when placed within said center, is automatically locked therein, substantially as and for the purpose specified.

4. A watch-case in which are combined an integral center and back, a movement-ring that is adapted to be fitted into and automatically locked within said center, and a glass bezel which is adapted to engage with the outer portion of said ring, substantially as and for the purpose set forth.

5. A watch-case in which are combined an integral center and back, a movement-ring that is adapted to fit into said center, a spring-latch which operates to lock said ring in place, and a glass bezel that engages with the outer portion of said ring, substantially as and for the purpose shown and described.

410,946. GANG-PLOW. AUGUST B. VERLEMANN and THEODORE A. VERLEMANN, Augusta, Me. Filed May 3, 1889. Serial No. 309,670. (No model.)

Claim.—1. The combination, substantially as hereinbefore set forth, of the plow-frame having a front cross-beam, the engine-beam, and the diagonal draft-rods crossed at their outer ends, hinged to the front beam of the plow-frame and supported on the engine-beam, on which they are free to slide transversely to the line of draft.

2. The combination, substantially as hereinbefore set forth, of the plow-frame having a front cross-beam, the engine-beam, the diagonal draft-rods hinged to the front beam of the plow-frame, crossed at their outer ends and sliding upon a bolt or bar suspended from the engine-beam and extending through eyes or loops on the outer ends of the draft rods.

3. The combination, substantially as hereinbefore set forth, of the plow-frame having a front cross-beam, the engine-beam, the diagonal draft-rods hinged to the front beam of the plow-frame and crossed at their outer ends, and the horizontal rod or bar on the engine-beam, and secured thereto by three eyebolts, said horizontal bolt or rod extending through eyes or loops in the outer ends of the draft-rods, which are free to slide on the horizontal rod between the central eye-bolt and the end ones.

4. The combination, substantially as hereinbefore set forth, of the plow-frame, a plow mounted therein, the engine or draft-power, and connections between the plow and the draft-power for moving the plow horizontally in the frame.

5. The combination, substantially as hereinbefore set forth, of the plow-frame having a front cross-beam, a series of plows connected with the front beam by vertical pivots, the engine or draft-power, and connections between the engine and the plows, whereby they may be moved horizontally relatively to their frame.

6. The combination, substantially as hereinbefore set forth, of the plow-frame, a series of plows mounted therein, the plow-connecting beam L, the cross-head, the link connecting the cross-head with the plow-connecting beam, the engine or draft-power, and flexible connections between the engine or draft-power and the cross-head.

7. The combination, substantially as hereinbefore set forth, of the plow-frame, the plows flexibly connected therewith, the plow-connecting beam, the cross-head, a link connecting the cross-head to the plow-connecting beam, the chains secured to the front side of the front cross-beam of the plow-frame and to opposite arms of the cross-head, and the sheaves or pulleys on the plow-frame and on the cross-beam of the engine, over which the chains extend.

8. The combination, substantially as hereinbefore set forth, of the plow-frame, the plows flexibly connected therewith, the plow-connecting beam, the oscillating cross-head, the link connecting the cross-head to the plow-connecting beam, the platform on which the cross-head is mounted and which is hinged to the front cross-beam of the frame, and flexible connections between the cross-head and the engine or draft-power.

9. The combination, substantially as hereinbefore set forth, of the plow-frame, a series of plows mounted therein, the plow-beams, the draft-rods flexibly connected to the plow-beams and to the front cross-beam of the plow-frame, the diagonal plow-connecting beam, the cross-head, the link connecting the cross-head with the plow-connecting beam, and the platform on which the cross-head is mounted, hinged to the front beam of the frame and resting on one or more of the draft-rods to which the plow-beams are connected.

10. The combination, substantially as hereinbefore set forth, of the plow-frame, the plows mounted therein, the rear plow-connecting beam to which the plows are attached, and the bar T' at one end of the frame, yieldingly connected with the plow-connecting beam T and flexibly connected to the front cross-beam.

11. The combination, substantially as hereinbefore set forth, of the plow-frame, the diagonal rods W and W', the brackets on the ends of the rods, the shaft journaled in the ends of said brackets, a drum on each end of the shaft, the rear plow-connecting beam, the flexible connection between each drum and the plow-connecting beam near each end, and a chain for operating the shaft and drums.

12. The combination, substantially as hereinbefore set forth, of the plow-frame, a series of plows mounted therein, the plow-beams, the draft-rods flexibly connected with the plow-beams and with the front beam of the plow-frame, the front plow-connecting beam, and vertical guide-rods extending through eyes or guides in the plow-connecting beam.

13. The combination, substantially as hereinbefore set forth, of the front beam of the plow-frame, the draft-rods extending rearwardly therefrom, and the caster-wheels secured to the draft-rods and adjustable thereon both vertically and horizontally.

14. The combination, substantially as hereinbefore set forth, of the plow-frame, a plow, a plow-beam circular in cross-section at its front end, a clevis having a circular socket on the end of the plow-beam, a break-pin connecting the plow-beam to the clevis, and a draft-rod connecting the clevis to the plow-frame.

15. The combination, substantially as hereinbefore set forth, of a plow, the plow-beam, a draft-rod, and a coupling for connecting the plow-beam with the draft-rod, having a flat horizontal circular link *m'*, connected with the plow-beam and hinged between a bifurcated end *o* of the coupling and adjustably connected with the draft-rod.

16. The combination, substantially as hereinbefore set forth, of a plow-beam, a draft-rod screw-threaded on its rear end, a coupling having a socket screw-threaded to receive the screw-threaded end of the draft-rod and serrated on its outer end, a washer serrated on its face and adapted to engage with the serrated end of the coupling and provided with a lug or feather engaging with a groove in the rear end of the draft-rod, and a clamping-nut on the screw-threaded end of the draft-rod for holding the washer in engagement with the coupling.

17. The combination, substantially as hereinbefore set forth, of the plow-frame, a plow mounted therein, a beam T above the plow, a vertical rod S, secured to the plow-beam, the frame S', secured to the beam T, through which the rod S extends, and the chain V, connecting the plow-beam with the beam T.

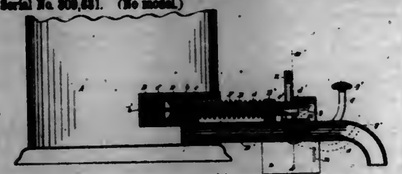
18. The combination, substantially as hereinbefore set forth, of the plow-frame, the beam T, the vertical rod S, secured to the plow-beam, the frame S', having a yielding cross-piece S^2, and a rod U, connected to the front end of the plow-beam and extending through a perforation in the lower end of the rod S, for the purpose specified.

19. The combination, substantially as hereinbefore set forth, of the plow-frame, a series of plows mounted therein, the draft-rods connected to the front cross-beam of the plow by vertical and horizontal pivots and connected to the plow-beam by couplings having vertical and horizontal pivots, the front plow-connecting beam having eyes or guides through which extend guide-bars on the couplings, the rear plow-connecting beams, the oscillating cross-head, connections between the oscillating cross-head and the front plow-connecting beam, the engine or draft-power, and connections between the engine or draft-power and the oscillating cross-head.

410,947. BOILER-STAND. JACOB VOEGTLEY, St. Louis, Mo. Filed Jan. 14, 1889. Serial No. 296,576. (No model.)

Claim.—1. A metallic boiler-stand consisting of a ring A and three crossed and interlocked legs B, secured to the ring, substantially as described.

2. The combination of a metallic ring containing three slots with the metallic legs penetrating said slots and crossing each other, and so constructed as to interlock with said ring at their tops and with each other at the point of their crossing, thus forming a stand without the use of screws or other fastenings, substantially as set forth.



3. A boiler-stand leg B, constructed with a head b', a hook b^2 at the under side, and a projection b^3 at the upper side, substantially as described.

4. The combination of the ring A, having depressions a^3 and oblong slots a^2, and the crossed and interlocked legs B, having oblong heads b', by which the legs are secured to the ring, substantially as described.

5. A boiler-stand consisting of the ring A, formed with a flange a', depressions a^3, and slots a^2, and the legs B, formed with hooks b^3, projections b^2, and heads b', substantially as described.

410,948. COIN-CONTROLLED MEASURING-FAUCET. CLARENCE O. WHITE, Minneapolis, Minn., assignor of part to Charles L. Travis, O. A. Pray, and Charles R. Chute, all of same place. Filed May 6, 1889. Serial No. 309,681. (No model.)

Claim.—1. The combination, with a faucet, of valves, one moving in advance to open the induction-port and the other following to close said port, substantially as described.

2. The combination, with a faucet having a valve-seat and an induction-port, of separable valves normally held in contact to close said port and means for operating and connecting said valves, whereby, when one valve is moved to open the induction-port, it starts the other to close the same automatically, substantially as described.

3. A faucet having an induction-port and provided with separable valves for opening and closing said port, one valve following the other, as set forth, in combination with a coin-receiving chute and a pivoted lever for operating the valve mechanism when a coin is dropped into the chute, substantially as described.

4. The combination, with a faucet provided with a communicating valve-seat section, of a pair of valves in said valve-section normally in contact and closing its induction-port, the outer of said valves being loosely mounted, a spring attached to the stem of the inner valve and compressible on the stem of the inner valve by the movement of the outer valve, and an inlet behind the inner valve, substantially as described.

5. The combination, with a tank, of a faucet constructed of two communicating sections, a pair of valves in one of said sections normally in contact and closing the induction-port, the outer of said valves being loosely mounted on the stem of the inner valve and provided with a stem extending to the exterior of the tank, coiled springs on the valve-stems, compressible by the movement of the outer valve, an inlet behind the inner valve, and a coin-controlled device for operating said outer valve, substantially as described.

6. The combination, with a faucet having a valve-seat provided with an inlet-aperture and with induction and eduction ports, of valves operating to open and close said ports, substantially as set forth.

7. The combination, with a faucet provided with an induction-port and with an inlet-aperture, as set forth, of a differentially-timed valve device for opening and closing said port, substantially as described.

8. The combination, with a faucet, of valves and mechanism for operating said valves with a differential movement to open and close the induction-port, and a coin-controlled device for actuating said mechanism, substantially as described.

9. The combination, with a faucet, of the perforated valve D, having a tubular stem, the valve C, provided with a stem passing through valve D, and mechanism for operating said valves to open and close the induction-port, substantially as described.

10. The combination, with a faucet, of valves for opening and closing the induction-port, one valve being closed upon the stem of the other, and mechanism for operating said valves, substantially as described.

11. The combination, with a faucet, of differentially-timed valves for opening and closing its induction-port, valve-stems located one within the other, a coin-controlled device for actuating said valves, and springs for returning the valves to their normal position, substantially as set forth.

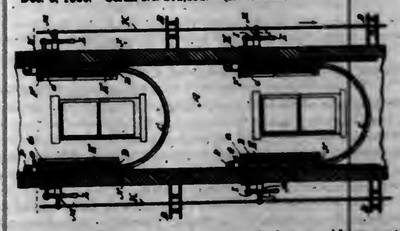
12. The combination, with a faucet having a valve-seat provided with an induction-port, of a pair of differentially-timed valves working in said seat, stems for said valves, spiral springs surrounding the stems, a device on one of the valve-stems for regulating the tension of the spring, and a coin-controlled device for actuating the valves, substantially as described.

13. The combination, with a tank, of a faucet composed of two communicating sections, a pair of valves operating in one of said sections to open and close the induction-port, the outer valve being loosely mounted on the stem of the inner valve, and being provided with a stem having on its extremity a notched or slotted arm, and a coin-controlled device for operating said valves, substantially as set forth.

14. The combination, with a faucet, of differentially-timed valves for opening and closing the induction-port, stems for said valves, springs, one of high and the other of low tension, surrounding said stems, a coin-receiving chute, and a pivoted two-armed lever for actuating the valves when a coin is dropped into the chute, substantially as set forth.

15. A faucet having a valve-seat provided with an induction-port, valves operating in said seat to open and close said port, a stem attached to the inner valve and passing through the body of the outer valve, and a spring upon said stem, whereby the outer valve can move in advance of the other to open the induction-port, substantially as set forth.

16. The combination, with a faucet having the valve-seat section B and the discharge-spout section B', of the valve C, having stem c, threaded at its outer end, the longitudinally-perforated valve D, provided with hollow stem d, the spiral springs E F, the threaded collar d', slotted arm d', coin-receiving chute K, and pivoted lever G, substantially as set forth.



17. The combination, with a faucet having an induction-port, of a differentially-timed valve device for opening and closing said port, and a coin-controlled mechanism for actuating said valve device, substantially as set forth.

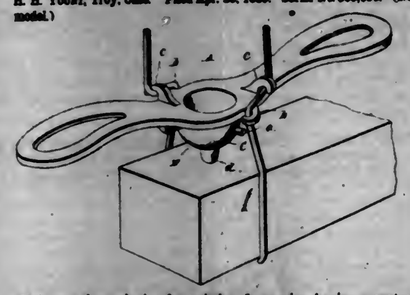
410,949. CHURN. SOLOMON WHITNEY, Manhattan, Kans. Filed Jan. 31, 1888. Serial No. 262,585. (No model.)

Claim.—The combination of the cylinder or body having at one end an extension provided with a socket, the rod having an angular end resting in a corresponding socket in the frame-work and its opposite end resting in the socket of the said extension, and the dasher having a sleeve or tubular portion connected to said rod, substantially as set forth.

410,950. HATCHWAY. PHILIP G. WIRTZ, Hoboken, N. J. Filed Dec. 6, 1888. Serial No. 292,532. (No model.)

Claim.—1. The combination, with a shaft A, a guideway extending in a direction across the shaft, and shutters adapted to travel in said guideway to transversely close the shaft, of detents G, adapted to engage said shutters, and a rod or connection K, connected to said detents, said rod or connection being adapted to release said detents, substantially as set forth.

2. The combination, with a shaft A, a guideway extending in a direction across the shaft, and shutters adapted to travel in said guideway to transversely close the shaft, of detents G, adapted to engage said shutters, and rods or connections K, located at opposite sides of the shaft and connected to said detents and to one another, said rods or connections being adapted to release said detents, substantially as set forth.



3. The combination, with a shaft A, a guideway extending in a direction across the shaft, and shutters adapted to travel in said guideway to transversely close the shaft, of detents G, adapted to engage said shutters, a rod or connection K, connected to said detent, and a handle L, connected to said rod, substantially as set forth.

4. The combination, with a shaft A, a guideway extending in a direction across the shaft, and shutters adapted to travel in said guideway to transversely close the shaft, of detents G, adapted to engage said shutter, a rod or connection K, adapted to release said detents, actuating-handles L for said rod K, and a rock-shaft M, made to connect said handles L, substantially as set forth.

5. The combination, with a shaft A, a guideway extending in a direction across the shaft, and shutters adapted to travel in said guideway to transversely close the shaft, of detents G, adapted to engage said shutters, a rod or connection K, adapted to release said detents, and stops N for said shutters, substantially as set forth.

6. The combination, with a shaft A, a guideway extending in a direction across the shaft, and shutters adapted to travel in said guideway to transversely close the shaft, of detents G, adapted to engage said shutters, a rod or connections K, adapted to release said detents, and restoring-cords O, connected to said shutters, substantially as set forth.

410,951. TWISTING DEVICE FOR FENCE-WIRES. WILLIAM H. H. YOUNT, Troy, Ohio. Filed Apr. 23, 1889. Serial No. 308,096. (No model.)

Claim.—A lever device for twisting fence-wire, having a central body provided with the convex boss C, lateral oblique legs a on said boss, a central pivot-point d, the lateral horizontal edge hooks b, and the vertical hooks c at right angles to said edge hooks, substantially as specified.

410,952. SPRING-SCALE. EDWARD F. BUSSMAN, Frankfort, assignor of one-half to John R. Shaak, Ilion, N. Y. Original application filed Oct. 20, 1888, Serial No. 288,962. Divided and this application filed May 3, 1889. Serial No. 309,605. (No model.)

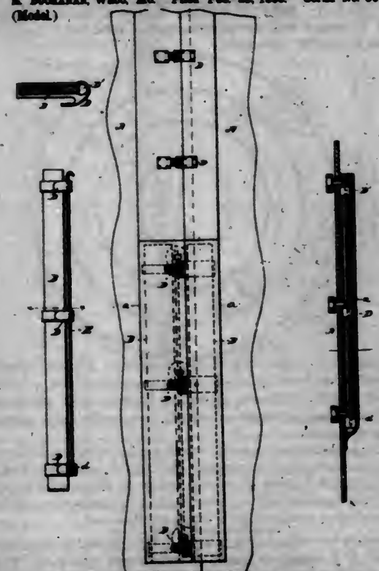
Claim.—1. The combination of the backing B and a spring secured to said backing and bent outwardly therefrom with an indicator-finger, a weight-engaging device pivoted to a support mounted on the backing B, and a connection between said spring and weight-engaging device, substantially as and for the purpose specified.

2. The combination of the backing B and the spring A secured thereto and bent outwardly therefrom, a spring-scale F, an indicator-finger E, pivoted to the backing B, and a connection G between said spring and indicator-finger with a weight-engaging device pivoted to the backing and a connection between said spring and weight-engaging device, substantially as and for the purpose described.

3. The combination of the backing B, the spring A secured thereto and bent outwardly therefrom, the weight-engaging device pivotally supported upon the backing B, and a connection D between said spring and weight-engaging device with an indicator-finger E, pivoted to a support of the backing B, and a link G, pivoted to separate supports upon said spring and backing, substantially as and for the purpose set forth.

410,953. AIR-TIGHT COVERING FOR ELECTRIC CABLES. DAVID BROWN, Jr., Philadelphia, Pa., assignor to the Electric Cable Construction and Maintenance Company, same place. Filed Dec. 20, 1888. Serial No. 293,110. (No model.)

Claim.—1. An electric cable consisting of dry fibrous-covered wires saturated with an insulating material and having an incasement of tin-foil and rubber strips vulcanized, substantially as described.



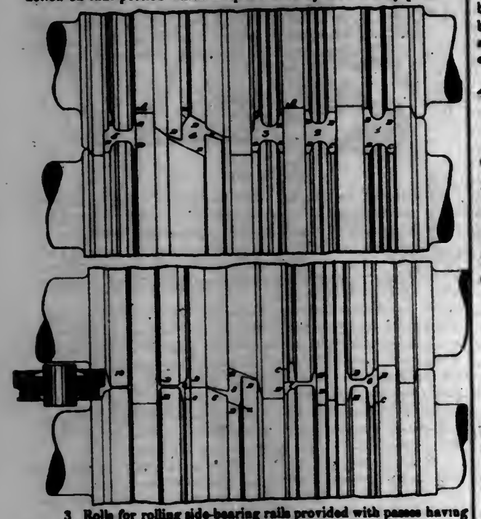
2. An insulated bunch of wires having a covering composed of a layer of tin-foil, an outer covering of rubber, with an exterior wrapping of fibrous material having a rubber coating, said parts being combined substantially as described.

3. An electric cable consisting of wires having a fibrous covering with a saturation of insulating material, the latter being provided with a dry-powder coating, one or more layers of tin-foil surrounding said wires, one or more layers of rubber surrounding said tin-foil, and an exterior wrapper of fibrous material having a rubber coating, said parts being combined substantially as described.

4. An electric cable composed of fibrous-covered wires saturated with insulating material and coated with a dry powder, and an incasement of tin-foil and rubber, substantially as described.

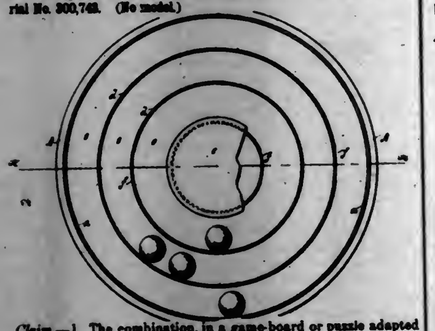
5. An electric cable composed of fibrous-covered wires saturated with insulating material, having an impervious incasement consisting of tin-foil and rubber and an exterior wrapping of painted braid, substantially as described.

410,954. COMBINED DRESS STAY AND FASTENER. LAURENA R. BUCHANAN, Waco, Mo. Filed Feb. 25, 1889. Serial No. 301,065. (Model.)



Claim.—The combination, with the strips of fabric A, of the steels B, one of which has hooks with guides D' therein, and a pocket, as d, at its lower end, and the other provided with eyes, and the wire E, substantially as described.

410,955. ROLLS FOR ROLLING SIDE-BEARING RAILS. FREDERICK CELLEY, Johnstown, Pa., assignor to the Johnson Company, of Kentucky. Filed Feb. 26, 1889. Serial No. 301,260. (No model.)



Claim.—1. Rolls for rolling side-bearing rails provided with an oblique dummy pass having a projecting angle or corner, as x, substantially as and for the purpose described.

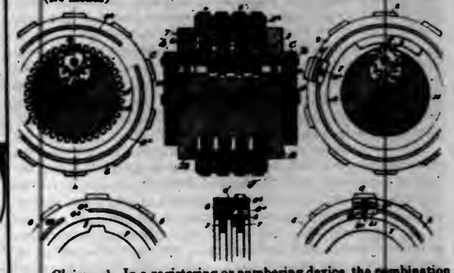
2. Rolls for rolling side-bearing girder-rails provided with edging-passes and oblique dummy passes, so that said edging-passes exert their live action on that part of the lower flange of the metal being rolled which is not operated on by the dummy passes, and their dead action on that portion which is operated on by said dummy passes.

3. Rolls for rolling side-bearing rails provided with passes having the respective conformations indicated by the numbers 1 to 10, inclusive.

410,956. GAME OR PUZZLE. CHARLES M. CRANDALL, Waverly, N. Y., assignor to Moses Lyman, same place. Filed Feb. 21, 1889. Serial No. 300,743. (No model.)

Claim.—1. The combination, in a game-board or puzzle adapted to be held in the hand, of a base having a continuous wall, a central pen, and a series of interior concentric fences, each of said fences having an opening arranged alternately on opposite sides, substantially as described.

2. A game-board or puzzle constructed to be held in the hand, having, in combination, a base provided with a continuous wall, a central pen, and a series of interior concentric fences, each of said fences being provided with an opening, which openings are out of line with each other, substantially as shown and described.

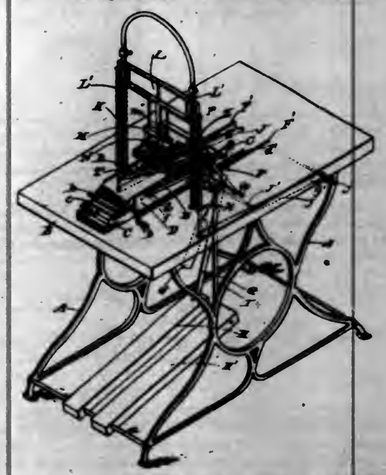


410,957. WINDOW-CLEANING CHAIR. SAMUEL H. CROOK, New York, N. Y., assignor of one-half to Isidor Bremer, same place. Filed Apr. 24, 1889. Serial No. 308,262. (No model.)

Claim.—1. The combination of a window-cleaning chair having short legs adapted to rest on the sill, and provided with a hook attached to the under side of the seat, with a keeper attached to the sill of the window-casing, substantially as set forth.

2. A window-cleaning chair composed of a seat and a back, the bow of which passes through openings of the seat to some distance below the same, so as to form short inclined legs for the seat, a hook attached to the under side of the seat, and transverse holes for fastening the bow to the seat, substantially as set forth.

410,958. NUMBERING DEVICE. CHARLES H. DAVIES, Brooklyn, N. Y. Filed Jan. 24, 1887. Renewed Dec. 15, 1888. Serial No. 293,760. (No model.)



Claim.—1. In a registering or numbering device, the combination of concentric wheels and gear-wheels attached thereto, gear-pinions for driving the same with a spline and with mechanism, substantially such as described, for disengaging said pinions from said gear-wheels and for engaging them with said spline, substantially as and for the purpose specified.

2. A cipher-block O, having a recess O′, combined with a wheel carrying said cipher-block, and also with an adjacent wheel having a flange O^2 and a space O^2, substantially as herein described.

3. A depressible cipher-block O, having a recess O′ and a spring O^4, combined with a wheel carrying said cipher-block, and also with an adjacent wheel having a flange O^2 and a space O^2, substantially as herein described.

410,959. CIGAR-BUNCHING MACHINE. JOSEPH DE LA MAR, Poughkeepsie, assignor of one-half to Frederick Bostwick, Pine Plains, N. Y. Filed Sept. 21, 1883. Serial No. 286,963. (No model.)

Claim.—1. In a cigar-bunching machine, a reciprocating carriage-frame carrying a roller-board, a rolling-belt, and a removable mold having a yielding bottom, in combination with a treadle, counterpoise, and connecting rods and levers for reciprocating said carriage-frame, and a plunger for ejecting the tobacco from the mold when the latter arrives beneath it, substantially as described.

2. In a cigar-bunching machine, the combination of a reciprocating carriage consisting of a pair of side plates carrying a mold having a yielding bottom, a roller-board, and roller-belt stretched over said board and passing around suitable rollers, and mechanism, substantially as described, for reciprocating said carriage, in the manner and for the purpose described.

3. In a cigar-bunching machine, a reciprocating carriage consisting of side plates carrying a mold having a yielding bottom, a rolling-board mounted between said plates and having a slight reciprocal movement independent of the carriage, whereby the bight is formed, and a roller-belt stretched over said board and suitable rollers, substantially as described.

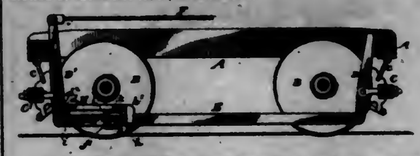
4. In a cigar-bunching machine, a reciprocating carriage consisting of side plates, a roller-board having a slight reciprocal movement independent of said carriage, thereby forming a bight in the roller-belt, and a roller-belt stretched over said board and suitable rollers, in combination with a mold supported on the side plates of said carriage and having a yielding bottom, a plunger arranged to press down through said mold and press the filler into said bight, and a sliding finger-roller mounted in a stationary framing, all arranged and adapted to operate as described.

5. In a cigar-bunching machine, a sliding carriage consisting of side plates and a rolling-board, and a roller-belt arranged on the board and adapted to have a bight formed therein, in combination with a removable mold having a yielding bottom and supported on said side plates and normally situated directly above the bight in said roller-belt, a plunger arranged to force the filler from said mold into said bight, a finger-roller situated above said belt, and suitable forms or molds into which the rolled bunches are discharged, and mechanism, substantially as described, for reciprocating said carriage, in the manner and for the purpose set forth.

6. In a cigar-bunching machine, the combination of a rolling-board, a roller-belt stretched over said board and around a bunching-roller, said board having an independent reciprocal movement, whereby a bight is formed between the same and said bunching-roller, a mold arranged upon the carriage and normally situated directly over said bight, and a plunger for forcing the filler into the bight, substantially as described.

7. In a cigar-bunching machine, a reciprocating carriage consisting of side plates, a rolling-board mounted between the same and capable of having a slight independent reciprocal movement imparted to it, and a roller-belt passing over said board and around suitable rollers, in combination with a finger-roller situated above said belt and mounted in a stationary framing provided with slots in which said roller slides, a filler-mold arranged on the carriage and having a yielding bottom, a plunger arranged to force the filler from said mold, a treadle, counterpoise, and connecting-rods and levers for reciprocating said carriage, substantially as described.

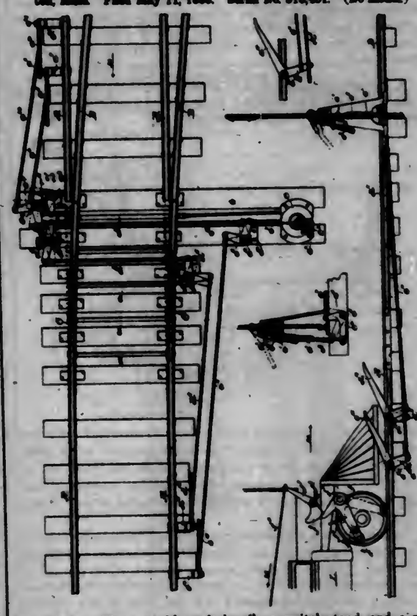
8. In a cigar-bunching machine, a reciprocating carriage consisting of side plates carrying a filler-mold having a yielding bottom and a rolling-board having an independent reciprocal movement, and a roller-belt stretched over said board and suitable rollers, in combination with a plunger for forcing the filler from said mold into the bight, a spring-actuated finger-roller situated above said belt and mounted in a stationary frame provided with slots in which said roller slides, suitable stops for holding said roller in position, and a treadle, counterpoise, and connecting-rods and levers for operating the machine, all arranged and adapted to operate in the manner and for the purpose substantially as described.



9. In a cigar-bunching machine, the combination of a hopper having a perforation in its bottom, a reciprocating carriage carrying a filler-mold, and a plate arranged to close the bottom of said hopper and having a perforation which registers with the perforation in the hopper and also that of the filler-mold, substantially as and for the purpose set forth.

10. In a cigar-bunching machine, the combination of a hopper having an opening at its bottom, a plate normally closing said opening and having a perforation arranged to register therewith, a reciprocating carriage carrying a filler-mold, a plate secured to said carriage above said mold and having an aperture arranged to register with the aperture in said upper plate, and also having elongated slots, and lugs on said upper plate sliding in said slots, in the manner and for the purpose substantially as described.

11. In a cigar-bunching machine, a hopper having a bottom consisting of a spring-actuated slide perforated to register with the filler-mold, in combination with a reciprocating carriage-frame carrying a filler-mold, a rolling-board and roller-belt, a plate covering the bottom slide of the hopper and provided with slots, and pins or lugs in said sliding bottom which engage said slots, substantially as described.

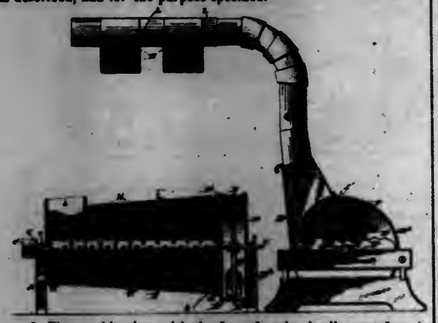


410,960. AUTOMATIC BRAKE-ADJUSTER. REMUS D. RAMEY, Watertown, assignor of one-half to William A. Foster, Corning, N. Y. Filed Sept. 22, 1888. Serial No. 286,092. (No model.)

Claim.—1. In a brake mechanism, a brake-lever, a short connection pivoted thereto, a brake-rod adapted to slide upon the short connection, a rod pivoted by means of a slot and pin to the brake-lever and having at its inner end a strap or shackle, combined with a dog applied to or within the strap or shackle and a dog or dogs applied to or within the said short connection, substantially as set forth, the first dog being adapted to grip the brake-rod as the brake-lever is moved to shorten said rod, and the second dog or dogs to detain the brake-rod and prevent its return movement upon the opposite motion of the brake-lever, as described.

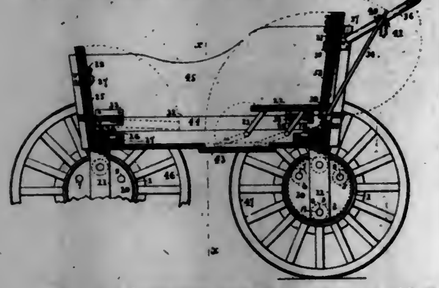
2. In a brake mechanism, a brake-lever, a brake-rod, and a shackle connected to said lever carrying a dog, combined with a second shackle, also carrying a dog, and with a link or rod connecting the brake-lever with said second shackle, the construction and operation being such that the brake-rod passing through said shackles shall be adjusted longitudinally as the result of the motion given to them by the movement of the brake-lever, substantially as set forth.

410,961. AUTOMATIC RAILWAY-SWITCH. RICHARD S. RAMSAY, Manchester, N. H., assignor of one-half to Abram W. Gilman, Boston, Mass. Filed May 11, 1888. Serial No. 310,401. (No model.)



Claim.—The movable switch-rails, a switch-stand, and a vertically-movable operating-lever, and mechanism intermediate between the said lever and switch-rails, whereby the said switch may be moved into one or another position by said operating-lever, and means controlled by the vertical movement of the said operating-lever for locking the said switch-rails in one or another position, combined with two track-levers located one at a greater distance from the switch-rails than the other and on the same side of the said switch-rails, to be acted upon and depressed by a moving train, and intermediate connecting-mechanism between the said track-levers and the said switch-rails and operating-lever, one of the said track-levers when depressed raising the operating-lever vertically to unlock the switch-rails, while the other of the said track-levers when depressed moves the said switch-rails into desired position, and means for automatically locking the switch-rails in such position, substantially as described.

410,962. SEED-COTTON CLEANER AND DISTRIBUTER. JAMES W. ELLIOTT, Columbus, TEX., assignor of one-half to George Whiting, same place. Filed May 21, 1888. Serial No. 274,371. (No model.)



Claim.—1. The combination, with the cylinder and drum, of a shaft mounted in bearings on the frame and extending through the

said cylinder and provided with the blades E of varying length, a fan located in the drum, a pipe leading tangentially out from said drum, said pipe having openings formed therein, and guides secured on said pipe over said openings, said guides having wire sides, substantially as described, and for the purpose specified.

2. The combination, with the fan, of a pipe leading out from its casing, said pipe having discharge-openings therein, and guides having bands or sleeves surrounding said openings and retained in place and allowed a lateral movement by said bands or sleeves surrounding said pipe, said sleeves being in width equal to the width of the said discharge-openings, substantially as and for the purpose specified.

410,968. FOLDING BABY-CARRIAGE. JOHN ELLIS, Jersey City, assignor of one-half to William T. Wallis, East Orange, N. J. Filed Sept. 29, 1888. Serial No. 286,720. (No model.)

Claim.—1. In combination, substantially as described, with the body of a vehicle and a wheel thereof, an arm pivoted at its upper end at or near the top of the vehicle-body, upon the lower end of which arm the wheel is journaled, and mechanism connected with said body at or near its bottom, whereby the swinging motion of said arm is stayed.

2. In combination, substantially as described, with a vehicle-body and four wheels, the forward pair being arranged to have a different width of track from the rear pair, an arm for each wheel pivoted at its top to the body of the vehicle and having at its bottom the journal of the wheel, and means connected with the body of the vehicle, whereby said arm is stayed from oscillation.

3. In combination, substantially as described, the body of a vehicle and its four wheels, an arm for each wheel pivoted to the body of the vehicle and having at its lower end the journal for the wheel, the pivots for the two arms on each side of the vehicle being separated by a distance nearly equal to the distance from each pivot to the ground.

4. In combination, substantially as described, with the body of a vehicle and a wheel thereof, an arm pivoted to the body and having at its lower end a journal for the wheel, said arm being composed of two parts, a spring interposed between the upper and lower parts of said arm, and means whereby said arm may be stayed from oscillation.

5. In a vehicle, in combination, substantially as described, with a folding body and a wheel thereof, an arm pivoted to a side of said body, so as to swing longitudinally, having the journal of the wheel at its lower end and adapted to be swung up at the side of the body.

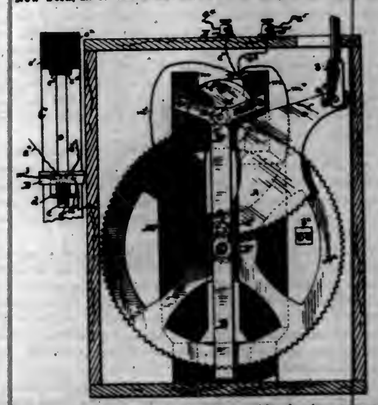
6. In combination, substantially as described, with a vehicle-body adapted to having its sides folded over upon one another, four arms, two of which are pivoted to each side and swing in parallel longitudinal planes, and four wheels journaled at the ends of said arms.

7. The combination, substantially as described, of the bottom of a body, the ends hinged thereto, the sides, each consisting of two sections hinged at different elevations above the bottom of the body, wheels, and the arms upon which the wheels are journaled, and which are pivoted to the upper sections of the sides of the body.

8. The combination, substantially as described, of the bottom of the body, the sides thereof, each composed of two sections hinged together at different elevations above the bottom, the wheels, and the arms upon which the wheels are journaled, and which are pivoted to the upper sections of the sides.

9. In a vehicle having a folding body, the combination, with each side of said body, of two arms pivoted thereto and a wheel journaled upon the end of each arm and so arranged that the wheel upon one arm may be swung up to overlap the wheel upon the other arm, substantially as described.

10. In a vehicle having a folding body, the combination, with each side of said body, substantially as described, of two arms pivoted thereto and swinging longitudinally, a wheel journaled to each arm, and mechanism whereby the oscillation of said arms may be stayed.



11. In a vehicle having a folding body, the combination, with each side of said body, of a wheel, an arm pivoted to the body and upon which the wheel is journaled, a stop, an overhanging lip, and a bolt, whereby the said arm may be held securely in a vertical position when required, substantially as described.

12. The combination, with the flexible strip 53, of a link pivotally connected with each end thereof and braces adapted to extend from the free end of each of said links outward against the said flexible strip and having one end detachably secured, substantially as described, whereby, when in use, the flexible strip is held in the bowed form adapted for a rocker and when not in use it may be permitted to straighten out and the links and braces folded thereon, as set forth.

13. In combination with a baby-carriage having folding wheels to adapt it to be converted into a cradle-body, the flexible strip 53, a link hinged to each end of said flexible strip, means for detachably securing the end of each of said links to the bottom of the cradle-body, and braces hinged to the free ends of said links and adapted to abut against the flexible strip, whereby the baby-carriage may be converted into a cradle, substantially as described.

14. In combination, the vehicle-body, the wheels thereof, the arms pivotally connected to said body and upon which the said wheels are journaled, whereby the said wheels may be swung so as to overlap each other at the sides of the body, and the rockers adapted to have attachment to said vehicle-body, whereby the same may be converted into a cradle, substantially as described.

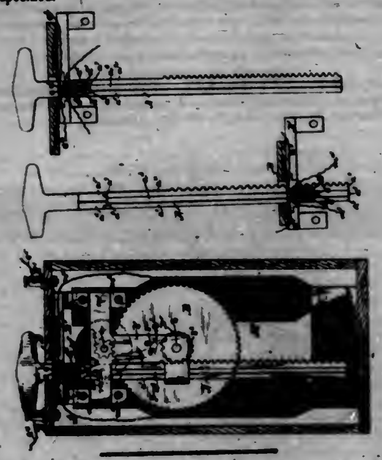
410,964. MAGNETO-ELECTRIC MACHINE. ARDEN S. PITCH, New York, N. Y. Filed June 20, 1889. Serial No. 314,949. (No model.)

Claim.—1. In a magneto-electric machine having two separate circuits, one including the rotary armature, magnet-coils, and connections inside the machine and the other comprising the working-circuit outside the machine, the combination, with the armature-operating device, of a circuit-controller common to both said circuits and having motion concurrently with said armature-operating device, and fixed contacts connected with said circuits and in electrical relation to said circuit-controller to maintain the inside circuit closed and the outside circuit open or broken during the movement of said operating device in the direction to rotate the armature and to establish electrical connection between said inside and outside circuits at the conclusion of said movement of said operating device, substantially as and for the purpose set forth.

2. In a magneto-electric machine having two separate circuits, one including the rotary armature, magnet-coils, and connections inside the machine, and the other comprising the working-circuit outside the machine, the combination, with the rotary armature-operating device adapted to rotate said armature by a single movement in one direction, of a circuit-controller common to both said circuits and carried by said armature-operating device, and having movement therewith, and comprising fixed contacts connected with said circuits and in electrical relation to said circuit-controller to maintain the inside circuit closed and the outside circuit open or broken during said movement of said operating device, and to establish electrical connection between said circuits at the conclusion of said movement, substantially as and for the purpose set forth.

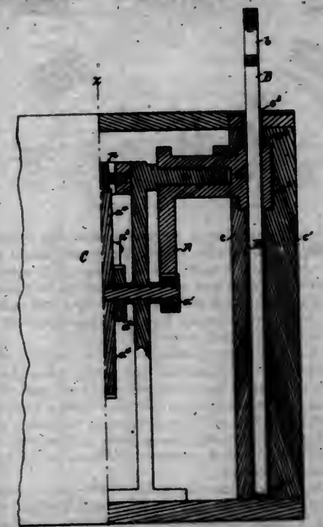
3. In a magneto-electric machine having two separate circuits, one including the rotary armature, magnet-coils, and connections inside the machine and the other comprising the working-circuit outside the machine, the combination, with the rotary armature and a pinion fixed on the arbor thereof, of a gear engaging said pinion, a clutch-pinion on the shaft of said gear and adapted to rotate said gear in one direction only, and a toothed segment engaging said clutch-pinion and adapted to rotate it through a single revolution, together with a circuit-controller common to both said circuits and carried by said segment, and adapted in its movement therewith in the direction to rotate said armature to maintain said inside circuit closed and said outside circuit open, and to establish electrical connection between said circuits at the conclusion of said movement, substantially as and for the purpose set forth.

4. In a magneto-electric machine having two separate circuits, one including the rotary armature, magnet-coils, and connections, and spring-terminals for said coils carried by an insulating-support, and the other comprising the main or working circuit having spring-terminals carried by said insulating-support, the combination, with the operating device adapted to rotate the armature by a single movement in one direction only, of a circuit-controller consisting of a metal block carried by and moving with said operating device, and provided with bearing-faces for the terminals of the magnet-circuit, and with a channel in its face for the traverse of the terminals of the working-circuit during its movement with said operating device in the direction to rotate the armature, and with insulated switch-plates adapted to engage the terminals of similar polarity of both said circuits at the conclusion of its said movement, substantially as and for the purpose set forth.



5. In a magneto-electric machine having the separate magnet-circuit and working-circuit, as described, the combination, with the rotary armature-operating device adapted to rotate said armature by a single movement in one direction, of a circuit-controller C, carried by and moving with said armature-operating device and consisting of a metal block having bearing-faces for the spring-terminals d d' of said magnet-circuit, and a channel c in its face for the traverse of spring-terminals c c' of the working-circuit during its movement with the said operating device in the direction to rotate the armature, and the switch-plates c^3 c^4, provided with the extensions c^5 c^6, adapted to enable said terminals of the magnet-circuit to establish connection with said plates before leaving said bearing-faces of the controller, and thereafter to establish connection between the terminals of similar polarity of both circuits, substantially as and for the purpose set forth.

6. In a magneto-electric machine of the class described having an inclosing-case, the combination, with the segment A, adapted to actuate the gearing by a single movement in one direction to rotate the armature, and provided with the extension-arm a^3, of a lever b', fulcrumed on the exterior of the inclosing-case, and a rod b, pivotally connecting said arm and lever through an opening in the case-wall, substantially as and for the purpose set forth.



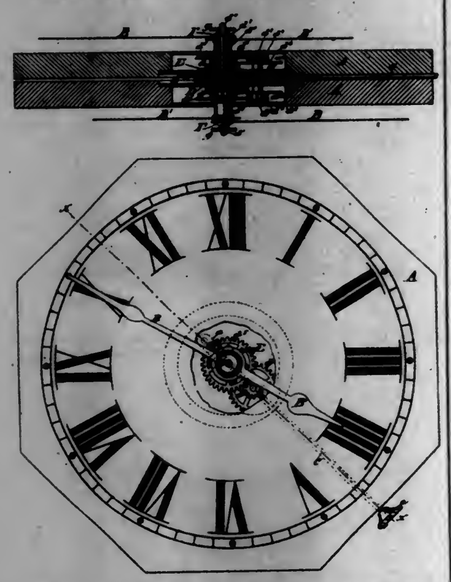
410,965. MAGNETO-ELECTRIC MACHINE. ARDEN S. PITCH, New York, N. Y. Filed June 20, 1889. Serial No. 314,950. (No model.)

Claim.—1. In a magneto-electric machine having one circuit comprising the magnet, rotary armature, and connections and another and separate circuit comprising the working-circuit, the combination, with a reciprocatory rack-bar, which operates by a single movement in one direction to rotate said armature, of a circuit-controller carried by and adapted to move concurrently with said rack-bar and fixed contacts connected with said circuits and in electrical relations with said circuit-controller to maintain said circuits, respectively, closed and open during the reciprocation of said bar, and to establish connection between said circuits at the conclusion of the movement of said bar in the direction to effect the rotation of the armature, substantially as and for the purpose specified.

2. In a magneto-electric machine having one circuit comprising the magnet-armature and connections and terminals d d' and another and separate circuit comprising the working-circuit and terminals c c', the combination, with the armature, of the reciprocatory rack-bar A, adapted by a single movement in one direction to effect the rotation of said armature, and provided with the longitudinal faces c' c^2, for engagement and traverse by said terminals d d', and the longitudinal channel c^2, for traverse by said terminals c c' during the reciprocation of the bar, together with the described plates c^3 and c^4, located on said bar to engage, respectively, the said terminals of similar polarity of both said circuits at the conclusion of said movement of said bar to effect the rotation of said armature, substantially as and for the purpose specified.

410,966. MAGNETO-ELECTRIC MACHINE. ARDEN S. PITCH, New York, N. Y. Filed Aug. 21, 1889. Serial No. 321,482. (No model.)

Claim.—1. In a magneto-electric machine, the combination, with the armature-operating device adapted to swing or rotate in its movement to operate the armature for the generation of an electric current, of a bar seated in or upon said armature-operating device and adapted to slide or move longitudinally therein and transversely thereof, substantially as and for the purpose set forth.



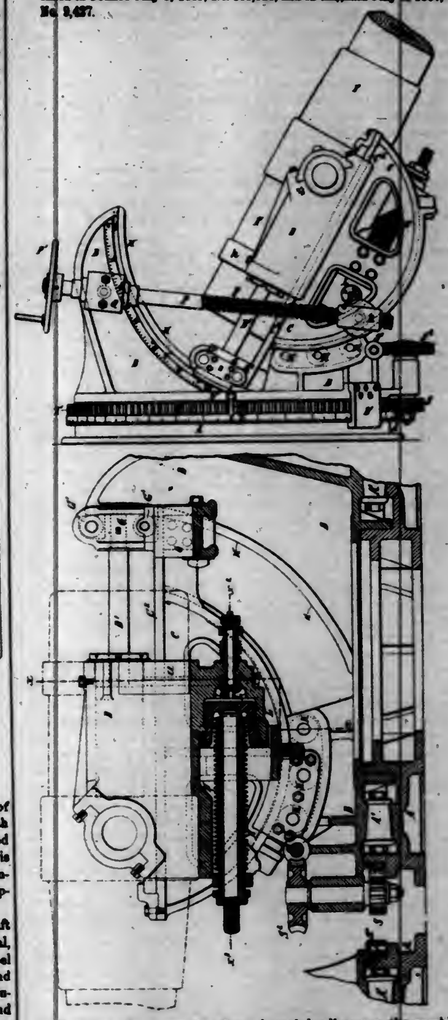
2. In a magneto-electric machine, the combination, with a journaled toothed segment for operating the rotary armature to generate an electric current, of a bar seated in or upon said segment and adapted to slide or move longitudinally therein and transversely thereof, substantially as and for the purpose set forth.

3. In a magneto-electric machine, the combination, with a journaled toothed segment for operating the rotary armature to generate an electric current and provided with a lateral extension or hub in

which is a transverse slot, of a bar seated in and adapted to play longitudinally in said slot in said hub, substantially as and for the purpose set forth.

4. In a magneto-electric machine, the combination, with a journaled toothed segment for operating the rotary armature to generate an electric current and provided with a laterally-extended hub having a transverse slot, of an inclosing-case having therein an apertured partition through which said hub extends and in which it has bearing, together with a bar seated and having play longitudinally in said slotted hub outside said partition, and a lid or wall on said case provided with a slotted aperture to permit the bar to project exteriorly of the inclosing-case, substantially as and for the purpose set forth.

410,967. TIME-INDICATOR. PETER G. GHOUD, Brooklyn, assignor to the New York School Book Clearing House, New York, N. Y. Filed Jan. 28, 1889. Serial No. 297,361. (No model.)



Claim.—1. In a time-indicator, the combination, with a dial, of a shaft extending to the exterior of the indicator and parallel with the said dial, a gear-wheel on said shaft, a cannon-pinion operated from said gear-wheel, a fixed stud upon which said cannon-pinion is loosely mounted, a minute-hand deriving motion from said cannon-pinion, and a train of gears operated from the cannon-pinion to operate an hour-hand, substantially as specified.

2. In a time-indicator, the combination, with a dial, of a shaft extending to the exterior of the indicator and parallel with said dial, a gear-wheel on said shaft, a layer-wheel with which said gear-wheel engages, a cannon-pinion connected to said layer-wheel, a fixed stud upon which said layer-wheel and cannon-pinion are mounted, a minute-hand deriving motion from said cannon-pinion, an hour-hand, and a train of gears operated from the cannon-pinion to operate the hour-hand, substantially as specified.

3. In a time-indicator, the combination, with a dial, of a shaft extending to the exterior of the indicator and parallel with said dial, a gear-wheel on said shaft, a cannon-pinion operated from said gear-wheel, a fixed stud upon which said cannon-pinion is mounted, a spring placed upon said stud, so as not to be capable of rotation, said spring being outside the minute-hand and bearing against the same, and a nut engaging said stud outside said spring, substantially as specified.

4. In a time-indicator, the combination, with a back plate, of a shaft extending to the exterior of the indicator, a gear-wheel mounted on said shaft, a stud rigidly secured in said back plate, a cannon-pinion loosely mounted on said stud and with which said gear-wheel engages, a minute-hand deriving motion from said cannon-pinion, an hour-hand, a train of gears operated from the cannon-pinion to operate the hour-hand, and a spring arranged intermediate of said cannon-pinion and back plate, substantially as and for the purpose specified.

410,968. GUN-CARRIAGE. JEAN B. G. A. CANET, Paris, France, assignor of one-half to Sir Joseph Whitworth & Co., (Limited,) Manchester, England. Filed July 11, 1888. Serial No. 279,602. (No model.) Patented in France July 3, 1886, No. 169,981, and in England July 3, 1887, No. 9,427.

Claim.—1. In a mounting for a breech-loading gun, the combination of a cradle or its equivalent in which the gun is mounted, and which is open at the rear to permit access to the breech of the gun, a top carriage having a bearing surface or slide upon which the said cradle is supported and moves in the recoil, and a base or under carriage upon which the said top carriage is supported and is arranged to turn about a horizontal axis extending through a point between the ends of the said bearing surface or slide, for the purposes above specified.

2. In a mounting for a breech-loading gun, the combination of a cradle or its equivalent in which the gun is mounted, and which is open at the rear to permit access to the breech of the gun, a top carriage having bearing-surfaces or slides upon which the said cradle is supported and moves in the recoil, an under carriage provided with bearing-surfaces on which the said top carriage is movable (for elevating the gun) through an arc of a circle the chord of which is in a plane extending through or parallel to the said bearing surfaces or slides on the top carriage, and a brake for controlling the recoil and return movement of the gun, for the purposes above specified.

3. In a gun-mounting, the combination of a cradle or frame in which the gun is rigidly secured, cheeks upon which the said cradle or frame is supported and arranged to slide, and an under carriage upon which the said cheeks are supported and are arranged to turn about a horizontal axis intersecting the longitudinal axis of the gun, substantially as and for the purposes set forth.

4. In a gun-mounting, the combination of a cradle or frame in which the gun is mounted, segmental cheeks upon which the said cradle or frame is supported and arranged to slide, an under carriage upon which the said cheeks are supported and are movable about a horizontal axis, a hydraulic brake for controlling the recoil movement of the said cradle upon the said cheeks, and a recuperator connected by suitable channels or passages with the cylinder of the said brake, for effecting the return movement of the said cradle after the recoil, substantially as and for the purposes set forth.

5. In a gun-mounting, the combination of a cradle or equivalent support for the gun, a segmental top carriage upon which the said cradle is supported and arranged to slide, an under carriage upon which the said top carriage is supported and is movable through an arc of a circle, and elevating mechanism comprising a screw fitted to rotate in a bearing attached to the said under carriage, and a nut in which the said screw works and which is attached to the top carriage, the said nut being made in halves, substantially as above described, so that the gun after being elevated may be released to permit its return to the loading position by gravity, as above specified.

6. In a gun-mounting, the combination of a cradle or equivalent support for the gun, a top carriage upon which the said cradle is supported and arranged to slide, an under carriage upon which the said top carriage is supported and is movable through an arc of a circle, an elevating-screw, a bearing in which the said screw is fitted to rotate and which is attached to the said under carriage so that it is capable of angular movement or adjustment, and a nut in which the said screw works and which is attached to the said top carriage so that it is capable of angular movement or adjustment, substantially as and for the purposes set forth.

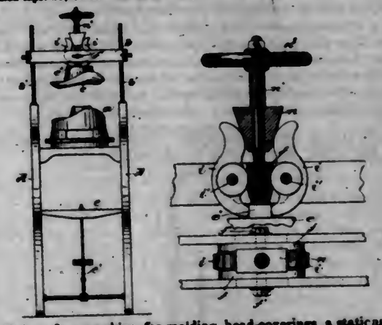
7. In a gun-mounting, the combination of a cradle or equivalent support for the gun, a top carriage upon which the said cradle is supported and arranged to slide, an under carriage upon which the said top carriage is supported and is movable through an arc of a circle, an elevating-screw, a bearing in which the said screw is fitted to rotate and which is attached to the said under carriage so that it is capable of angular movement or adjustment, a nut in which the said screw works and which is attached to the said top carriage so that it is capable of angular movement or adjustment, and means, substantially such as above described, for releasing or disengaging the said nut from the said screw, substantially as and for the purposes set forth.

8. In a gun-mounting, the combination of a cradle for the gun, a top carriage provided with a bearing surface or slide upon which the said cradle is supported and moves in the recoil, an under carriage upon which the said top carriage is supported and is movable about a horizontal axis extending through a point between the ends of the said bearing surface or slide, a brake for controlling the movement of the said cradle upon the top carriage, and a recuperator connected with the said brake, and whereby the gun, after its recoil, will be automatically run out to the firing position at any angle of elevation, the center of gravity of the gun, cradle, and top carriage when the gun is run out being forward of the said horizontal axis, so that the gun will gravitate to the loading position, but being sufficiently near to the said axis to insure the gravitation of the gun to its firing angle when loaded, substantially as and for the purposes set forth.

9. In a gun-mounting, the combination of a cradle for the gun, a segmental top carriage upon which the said cradle is supported and arranged to slide, and an under carriage or turn-table provided with arc-shaped bearing-surfaces upon which the said top carriage is supported and against which the force of the recoil is exerted, substantially as and for the purposes set forth.

10. In a gun-mounting, the combination of a cradle for the gun, bearing surfaces or slides upon which the said cradle is supported and moves in the recoil, hydraulic brakes for controlling the recoil movement of the cradle on the said slides, and means, comprising a cylinder L, connected with the brake-cylinders, and a piston M, working in the said cylinder L, substantially as above described, for storing up energy during the recoil and utilizing such energy for effecting the return of the gun to its firing position, all substantially as set forth.

11. In a gun-mounting, the combination of a cradle for the gun, bearing surfaces or slides upon which the said cradle is supported and moves in the recoil, hydraulic brakes for controlling the recoil movement of the cradle on the slides, means, comprising a cylinder L, connected with the brake-cylinders, and a piston M, working in the said cylinder L, substantially as above described, for storing up energy during the recoil and utilizing such energy for effecting the return of the gun to its firing position, a loaded valve which permits the flow of liquid from the brakes into the said cylinder L, but prevents its return to the said brakes, and a by-pass provided with an adjustable valve for permitting and controlling the return of the liquid from the said cylinder to the brakes, all substantially as and for the purposes set forth.



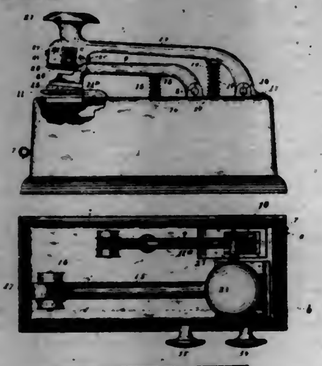
12. The combination of the base-plate A, the turn-table or under carriage B, supported thereon, the segmental cheeks C C', supported on the said turn-table and arranged to turn about a horizontal axis, the cradle E, arranged to slide upon the said cheeks, hydraulic brakes D, for controlling the movement of the said cradle on the said cheeks, means, comprising a cylinder L, connected with the brake-cylinders, and a piston M, working in the said cylinder L, substantially as above described, for storing up energy during the recoil and utilizing it to effect the return of the gun to the firing position, and elevating mechanism comprising a screw-shaft P, a bearing Q, in which the said screw-shaft turns and which is secured in the under carriage, and a nut through which the said screw-shaft works and which is secured in one of the said cheeks, the said bearing and nut being capable of angular movement, all substantially as and for the purposes set forth.

13. The combination of the under carriage B, the cheeks C C', provided with bearing surfaces or slides and supported upon the said under carriage so that they are movable thereon through an arc of a circle, the cradle E, supported upon the said bearing surfaces or slides and arranged to move thereon in the recoil, the screw P, the bearing Q, in which the said screw is fitted to rotate and which is attached to the said under carriage so that it is capable of angular movement or adjustment, a nut in which the said screw works and which is formed in two parts connected by a hinge-joint and is attached to one of the said cheeks so that it is capable of angular movement or adjustment, the cam *f*, connected with the two parts of the said nut by screws *g*, extending through slots in the said cam, and the lever f^2, for operating the said cam, all substantially as and for the purposes set forth.

14. The combination of the under carriage B, provided with the arc-shaped bearing-surfaces H and with the rollers K, the segmental cheeks C C', provided with the brackets G and rollers G', the cradle E, provided with the brakes D, the piston-rods D' of which are fixed in the said brackets G, and means, substantially such as above described, for turning the said cheeks about a horizontal axis, substantially as and for the purposes set forth.

15. The combination of the under carriage B, the cheeks C C', the cradle E, provided with the hydraulic brakes D, means, comprising the cylinder L, connected with the brake-cylinders, and the piston M, working in the said cylinder L, substantially as above described, for storing up energy during the recoil and utilizing it for effecting the return of the gun to its firing position, the loaded valve O, and the by-pass *b*, provided with the adjustable valve *c*, all substantially as and for the purposes set forth.

410,969. RAT-HOLDING MACHINE. JAMES HEDGES, Foxborough, Mass., assignor of three-fourths to Green Bros., Kirby & Co., same place. Filed Apr. 26, 1889. Serial No. 308,603. (No model.)



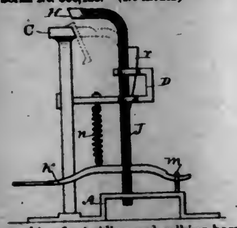
Claim.—In a machine for molding head-coverings, a stationary mold, a reciprocating crown-head, and a movable mold detachably connected to said crown-head by means of the grippers *i*, pivoted in said crown-head, the wedge-block *n*, interposed between the grippers, and the rod *n'*, screw-tapped in a nut in the crown-head and carrying the wedge-block and adapted to be rotated to adjust the wedge-block vertically between the grippers to engage and release the movable block, substantially as described.

410,970. COMBINED DATING AND CUTTING MACHINE. GEORGE J. HILL, Buffalo, N. Y., assignor of two-thirds to John T. Story, Albert B. Fox, and Frederick G. Fox, all of same place. Filed Oct. 20, 1887. Renewed June 7, 1889. Serial No. 313,495. (No model.)

Claim.—A dating and cutting press consisting of the base or body, a dating-die, an ink-ribbon for supplying it with ink, a pivoted

arm kept up to its normal position by a spring and carrying a platen and side projecting piece 27, in combination with a pivoted arm kept to its upward position by a spring, a cutting-die, and a drawer provided with a lock for receiving the cuttings, substantially as and for the purposes described.

410,971. CURRY-COMB. FREDERICK W. HOSFER, Freeport, Ill. Filed May 7, 1889. Serial No. 309,877. (No model.)



Claim.—1. The combination, with the parallel toothed ribs, of the transverse spring-coils secured to the ribs, covering their ends and cushioning the lateral margins of the comb, substantially as set forth.

2. The combination, with the parallel toothed ribs and the spring-coils passed, respectively, through apertures in the opposite ends of the ribs, of the hand-loop of spring-wire engaging said coils and bending back and forth in substantially the same plane.

3. The combination, with a series of parallel toothed ribs lying in the same plane, and a handle-loop substantially parallel to said ribs, of two transverse coiled springs having their spirals passed through apertures in the corresponding ends of the handle-loop and the ribs, whereby all the parts are united, forming a curry-comb flexible along lines parallel to the handle-loop, substantially as set forth.

410,972. HORSESHOE-ANVIL. JACOB HOSER, Anita, Iowa. Filed Apr. 5, 1889. Serial No. 306,135. (No model.)

Claim.—1. A machine for holding and calking horseshoes, comprising an anvil on the top of a post fixed to a suitable base, a frame and bearing fixed to the post to support a staff carrying a jaw, a jaw or clamping device adapted to engage the anvil and provided with a supporting-staff that extends down through the bearing, a cam fixed to the staff to press it toward the anvil as the staff descends in its bearing, a treadle pivoted to the staff and connected with the base, and a spring connected with the treadle to lift the staff and jaw constructed and combined to operate in the manner set forth, for the purposes stated.

2. The base A, the post B, having an anvil C on its top, the frame D, fixed to the post, the jaw H on a staff J, having a cam *r*, the treadle *k*, and a spring *n*, constructed, arranged, and combined substantially as shown and described, to operate in the manner set forth, for the purpose stated.

410,973. APPARATUS FOR SCORING BILLIARDS. WILLIAM HIGGINS, Liverpool, County of Lancaster, England. Filed Nov. 30, 1888. Serial No. 292,355. (No model.) Patented in England Apr. 30, 1888, No. 6,163.

Claim.—1. The combination, with the closed case, the scale thereon, and the pointers sliding over the scale to register points made, of a visibly-registering device and a registering device concealed within the case, each actuated by the movement of a pointer to the limit of its path, substantially as set forth, whereby the games completed are registered both visibly and secretly by means beyond the reach of the players or other unauthorized persons.

2. The combination, with a closed case provided with an external point-scoring scale and having its walls slotted parallel to said scale, of bars sliding in the slots, respectively, pointers fixed to the outer ends of the bars to pass along the scale, numbers upon the exterior of the case, pivoted disks normally concealing said numbers, and means whereby each bar, when pushed to its limit, may release the corresponding disk, allowing it to fall and display the concealed number beneath, substantially as set forth.

3. The combination, with the closed case provided with the hopper at the top and the locked compartment at the bottom, of the hopper-slide and its lever operated only from said compartment, the downwardly-inclined conduit leading from the hopper to a point above the compartment, the perforated spring-supported valve-bar closing the lower end of said conduit, the balls lying in said conduit, the cut-out block secured to the valve-bar, and the scoring-pointers automatically actuating said valve-bar when pushed forward in scoring, substantially as set forth.

4. The combination, with the case provided with the scale and the parallel slots upon each side thereof, of the bars sliding in the slots, respectively, the pointers upon the outer ends of the bars, the rollers upon the inner ends of the bars, the pivoted spring-actuated T-shaped bar normally obstructing the path of the rollers, and the key adapted to hold said bar out of its normal position, substantially as set forth.

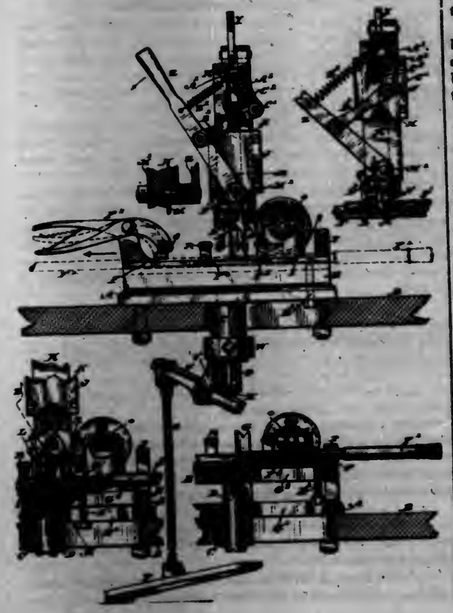
5. The combination of the case, the ball-conduit therein, the balls moving freely in the conduit, the spring-supported valve-bar closing the exit from said conduit, the locked compartment below the exit, the external scale upon the case, the pointers passing along the scale, the internal rollers carried with the pointers, and the oblique pivoted levers crossing the path of the rollers and engaging said valve-bar, substantially as and for the purpose set forth.

410,974. SUPPORT FOR SPINNING-SPINDLES. GILMAN JACKSON, Roller Springs, Ill., assignor to George Draper & Sons, Hopedale, Mass. Filed Nov. 3, 1887. Serial No. 254,159. (No model.) Patented in England June 6, 1888, No. 8,893.

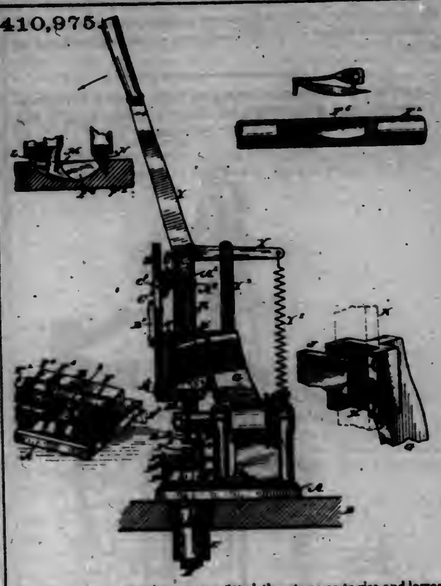
Claim.—The supporting-tube, an upper bearing, and a loose step therein, and an elastic support therefor, combined with a spindle free to move laterally at its lower end and having a conical point projecting slightly into the step, thereby enabling the lower end of the spindle to tip the step, as described.

410,975. MACHINE FOR SLOTTING UMBRELLA-STICKS. JOHN B. JESSOP, Camden, N. J., and JACOB K. WEBB, Philadelphia, Pa., assignors of one-third to Leonard H. Ladd, Philadelphia, Pa. Filed Feb. 27, 1889. Serial No. 301,204. (No model.)

Claim.—1. A machine for slotting umbrella-sticks, &c., having a base, a rising and falling table, a slide working on said table and provided with a clamping device, and a plunger with cutters above said table, said parts being combined substantially as described.



2. A machine for slotting umbrella-sticks, &c., having a base, a rising and falling table guided on said base, a channeled slide working on said table and provided with a clamping device secured thereto and adapted to hold the stick operated on in position, a rotary saw journaled above said table, and a stop above and connected with said base for limiting the rising motion of the said table, said parts being combined substantially as described.



3. A machine for slotting umbrella-sticks, &c., having a base, a rising and falling table guided on said base, a channeled slide working on said table, a rising and falling plunger working in a guide secured to the device, said guide being above the table and said plunger carrying cutters, and a rotary saw journaled in bearings secured to the base, said parts being combined substantially as described.

4. A saw, a rising and falling table, and a slide on said table, in combination with a plunger above said slide carrying a cutter which is adapted to vibrate thereon, whereby a kerf may be formed by said saw, and one end of the same gouged out by said cutter, substantially as described.

5. A plunger carrying two cutters, and a vibrating cutter between the same, said parts being combined substantially as described.

6. A vibrating cutter mounted upon a plunger, and a rising and falling cutter fitted to said plunger, said parts being combined substantially as described.

7. A plunger having a cutter fitted thereto so as to rise and lower, in combination with a cam which engages with the shank or stock of said cutter, and a lever for operating said cam, substantially as described.

8. A plunger having a vibrating cutter mounted thereon, and a rising and falling cutter fitted thereto, in combination with a cam which engages with the shank or stock of the rising and falling cutter, and a lever which is connected with the shafts of the vibrating cutter, and the cam for simultaneously operating both shafts and their connected parts, substantially as described.

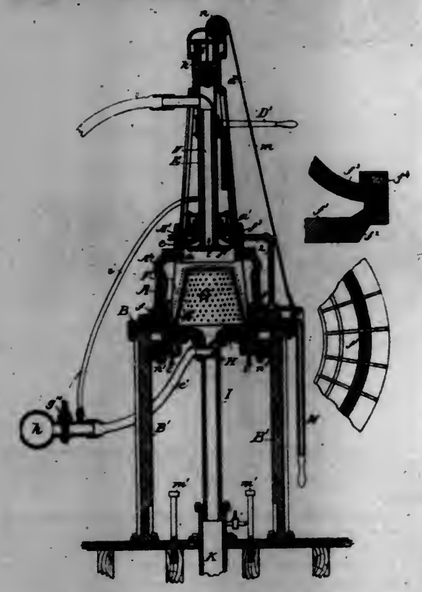
9. A rising and falling table, a slide fitted on said table, and a saw mounted above the slide, in combination with a plunger carrying cutters adapted to pierce the wood at the end of the kerf formed by the saw, and a vibrating cutter fitted between said cutters adapted to gouge the wood at one end of said kerf.

10. A rising and falling table, and a slide fitted thereon, in combination with a bolt which depends from said slide and passes through slots in the table and base of the machine, one end of the slot in the base being enlarged to permit the head of the bolt to pass through the same when the table is properly raised, substantially as described.

11. A plunger carrying a vibrating cutter and a rising and falling cutter, in combination with a cam which engages with the shank or stock of said rising and falling cutter, a lever which is connected with the axis of said cutter, and a toggle, one limb of which is secured to the axis of the cam and the other limb pivoted to said lever for simultaneously operating both cutters, substantially as described.

12. A rising and falling table, cutters above the same, a rising and falling plunger carrying saw, and a cutter, in combination with a stop connected with said table, whereby the article that has been cut is stripped off the cutter when the plunger rises, substantially as described.

13. A saw, a rising and falling table, and a cutter, in combination with the stop P, rising from the base or bed of the machine, and the stop R, rising from said table, substantially as described.



410,976. DIAPHRAGM FOR ELECTROLYTIC APPARATUS. GEO. KREBS, Frankfort-on-the-Main, Prussia, and JULIUS MARX, Ulm-on-the-Danube, Würtemburg, Germany. Filed Jan. 9, 1889. Serial No. 296,908. (No model.) Patented in France Dec. 14, 1887, No. 187,009; in Italy June 19, 1888, XXII, 23,169, XLVI, 191, and in Belgium July 4, 1888.

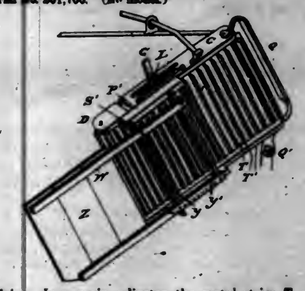
Claim.—In electrolytic apparatus, a diaphragm consisting of a liquid inclosed between two or more partitions having perforations therethrough of considerable size, which are too large to act osmotic-

ally by themselves, in contradistinction to diaphragms of porous clay or animal membrane, or similar partitions, as fully set forth and described.

410,977. MACHINE FOR MOLDING PULP. FRANK. H. KEYES, Peterborough, assignor of one-half to P. C. Cheney Co., Manchester, N. H. Filed June 6, 1887. Serial No. 240,621. (No model.)

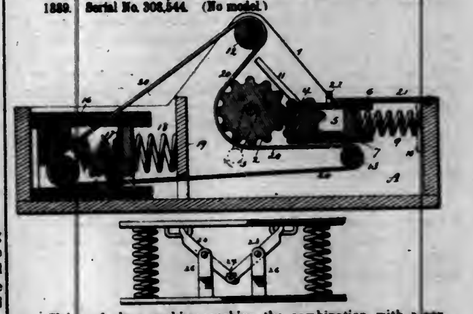
Claim.—1. The combination of the former, the chamber inclosing the same and provided with a cylinder located above the former, the flexible partition or diaphragm surrounding the former and connected at the ends with said chamber, the independently-movable end piece operated in said cylinder, and means for operating said end piece and diaphragm, substantially as described.

2. The combination of the former, the chamber inclosing the same and provided with a cylinder located above the former, the flexible partition or diaphragm surrounding the former, and the piston having a working fit in said cylinder, and a perforated piece fitted in said cylinder and connected with said piston, a chamber or recess between said piston and perforated piece, and means for producing suction in the said chamber, substantially as described.



3. In a pulp-molding machine, the combination of a former to support the material while being acted upon, a flexible partition surrounding the former, an outer chamber A, provided at its upper end with an enlargement A^3 to admit of an increased deposit of material on the former opposite the same, and means for forcing fluid in said chamber, to apply pressure to the material on the former through the flexible partitions, substantially as described.

410,978. DEVICE FOR TYING BAGS. MADISON C. KIMBALL, Elkhead, Pa., assignor of one-half to Charles L. Pattison, same place. Filed July 12, 1889. Serial No. 317,330. (No model.)



Claim.—The bag or package fastener consisting of the double binding-cord and the link or clasp having its sides curved outward in opposite directions at the center, forming seats or bearings for the said cord, said cord being passed before doubling through said link or clasp, substantially as set forth.

410,979. GRAIN-ADJUSTER. THOMAS B. KIRKWOOD, Milton, Ind., assignor of one-half to Henry Stokes, same place. Filed Jan. 29, 1889. Serial No. 261,706. (No model.)

Claim.—In a grain-adjuster, the metal stripe T, with edge T', bent at right angles, fastened by rivets *u* to leather bands V V, the lever G, bearing I, extension-bar H, with notch M, the cross-pieces E F, connecting the sides of the frame A B C D, the pieces A C and B D being formed with slot J in side piece C for receiving lever G, and with grooves O O in side pieces A B C D of frame, and the slides N N, working therein, substantially as and for the purposes therein named.

410,980. WASHING-MACHINE. HENRY W. KRISTE, Charleston, S. C., assignor to Laura Frances Kriste, same place. Filed Apr. 26, 1889. Serial No. 308,544. (No model.)

Claim.—1. In a washing-machine, the combination, with a corrugated washing-roller journaled in fixed bearings, and a corrugated washing-roller mounted in yielding bearings, and idle-rollers, one of said idle-rollers being mounted in yielding bearings, of an endless belt passing around the idle-rollers and partially around the washing-roller mounted in fixed bearings, substantially as set forth.

2. In a washing-machine, the combination, with a pair of corrugated washing-rollers, and idle-rollers, of an endless belt passed around the idle-rollers, and spring-cushions for one of the corrugated rollers and one of the idle-rollers, substantially as set forth.

3. In a washing-machine, the combination, with a box and frame, of a pair of corrugated rollers mounted therein, a spring-cushion for forcing one of said rollers toward the other, idle-rollers, an endless belt passing around the idle-rollers and bearing against one of the corrugated rollers, and a spring-cushion for one of the idle-rollers, whereby the endless belt is maintained under tension, substantially as set forth.

4. In a washing-machine, the combination, with a water-tight box, a frame projecting from the top of the box, and a pair of corrugated washing-rollers, one of which has a spring-cushion back of it, of an idle-roller in the top of the frame, one in the bottom and forward end, and a spring-cushioned one in the rear end, and an endless belt passed over the idle-rollers and in contact with one of the corrugated rollers, substantially as set forth.

5. In a washing-machine, the combination, with a water-tight box, a frame, and a pair of corrugated washing-rollers, one of said rollers being journaled in spring-cushioned slide-blocks, of idle-rollers, one of which is journaled in spring-cushioned slide-blocks, an endless belt, and a pivoted cover, substantially as set forth.

6. In a washing-machine, the combination, with a box, corrugated and idle rollers, of an endless belt, and spring-cushions consisting of cross-pieces, springs, and balance-levers between these springs, substantially as set forth.

7. In a washing-machine, the combination, with corrugated washing-rollers, idle-rollers, and an endless belt passing around said idle-rollers and bearing against one of the corrugated rollers, of guard-fingers projecting over one of the corrugated rollers, substantially as set forth.

410,981. AUTOMATIC RACE-COURSE. FRED H. LAPE, Minneapolis, Minn., assignor to the National Automatic Device Company, same place. Filed Feb. 21, 1889. Serial No. 300,760. (No model.)

Claim.—1. In a toy race-track, the combination, with a rotary shaft, of arms or rods journaled thereon and carrying miniature figures, and means for securing the arms to said shaft during its period of rotation and for releasing them therefrom when the motion of the shaft is arrested, so that they can revolve thereon by acquired momentum, substantially as and for the purpose set forth.

2. The combination, with a revolvable shaft and actuating mechanism therefor, of one or more collars loosely mounted on said shaft, each having a figure connected therewith, and escapement and clamping devices for temporarily releasing the actuating mechanism and locking said collars to the shaft, substantially as described.

3. The combination, with a revolvable shaft under tension, of one or more collars loosely mounted on said shaft, each having a figure connected therewith, and escapement and clamping devices for temporarily releasing said shaft and locking said collars to the shaft, substantially as described.

4. The combination, with a revolvable shaft under tension, of one or more collars loosely mounted on said shaft, each having a figure connected therewith, escapement and clamping devices for temporarily releasing said shaft and locking said collars to the shaft, and a coin-controlled device for operating said escapement and clamping devices, substantially as described.

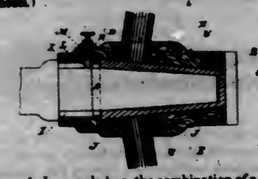
5. The combination, with a graduated or shouldered shaft under tension, of a series of collars loosely mounted on said shaft, each having a figure connected therewith, and escapement and clamping devices for temporarily releasing said shaft and clamping said collars to the shaft, substantially as described.

6. The combination, with a shaft under tension, of a series of collars loosely mounted on said shaft, each having a figure connected therewith, an escapement-wheel for said shaft, and a lever for controlling said escapement and for clamping said collars to said shaft, substantially as described.

7. The combination, with a graduated or shouldered shaft under tension, of a series of collars loosely mounted thereon, each having a figure connected therewith, an escapement-wheel for said shaft, a lever for controlling said escapement and for clamping said collars together and to the shaft, and a coin-controlled device for operating said lever, substantially as described.

8. The combination, with a graduated or shouldered shaft under tension, of collars loosely mounted thereon, having figures connected therewith, the escapement-wheel for said shaft, the combined escapement and clamping lever, and the controlling and tripping cylinder having a coin-slot adapted to hold a coin in position to operate said lever as the cylinder is revolved to drop the coin, substantially as described.

410,982. COMPOUND SPINNING-SPINDLE. JAMES LEES, Lucknow, Ontario, Canada, assignor to George Draper & Sons, Hopedale, Mass. Filed June 5, 1889. Serial No. 313,167. (No model.)

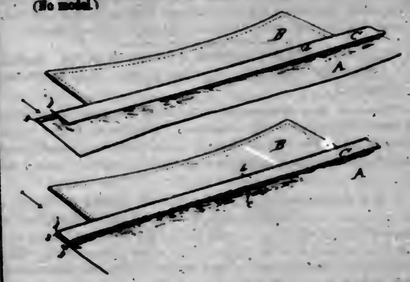


Claim.—1. The socketed or chambered whirl-section and bearings therefor, combined with a bobbin-carrying section mounted loosely in the socket of the whirl-section, and a friction-block interposed between the lower end of the bobbin-carrying section and a part of the whirl-section on which the bobbin-carrying section rests, substantially as described.

2. The socketed or chambered whirl-section and bearings therefor, combined with a bobbin-carrying section mounted loosely in the socket of the whirl-section, and with a friction-block *c*, and a flexible or yielding packing, as *c'*, interposed between the said whirl-section and bobbin-carrying section, substantially as described.

3. The combination, with the chambered whirl-section and bearing therefor, and a bobbin-carrying section mounted loosely in the socket of the whirl-section, of the flexible section connected at one end positively to the chambered whirl-section and at its other end to the bobbin-carrying section, and having an intermediate flexible section *f'* to permit the bobbin-carrying section to tip freely laterally in any direction, substantially as described.

410,988. HUB-ATTACHING DEVICE. JOHN H. LYLE and EDWARD C. WARD, Parsons, Kans. Filed Sept. 17, 1888. Serial No. 286,001. (No model.)



Claim.—1. In an axle-box, the combination of a continuous groove around the inside of an axle-box with one or more grooves running from the said continuous groove to the end of the axle-box, adapted to admit lugs made or put on a spindle, or to admit the ends of a pin extending through a spindle and forming pins or lugs thereon, and also adapted for conducting oil or other lubricator from an axle-box to and lubricating the shoulder of a spindle or axle, against which the hub rubs while revolving.

2. The combination of a screw-lever mounted on the side of a hub with a lock-bolt to be operated through the side of an axle-box and hub, or either of them, whereby when said screw-lever is turned the said lock-bolt is pressed into or drawn out of a groove or other opening, substantially as and for the purpose hereinbefore specified.

3. In a hub-fastening device, the combination, with a spindle having lugs thereon, or having a pin through it to form one or more lugs thereon, of an axle-box having a continuous groove around its inside, with one or more longitudinal grooves running from said continuous groove to the end of the axle-box, adapted to let the axle-box pass over said lugs and admit said lugs into said continuous groove to operate therein as the hub revolves over them around the spindle, and having a hole through the side of the axle-box, and with a screw-lever mounted on the side of the hub, and connected with a lock-bolt and operated through the side of the hub and axle-box, or through either of them, by simply turning said screw-lever, whereby the said lock-bolt is lowered into the axle-box and securely locks said lugs in said continuous groove, and thus fastens the hub, or whereby by simply turning said screw-lever the reverse way said lock-bolt is drawn out, and thus the hub is unfastened, so that it can be pulled off of the spindle, substantially as and for the purpose specified.

410,984. WOOLEN SHIRT. SOLON MARSH, Chicago, Ill., assignor to Henry H. Hart, same place. Filed Mar. 8, 1889. Serial No. 302,867. (No model.)

Claim.—The combination, in a shirt composed of woolen fabric provided with an inelastic fortifying neck-strip overlying the collar its full length, the upper edge of the shirt-body being overturned to form a welt *w*, the upper edge of said strip being overturned to form welt *w'*, the collar B, having its lower edge interposed between the said welts, firmly held in position by a continuous line of stitching *b*, extending through said welts and collar, and a welt w^3, composed of a return at the lower edge of the strip C, said welt w^3 being connected to the body A by a continuous row of stitching *c*, substantially as described.

410,985. NUT-WRENCH. JOHN B. HEIM, Port Huron, Mich., assignor of one-half to Benj. J. Kaiser. Filed Mar. 21, 1889. Serial No. 304,202. (No model.)

Claim.—1. A wrench comprising the jaw G, having shank *g* and teeth *g'* on the rear portion of shank *g*, the part A, having jaw D, groove J', and apertured head C, the said aperture and groove J' being in line and adapted to receive shank *g*, and the part B, symmetrical with the grooved part of A, hinged to the head C, and having a corresponding groove J and a toothed portion A, substantially as described.

2. The hereinbefore-described wrench, consisting of the parts A and B, which form the handle, the part A having groove J' in its rear portion, jaw D and apertured head C at its front end, the part B being symmetrical with the rear groove part *g* A and having groove J and toothed portion A hinged to the head C, the spring F and catch E, and the jaw G, having shank *g*, which is adapted to work in the apertured head C and in the grooves J J', said shank having teeth *g'*, substantially as described.

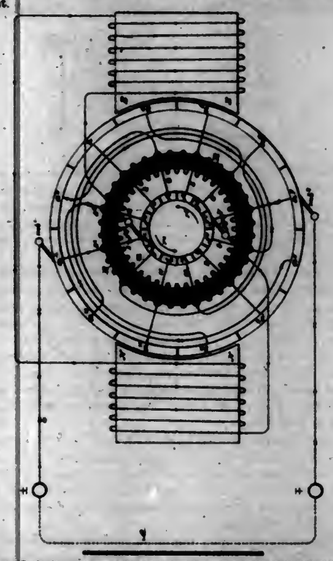
410,986. CARRYING-SHEAVE. ANTON MILL, Cincinnati, Ohio, assignor of one-half to Herman Bruckman, same place. Filed Dec. 8, 1888. Serial No. 292,996. (No model.)

Claim.—1. A sectional pulley consisting of the rim 3, having an annular concave seat in one side and formed integral with the spokes 2 and hub 1, the rim 4, having an annular convex bearing fitting the concave seat and formed with inwardly-projecting lugs 5, and bolts engaging the lugs and connecting the rims together, substantially as described.

2. A sectional pulley consisting of the rim 3, having an annular concave seat in one side and formed integral with the spokes 2 and hub 1, the detachable rim 4, having an annular convex bearing fitting the concave seat and formed with the wearing-groove 6 entirely within it, and bolts 7, uniting the rims, substantially as described.

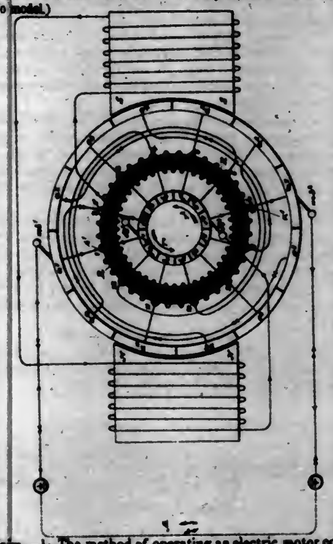
3. A sectional pulley consisting of the rim 3, formed integral with the spokes 2 and hub 1, the rim 4, formed with the cable receiving and bearing groove 6 entirely within it, and having its inside provided with inwardly-projecting lugs 5, coincident with the spokes, and bolts 7, connecting the lugs with the spokes, substantially as described.

410,987. DYNAMO-ELECTRIC MACHINE OR MOTOR. FRANCIS J. PATTEN, New York, N. Y. Filed July 3, 1889. Serial No. 316,894. (No model.)



Claim.—1. In a dynamo-electric machine or motor, a Gramme-ring armature provided with a collector the adjacent bars of which are connected to the ring-winding at points respectively contiguous to and opposite to the said adjacent segments in rotation around the ring.

2. In a dynamo-electric machine or motor, a Gramme ring provided with two sets of collector-bars, the bars of one set connected to successive coils of the ring in rotation and the other set having adjacent bars connected to the ring-winding at points respectively contiguous to and opposite to the said adjacent segments in rotation around the ring.



3. In a dynamo-electric machine or motor, an armature provided with a commutator or collector the adjacent bars of which are connected to the ring-winding at points respectively contiguous to and opposite to the said adjacent segments in rotation around the ring.

4. A dynamo-electric machine or motor provided with two sets of collector-bars, one set having adjacent bars connected to successive points of the armature-winding in rotation, the other set having adjacent bars connected alternately to points of the ring-winding contiguous to and opposite to the said bars in rotation around the ring.

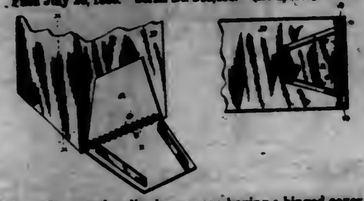
5. In a dynamo-electric machine or motor, an armature provided with two sets of collectors or commutators and two pairs of brushes, one collector having successive bars or segments connected in rotation to successive points of the armature-winding and the brushes bearing thereon connected to the field-circuit, the adjacent bars of the other collector being connected in succession to bars of the first collector that lie, respectively, contiguous to and diametrically opposite to the said adjacent segments in rotation around the ring, and the brushes bearing on this collector connected to a source of alternating current.

410,988. METHOD OF OPERATING ELECTRIC MOTORS. FRANCIS J. PATTEN, New York, N. Y. Filed July 24, 1889. Serial No. 318,508. (No model.)

Claim.—1. The method of operating an electric motor connected in an alternating-current circuit, which consists in giving a constant polarity to a continuously-wound armature by delivering the alternating impulses successively to opposite sides of the armature-winding.

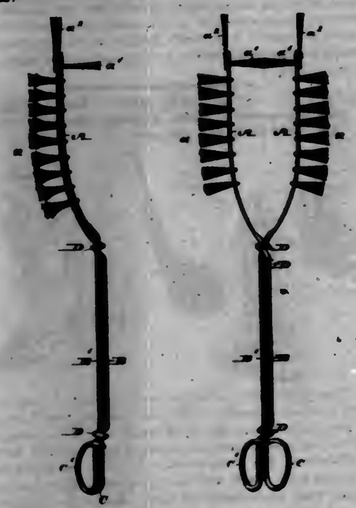
2. The method of operating an electric motor connected in an alternating-current circuit, which consists in giving a constant polarity to a continuously-wound armature-circuit by sending the opposite impulses of current successively to opposite sides of the armature-winding, and in giving a constant polarity to the field-magnet by a similar and simultaneous delivery of the same impulses to the field-circuit.

410,989. BRAKE-SHOE. JAMES FALLON, Selma, Ala., assignor of one-third to Edward G. Gregory, same place. Filed July 8, 1889. Serial No. 316,927. (No model.)



Claim.—1. The combination, with the brake-shoe, of the rods and the perforated plate, substantially as described.

2. The combination, with the shoe, of the rods provided with shoulders near their rear ends, substantially as described.



3. The combination of the brake-shoe and the rods, the latter being provided with a coating of boiled linseed-oil and mineral paint, as described.

410,990. MERCHANDISE-BOX. GEORGE H. RATHBUN, Chicago, Ill. Filed July 30, 1888. Serial No. 281,156. (No model.)

Claim.—The merchandise box or case having a hinged cover provided upon its inside with converging cleats or guides spaced apart at their approaching ends, said lid or cover having applied to its hinge-pintle a spring the action of which is to hold the lid tightly closed, substantially as set forth.

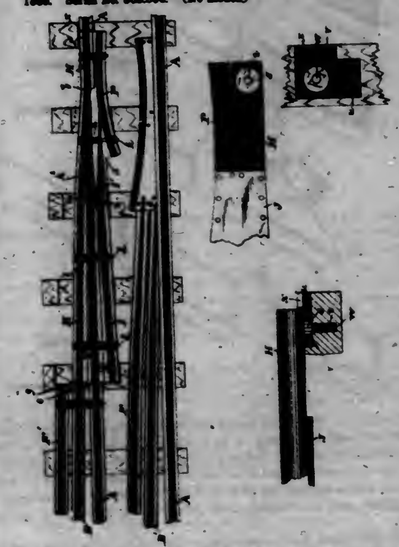
410,991. BRIDLE. JOSEPH RAFFETY, Buena Vista, assignor of one-half to Louis Conte, Camden, N. J. Filed Aug. 30, 1888. Serial No. 284,143. (Model.)

Claim.—1. In a brush, the combination of the curved heads of wire, having bristles on their sides and ends, shanks carried by said heads, and eyes on one of the shanks, forming bearings for the other shank, substantially as described.

2. In a brush, the combination of the brush-heads, the shanks, and the handles, one of said shanks having eyes integral therewith, forming bearings for the other shank as a journal, substantially as and for the purpose described.

3. In a brush, the combination of the curved brush-heads, shanks, and the handles formed on said shanks, the head carrying bristles, and handles having their ends bent so as to construct or form stops when the brush-heads are opened, substantially in the manner and for the purpose described.

4. In a brush, the combination of the curved heads having bristles on their ends at right angles to each other, shanks having handles formed with said heads, one of the shanks being bent around the other at a suitable place to form bearings for the device, substantially as described.



5. In a brush, the combination of heads of wire carrying bristles at their ends and sides, the shanks formed with handles carried by the heads, and eyes or loops on one of the shanks, forming bearings for the other, substantially as described.

6. In a brush, the combination of the heads, shanks on said heads, handles formed with the shanks, and stops or abutments on the handles adapted to contact when the brush is open to limit the opening of the heads, substantially as described.

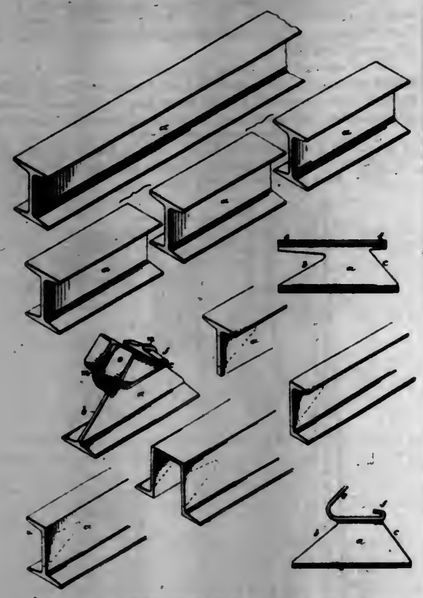
7. An opening and closing brush having handles provided with stops or abutments, which contact when the brush is opened and limit the opening of said brush, substantially in the manner and for the purpose described.

8. An opening and closing brush consisting of wire heads with shanks and handles, the said heads being curved and having bristles thereon, and one of said shanks being adapted to partially rotate upon the other, said parts being combined substantially as described.

410,992. RAILROAD-SWITCH. JOHN T. RIDDEY, Baltimore, Md., assignor of one-fifth to William D. Jenkins, same place. Filed Mar. 16, 1889. Serial No. 303,506. (No model.)

Claim.—1. The combination, with the main-track rails A, one of which is broken and the other unbroken, and the siding-rails B B', of a switch placed in the broken rail of the main track, said switch comprising three rails, to wit: the middle rail A', having a pivoted point, and the inside rail I, also having a pivoted point, both of these rails to connect alternately with the main-track rail A, and the outside rail H, to connect normally with the siding-rail B, all three of the switch-rails being secured together, and all turning on a pivot at the end of the said outside rail, for the purpose set forth.

2. The switch herein described, comprising a base-plate J, an outside rail H, pivoted at one end, a guard-rail P, a middle rail A', and an inside rail I, all of these said rails being secured to the base-plate, a pivoted point A^3, continuing from the middle rail and by a spring kept normally in contact with the said outside rail, and a pivoted point I', continuing from the inside rail and by a spring kept normally in contact with the said guard-rail.



3. The combination, in a switch, of a rail H, pivoted at one end and having a bend *g*, a shorter rail A', secured permanently alongside of the bent rail and movable by the same pivot, a pivoted point A^3, continuing from the said shorter rail and having its free end normally in contact with the said bent rail, the main-track rail A, and a siding-rail B.

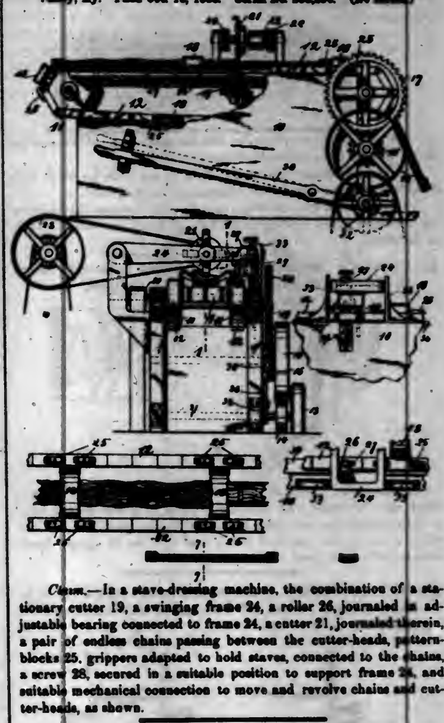
4. The combination, in a switch, of the main-track rails A, siding-rails B B', safety siding-rails F F', to run parallel to and connect with the siding-rails, and a switch comprising three rails, to wit: the middle rail A', having a pivoted point, and the inside rail I, also hav-

ing a pivoted point, both of these rails to connect alternately with the main-track rail A, and the outside rail H, to connect normally with the siding-rail B, all three of the switch-rails being secured together and all turning on a pivot at the end of the said outside rail, for the purpose set forth.

5. In a switch, the combination of the plate embracing in one piece the chair *x* and a bearing having a socket *v*, the main-track rail, and the switch-rail having on its under side a pivot-boss *s*.

410,993. PROCESS OF MAKING RAILROAD-RAIL CHAIRS. EDWARD RAWSON, Philadelphia, Pa., assignor to William Wharton, Jr., and Company, Incorporated, same place. Filed June 12, 1888. Serial No. 314,004. (No model.)

Claim.—1. The mode herein described of forming a railway-rail chair, said mode consisting in, first, producing a bar or blank in the form of a beam or shape having a top plate and web; second, cutting the web the desired distance to permit the top portion to be turned up, and, finally, bending the portion of the top plate freed by the severing of the web, thus forming a rail-retaining lip, substantially as set forth.



2. The mode herein described of forming a railway-rail chair, said mode consisting in, first, rolling a shape or beam having a top plate and web; second, cutting this beam or shape into suitable lengths; third, cutting the web the desired distance to permit the top portion to be turned up, and, finally, bending the portion of the top plate freed by the severing of the web to form a rail-retaining lip, substantially as described.

3. The mode herein described of forming a railway-rail chair, said mode consisting in, first, producing a beam or shape having a top plate and web; second, cutting out portions of the web at the proper places; third, dividing the beam or shape into suitable lengths to make the chairs, and, finally, bending the portion of the top plate freed by the severing of the web to form a rail-retaining lip, substantially as set forth.

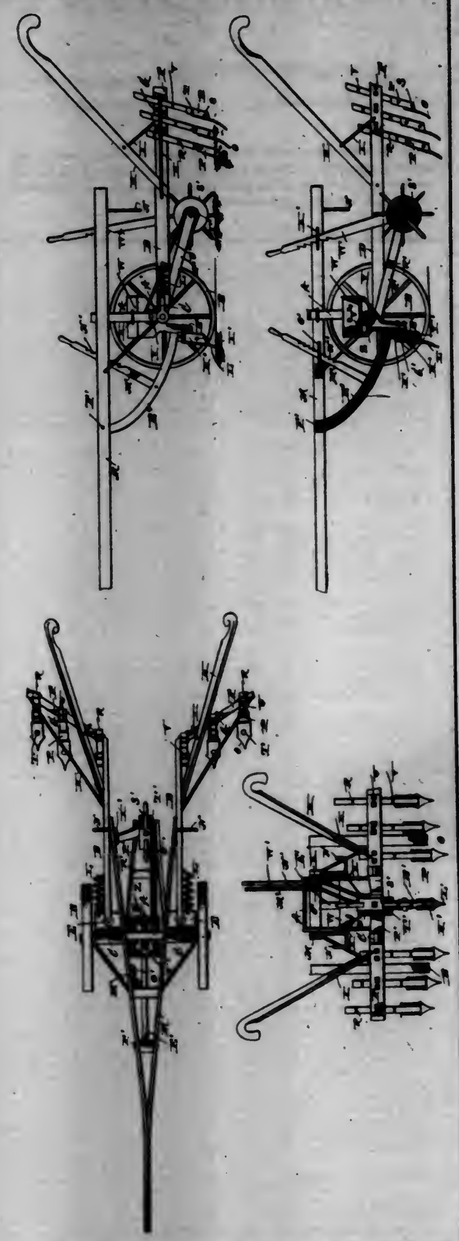
4. The process herein described of forming a railway-rail chair, said process consisting in, first, forming a shape or beam having a top plate or web; second, dividing said beam into sections; third, cutting the web at a point some distance below the top plate, and, finally, bending said freed portion of the top plate with its adhering web to form a ribbed rail-retaining lip, substantially as set forth.

5. The process herein described of forming a railway-rail chair, said process consisting in, first, forming a beam or shape having a top plate and web; second, cutting the outer portions of the web the desired distance to permit the top portion to be turned up, and, finally, bending the two ends of the top plate thereby freed from the web and thus forming opposite rail-retaining lips, substantially as and in the manner set forth.

410,994. STAVE-DRESSING MACHINE. CHARLES SCHEER, Rose's Valley, Ky. Filed Oct. 16, 1888. Serial No. 288,208. (No model.)

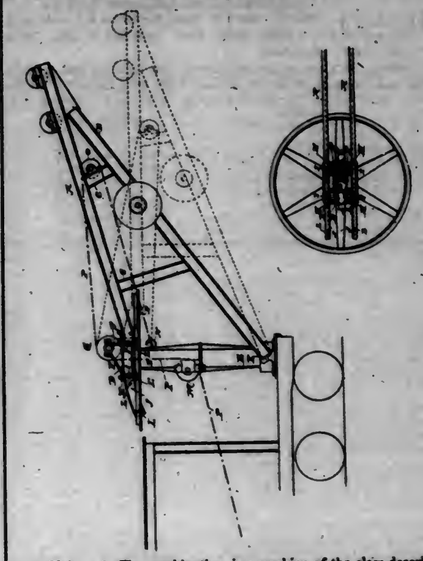
Claim.—In a stave-dressing machine, the combination of a stationary cutter 19, a swinging frame 24, a roller 26, journaled in adjustable bearing connected to frame 24, a cutter 21, journaled therein, a pair of endless chains passing between the cutter-heads, pattern-blocks 25, grippers adapted to hold staves, connected to the chains, a screw 28, secured in a suitable position to support frame 24, and suitable mechanical connection to move and revolve chains and cutter-heads, as shown.

410,995. LIFTING-JACK. MAJOR A. STEWART, Kingston, Ind., assignor of one-half to William K. Stewart, same place. Filed July 8, 1889. Serial No. 316,947. (No model.)



Claim.—The lifting-jack described, consisting of the base, the slotted standard supported thereon, the operating-lever fulcrumed on said standard, the inner face of the handle of the lever at its junction with the cam extending at substantially a right angle, as shown, and the lifting-block free to move vertically in the slot of the standard and formed with central web having convexed lower face and with rear and front guide-pieces, the lower edge of the front one being convexed and the lower edge of the rear one inclined upward, substantially as herein shown and described, and for the purpose specified.

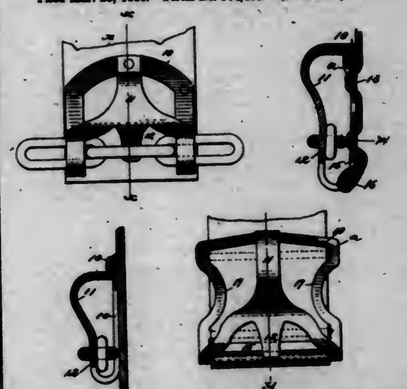
410,996. COMBINED CULTIVATOR AND PLANTER. JAMES D. SPEARER, Grayson, assignor of one-half to G. R. Arnold, Dearborn, Mo. Filed Feb. 20, 1889. Serial No. 300,549. (No model.)



Claim.—1. In a planter, the combination, with the seed-spout, of the draft-rod having its rear end movable vertically on the seed-spout, the furrow-opener attached to the draft-bar by means of a pivoting-bolt and a break-pin and guided on the seed-spout, and the lever adapted to raise and lower the draft-bar, substantially as described.

2. In a cultivator, the combination, with the arched axle, of the hinge-plate on the spindles thereof, the beams D, pivotally connected to said hinge-plate and having the oblique arms F, the vertically-adjustable standard secured on said arms, and the cultivating teeth or shovels secured to said standards, substantially as described.

3. The combination of the axle, the frame-bars M, having hooks N, the hinge-plates C, mounted loosely upon the spindles of the axle, the cultivator-beams connected pivotally to said hinge-plates by vertical bolts, and the contractile springs connecting the cultivator-beams with the outer rear corners of the hinge-plates, substantially as set forth.

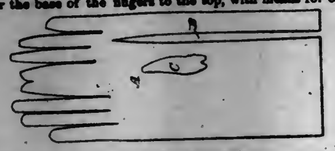


410,997. DERRICK. JOHN THOMPSON, Bucyrus, Ohio, assignor to the Bucyrus Foundry and Manufacturing Company, same place. Filed June 7, 1888. Serial No. 313,501. (No model.)

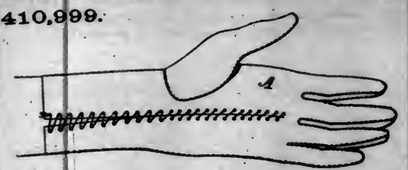
Claim.—1. The combination, in a machine of the class described and shown, of upper and lower braces, the rearward ends of the upper braces being formed on the arc of a circle struck from the base of the lower braces and provided with a plurality of bolt-holes, a casting turning on the head of the mast, to which the ends of the upper braces are bolted, and means whereby the crane may be adjusted to different elevations to admit of the coincidence of different bolt-holes in the upper braces with those in the casting, substantially as set forth.

2. The combination, in a machine of the class described and shown, of the upper braces A, the rearward ends whereof are curved as shown and provided with a plurality of bolt-holes, the lower braces B, set in a rotary socket at the foot of the mast, a rotary casting D, set on the top of the mast and provided with bolt-holes, substantially as described, and means for hoisting and lowering the braces, substantially as and for the purposes set forth.

410,998. BACK-BAND HOOK. FRANCIS A. YOST, Paducah, Ky. Filed Mar. 23, 1889. Serial No. 304,465. (No model.)



Claim.—A back-band hook consisting of the plate 10, provided with the outwardly and upwardly curved and bifurcated arm 11, forming trace-supporting loops, the said arm having its upper end secured to the upper part of the plate and provided with the tongue 12, pro-



jecting downwardly from the body of the arm, substantially as herein shown and described.

410,999. GLOVE. ABNER M. YOUNG, Providence, R. I., assignor of one-half to Abby C. Smith, Boston, Mass. Filed May 13, 1889. Serial No. 310,611. (No model.)

Claim.—A glove constructed with an opening in the palm portion from near the base of the fingers to the top, with means for closing

410,999.

the same, said opening being formed by the removal of a piece of the material, whereby the fullness of the glove in the palm of the hand is removed and the strain of the material opposite the thumb is obviated, substantially as shown and described.

PHOTO LITH NORRIS PETERS WASHINGTON D.C.

PATENT LAW OF WESTERN AUSTRALIA.

(The following copy of the new patent law lately passed by the Western Australian Government has been supplied from an official copy by Messrs. W. P. Thompson & Co., Liverpool, England, for publication.)

No. V.

An Act to amend and consolidate the Law relating to Patents for Inventions. [Assented to, 30th November, 1888.]

Whereas it is desirable to amend and consolidate the law relating to Patents for Inventions: Be it enacted by his Excellency the Governor of Western Australia and its Dependencies, by and with the advice and consent of the Legislative Council thereof, as follows:—

1. This Act may be cited as "The Patent Act, 1888."

2. This Act, except where it is otherwise expressed, shall come into operation on the first day of January, One thousand eight hundred and eighty-nine.

3. For the purposes of this Act, and save so far as the context requires a different meaning, the following words shall have the meanings in this section assigned to them, namely:—

"The Registrar" shall mean the Registrar of Patents.

"The Court" shall mean the Supreme Court of this Colony.

"Prescribed" shall mean prescribed by any of the schedules to this Act, or by regulations under this Act.

"Examiner" shall mean any skilled person or persons to whom the Registrar shall refer questions concerning Patents under this Act.

"Foreign vessel" shall mean vessel belonging to any other state or colony.

4. The Patent Office shall be attached to the Department of the Registrar General, or to a branch of such Department, and shall be under the immediate control of the Registrar of Patents, who shall be appointed by the Governor.

5. Any act or thing directed to be done by or to the Registrar may, in his absence, be done by or to any officer for the time being in that behalf authorized by the Registrar General.

6. There shall be a seal for the Patent Office, to be called "The Seal of the Patent Office," and impressions thereof shall be judicially noticed and admitted in evidence.

7. Any person, whether a British subject or not, may make an application for a patent, or two or more persons may make a joint application for a patent, and a patent may be granted to them jointly.

8. (1.) An application for a patent must be made in the form set forth in the First Schedule to this Act, or in such other form as may be from time to time prescribed, or in a form as like thereto as the circumstances will permit; and must be left at the patent office in the prescribed manner.

(2.) An application must contain a statutory declaration by the applicant, or, in the case of a joint application, by one of the applicants, to the effect that one or more of the applicants is or are in possession of an invention, whereof one or more of the applicants claims or claim to be the true and first inventor or inventors, or to which one or more of the applicants claims or claim to be entitled as legal representative or representatives, or under a bequest in the will of the true and first inventor, and for which the applicant or applicants desires or desire to obtain a patent. The application must be accompanied by either a provisional or complete specification, and must state an address in Perth for the reception of notices and other communications with respect to the application or invention.

(3.) A provisional specification must describe the nature of the invention, and be accompanied by drawings, if required.

(4.) A complete specification, whether left on application or subsequently, must particularly describe and ascertain the nature of the invention, and in what manner it is to be performed, and must be accompanied by drawings, if required.

(5.) A specification, whether provisional or complete, must commence with the title, and in the case of a complete specification must end with a distinct statement of the invention claimed.

9. The Registrar shall, if he think fit, refer any application to an examiner, who shall ascertain whether the nature of the invention has been fairly described, and the application, specification, and drawings (if any) have been prepared in the prescribed manner, and the title sufficiently indicates the subject-matter of the invention, and shall report thereon to the Registrar.

10. (1.) If the examiner reports that the nature of the invention is not fairly described, or that the application, specification, or drawings has not or have not been prepared in the prescribed manner, or that the title does not sufficiently indicate the subject-matter of the invention, the Registrar may require that the application, specification, or drawings be amended, before he proceeds with the application.

(2.) Where the Registrar requires an amendment, the applicant may appeal from his decision to the Attorney General.

(3.) The Attorney General shall, if required, hear the applicant and the Registrar, and may make an order determining whether and subject to what conditions (if any) the application shall be accepted.

(4.) The Registrar shall, when an application has been accepted, give notice thereof to the applicant.

(5.) If after an application has been made, but before a patent has been sealed, an application is made, accompanied by a specification bearing the same or a similar title, the Registrar, if he think fit, may refer the question to an examiner, who shall report to the Registrar whether the specification appears to the examiner to comprise the same invention; and, if he reports in the affirmative, the Registrar shall give notice to both applicants that he has so reported. Where the examiner reports in the affirmative, the Registrar may determine, subject to an appeal to the Attorney General, whether the invention comprised in both applications is the same, and, if so, he may refuse to seal a patent on the application of the second applicant.

11. (1.) If the applicant does not leave a complete specification with his application, he may leave it at any subsequent time within nine months from the date of application, and the Registrar may, on payment of the prescribed fee, extend such time to ten months.

(2.) Unless a complete specification is left within nine months, or such extended time, the application shall be deemed to be abandoned.

12. (1.) Where a complete specification is left after a provisional specification, the Registrar may, if he think fit, refer both specifications to an examiner for the purpose of ascertaining whether the complete specification has been prepared in the prescribed manner, and whether the invention particularly described in the complete specification is substantially the same as that which is described in the provisional specification.

(2.) If the examiner reports that the conditions hereinbefore contained have not been complied with, the Registrar may refuse to accept the complete specification unless and until the same shall have been amended to his satisfaction; but any such refusal shall be subject to appeal to the Attorney General.

(3.) The Attorney General shall, if required, hear the applicant and the Registrar, and may make an order determining whether and subject to what conditions, if any, the complete specification shall be accepted.

(4.) Unless a complete specification is accepted within twelve months from the date of application, or such extended time not exceeding fifteen months from the date of the application, as the Registrar on payment of the prescribed fee may allow, then (save in the case of an appeal having been lodged against the refusal to accept) the application shall, at the expiration of the said twelve months, or such extended time, become void.

(5.) Reports of examiners shall not in any case be published or be open to public inspection, and shall not be liable to production or inspection in any legal proceeding, other than an appeal to the Attorney General under this Act, unless the court or officer having power to order discovery in such legal proceeding shall certify that such production or inspection is desirable in the interests of justice, and ought to be allowed.

13. On the acceptance of the complete specification, the Registrar shall advertise the acceptance in the *Government Gazette* of Western Australia; and the application and specification or specifications with the drawings (if any) shall be open to public inspection.

14. (1.) Any person may, at any time within two months from the date of the advertisement of the acceptance of a complete specification, give notice at the patent office of opposition to the grant of the patent on the ground of an applicant having obtained the invention from him, or from a person of whom he is the legal representative, or on the ground that the invention has been patented in this Colony on an application of prior date, or on the ground of an examiner having reported to the Registrar that the specification appeared to him to comprise the same invention as is comprised in a specification bearing the same or a similar title, and accompanying a previous application, but on no other ground.

(2.) Where such notice is given, the Registrar may require the applicant to give security to an amount not exceeding Twenty-five pounds for the costs of the opposition; and if the security so required is not given within the said two months, the opposition shall lapse.

(3.) Where such notice and such security, if required, is given, the Registrar shall give notice of the opposition to the applicant, and shall, on the expiration of the said two months, after hearing the applicant and the person so giving notice, if desirous of being heard, decide on the case, but subject to appeal to the Attorney General.

(4.) The Attorney General shall, on such appeal, hear the applicant and any person so giving notice and being, in the opinion of the Attorney General, entitled to be heard in opposition to the grant, and shall determine whether the grant ought or ought not to be made.

(5.) The Attorney General may, if he thinks fit, obtain the assistance of an expert, who shall be paid such remuneration as the Attorney General shall determine.

(6.) The Attorney General or the Registrar, as the case may be, may, after decision, make such order as may be thought fit for the payment of costs by the applicant to the party giving notice or *vice versa*, and such order may be made a rule of the Court on an application *ex parte*.

15. Where an application for a patent has been abandoned, or become void, the specification or specifications and drawings (if any) accompanying or left in connection with such application shall not at any time be open to public inspection or be published by the Registrar.

16. (1.) If there is no opposition, or, in the case of opposition, if the determination is in favor of the grant of a patent, the Registrar shall cause a patent to be sealed with the seal of the Patent Office.

(2.) A patent shall be sealed as soon as may be, and not after the expiration of fifteen months from the date of application, except in the cases hereinafter mentioned, that is to say—

(a.) Where the sealing is delayed by an appeal to the Attorney General, or by opposition to the grant of the grant of the patent, the patent may be sealed at such time as the Attorney General may direct.

(b.) If the person making the application dies before the expiration of the fifteen months aforesaid, the patent may be granted to his legal representative and sealed at any time within six months after the death of the applicant.

(c.) Where the Registrar has extended the time for leaving or the time for accepting the complete specification, or both such times, the total period of time so extended shall be added to the period of fifteen months above provided.

17. Every patent shall be in duplicate, and one duplicate shall be deposited in the Patent Office, and every patent shall be dated and sealed as of the day of the application: Provided that no proceedings shall be taken in respect of an infringement committed before the publication of the complete specification: Provided also, that in case of more than one application for a patent for the same invention, the sealing of a patent on one of those applications shall not prevent the sealing of a patent on an earlier application.

PROVISIONAL PROTECTION.

18. Where an application for a patent in respect of an invention has been accepted, the invention may during the period between the date of the application and the date of sealing such patent be used and published without prejudice to the patent to be granted for the same; and such protection from the consequences of use and publication is in this Act referred to as provisional protection.

PROTECTION BY COMPLETE SPECIFICATION.

19. After the acceptance of a complete specification, and until the date of sealing a patent in respect thereof, or the expiration of the time for sealing, the applicant shall have the like privileges and rights as if a patent for the invention had been sealed on the date of the acceptance of the complete specification: Provided that an applicant shall not be entitled to institute any proceeding for infringement, unless and until a patent for the invention has been granted to him.

PATENT.

20. A patent may be granted to several applicants jointly, although some or one of them only are or is the true and first inventors or inventor.

21. Every patent, when sealed, shall have effect throughout the Colony of Western Australia.

22. (1.) The term limited in every patent for the duration thereof shall be fourteen years from its date.

(2.) But every patent shall, notwithstanding anything therein or in this Act, cease if the patentee fails to make the prescribed payments within the prescribed times.

(3.) If, nevertheless, in any case, by accident, mistake, or inadvertence, a patentee fails to make any prescribed payment within the prescribed time, he may apply to the Registrar for an enlargement of the time for making that payment.

(4.) Thereupon the Registrar shall, if satisfied that the failure has arisen from any of the above-mentioned causes, on receipt of the prescribed fee for enlargement, not exceeding Ten pounds, enlarge the time accordingly, subject to the following conditions:

(a.) The time for making any payment shall not in any case be enlarged for more than six months:

(b.) If any proceeding shall be taken in respect of an infringement of the patent committed after a failure to make any payment within the prescribed time, and before the enlargement thereof, the Court before which the proceeding is proposed to be taken may, if it shall think fit, refuse to award or give any damages in respect of such infringement.

AMENDMENT OF SPECIFICATION.

23. (1.) An applicant or a patentee may, from time to time, by request in writing left at the Patent Office, seek leave to amend his specification, including drawings forming part thereof, by way of disclaimer, correction, or explanation, stating the nature of such amendment and his reasons for the same.

(2.) The request and the nature of such proposed amendment shall be advertised in the *Government Gazette*, and at any time within one month from its first advertisement any person may give notice at the patent office of opposition to the amendment.

(3.) Where such notice is given, the Registrar shall give notice of the opposition to the person making the request, and shall hear and decide the case, subject to an appeal to the Attorney General.

(4.) The Attorney General shall, if required, hear the person making the request and the person so giving notice, and being, in the opinion of the Attorney General, entitled to be heard in opposition to the request, and shall determine whether, and subject to what conditions, if any, the amendment ought to be allowed.

(5.) Where no notice of opposition is given, or the person so giving notice does not appear, the Registrar shall determine whether, and subject to what conditions, if any, the amendment ought to be allowed.

(6.) When leave to amend is refused by the Registrar, the person making the request may appeal from his decision to the Attorney General.

(7.) The Attorney General shall, if required, hear the person making the request and the Registrar, and may make an order determining whether, and subject to what conditions, if any, the amendment ought to be allowed.

(8.) No amendment shall be allowed that would make the specification, as amended, claim an invention substantially larger than or substantially different from the invention claimed by the specification as it stood before amendment.

(9.) Leave to amend shall be conclusive as to the right of the party to make the amendment allowed, except in case of fraud; and the amendment shall in all courts and for all purposes be deemed to form part of the specification.

(10.) The foregoing provisions of this section do not apply when and so long as any action for infringement or other legal proceeding in relation to a patent is pending.

24. In an action for infringement of a patent, and in a proceeding for revocation of a patent, the Court or a Judge may order that the patentee shall, subject to such terms as to costs and otherwise as the Court or a Judge may impose, be at liberty to apply at the Patent Office for leave to amend his specification by way of disclaimer, and may direct that in the meantime the trial or hearing of the action shall be postponed.

25. Where an amendment by way of disclaimer, correction, or explanation has been allowed under this Act, no damages shall be given in any action in respect of the use of the invention before the disclaimer, correction, or explanation, unless the patentee establishes to the satisfaction of the Court that his original claim was framed in good faith and with reasonable skill and knowledge.

26. Every amendment of a specification shall be advertised in the *Government Gazette* of Western Australia.

COMPULSORY LICENSES.

27. If on the petition of any person interested it is proved to the Governor in Council that, by reason of the default of a patentee to grant licenses on reasonable terms—

(a.) The patent is not being worked in this Colony; or

(b.) The reasonable requirements of the public with respect to the invention cannot be supplied; or

(c.) Any person is prevented from working or using to the best advantage an invention of which he is possessed; the Governor in Council may order the patentee to grant licenses on such terms as to the amount of royalties, security for payment, or otherwise, as the Governor in Council, having regard to the nature of the invention and the circumstances of the case, may deem just, and any such order may be enforced by mandamus.

REGISTER OF PATENTS.

28. (1.) There shall be kept at the Patent Office a book called the Register of Patents, wherein shall be entered the names and addresses of grantees of patents, notifications of assignments and of transmissions of patents, of licenses under patents, and of amendments, extensions, and revocations of patents, and such other matters affecting the validity or proprietorship of patents as may from time to time be prescribed.

(2.) The Register of Patents shall be *primâ facie* evidence of any matters by this Act directed or authorized to be inserted therein.

(3.) Copies of deeds, licenses, and any other documents affecting the proprietorship in any letters patent or in any license thereunder, must be supplied to the Registrar in the prescribed manner for filing in the Patent Office.

FEES.

29. There shall be paid, in respect of the several matters and things described in the Second Schedule to this Act, the fees in that schedule mentioned; and such fees shall be levied and paid to the credit of the general revenue of the Colony.

EXTENSION OF TERM OF PATENT.

30. (1.) A patentee may, after advertising in manner directed by any rules made under this section his intention to do so, present a petition to the Governor in Council, praying that his patent may be extended for a further term; but such petition must be presented at least six months before the time limited for the expiration of the patent.

(2.) Any person may enter a caveat, addressed to the Clerk of the Executive Council at the Council Office, against the extension.

(3.) If the Governor in Council shall be pleased to refer any such petition to the Supreme Court, the Court shall proceed to consider the same, and the petitioner and any person who has entered a caveat shall be entitled to be heard by himself or by counsel on the petition.

(4.) The Court shall, in considering their decision, have regard to the nature and merits of the invention in relation to the public, to the profits made by the patentee as such, and to all the circumstances of the case.

(5.) If the Court report that the patentee has been inadequately remunerated by his patent, it shall be lawful for the Governor in Council to extend the term of the patent for a further term not exceeding seven, or, in exceptional cases, fourteen years; or to order the grant of a new patent for the term therein mentioned, and containing any restrictions, conditions, and provisions that the Court may think fit.

(6.) It shall be lawful for the Governor in Council to make, from time to time, rules of procedure and practice for regulating proceedings on such petitions, and subject thereto such proceedings shall be regulated according to the existing procedure and practice in patent matters of the Court.

(7.) The costs of all parties of and incident to such proceedings shall be in the discretion of the Court; and the orders of the Court respecting costs shall be enforceable in like manner as other orders of the Court.

REVOCATION.

31. (1.) No proceeding by *scire facias* to repeal a patent shall be taken.

(2.) Revocation of a patent may be obtained on petition to the Court.

(3.) Every ground on which a patent might, at the commencement of this Act, be repealed by *scire facias* shall be available by way of defense to an action for infringement, and shall also be a ground of revocation.

(4.) A petition for revocation of a patent may be presented by—

(a.) The Attorney General:

(b.) Any person authorized by the Attorney General:

(c.) Any person alleging that the patent was obtained in fraud of his rights, or of the rights of any person under or through whom he claims:

(d.) Any person alleging that he, or any person under or through whom he claims, was the true inventor of any invention included in the claim of the patentee:

(e.) Any person alleging that he, or any person under or through whom he claims an interest in any trade, business, or manufacture, had publicly manufactured, used, or sold, within this Colony, before the date of the patent, anything claimed by the patentee as his invention.

(5.) The plaintiff must deliver with his petition particulars of the objections on which he means to rely; and no evidence shall, except by leave of the Court or a Judge, be admitted in proof of any objection of which particulars are not so delivered.

(6.) Particulars delivered may be from time to time amended by leave of the Court or a Judge.

(7.) The defendant shall be entitled to begin, and give evidence in support of the patent; and if the plaintiff gives evidence impeaching the validity of the patent, the defendant shall be entitled to reply.

(8.) Where a patent has been revoked on the ground of fraud, the Registrar may, on the application of the true inventor made in accordance with the provisions of this Act, grant to him a patent in lieu of and bearing the same date as the date of the revocation of the patent so revoked, but the patent so granted shall cease on the expiration of the term for which the revoked patent was granted.

CROWN.

32. A patent shall have to all intents the like effect as against Her Majesty the Queen, Her heirs and successors, as it has against a subject, excepting always that the officers or authorities administering any department of the service of the Crown may, by themselves, their agents, contractors, or others, at any time after the application, use the invention for the services of the Crown on terms to be before or after the use thereof agreed on, with the approval of the head of the department, between those officers or authorities and the patentee, or, in default of such agreement, on such terms as may be settled by the Court after hearing all parties interested.

LEGAL PROCEEDINGS.

33. (1.) In an action or proceeding for infringement or revocation of a patent, the Court may, if it think fit, or on the request of either of the parties to the proceeding, call in the aid of an assessor specially qualified, and try and hear the case wholly or partially with his assistance; the action shall be tried without a jury, unless the Court shall otherwise direct.

(2.) The remuneration, if any, to be paid to an assessor under this section shall be determined by the Court and be paid in the same manner as the other expenses of the execution of this Act.

34. (1.) In an action for infringement of a patent, the plaintiff must deliver with his statement of claim, or, by order of the Court or a Judge, at any subsequent time, particulars of the breaches complained of.

(2.) The defendant must deliver with his statement of defense, or, by order of the Court or a Judge, at any subsequent time, particulars of any objections on which he relies in support thereof.

(3.) If the defendant disputes the validity of the patent, the particulars delivered by him must state on what grounds he disputes it, and if one of those grounds is want of novelty must state the time and place of the previous publication or user alleged by him.

(4.) At the hearing no evidence shall, except by leave of the Court or a Judge, be admitted in proof of any alleged infringement or objection of which particulars are not so delivered.

(5.) Particulars delivered may be from time to time amended, by leave of the Court or a Judge.

(6.) On taxation of costs regard shall be had to the particulars delivered by the plaintiff and by the defendant; and they respectively shall not be allowed any costs in respect of any particular delivered by them, unless the same is certified by the Court or a Judge to have been proven or to have been reasonable and proper, without regard to the general costs of the case.

35. In an action for infringement of a patent, the Court or a Judge may, on the application of either party, make such order for an injunction inspection or account, and impose such terms and give such directions respecting the same and the proceedings thereon as the Court or a Judge may see fit.

36. In an action for infringement of a patent, the Court or a Judge may certify that the validity of the patent came in question; and if the Court or a Judge so certifies, then in any subsequent action for infringement, the plaintiff in that action, on obtaining a final order or judgment in his favor, shall have his full costs, charges, and expenses as between solicitor and client, unless the Court or Judge trying the action certifies that he ought not to have the same.

37. Where any person claiming to be the patentee of an invention, by circulars, advertisements, or otherwise, threatens any other person with any legal proceedings or liability in respect of any alleged manufacture, use, sale, or purchase of the invention, any person or persons aggrieved thereby may bring an action against him, and may obtain an injunction against the continuance of such threats, and may recover such damage (if any) as may have been sustained thereby, if the alleged manufacture, use, sale, or purchase to which the threats related was not in fact an infringement of any legal rights of the person making such threats: Provided that this section shall not apply if the person making such threats with due diligence commences and prosecutes an action for infringement of his patent.

MISCELLANEOUS.

38. It shall be lawful for the Registrar, with the sanction of the Governor, to license fit and proper persons to be patent agents for transacting business under the provisions of this Act, and, upon proof to the Registrar satisfaction of the malfeasance or incapacity of any such licensed patent agent, or on non-payment of any annual fee for any such license, as prescribed by the Second Schedule hereto, and with such sanction as aforesaid, to revoke any such license.

39. Every patent may be in the form in the First Schedule to this Act, and shall be granted for one invention only, but may contain more than one claim; but it shall not be competent for any person in an action or other proceeding to take any objection to a patent on the ground that it comprises more than one invention.

40. (1.) If a person possessed of an invention for which he is entitled to obtain a patent dies without making application for a patent for the invention, application may be made by, and a patent for the invention granted to, the legal representative of the inventor, or to any person to whom the inventor may have bequeathed or assigned the right to obtain the patent.

(2.) Every such application must be made within six months of the decease of such person, and must contain a declaration by the legal representative that he believes such person to be the true and first inventor of the invention.

41. A patent granted to the true and first inventor shall not be invalidated by an application in fraud of him, or by provisional protection obtained thereon, or by any use or publication of the invention subsequent to that fraudulent application during the period of provisional protection.

42. A patentee may assign his patent for the whole of the Colony or any place or in any part thereof.

43. If a patent is lost or destroyed, or its non-production is accounted for to the satisfaction of the Registrar, the Registrar may at any time cause a triplicate thereof to be sealed and delivered to the person entitled thereto.

44. For the purpose of any application or opposition or other matters requiring the decision of the Registrar or the Attorney-General, they or either of them may, and at the request of any party to be heard shall, issue summonses under the seal of the Patent Office for the attendance of witnesses, and may examine witnesses on oath and administer oaths for that purpose under this part of the Act, and every witness so summoned shall be bound to attend at the time and place mentioned in such summons on being paid his expenses according to the scale for the time being allowed to witnesses on trials in local courts, and to continue in attendance until the matter shall have been disposed of, and to produce any document in his power, possession, custody, or control which he shall by such summons be required to produce.

45. The Attorney-General may from time to time make, alter, and rescind rules regulating references and appeals to the Attorney General, and the practice and procedure before him under this part of this Act; and in any proceeding before the Attorney General under this part of this Act, he may order costs to be paid by either party, and any such order may be made a rule of the Court.

46. The exhibition of an invention at an industrial or international exhibition, certified as such under the hand of the Registrar, or the publication of any description of the invention during the period of the holding of the exhibition, or the use of the invention for the purpose of the exhibition in the place where the exhibition is held, or the use of the invention during the period of the holding of the exhibition by any person elsewhere, without the privity or consent of the inventor, shall not prejudice the right of the inventor or his legal personal representative to apply for and obtain provisional protection and a patent in respect of the invention or the validity of any patent granted on the application, provided that both the following conditions are complied with, namely:

(a.) The exhibitor must, before exhibiting the invention, give the Registrar the prescribed notice of his intention to do so; and

(b.) The application for a patent must be made before or within six months from the date of the opening of the exhibition.

47. Where the invention is one which admits of being represented by a model, the Registrar may require the patentee to furnish him with a model of the invention on payment to the patentee of the cost of the manufacture of the model; the amount to be settled in case of dispute by the Attorney General.

48. (1.) The inventor of any improvement in instruments or munitions of war, his executors, administrators, or assigns (who are in this section comprised in the expression the inventor) may (either for or without valuable consideration) assign to the Colonial Secretary, on behalf of Her Majesty, all the benefit of the invention and of any patent obtained or to be obtained for the same; and the Colonial Secretary may be a party to the assignment.

(2.) The assignment shall effectually vest the benefit of the invention and patent in the Colonial Secretary on behalf of Her Majesty, and all covenants and agreements therein contained for keeping the invention secret and otherwise shall be valid and effectual, (notwithstanding any want of valuable consideration,) and may be enforced accordingly by the Colonial Secretary for the time being.

(3.) Where any such assignment has been made to the Colonial Secretary he may at any time before the application for a patent for the invention, or before publication of the specification or specifications, certify to the Registrar his opinion that, in the interest of the public service, the particulars of the invention and of the manner in which it is to be performed should be kept secret.

(4.) If the Colonial Secretary so certifies, the application and specification or specifications, with the drawings (if any,) and any amendment of the specification or specifications, and any copies of such documents and drawings, shall, instead of being left in the ordinary manner at the Patent Office, be delivered to the Registrar in a packet sealed by authority of the Colonial Secretary.

(5.) Such packet shall, until the expiration of the term or extended term during which a patent for the invention may be in force, be kept sealed by the Registrar, and shall not be opened save under the authority of an order of the Colonial Secretary, or of the Attorney General.

(6.) Such sealed packet shall be delivered at any time during the continuance of the patent to any person authorized by writing under the hand of the Colonial Secretary to receive the same, and shall, if returned to the Registrar, be again kept sealed by him.

(7.) On the expiration of the term or extended term of the patent, such sealed packet shall be delivered to any person authorized by writing under the hand of the Colonial Secretary to receive it.

(8.) Where the Colonial Secretary certifies as aforesaid, after an application for a patent has been left at the Patent Office, but before the publication of the specification or specifications, the application, specification, or specifications, with the drawings, (if any,) shall be forthwith placed in a packet sealed by authority of the Registrar, and such packet shall be subject to the foregoing provisions respecting a packet sealed by authority of the Colonial Secretary.

(9.) No proceeding by petition or otherwise shall lie for revocation of a patent granted for an invention in relation to which the Colonial Secretary has certified as aforesaid.

(10.) No copy of any specification or other document or drawing, by this section required to be placed in a sealed packet, shall in any manner whatever be published or open to the inspection of the public, but save as in this section otherwise directed, the provisions of this part of this Act shall apply in respect of any such invention and patent as aforesaid.

(11.) The Colonial Secretary may, at any time by writing under his hand, waive the benefit of this section with respect to any particular invention, and the specifications, documents, and drawings shall be thenceforth kept and dealt with in the ordinary way.

(12.) The communication of any invention for any improvement in instruments or munitions of war to the Colonial Secretary or to any person or persons authorized by him to investigate the same or the merits thereof, shall not, nor shall anything done for the purposes of the investigation, be deemed use or publication of such invention so as to prejudice the grant or validity of any patent for the same.

49. No person shall receive a patent or an instrument in the nature of letters patent under this Act for an invention or discovery which has been previously patented in Great Britain or any other country, but it shall be lawful for the Governor in his discretion, on the application of any person being the holder or assignee of any patent granted or issued in Great Britain or any other country for any new discovery or invention, and upon such proof as the Governor may deem sufficient, that such person is the *bona fide* holder or assignee of the said patent, and that the same is in full force, and upon payment to the Colonial Treasurer of the sum of Fifteen pounds, to grant letters of registration under the seal of Western Australia to the holder of such patent as aforesaid or his assignee, and such letters of registration shall be deposited in the Patent Office, and shall be deemed to be letters patent issued under this Act for such invention or improvement, and shall have the same force and effect as letters patent issued thereunder; and shall inure to the benefit of the holder during the continuance of the original patent in the country in which it was issued or granted, and no longer, and all the provisions of this Act shall apply to such letters of registration in the same way *mutatis mutandis*, and as fully as to letters patent or an instrument in the nature of letters patent issued under this Act.

50. The Governor may make regulations for carrying into effect the provisions of this Act, and for regulating the amount, collection, and disposal of the fees in the schedules hereto, and may also from time to time rescind, alter, or vary any such regulations. All such regulations shall, upon publication in the *Government Gazette* of Western Australia, be in force and effect. A copy of every such regulation shall be laid upon the table of the Legislative Council within fourteen days from the issue thereof, or, if the Legislative Council be not sitting, then within fourteen days after the commencement of the next ensuing session. Provided that, until such regulations be made, the fees in the Schedule to this Act contained shall be the fees payable in respect of the matters to which they are respectively applicable.

51. The Act intituled "An Act to regulate Grants of Patents for Inventions in the Colony of Western Australia" is hereby repealed, but without prejudice to the past operation thereof, or to any letters patent lawfully granted or assigned thereunder.

52. The Act 50 Vict., No. 5, is hereby repealed in so far as it relates to Patents, and the Officer therein described as Registrar of Patents, Designs, and Trade-Marks shall be and be called Registrar of Designs and Trade-Marks.

53. Nothing in this Act shall take away, abridge, or prejudicially affect the prerogative of the Crown in relation to the granting of any letters patent or to the withholding of a grant thereof.

In the name and on behalf of the Queen I hereby assent to this Act.

F. NAPIER BROOME, *Governor.*

—

SCHEDULES.

The First Schedule, (*Section* 8,) *Forms of Application, &c.*

FORM A—*Form of Application for Patent.*

I, of in do solemnly and sincerely declare that I am in possession of an invention for that I am the true and first inventor thereof; and that the same is not in use by any other person or persons to the best of my knowledge and belief; and I humbly pray that a patent may be granted to me for the said invention.

And I make the above solemn declaration conscientiously believing the same to be true, etc.

Declared at , in , this day of 18 .

Before me,

Justice of the Peace.

[NOTE.—This declaration must be accompanied by the statement of an address in the city of Perth in Western Australia for the reception of all notices and other communications with respect to the application or invention.]

FORM B—*Form of Provisional Specification.*

I, , of , in , do hereby declare the nature of my invention for to be as follows:—

Dated this day of , 18 .

FORM C—*Form of Complete Specification.*

I, of in of do hereby declare the nature of my invention for and in what manner the same is to be performed, to be particularly described and ascertained in and by the following statement:

* * * * * *

Having now particularly described and ascertained the nature of my said invention and in what manner the same is to be performed, I declare that what I claim is—

1.
2.
3. &c.,

Dated this day of 18 .

FORM D—*Form of Patent.*

Victoria, by the grace of God, of the United Kingdom of Great Britain and Ireland, Queen, Defender of the Faith: To all to whom these presents shall come greeting:

Whereas of in , hath by his solemn declaration represented unto us that he is in possession of an invention for that he is the true and first inventor thereof, and that the same is not in use by any other person to the best of his knowledge and belief:

And whereas the said inventor hath humbly prayed that we would be graciously pleased to grant unto him (hereinafter together with his executors, administrators, and assigns, or any of them, referred to as the said patentee) our Royal Letters Patent for the sole use and advantage of his said invention:

And whereas the said inventor hath by and in his complete specification particularly described the nature of his invention:

And whereas we being willing to encourage all inventions which may be for the public good, are graciously pleased to condescend to his request:

Know ye, therefore, that we of our especial grace, certain knowledge, and mere motion do by these presents, for us, our heirs and successors, give and grant unto the said patentee our especial license, full power, sole privilege, and authority, that the said patentee by himself, his agents, or licensees, and no others, may at all times hereafter, during the term of years herein mentioned, make, use, exercise, and vend the said invention within in such manner as to him or them may seem meet, and that the said patentee shall have and enjoy the whole profit and advantage from time to time accruing by reason of the said invention, during the term of fourteen years from the date hereunder written of these presents: and to the end that the said patentee may have and enjoy the sole use and exercise and the full benefit of the said invention, we do by these presents for us, our heirs and successors, strictly command all our subjects whatsoever within that they do not at any time during the continuance of the said term of fourteen years, either directly or indirectly, make use of or put in practice the said invention, or any part of the same, nor in anywise imitate the same, nor make or cause to be made any addition thereto or subtraction therefrom, whereby to pretend themselves the inventors thereof, without the consent, license, or agreement of the said patentee in writing under his hand and seal, on pain of incurring such penalties as may be justly inflicted on such offenders for their contempt of this our Royal command, and of being answerable to the patentee according to law for his damages thereby occasioned: Provided that these our letters patent are on this condition, that, if at any time during the said term it be made to appear to us, our heirs or successors, or to our Supreme Court that this our grant is contrary to law, or prejudicial or inconvenient to our subjects in general, or that the said invention is not a new invention as to the public use and exercise thereof within , or that the said patentee is not the first and true inventor thereof within this as aforesaid, these our letters patent shall forthwith determine, and be void to all intents and purposes, notwithstanding anything hereinbefore contained: Provided also, that if the said patentee shall not pay all fees by law required to be paid in respect of the grant of these letters patent, or in respect of any matter relating thereto at the time or times, and in manner for the time being by law provided; and also if the said patentee shall not supply or cause to be supplied, for our service all such articles of the said invention as may be required by the officers or commissioners administering any department of our service in such manner, at such times, and at and upon such reasonable prices and terms as shall be settled in manner for the time being by law provided, then, and in any of the said cases, these our letters patent, and all privileges and advantages whatever hereby granted shall determine and become void notwithstanding anything hereinbefore contained: Provided also, that nothing herein contained shall prevent the granting of licenses in such manner and for such considerations as they may by law be granted: and lastly, we do by these presents for us, our heirs and successors, grant unto the said patentee that these our letters patent shall be construed in the most beneficial sense for the advantage of the said patentee. In witness whereof we have caused these our letters to be made patent this one thousand eight hundred and and to be sealed as of the said one thousand eight hundred and [Seal of Patent Office.]

PATENTS REGULATIONS OF JAPAN.

Imperial Ordinance No. LXXXIV.

PATENTS REGULATIONS.

Promulgated December 18, 1888.

Article I.—Any person who has invented any useful technical process, machinery, manufactured or other article, or any improvement on any useful technical process, machinery, manufactured or other article, may secure a patent for the same under these regulations.

Art. II.—For inventions specified below patents will not be granted—

1. Articles of food or drink, or of fashion.
2. Medicines or methods of compounding the same.
3. Articles that have been in public use prior to the application for a patent.

NOTE.—This provision shall not apply in the case of articles that have been in public use for purposes of trial during a period of not more than two years.

Art. III.—Persons desirous of obtaining patents shall apply to the Minister of State for Agriculture and Commerce, transmitting also a written detailed statement with diagrams of each invention.

NOTE.—Such application, statement, and diagrams shall be submitted to the Patents Bureau.

Art. IV.—Every application for a patent shall be placed by the Director of the Patents Bureau before the judges of the Bureau for their examination. If such inspection is satisfactory, the invention shall be duly registered after the approval of the Minister of State for Agriculture and Commerce has been obtained, and a patent certificate shall be issued in due form.

Art. V.—The patent certificate shall be signed by the Minister of State for Agriculture and Commerce and the Director of the Patents Bureau, and handed to the applicant together with his detailed statement and diagrams.

Art. VI.—Patents will be issued for 5, 10, and 15 years, computed from the date of registration.

Art. VII.—In the case of an invention the unrestricted use of which will be for the public interest, or which is of military importance, or should be maintained in secrecy, the Minister of State for Agriculture and Commerce may affix conditions to or decline to grant a patent, or may affix conditions to or withdraw a patent already granted.

In such an event the Minister of State for Agriculture and Commerce may award such compensation as he shall deem suitable to an inventor or patentee.

Art. VIII.—Any person who has invented an improvement upon an already existing patent and desires to secure a patent for such improvement, should first consult the original patentee, and send in his application after having obtained the consent of the latter to use the original invention together with his own. In the event of such consent being withheld, the inventor of the improvement may still send in his application, stating the circumstances, and the Minister may grant him the required patent, but shall fix an amount of compensation to be given by him to the original patentee.

Art. IX.—When a patentee, or an inventor about to apply for a patent dies, his rights and privileges shall go to his heir.

Art. X.—Patents granted to the following classes of inventions shall be held invalid, and none shall be issued in future:—

1. Such as have proved neither new nor useful.
2. Such as are found to come under Art. II.
3. Inventions in the case of which an important fact has been willfully omitted from the detailed statement.
4. Inventions in the case of which some fact not necessary in the working of the same has been willfully inserted in the detailed statement.

Art. XI.—When the judges of the Bureau decide that a patent should not be issued, the Director of the Bureau shall transmit a written report of their examination to the applicant.

Art. XII.—Any person who objects to the above decision may send in an application for a re-examination, stating his grounds for the same. In such an event the judges will re-examine the invention, and should their decision be again adverse, a written statement to that effect will be transmitted to the applicant.

Art. XIII.—When it appears that an invention for which a patent is applied coincides with another for which a patent has been requested or granted, the parties concerned shall be informed of the points of resemblance and required to send in to the Bureau full particulars of their inventions. The judges will then decide the question of priority, and a statement of their decision shall be sent to the parties concerned.

Art. XIV.—When under the foregoing article an existing patent is withdrawn and another issued, the term of the latter shall be computed from the date of registration of the former.

Art. XV.—Any one dissatisfied with decisions under Arts. XII. and XIII. may claim the arbitration of the Patents Bureau.

Art. XVI.—A patentee who finds that his patent rights conflict with those of other patentees may claim the arbitration of the Bureau to secure his rights.

Art. XVII.—Any person who finds that an invention for which a patent has been granted falls under Art. X., may claim the arbitration of the Bureau to decide the question of validity.

Art. XVIII.—When arbitration is required, the Director of the Bureau shall consider the matter with the assistance of not less than two arbitrators.

Art. XIX.—No objection can be raised against the arbitration of the Patents Bureau nor can there be any appeal or resort to a law court.

Art. XX.—When persons affected by the judgment provided by Art. XIII., or by the arbitration of the Patents Bureau, request that evidence should be heard, the Director of the Bureau may require a Peace Court to collect the same.

Art. XXI.—Costs incurred under Arts. XVI. and XVII. shall be borne in accordance with the practice in civil suits.

Art. XXII.—A patent may be sold or transferred or made property in common, with or without conditions, or may be hypothecated, but an application to have such sale, transfer, or hypothecation registered must be sent to the Patents Bureau, and no sale, transfer, or hypothecation shall be held as legally valid towards a third party unless registered.

Art. XXIII.—No official of the Patents Bureau shall apply for or become the owner of a patent while employed in the Bureau.

NOTE.—An official falling heir to a patent shall not come under the above provision.

Art. XXIV.—Patents shall become invalid in the following cases:—

1. When the invention has, without any proper reason, not been practically applied in public for three years after the date of the certificate.
2. When practical use of the invention has, without proper reason, been suspended for a period of three years.
3. When a patentee has imported and sold patented articles from abroad, or has ignored the fact that articles liable to infringe on his rights have been imported and sold.

Art. XXV.—A patentee who has lost his certificate or had it defaced or mutilated, may apply for a new one, stating at the same time the circumstances of the case.

Art. XXVI.—When a patentee discovers that his detailed statement or diagrams were imperfect, he may apply for a revised patent certificate to secure the efficacy of his patent, sending in at the same time a revised detailed statement and diagrams.

NOTE.—This provision shall not apply where important changes in an invention are involved.

Art. XXVII.—When a patentee discovers that he has inserted as his own in his detailed statement something that was not his, he may apply to have the same corrected.

Art. XXVIII.—Applications under the two foregoing articles shall be considered by the Judges of the Bureau. Any persons dissatisfied with the decision of the judges in such a case may apply for re-examination under Art. XII.

Art. XXIX.—Patentees shall affix to their articles such trade marks as are fixed by the Minister of State for Agriculture and Commerce.

Art. XXX.—The following fees shall be paid by persons making applications with reference to patents:—

1. For application to secure a patent—3 *yen* for each invention.
2. For application for registration of sale, transference, hypothecation, &c.—3 *yen* for each invention.
3. For reissue of a patent certificate—1 *yen* for each certificate.
4. For revision of a patent certificate or correction of a detailed statement—5 *yen* for each invention.
5. For a claim for arbitration—7 *yen* for each case.

Art. XXXI.—The following fees shall be paid by persons receiving patent certificates, or revised patent certificates:—
1. A patent for 5 years ..... 10 *yen*.
2. A patent for 10 years ..... 15 *yen*.
3. A patent for 15 years ..... 20 *yen*.

Art. XXXII.—The Patents Bureau shall print and sell at reasonable prices to the public, detailed statements of patented inventions and official reports regarding the same.

Art. XXXIII.—Anyone may, on payment of a suitable fee, receive permission from the Bureau to copy documents or prepare diagrams relating to patents.

Art. XXXIV.—Any person infringing the patent of another shall be held liable for the payment of an indemnity to such other patentee.

Art. XXXV.—Three years shall be regarded as the full term of liability for indemnity.

Art. XXXVI.—Anyone who imitates and employs or sells an imitation of a patented invention, or who employs the same or sells it to others with previous knowledge of the fact of such imitation, or uses the patented technical process of another, shall be liable to major confinement for not less than one month and not more than one year, or to a fine of not less than 20 *yen* and not more than 200 *yen*. Persons who import from abroad for use or sale any article in witting violation of the rights of a patentee, or who, with knowledge of the fact, use or sell imported articles that infringe patent rights, shall be liable to similar punishment.

Art. XXXVII.—Under any of the foregoing circumstances the articles or apparatus in respect of which an offence has been committed shall be confiscated and handed over to the patentee whose rights have been infringed; and in the case of articles which have been sold their value shall be exacted from the offender and handed to the patentee.

Art. XXXVIII.—Persons who fraudulently obtain patent rights or who apply to unpatented articles patent marks or marks resembling the same, or who sell such articles with previous knowledge of those facts, shall be liable to major confinement for a period of not less than 15 days and not exceeding 6 months, or a penalty not less than 10 *yen* and not exceeding 100 *yen*.

Art. XXXIX.—For offences under Art. XXXVI. the criminal investigation shall take place on the initiation of an action by the party injured, and in such a case a judge may on the motion of the injured party suspend the use or sale of the articles on which the cause is based.

Art. XL.—A patentee who neglects to affix a patent mark as provided in Art. XXIX. to his goods cannot appeal or sue for indemnity on account of alleged damages.

Art. XLI.—When a defendant wishes to show that a patent is null and void, he may lay such fact before the Court, and shall, within 30 days subsequently, apply to the Patents Bureau for arbitration as laid down in Art. XVII. In such an event the Court shall suspend judgment pending the conclusion of such arbitration.

Art. XLII.—The provisions of the Penal Code as to the concurrence of several offences shall not apply to offences under these regulations.

Art. XLIII.—Detailed rules for the carrying out of these regulations will be specially prepared by the Minister of State for Agriculture and Commerce.

Art. XLIV.—These regulations shall come into force on February 1st, 1889.

Art. XLV.—The Patents Regulations (Notification No. 7, April, 1885) shall be abolished on the date these regulations come into force.

NOTE.—Patents secured under the former Patents Regulations shall have the same validity as those secured in accordance with the present regulations. Any application for a patent which may not be settled on the date these regulations come into force, will be settled in accordance with the present Patents Regulations.

PATENT LAW OF PERU.

(The following translation of the law of 1869 has been made by Messrs. W. P. Thompson & Co., of Liverpool, Manchester, and London.)

Law of November 28, 1869.

Article 1. Any discovery or invention in any branch of industry whatsoever, gives the author the exclusive right to work it to his profit, under the conditions and during the time determined by this law. This right is derived from a patent granted by the Government.

Art. 2. The following are considered inventions and discoveries: 1st. New industrial products. 2nd. New processes or the new application of known processes for obtaining an industrial product.

Art. 3. The following cannot be patented: 1st. Pharmaceutical preparations or remedies of any kind whatever. 2nd. Plans or combinations of credit or finance. 3rd. Processes having for their object the use of known methods for the improvement of an industry the exercise of which is free within and without the territory of the Republic.

Art. 4. In the third case of the preceding article, will be admitted and then only in cases of necessity, proposals relating to contracts allowed by the laws.

Art. 5. The duration of the patents cannot exceed the term of ten years, and the proprietors shall pay every year a tax of (100) one hundred soles (dollars.)

Art. 6. The applicants for patents of invention or of importation must present themselves at the Prefecture of the department in which they may desire to establish their industry or at the Prefecture of the department in which they reside if it is to be established in two or more departments.

Art. 7. Their application must contain: 1st. The specification of the invention or of the object which it is proposed to introduce. 2nd. The drawings or models necessary for understanding the same. 3rd. The list and explanation of the models presented. 4th. The clear and precise indication or determination of the principal object and of the details which constitute the invention and the specification of its methods of application. 5th. The duration of the patent. 6th. The indication of the guarantees presented for the realization of the product.

Art. 8. This application shall be written in Spanish and, in conformity, as regards the metric system of weights and measures, with that in use in the Republic. In the case of an application for patent bearing the signature of a foreigner, this latter must expressly reject all diplomatic intervention with regard to the patent applied for, and must submit, absolutely and exclusively to the laws and tribunals of the Republic. Without this condition his application will not be taken under consideration.

Art. 9. The prefects will, with regard to the application for patent, take the opinion of the municipality, the treasury or agent of the treasury, or other functionaries according to the nature of the case and will consult experts if required. After having fulfilled these formalities they will forward the documents, with the specification, plans, models, &c., to the proper authorities at the expense of the person interested.

Art. 10. The Minister of the said department will take the opinion of the treasury of the Supreme Court and of any other functionaries which he may consider necessary to consult and, according to the information he may receive, will grant or refuse the patent.

Art. 11. A prolongation of the duration of patents as well as changes or alterations in the terms of the same can only be granted by a resolution of the legislature, made at the request of the persons interested and for just causes founded on proved facts and authentic documents.

Art. 12. The proprietor of a patent alone may work such patent during the period of its duration. Any other person desiring to do so must be authorized by him or must be put in his place and stead by a contract of transfer or by any other means provided by the laws.

Art. 13. The patents are void and of non effect in the following cases: 1st. If the discovery, invention or application be not new. 2nd. If the object of the patent do not come under the terms of art. 2. 3rd. If the patent refer to principles, methods systems, or theoretical or scientific discoveries for which no industrial application is shown. 4th. If the discovery, invention or application be contrary to order and public safety, or to the laws without exemption, in this case, from the penalties imposed upon manufacturers or merchants of prohibited objects. 5th. If it should appear that the applicant for a patent has fraudulently obtained privilege for an object different to and distinct from the invention. 6th. If, on working the invention it be found not to agree with the specification annexed to the application. 7th. If the patent have been obtained in infraction of any of the provisions of the present law. 8th. If, at the same time as the patent there be given pecuniary grants not included in the budgets of the Republic, or contrary to the laws. Authorizations relating to changes, additions or improvements not contained in the original patent are also void and of non effect.

Art. 14. A discovery, invention or application will not be considered new which prior to the date of application for the patent shall have had, in Peru or elsewhere, sufficient publicity to enable it to be put in practice.

Art. 15. The proprietor will forfeit his rights if, 1st, he do not pay the annuity or tax fixed in art. 2. 2nd. If he do not put in practice the discovery or invention within two years or any term which may be stated on the Letters Patent unless he can legally justify his delay. 3rd. If he introduce objects manufactured abroad and similar to those protected by his patent with the sole exception of the models of machines the introduction of which may be authorized by the Government after due investigation.

Art. 16. Whoever shall by means of advertisements, prospectuses marks or otherwise give himself the title of proprietor of a patent without legally possessing such patent or after it has gone void shall be punished by a fine of fifty (50) to a thousand (1000) soles (dollars) without exempting him from the penalties incurred for the crime of forgery.

Art. 17. All persons who may be justly interested will have the right to demand the voidance or lapsing of a patent. The public prosecutor will take part in the action and if the patent be declared null or lapsed, from whatever cause, notice will be given thereof by the said prosecutor.

Art. 18. Any infringement of the rights of a proprietor of a patent, whether in the manufacture of the products or in the use of processes mentioned in the application will constitute the crime of adulteration and will be punished, according to the importance of the case, by a fine in favor of the person interested and by the confiscation of the objects manufactured.

Art. 19. All privileges or patents at present in force and which have been granted in conformity with provisions prior to this law, will remain in force for the whole period for which they have been granted.

Changes in Classification.

(ORDER No. 573.)

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., September 2, 1889.

The following changes are directed in Division IV:

New Class 189, Iron Structures, and sub-classes thereunder are established, as follows:

1. Jails.
2. Buildings.
3. Grilles.
4. Metallic ceilings.

The following sub classes are established:

In Class 14, Bridges:
11. Flooring.
12. Truss, Bow-string.

In Class 108, Roofing:
8. Flashing.

In Class 150, Fire Escapes and Ladders:
20. Fluid-check.
21. Fly-check.
22. Escapement-check.
23. Governor-check.

ROBERT J. FISHER,
Acting Commissioner.

Additional Sub-Classes.

(ORDER No. 579.)

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., September 3, 1889.

The following additional sub-classes are hereby established in Division XXVI:

In Class 171, Electricity, Generation:
121. Inductoriums—
122. Induction-coils.
123. Transformers, Rotary.
124. Transformers, Stationary.
125. Pyro-magneto-electric devices.

In Class 172, Electricity, Motive-Power:
126. Motors, Reciprocating.

ROBERT J. FISHER,
Acting Commissioner.

Publishers' Catalogues.

This Office would be pleased to receive from manufacturers and publishers such catalogues, circulars, price-lists, or other advertisements relating to the sciences and mechanical arts as are published by them for gratuitous distribution; but notice is hereby given such manufacturers or dealers who feel disposed to send their publications that not less than three copies should be forwarded in order that the subjects may be properly indexed, classified, and subclassified in the Scientific Library for convenient and ready reference.

"The representation of a glove and the words 'AU GANT.'"

17,025.—COTTON THREAD.—*Les Fils de Cartier-Bresson*, Paris, France. Application filed August 21, 1888. Used since 1868.
"The words 'A LA LYRE' and the representation of a lyre."

17,026.—COTTON LACE.—*Les Fils de Cartier-Bresson*, Paris, France. Application filed August 21, 1888. Used since 1861.
"The representation of an acorn and the words 'AU GLAND.'"

17,027.—COTTON THREAD.—*Les Fils de Cartier-Bresson*, Paris, France. Application filed August 21, 1888. Used since 1865.
"The representation of a hand and the words 'A LA MAIN.'"

17,028.—COTTON THREAD.—*Les Fils de Cartier-Bresson*, Paris, France. Application filed August 21, 1888. Used since 1833.
"The letters 'C B.'"

17,029.—COTTON LACE.—*Les Fils de Cartier-Bresson*, Paris, France. Application filed August 21, 1888. Used since 1862.
"The representation of a cross and the words 'A LA CROIX.'"

17,030.—COTTON THREAD.—*Les Fils de Cartier-Bresson*, Paris, France. Application filed August 21, 1888. Used since 1867.
"The representation of a human foot and the words 'AU PIED.'"

17,031.—COTTON THREAD.—*Les Fils de Cartier-Bresson*, Paris, France. Application filed August 21, 1888. Used since 1874.
"The representation of an acorn and the words 'AU GLAND.'"

17,032.—COMMERCIAL NOTE WRITING-PAPER.—*H. S. Crocker & Co.*, San Francisco, Cal. Application filed July 19, 1889. Used since 1876.
"The pictorial representation of a lake surrounded with mountains, with its foreground of rocks and trees, and the words 'COMMERCIAL NOTE.'"

17,033.—MEDICINE AGAINST SEA-SICKNESS.—*Eugène Fournier*, Paris, France. Application filed June 11, 1888. Used since May, 1885.
"The word 'PELAGINE.'"

17,034.—LIQUOR EXTRACTED FROM CHERRIES.—*Dubonnet Frères*, Paris, France. Application filed July 18, 1888. Used since September, 1884.
"The words 'ROYAL MONTMORENCY.'"

17,035.—PAINTS, COMPOSITIONS, ANTI-CORROSIVES, AND ANTI-FOULERS.—*Suter, Hartmann & Rahtjens Composition Company, (Limited.)* London, England. Application filed December 14, 1888. Used since January, 1884.
"The representation of an open hand."

17,036.—SHOE-ELASTIC, BOOTS, AND SHOES.—*Herbert & Rapp Company*, Brockton and Boston, Mass. Application filed June 20, 1889. Used since June 13, 1889.
"The representation, in any colors, of the rear half of a Congress shoe with upper part turned back, showing inside of the right-hand portion, on which is a strip with 'HUB GORE, &c. On the lower part are the words 'THE ELASTIC IN A CONGRESS SHOE IS CALLED 'GORE.'"

17,037.—CHAMPAGNE.—*Krug & Co.*, Rheims, France. Application filed July 17, 1889. Used since March, 1865.
"A hand-roll with the word 'KRUG.'"

17,038.—PARCHMENTIZED PAPER.—*The Leatheroid Manufacturing Company*, Kennebunk, Maine, and Boston, Mass. Application filed August 2, 1889. Used since May 6, 1861.
"The word 'LEATHEROID.'"

17,039.—CHOCOLATE.—*Menier*, Paris, France. Application filed July 16, 1888. Used since 1836.
"The word 'MENIER.'"

17,040.—UNDERWEAR.—*J. Meyer & Co.*, New York, N. Y. Application filed July 24, 1889. Used since July 1, 1889.
"The block-letter 'M' printed within an ellipse which is surrounded by a design approximately diamond-shaped."

17,041.—METALLIC PENS.—*Poure, O'Kelly & Co.*, Boulogne, France. Application filed July 18, 1888. Used since March, 1885.
"The representation of the cross of the Legion of Honor upon a groundwork of pens set in lines."

17,042.—GLYCERINE-CREAM.—*Joseph Simon*, Paris, France. Application filed June 11, 1888. Used since 1876.
"The picture of Figaro."

17,043.—CATHETERS, BOUGIES, STOMACH, RECTUM, AND VAGINA TUBES, SPECULA AND EUREKA TUBES.—*Henry Bedford Sleeman*, London, England. Application filed November 15, 1888. Used since November 2, 1888.
"A triangle and the letters 'P. P. W.'"

17,044.—AXLE AND SHAFTING GREASE AND OIL.—*Rufus D. Stetson*, Chicago, Ill. Application filed August 2, 1889. Used since March 1, 1881.
"The word 'CHALLENGE.'"

17,045.—LIGHT BREAD, CAKES, PIES, AND ALL BAKERY PRODUCTS.—*Benjamin H. Smith*, Kansas City, Mo. Application filed August 9, 1889. Used since June 1, 1889.
"The words 'NEW PROCESS.'"

17,046.—LIQUID REMEDY FOR INTERNAL AND EXTERNAL USE.—*John F. Venner*, Portland, Oreg. Application filed May 31, 1889. Used since April 20, 1889.
"The letters 'O E R' arranged in a monogram."

LABELS.

6,014.—Title: "DIEHL'S SAUSAGE."—*George H. Diehl*, Chicago, Ill. Application filed August 23, 1889.

6,015.—Title: "DART." (For a dress-stay.)—*Austin Kelley*, Brooklyn, N. Y. Application filed August 20, 1889.

6,016.—Title: "UNDER-ARM." (For a dress-stay.)—*Austin Kelley*, Brooklyn, N. Y. Application filed August 20, 1889.

6,017.—Title: "SIDE-BACK." (For a dress-stay.)—*Austin Kelley*, Brooklyn, N. Y. Application filed August 20, 1889.

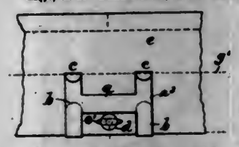
6,018.—Title: "ONE SOLID FOOT OF CHEWING TOBACCO FOR 10 CTS." (For tobacco.)—*L. P. Stovall & Co*, Danville, Va. Application filed August 7, 1889.

6,019.—Title: "VOELCKER'S PRUNE SYRUP LAXATIVE."—*Jacob C. H. Voelcker*, Louisville, Ky. Application filed August 19, 1889.

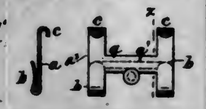
6,020.—Title: "WHITE PINE." (For a cough cure.)—*Robert J. Watt*, Greenwich, N. Y. Application filed August 19, 1889.

PATENTS

GRANTED SEPTEMBER 17, 1889.

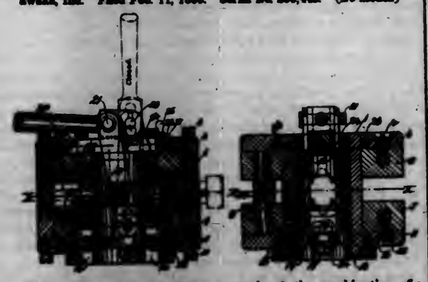


411,000. BOLT. EMELD ARENBERG, Peekskill, N. Y. Filed July 13, 1889. Serial No. 317,570. (No model.)



Claim.—1. A bolt-head formed from one piece of metal into two square sections, one above the other, one section having its sides stand at an angle of forty-five degrees with the sides of the other, substantially as shown.

2. A bolt-head formed from one piece of metal into two or more sections, arranged one above another, the relative position of their sides being symmetrically angled, substantially as shown and described.



411,001. NECKTIE-FASTENER. HENRY W. ATWATER, East Orange, N. J. Filed Dec. 5, 1888. Serial No. 292,693. (No model.)

Claim.—The holder for necktie, constructed from sheet metal, substantially as herein described, with the bar *a*, having cross-pieces a^2 at its extremities, each cross-piece being provided at opposite sides of the bar with spring-clip *b* and hook *c*, respectively, and the bar being adapted to bear upon the upper side of the collar-button shank to support the holder, as and for the purpose set forth.

411,002. BOLT-THREADING MACHINE. JAMES A. BRUNER, Mishawaka, Ind. Filed Feb. 11, 1889. Serial No. 299,445. (No model.)

Claim.—1. In a screw-cutting turret-head, the combination of a turret-post with its upper and lower opening and closing turret-jaws, and their cutting-dies arranged around their peripheries, and mechanism for operating the said jaws, substantially as and for the purpose described.

2. In a screw-cutting turret-head, the combination of a turret-post with its upper and lower opening and closing turret-jaws and their corresponding pairs of dies adjustably secured around their peripheries, substantially as and for the purpose described.

3. In a screw-cutting turret-head, the combination of the receding and approaching turret-jaws mounted and moving freely on a suitable supporting-post, with their corresponding pairs of cutting-dies arranged around their peripheries and having their cutting-faces turned inwardly, substantially as and for the purpose described.

4. In a screw-cutting turret-head, the combination of an upper receding and approaching turret-jaw with a similar lower turret-jaw mounted and adapted to rotate on a suitable post, said upper and lower jaws having radial grooves formed on their inner surfaces coincident with the radial centers of the cutting-dies, substantially as and for the purpose described.

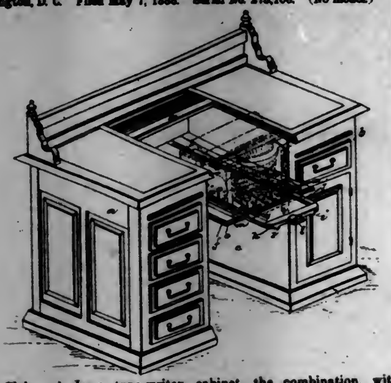
5. In a screw-cutting turret-head, the upper and the lower receding and approaching turret-jaws mounted and adapted to rotate on a suitable post, said jaws having radial grooves formed on their inner surfaces and arranged in opposite pairs to coincide with opening formed in turret-post in line of centers of cutting-faces of dies, substantially as and for the purpose described.

6. In a screw-cutting turret-head, the combination of an upper receding and approaching turret-jaw and its guide-pins secured perpendicularly to its inner surface, with a lower receding and approaching turret-jaw, the latter jaw being provided with guide-holes formed therein to loosely receive said guide-pins, substantially as and for the purpose described.

7. In a screw-cutting turret-head, the combination of an upper receding and approaching turret-jaw and its guide-pins secured perpendicularly to its inner surface with a similar lower turret-jaw provided with guide-holes to freely receive said guide-pins, said jaws arranged to be rotated simultaneously, substantially as and for the purpose described.

8. In a screw-cutting turret-head of the character described, the combination of an upper turret-jaw and its cap secured thereto and an upper cross-head arranged to slide in guides formed in turret-post, and having its projecting ends inserted into an annular groove formed between the surfaces of the said upper turret-jaw and its cap, with a lower turret-jaw, cap, and cross-head of like construction, and toggle-links connecting said cross-heads for opening and closing said jaws, substantially as and for the purpose described.

9. In a screw-cutting turret-head, the combination of an upper receding and approaching turret-jaw and a lower receding and approaching turret-jaw with their expanding springs contacting with inner surfaces of said jaws, substantially as and for the purpose described.



10. In a screw-cutting turret-head, the combination, with the turret-post, the turret-jaws, and their cross-heads, of the character described, of an interchangeable stop-pin arranged to be inserted into stop-holes formed in top turret-cap and top cross-head, substantially as and for the purpose described.

11. In a screw-cutting turret-head of the character described, the combination, with the post 1, fulcrum 22, carrying turret-cap 3, and its upper disengaging jaw 2, having adjustable dies 5 arranged around its periphery and adjusted by the screws 6, of the lower disengaging turret-jaw 7 and its cap 11, said jaw 7 having adjustable dies 9 arranged around its periphery and adjusted by the screws 10, and means for opening and closing the jaws, substantially as and for the purpose set forth.

12. In a screw-cutting turret-head, the combination, with the upper disengaging turret-jaw 2 and its cap 3, mounted on post 1 and having the guide-pin 8 secured thereto, and their spring 26, encircling said pins, of the lower disengaging turret-jaw 7 and its cap 11, said jaw provided with holes to loosely receive said guide-pins and limited in its motion by its cap 11, connecting with end of said guide-pins, substantially as and for the purpose described.

13. In a screw-cutting turret-head, the combination of the turret-post and its upper and lower disengaging jaws with the cross-piece sliding in the slots 14 and having its ends inserted in the annular groove 15, the toggles 18, hinged to bolt 16 by the pin 19 on their lower ends and on their upper ends to the handle 20 by the pin 21, and handle fulcrumed by the pin 23 to the fulcrum 22, sliding in notches 24, formed on turret-post 1, and having its ends inserted in grooves 25, formed in cap 11, all substantially as and for the purpose described.

411,003. TYPE-WRITER CABINET. LOTHER G. BILLING, Washington, D. C. Filed May 7, 1888. Serial No. 273,108. (No model.)

Claim.—1. In a type-writer cabinet, the combination, with stationary ends connected by a back, with a well between them and a dust-board in the well, of a platform pivoted in the well and having its side and rear edges provided with felt, cloth, rubber, or other flexible material, whereby the spaces between the platform, the dust-board, and the sides of the well are filled up, substantially as and for the purposes described.

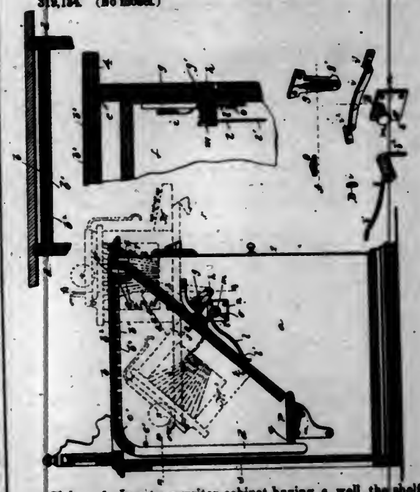
2. In a type-writer cabinet having a well and usual dust-board therein, a pivoted platform in said well, combined with flexible packing-strips arranged upon its sides and rear end to exclude rising dust, and also to insulate the platform from the cabinet and impede or intercept the transmission of sound, substantially as described.

3. In a type-writer cabinet having an open-front well to receive the machine, a platform pivoted in said well and adapted to be moved toward the operator, combined with a machine-carriage arranged upon the face of the platform and adapted to be moved thereon toward the operator, substantially as and for the purpose described.

4. In a type-writer cabinet having an open-front well to receive the machine, a platform pivoted in said well and adapted to be moved toward the operator, and having parallel dovetail grooves in its face, combined with slides having rails arranged in said grooves, and thereby secured to the platform, and constituting a carriage to receive the machine and adapted to be moved toward the operator, substantially as described.

5. In a type-writer cabinet having an open-front well, a platform pivoted in said well and adapted to be moved toward the operator, and having grooves in its face, combined with a machine-carriage comprising slides and rails fitted in said grooves, and also adapted to be moved toward the operator additionally to the movement of the platform, the slides being provided with sockets to receive the usual feet of the machine, and turn-buttons to lock the machine to the slides and incidentally to fix the slides in given position, substantially as described.

6. In a type-writer cabinet having an open-front well, the pivoted platform for moving the machine toward the operator for use and back again for disuse, having longitudinal grooves in its face, and a traversing carriage provided with rails fitted to slide in said grooves and adapted to receive the machine and further move it toward the operator, combined with a screw to retain the carriage in adjusted position, substantially as described.



7. In a type-writer cabinet having an open-front well, the pivoted platform for moving the machine toward the operator for use and back again for disuse, and provided with face grooves, combined with a carriage adapted to further move the machine toward the operator, and having rails fixed to it and fitted to slide in said grooves and of a height greater than the depth of the grooves to elevate the carriage slightly above and so insulate it from the platform, substantially as described.

8. In a type-writer cabinet, the sides *a b* and open-front well *c* between them, combined with the platform pivoted in said well and adapted to move toward the operator and having grooves in its face, and the machine-carriage adapted to further move the machine toward the operator, and having parallel slides constructed with rails which are fitted in said grooves, and the cross-piece connecting the slides at their outer or leading ends and provided with a handle, substantially as described.

9. In a type-writer cabinet, the combination of a platform arranged in a horizontal plane for supporting the machine for use within the cabinet and having grooves in its face, a machine-carriage having slides and rails fitted to said grooves and adapted to be drawn forward beyond the front of the cabinet, and so as to project over the front edge of the platform and well into the lap of the operator, stationary pins on the platform, and intercepting movable pins on the carriage to arrest the forward movement of the carriage, substantially as described.

10. In a type-writer cabinet, the platform arranged in a horizontal plane for supporting the machine for use within the cabinet, combined with an extension for receiving the machine, movable upon the platform and adapted to be projected not only beyond the front of the cabinet, but also over the outer end of the platform, thus to place the machine well out of the cabinet and into the lap of the operator, as desired, substantially as described.

411,004. CABINET FOR TYPE-WRITERS. LOTHER G. BILLING, Washington, D. C. Original application filed Mar. 22, 1888, Serial No. 268,134. Divided and this application filed July 30, 1889. Serial No. 318,184. (No model.)

Claim.—1. In a type-writer cabinet having a well, the shelf for the machine, and arms for supporting the shelf rigidly secured to the shelf at points forward of a line drawn midway between its ends and projecting below said shelf, and pivots for said arms arranged near the front of the cabinet, all constructed and arranged to throw the front of the shelf out of the well and beyond the front of the cabinet when the shelf is brought into a horizontal position, and guides for said arms, which also serve to limit their throw, substantially as shown.

2. The cabinet or desk having end sections, combined with a shelf arranged between such sections, arms secured rigidly to the sides of the shelf and projecting below the shelf and pivoted to the cabinet at their lower ends, and guides or ways embracing said arms, whereby the shelf is not only pivoted and guided in its movements, but it and the end sections are intimately and securely united, substantially as described.

3. The cabinet or desk having a well, a shelf arranged in said well, arms secured rigidly to the sides of the shelf and pivoted to the cabinet within the well, and guides or ways embracing said arms and controlling the extent of their movement, combined with the coiled springs arranged in conjunction with the shelf, so as to tend to throw the shelf into horizontal position, substantially as described.

4. In a cabinet, the combination, with the shelf and its pivoting-arms, of guides or ways about which the shelf moves, and on which it takes bearings in its positions of use and disuse, substantially as described.

5. In a cabinet, the combination, with the shelf and its pivoting-arms, of segmental cervilinear ways receiving and guiding such arms and forming bearings for the shelf, and stops in the ends of said ways to arrest the arms and shelf in their two positions, substantially as described.

6. In a type-writer cabinet, the combination, substantially as shown and described, of the two sides and a back connecting them and having a well or recess bounded on three sides by said sides and back, a flat top for the well, a platform pivoted in said well and adapted to be inclined rearward and inclosed in the well by the sides and top and provided with hooks to engage loosely the inner walls of the base of the type-writing machine and permit such machine to

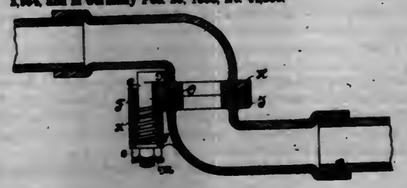
be slipped back upon the inclined platform so as to be inclosed within the well by the top, sides, platform, and back, and to be drawn forward beyond the front of the desk when the well is uncovered and the platform is brought into a horizontal position.

7. In a type-writer cabinet, the pivoted shelf provided with hooks to engage the machine, and guide-pins for keeping the machine in place on the shelf, and at the same time admitting of its being freely moved, substantially as described.

8. In a cabinet, the shelf pivoted out of its center of gravity within said cabinet, combined with coiled springs of slightly greater resistance than the combined weight of the shelf and the type-writing machine, and arranged beneath the shelf and in the rear of its pivots and attached to the side walls of the recess on opposite sides of the shelf, and having their free ends extended toward the rear of and engaging said shelf, whereby the springs are held in tension by said shelf, so that the said springs tend to force the shelf into a horizontal position and are overcome by the weight of the machine and shelf under the manipulation of the operator and permit the shelf to gain an inclined position without jar or shock, substantially as described.

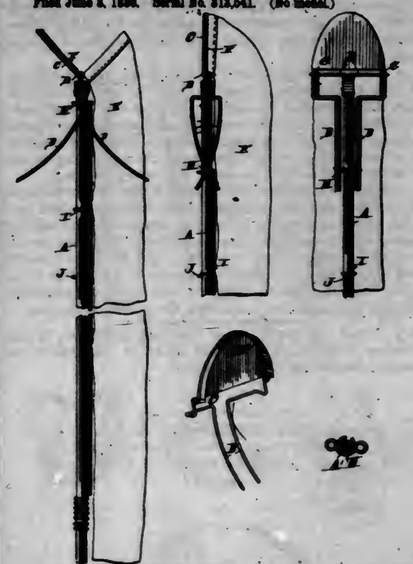
9. In a cabinet, the combination, with the sides and the shelf pivoted in the well between said sides, of coiled springs and fastenings therefor, consisting of headed studs, upon which the coils of the springs are slipped when free from tension, and by the heads of which the coils are retained by their decrease in diameter when under tension, posts for locking one end of the springs, and plates from which the studs and posts rise, and by which they and the springs are secured to the cabinet, substantially as described.

411,005. CORN AND FERTILIZER DROPPER. JOHN P. BIRMINGHAM, Lexington, Va., assignor of one-half to Andrew T. Staton, same place. Filed June 17, 1889. Serial No. 314,853. (No model.)



Claim.—1. The combination, with the frame, and the bifurcated arm N, fitting a socket in the platform on said frame, of the wheel B, having a lateral lug, the lever M, the slide carried thereby, the removable pin connecting said lever and arm N, and the cord O, connecting said pin with the side bar of the frame, substantially as described.

2. The combination, with the frame, the wheel, and the slide, of the transverse bar *m*, connecting said slides, the levers L M, the latter formed with elongated slot *r*, through which said bar *m* passes, and the former with an open-ended slot O, the standards, and the transverse rods *b*, connecting the upper ends of said standards and engaging the slot *e* of the lever L, and provided with a step *g*, substantially as shown and described, and for the purpose specified.

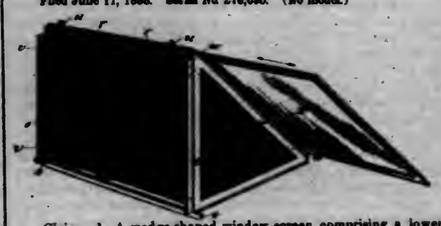


3. The combination, with the hopper, the slides working vertically in guides therein, the wheel B, having the lugs upon opposite sides thereof, the transverse bar *m*, connecting the upper ends of the slides, and the roller *n* on said bar between the slides, of the standards, transverse bar *p*, connecting the upper ends thereof, the lever having its free end arranged in the path of one of the lugs on the wheel, and its other end bifurcated and engaging the bar connecting the standards, and connected with the bar connecting the slides, and the lever having its free end arranged in the path of the other lug on the wheel, and having its rear end slotted and engaging the bar connecting the slides, and a support for the said lever between its ends, substantially as shown and described.

411,006. PIPE-CONNECTION FOR PNEUMATIC BRAKES. LUDWIG BLATZ, Cannstad, Würtemberg, Germany. Filed Mar. 26, 1888. Serial No. 304,390. (No model.) Patented in England Feb. 27, 1888, No. 2,934, and in Germany Feb. 29, 1888, No. 44,358.

Claim.—In pipe-connections for pneumatic brakes and the like, the combination, with two sections of pipe, of flanges H J in the ends thereof, respectively, an annular space between said flanges, a ring O therein, sockets on one of said flanges, hooked bolts G N in said sockets, and springs K, operating on said hooked bolts, substantially as and for the purpose set forth.

411,007. FRUIT-GATHERER. CHARLES J. BLOOM, Atchison, Kans. Filed June 5, 1889. Serial No. 313,541. (No model.)



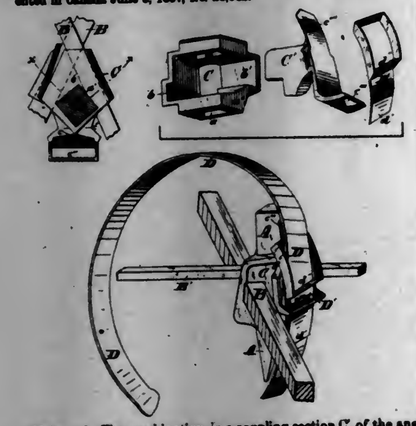
Claim.—1. The combination of the handle, the jaws mounted thereon and having depending crossed arms, and the operating-rod mounted on the handle and provided with rings or eyes engaging the crossed arms of the jaws, as set forth.

2. The combination of the handle, the pin projecting therefrom, the jaws mounted on the handle and having depending crossed arms, and the operating-rod mounted on the handle and having rings or eyes engaging the crossed arms and provided with an offset adapted to impinge against the pin projecting from the handle, as set forth.

3. In a fruit-gather, the handle having the lateral arms B, the jaws mounted thereon and consisting of wire frames C, which are fulcrumed on the arms B, and are provided with the integral depending crossed spring-wire arms D, and the operating-rod provided with rings or eyes H, which slide on the crossed arms D, for the purpose set forth.

411,008. WINDOW-SCREEN. LUDWIG W. BRAUN, Chicago, Ill. Filed June 11, 1888. Serial No. 276,695. (No model.)

Claim.—1. A wedge-shaped window-screen comprising a lower horizontal rectangular frame, an upper inclined rectangular frame, the outer edge of which rests upon the outer edge of the lower frame, and a pair of triangular end frames connecting said upper and lower frames at the ends thereof, all of said frames being covered with wire-gauze substantially as and for the purpose described.



2. A hollow wedge-shaped window-screen comprising a lower horizontal rectangular frame, an upper inclined rectangular frame hinged thereto at the outer edge thereof, and a pair of triangular end frames hinged to said upper frame and connecting and supporting the same upon the lower frame, all of said frames being covered with wire-gauze, substantially as described.

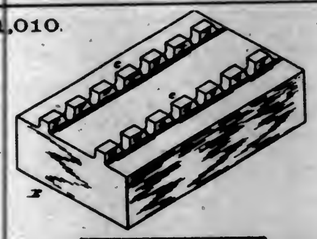
3. A hollow wedge-shaped window-screen comprising a lower horizontal rectangular frame provided with a strip to rest upon the window-sill between the stiles of the frame thereof, an upper inclined rectangular frame hinged to the lower frame at the outer edge thereof and provided with cleats adapted and arranged to abut against the upper sash of the window, and triangular end frames hinged to said upper frame at the ends thereof, connecting the same with and supporting it upon the lower frame, all of said frames being covered with wire-gauze, and lock-bolts upon said triangular frames adapted and arranged to engage corresponding sockets in the bottom frame, whereby the frame may be locked in position, substantially as described.

4. In a hollow wedge-shaped window-screen, the combination, with the lower horizontal rectangular frame, the upper inclined rectangular frame connected therewith at the outer edge thereof, and a pair of triangular end frames connecting said upper and lower frames at the ends thereof, all of said frames being covered with wire-gauze, of a removable cover for said upper frame, having a sliding connection therewith, substantially as and for the purpose described.

5. In a hollow wedge-shaped window-screen, the combination, with the lower horizontal rectangular frame, the upper inclined rectangular frame hinged thereto at the outer edge thereof, and a pair of triangular end frames hinged to said upper frame at the ends thereof, connecting the same with and supporting it upon the lower frame, all of said frames being covered with wire-gauze, of guide-strips along the upper and lower edges of said upper frame, and a removable shade guided and working between said strips, substantially as described.

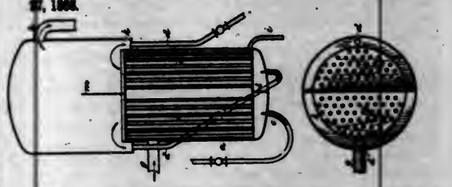
411,009. HARROW. AUSTIN CALLANDER, Merrickville, Ontario, Canada. Filed Feb. 27, 1889. Serial No. 301,383. (No model.) Patented in Canada June 8, 1887, No. 26,912.

Claim.—1. The combination, in a coupling-section C, of the angular face, the top *c*, cheek *c'*, mortise *c²*, neck *c³*, upwardly-tapering tongue *c⁴*, and stirrup *c⁵*, substantially as set forth.



2. In a harrow, the combination of the bulls B B', crossing each other at an angle and held in a coupling, the main body of a coupling C, having mortises for the free insertion of the bulls and for the tight insertion of the tooth A, a loose section C', having a mortise for the tooth A, and faces pressing against the bulls when wedged in the main body by said tooth, the tooth A passing through the main body of the coupling and the loose piece C' and wedging the latter against the bulls, said loose piece provided with an attachment *c⁶*, *c⁷*, and *c⁸*, substantially as set forth.

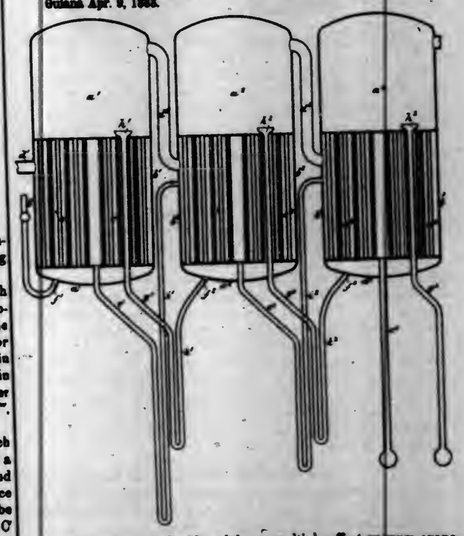
3. In a harrow, the combination of the bulls B B', crossing each other at an angle and contained in a coupling, the main body C of a coupling provided with mortises for the free insertion of the bulls and a vertical mortise for a straight harrow-tooth, a loose coupling-piece C', provided with faces impinging on the bulls, and a mortise to be engaged by the harrow-tooth and locked in said body, said piece C' being provided with an attachment *c⁶* *c⁷* *c⁸*, for the reception of a spring-tooth, the straight tooth A, passing through said coupling and engaging the loose piece and wedging the bulls, the spring-tooth D, and the spring-tooth clip D', substantially as set forth.



411,010. PAVING-BRICK. HORACE R. CAMP, Talladega, Ohio. Filed May 2, 1889. Serial No. 309,382. (No model.)

Claim.—As an improved article of manufacture, a paving-brick having on one side one or more serrated ridges, substantially as shown, and for the purpose specified.

411,010.

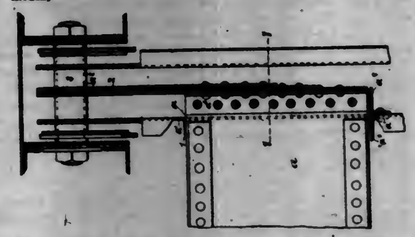


411,011. EVAPORATING APPARATUS. ALFRED CHAPMAN, Liverpool, England. Filed Oct. 6, 1888. Serial No. 287,441. (No model.) Patented in England Feb. 6, 1888, No. 1,782, and in British Guiana Mar. 27, 1888.

Claim.—1. In an evaporating-pan, the steam-drum *c* and the tubes *b* therethrough for the upward flow of the liquid, in combination with the recess or well *k*, the bottom of which is below the upper ends of said tubes *b*, and a downflow-tube *d*, extending from the bottom of said recess or well, substantially as set forth.

2. In an evaporating-pan, the combination, with the steam-drum *c*, and with the tubes *b*, for the upward flow of the liquid, of the partitions *l* and *m*, recess or well *k*, and downflow-tubes *d*, exterior to the pan, substantially as set forth.

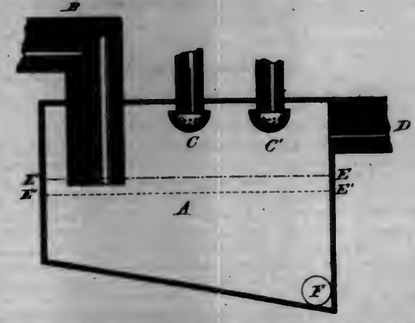
411,012. VACUUM EVAPORATING APPARATUS. ALFRED CHAPMAN, Liverpool, England. Filed Oct. 6, 1888. Serial No. 287,442. (No model.) Patented in England Feb. 20, 1888, No. 2,511, and in British Guiana Apr. 9, 1888.



Claim.—1. In a double, triple, or multiple effect vacuum evaporating apparatus, the steam-drums thereof, wherein different degrees of pressure are maintained, in combination with depending bent tubes or inverted siphons connecting adjacent drums, said tubes or siphons conveying the water of condensation from one steam-drum to the next in the series, and said tubes or siphons extending below said drums a sufficient distance to maintain a column of water of sufficient height to balance the difference in barometric pressure between adjacent drums, substantially as set forth.

2. In a double, triple, or multiple effect vacuum evaporating apparatus, the evaporating-pans thereof, wherein different degrees of pressure are maintained, in combination with depending bent tubes or inverted siphons connecting adjacent pans, said tubes or siphons conveying the saccharine liquid from one pan to the next in the series, and said tubes or siphons extending below said pans a sufficient distance to maintain a column of saccharine liquid of sufficient height to balance the difference in barometric pressure between adjacent pans, substantially as set forth.

3. In a double, triple, or multiple effect vacuum evaporating apparatus, the evaporating-pans thereof, wherein different degrees of pressure are maintained, and the steam-drums, in combination with depending bent tubes or inverted siphons connecting adjacent steam-drums, and depending bent tubes or inverted siphons connecting adjacent evaporating-pans, said tubes or siphons extending below said pans and drums a distance determined by the relative pressures in said pans and drums, substantially as set forth.

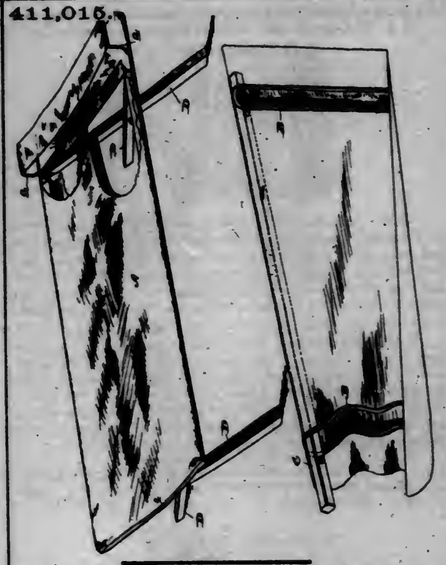


411,013. CONSTRUCTION OF METALLIC STRUCTURES. FRANK H. CILLEY, Boston, Mass. Filed Mar. 25, 1889. Serial No. 304,563. (No model.)

Claim.—1. The herein-described combination of beam *a*, post *a'*, and support *a²*, the post being provided with an opening to allow the beam to pass through it clear of the lower wall of the opening, all substantially as and for the purpose set forth.

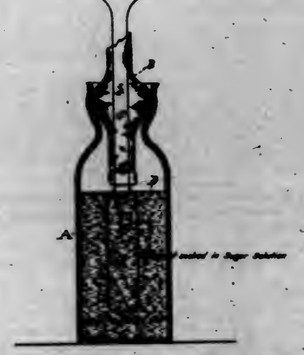
2. The herein-described combination of beam *a*, post *a'*, and support *a²*, with a safety-iron *a³*, secured to the post *a'*, crosswise thereto, substantially as and for the purpose set forth.

411,014. PROCESS OF CONDENSING FUMES FROM METALLURGIC FURNACES. FREDERIC P. DEWEY, Washington, D. C. Filed Feb. 20, 1888. Serial No. 265,743. (No model.)



Claim.—The process of catching and saving the fumes arising from metallurgic operations, which consists in subjecting such fumes to the action of an organic chemical bath, as herein described.

411,015. CAMP-BED. JOHN DICK, Toronto, Ontario, Canada. Filed Sept. 12, 1888. Serial No. 285,166. (No model.)

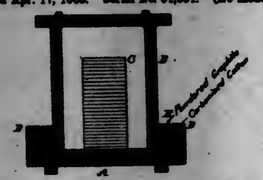


Claim.—1. As an improved article of manufacture, a camp-bed composed of a fabric bag A, folded and closed at its ends and edges with a space between the folds, and one of said folds formed with the transverse openings B at a point remote from the ends, and a frame inserted in said openings and serving to stretch and support said bag, substantially as shown and described.

2. The camp-bed described, consisting of the bag-shaped stretcher A, folded, as described, and closed at the ends and edges, and one of said folds provided at a point remote from each end with the transverse openings B, the removable and detachable side rails C, inserted in said openings B, and the detachable legs D, all arranged and operating substantially as shown and described.

411,016.

411,016. MANUFACTURE OF CARBON FILAMENTS. THOMAS A. EDISON, Menlo Park, N. J., assignor to the Edison Electric Light Company, New York, N. Y. Filed Oct. 20, 1888. Serial No. 74,780. (No model.)

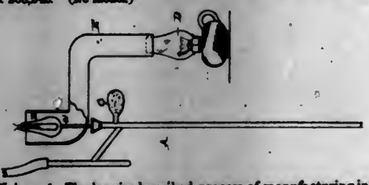


Claim.—1. The method of ascertaining the character of the carbon filament intended for use in an incandescing electric lamp, consisting in immersing the filament in a non-oxygenated liquid inert under the conditions described and then raising the filament to a red heat by passing an electric current therethrough, substantially as set forth.

2. The method of changing the resistance of a carbon filament, consisting in coating it with a carbonizable material, then immersing it in a liquid, and then raising it to a red heat by passing an electric current therethrough, said carbonizable material not being soluble in the liquid, and the gas of said liquid not being decomposable when the filament is at a red heat, substantially as set forth.

3. The method of carbonizing, consisting in raising a conductor in a liquid in the presence of a carbonizable material to a heat sufficient to carbonize the material by passing an electric current through said conductor, the liquid used not being decomposable under such heat, substantially as set forth.

4. The method of changing the resistance of a carbon filament and ascertaining its character and resistance, consisting in coating it with a carbonizable material, immersing it in a liquid, said carbonizable material not being soluble in the liquid used, and said liquid not being decomposable when heated in the presence of carbon, and then raising it to a red heat by the passage of an electric current therethrough, substantially as set forth.

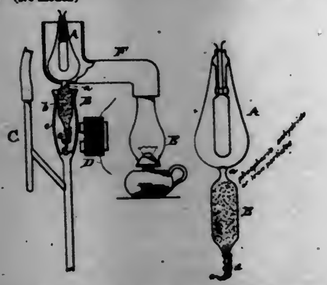


411,017. CARBONIZING-FLASK. THOMAS A. EDISON, Menlo Park, N. J. Filed Apr. 17, 1888. Serial No. 91,361. (No model.)

Claim.—1. A carbonizing-flask constructed of a material—such as plumbago or nickel—capable of withstanding a high temperature and composed of a base with a raised edge, a cover resting on said base within the raised edge and leaving a space between said cover and edge, a luting—such as graphite—capable of withstanding a high temperature placed in said space, and an absorbent of oxygen placed in the joint between the parts of the flask, substantially as set forth.

2. A carbonizing-flask constructed of a material—such as plumbago or nickel—capable of withstanding a high temperature and composed of a base with a raised edge, a cover resting on said base within the raised edge and leaving a space between said cover and edge, a luting—such as graphite—capable of withstanding a high temperature placed in said space, and a body of carbonized cotton placed in the joint between the parts of the flask, substantially as set forth.

411,018. MANUFACTURE OF INCANDESCENT ELECTRIC LAMPS. THOMAS A. EDISON, Llewellyn Park, N. J. Filed July 17, 1886. Serial No. 208,242. (No model.)



Claim.—1. The herein-described process of manufacturing incandescent electric lamps, consisting in externally heating the lamp-globe during the process of exhaustion.

2. The herein-described process of manufacturing incandescent electric lamps, consisting in exhausting the globe by a Sprengel vacuum-pump and at the same time heating such globe externally.

3. The herein-described process of manufacturing incandescent electric lamps, consisting in heating the lamp-globe by a current of heated air or gas during the process of exhaustion.

411,019. MANUFACTURE OF INCANDESCENT ELECTRIC LAMPS. THOMAS A. EDISON, Llewellyn Park, N. J. Filed July 20, 1886. Serial No. 208,501. (No model.)

Claim.—1. The herein-described method of removing moisture from the inclosing-globe of an incandescent electric lamp, which consists in hermetically sealing said globe to a sealed chamber containing a material capable of absorbing or decomposing such moisture and then externally heating said globe.

2. The herein-described method of exhausting an incandescent electric lamp, which consists in hermetically sealing the lamp to a sealed chamber containing a material capable of absorbing or decomposing such moisture, heating said lamp, and afterward withdrawing the air from said lamp.

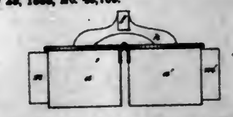
3. The herein-described method of exhausting an incandescent electric lamp, which consists in hermetically sealing such lamp to a sealed chamber containing a material capable of absorbing or decomposing such moisture, heating the lamp, forming an opening in said receptacle, and withdrawing the air from the lamp through said opening.

4. The herein-described method of exhausting an incandescent electric lamp, which consists in hermetically sealing the lamp to a sealed chamber containing a material capable of absorbing or decomposing such moisture, heating the lamp, attaching the said receptacle to an air-exhausting apparatus, forming an opening in said receptacle, and exhausting the lamp by means of said apparatus.

5. The herein-described method of exhausting an incandescent electric lamp, which consists in hermetically sealing such lamp to a sealed chamber containing a material capable of absorbing or decomposing such moisture, heating the lamp, attaching said receptacle to an air-exhausting apparatus, forming an opening in said receptacle by the attraction of a magnet for a magnetic body attached to said receptacle, and exhausting the lamp by means of said apparatus.

6. The herein-described method of exhausting an incandescent electric lamp, which consists in hermetically sealing the lamp to a sealed chamber containing a material capable of absorbing or decomposing such moisture, heating the lamp, and then withdrawing the air from the lamp and at the same time heating it again.

7. The combination, with an incandescent electric-lamp globe, of a sealed receptacle hermetically sealed thereto containing a material capable of absorbing or decomposing moisture and having a magnetic body attached to it, substantially as and for the purpose set forth.



8. The combination, with an incandescent electric-lamp globe, of a receptacle hermetically sealed thereto containing a material capable of absorbing or decomposing moisture and having a sealed hooked end, and a coil of iron wire hung on said hooked end, substantially as and for the purpose set forth.

411,020. MANUFACTURE OF CARBON FILAMENTS. THOMAS A. EDISON, Llewellyn Park, N. J. Filed Dec. 6, 1886. Renewed Feb. 11, 1889. Serial No. 299,557. (No model.)

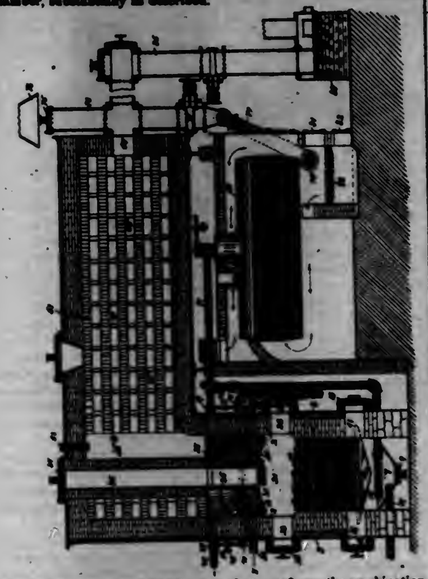
Claim.—1. The method of making carbon filaments for electric lamps, consisting in forming filaments from a plastic refractory material, baking said filaments, coating said filaments with carbon, and then removing the refractory material by a solvent, substantially as set forth.

2. The method of making carbon filaments for electric lamps, consisting in forming filaments from a plastic refractory material, baking said filaments, heating said filaments in the presence of a decomposable compound containing carbon, and then removing the refractory material by a solvent, substantially as set forth.

411,021. POCKET-INKSTAND. ERNST BERLINER, Berlin, Germany. Filed June 3, 1889. Serial No. 312,954. (No model.) Patented in Germany July 20, 1888, No. 46,769.

Claim.—1. In folding or pocket inkstands, the combination of two hinged receptacles *a a'* and a hinged frame *A* with tube *l* on said frame and tubes *m m'* on said receptacles, respectively.

2. The combination of two receptacles *a a'*, hinged together at their upper edge, a frame *A*, hinged thereto at *g*, and having hooks *o o*, adapted to hold said receptacles closed, substantially as set forth.



3. The combination of two hinged receptacles *a a'*, open above and closed below and adapted to be folded together and so close each other, two bottles *t* and *s* in said receptacles, and springs *v*, substantially as set forth.

4. The combination of two hinged receptacles *a a'*, adapted to be folded together, as set forth, tubes on said receptacles, and a pen-holder having a button *n* and screw-threaded part adapted to be inserted in said tubes and to hold the inkstand closed, substantially as set forth.

411,022. APPARATUS FOR THE MANUFACTURE OF GAS. VINCENT L. RILEY, Minneapolis, Minn. Filed Jan. 28, 1889. Serial No. 297,762. (No model.)

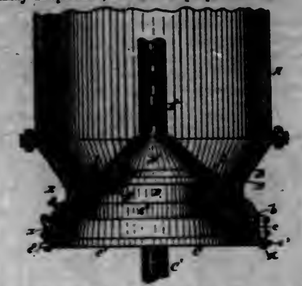
Claim.—1. In an apparatus for the manufacture of gas, the combination, with a combustion-chamber and a superheater, of radiating arches between said combustion-chamber and superheater formed with openings 33, extending vertically and laterally through the leg of said arches, passage-ways 31, extending around the wall of the cupola and communicating with said openings 33, and pipes 30, connecting with said passage-ways for forcing separate blasts of air through said openings into the combustion-chamber, substantially as and for the purposes set forth.

2. In an apparatus for the manufacture of gas, the combination, with a combustion-chamber and a superheater connected therewith, of a series of arches above said combustion-chamber, with passages between the legs of the arches for the passage of gases from the combustion-chamber to the superheater, and a magazine 35, extending downward through said arches and opening into said combustion-chamber, substantially as described.

3. In an apparatus for the manufacture of gas, the combination, with a cupola having a combustion-chamber and arches over said combustion-chamber, having passages between the legs of the arches for the flow of gases from the combustion-chamber, of a horizontal superheater-chamber connected with the cupola above said arches, a boiler arranged underneath said superheater-chamber, the pipe 73, communicating with the end of said superheater-chamber, and the pipe 79, connecting said pipe 73 with the space beneath the boiler, whereby the waste gases from the superheater-chamber may be used to heat said boiler, and thus supply steam for the cupola, and the radiated heat of the boiler is utilized in heating the superheater-chamber, substantially as described.

4. In an apparatus for the manufacture of gas, the combination, with the cupola 2, having the combustion-chamber 1, the series of arches 27, the fuel-magazine 35, extending through said arches, steam and oil pipes opening into the passages between the legs of said arches and air-passages in said arches opening into the combustion-chamber, of the superheater-chamber 51, connected with the cupola and arranged with an inclosed space 35* between said chamber and magazine 35, and the air-pipe 53, opening into said space, substantially as and for the purposes set forth.

5. In an apparatus for the manufacture of gas, the combination, with the cupola 2, of the horizontal superheater-chamber 51, arranged at one side of the cupola, the boiler 59, arranged underneath the superheater-chamber, the pipe 79, adapted to convey the waste gases of the superheater underneath the boiler, and the pipe 71, arranged to convey steam from said boiler to the steam-pipes of the cupola, substantially as described.

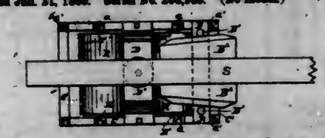


411,028. MACHINE FOR MAKING CURVED PIPE. PERRY J. FISH, Akron, Ohio. Filed Jan. 30, 1889. Serial No. 298,060. (No model.)

Claim.—1. In a press of the kind shown, a ring provided with an elliptical opening and adjustably mounted upon the mandrel and operating to retard at desired points the moving mass of clay and impart curvature to the issuing pipe, substantially as described.

2. In a press of the kind shown, the combination of the mandrel provided with a ledge, a ring having an elliptical opening and adapted to rest on said ledge, and means for moving said ring on said ledge, substantially as shown and described, and for the purpose specified.

3. The combination of the mandrel, the ring having the elliptical opening embracing said mandrel and adjustably connected thereto, and the annulus also embracing the mandrel above the point of location of the ring, substantially as shown, and for the purpose described.



4. The combination of the cylinder-head and the hook pivotally connected therewith and capable of outward vertical movement of the inner die with its outwardly-extending lug for engaging said hook, substantially as specified, and for the purpose stated.

5. The combination, with the cylinder of a sewer-pipe press, of a hook pivotally connected therewith and capable of outward vertical movement for sustaining the inner socket-die upon the lower head of the cylinder, substantially as shown and described.

6. In a press for sewer-pipe, the combination, with the mandrel having an annular outer ledge, of a ring adapted to fit said mandrel and rest on said ledge and having an internal groove to form a dam for the clay escaping between said ring and mandrel, substantially as shown and described.

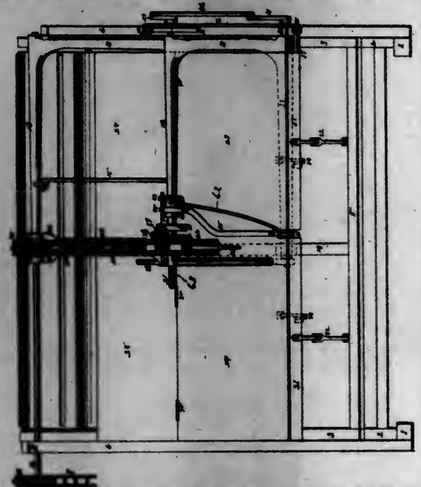
411,024. HOUSE-MOVING TRUCK. GEORGE GANT, Wichita, Kans. Filed Jan. 21, 1889. Serial No. 296,989. (No model.)

Claim.—1. A truck for moving buildings, consisting of the combination of a frame, as set forth, of the cylindrical rolls R, having the cast heads R^3, extension-hubs E', and axle F, upon which said frame is mounted, of the central cross-plate D, having secured thereto the pivotal plate D', and of the shoulder-lugs *a* and *a'*, secured to said frame at either end thereof, substantially as and for the purpose set forth.

2. In the house-moving truck described, in combination with the frame thereof bearing a central pivotal support and mounted on two rolls, one of which is in advance of its fellow, the shoulder-lugs *a* and *a'*, arranged in sets at either end of the truck-frame, whereby a truck may be turned and guided by means of a lever, in the manner substantially as and for the purpose set forth.

3. In the truck described, the metal frame thereof, consisting of the combination of the side bars C and Z, cross-bars C' and W, cross-plate D, having the central pivot-plate D' and the brace-bars Z' and *t*, and tie-rods *n*, arranged as set forth, and the shoulder-lugs *a* and *a'*, secured to the upper bars thereof, substantially as and for the purpose specified.

4. In the house-moving truck described, in combination with the frame thereof bearing a central pivotal support and a portable sill S, mounted upon said support, the bolster B, having the arms B' B'' and adapted to be seated on the truck-frame and hold the truck parallel with said sill by means of wedge-blocks or their equivalent, substantially as and for the purpose set forth.



5. In combination with the house-moving truck described, the bolster B, having the opposite extending arms B' and B'' and adapted to be seated upon the truck-frame and hold the truck in a fixed position with relation to its portable sill by means of wedge-blocks, in the manner substantially as and for the purpose specified.

6. In the compound truck described for moving buildings, the combination, with the two rear individual trucks, of the portable sills S, the bolsters B and wedge-blocks B^2, for holding said trucks in a fixed position with relation to said sills, and the means set forth for guiding and turning the individual forward trucks, substantially as and for the purpose specified.

7. In the compound truck described, the individual trucks thereof, each consisting of a double roll bearing one roll in advance of its fellow, a carriage-frame having a central pivotal support, and a set of shoulder-lugs *a* and *a'* at either end thereof adapted to be engaged by a lever to turn and guide each truck individually, in combination with the portable sills S and means of transportation, substantially as and for the purpose specified.

411,025. GRAIN-BINDER. GEORGE GRIESMER, Jr., Belvidere, Ill. Filed Apr. 21, 1887. Serial No. 235,700. (No model.)

Claim.—1. The combination of the grooved cam fixed on the overhanging arm of the binder-supporting frame, a dog-carrying arm fixed on the binder-shaft, a constantly-driven wheel loosely mounted on said shaft, a pin on said wheel, a dog pivoted to the arm and adapted to traverse the groove in the cam, and a sliding bolt in the cam-groove for withdrawing the nose of the dog from engagement with the pin, and thereby unlocking the said arm, and hence the binder-shaft, from the driving-wheel, substantially as set forth.

2. The combination, with the binding mechanism, the binder-shaft, and a suitable support for the same, of a grooved cam located on the shaft-support, a dog secured to the shaft in position to traverse the cam-groove, a driven wheel loosely mounted on the shaft in position to engage the free arm of the dog, and thereby cause the shaft to rotate with the wheel, an endwise-sliding bolt mounted in the shaft-support to control the action of the dog, a gavel-receiving arm in engagement with the endwise-sliding bolt, and a spring to hold the gavel-receiving arm, substantially as set forth.

3. The combination, with the grooved cam fixed on the overhanging tubular arm, of the supporting-frame, the binder-shaft, a dog to traverse the cam-groove fixed to rotate with the shaft, a driven wheel loosely mounted on the shaft, an endwise-moving bolt entering the cam-groove to control the movements of the dog to throw it into or out of engagement with the driven wheel, and the gavel-receiving arm, substantially as set forth.

4. The combination, with the trip-lever, a gavel-receiving arm pivoted centrally to the long arm of the lever, the upper end of the gavel-receiving arm having an engagement with the lever to limit the rearward movement of its upper end, and a spring in engagement with the gavel-receiving arm adapted to act directly upon the gavel-receiving arm and through the gavel-receiving arm on the lever, substantially as set forth.

5. The combination of a hinged binding-table, a guard-board pivoted to the lower edge of the binding-table and provided with an arm fixed thereto and depending below the hinge between the board and the table, as described, a link connecting said arm with the supporting-frame, so that as the table descends the link and the arm on the board fold inward, and means for raising and lowering the hinged binding-table, substantially as set forth.

6. The combination of a hinged binding-table, a guard-board pivotally secured to the lower edge of the table and provided with an arm fixed thereto and depending below the hinge between the board and the table, as described, a link connecting the depending arm with the supporting-frame, so that as the table descends the link and the arm on the board fold inward, a rock-shaft, a jointed connection between the rock-shaft and the free end of the hinged binding-table, and means for operating the rock-shaft, substantially as set forth.

411,026. SIRUP-FAUCET. EDWIN HAAS, Philadelphia, Pa. Filed May 10, 1889. Serial No. 310,208. (No model.)

Claim.—1. A hollow plug of the character described, provided with an exit-aperture, in combination with a sleeve projecting through the bottom of said plug, and a stem projecting through said sleeve and bearing a stop for the closing of said aperture, substantially as described.

2. A hollow plug of the character described, having an aperture at the top thereof, and an exit-aperture at the bottom, in combination with a sleeve extending into said plug, a stem passing through said sleeve, and two stops on said stem, one of said stops closing said upper and one said lower aperture, substantially as described.

3. A hollow plug having a top and a bottom aperture, in combination with a sleeve extending into the same, a cross-piece borne upon said sleeve, a plug on said cross-piece disposed to close the upper aperture, and a depending plug on said cross-piece for the purpose of closing the lower aperture, substantially as described.

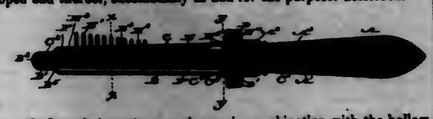
4. A hollow plug adapted to be screwed into the bottom of a jar, and having a top and a bottom aperture, in combination with a sleeve covered with rubber extending into said plug, and a stem projecting through said sleeve and bearing a stop for each of said apertures, substantially as described.

5. A hollow plug of the character described, having an upper and a lower aperture, in combination with a stem bearing an upward-extending post bearing a stop for the upper aperture and a valve for the lower aperture, and washers adapted to be placed upon said posts, substantially as described.

6. A plug of the character described, having an upper and a lower aperture, and a sleeve extending into the bottom thereof, said sleeve being covered with rubber, in combination with a stem passing through said sleeve, a post extending upward and borne upon said stem and bearing a stop for said upper aperture and a valve for the lower aperture, and supplementary washers adapted to be placed upon said post, substantially as described.

7. A hollow plug of the character described, having an upper and a lower aperture, and a sleeve extending into the same, in combination with a stem passing through said sleeve, a post on said stem bearing a stop for said upper aperture, a depending stem bearing a stop for said lower aperture, and washers adapted to be placed upon said post, substantially as described.

8. A hollow plug of the character described, having an upper and a lower aperture, and a sleeve extended into said plug, in combination with a stem passing through said sleeve and bearing a stop for each of said apertures, and a lever pivoted to the bottom of said plug, pivotally attached to said stem and provided with a weight and a forward-projecting arm, substantially as described.



411,027. CLAY FENCE-POST. WILLIAM H. HERRON, Edgewater, Ind. Filed June 6, 1889. Serial No. 313,370. (No model.)

Claim.—The clay-post coupling-rod D, made with an eye *d* at one end, in combination with a cross rod or bolt E, arranged near the top of a one-piece ground-section B, as and for the purpose described.

411,028. HAIR CURLING AND CRIMPING DEVICE. ISAAC W. HEYBURN, Philadelphia, Pa. Filed Feb. 7, 1889. Serial No. 298,970. (No model.)

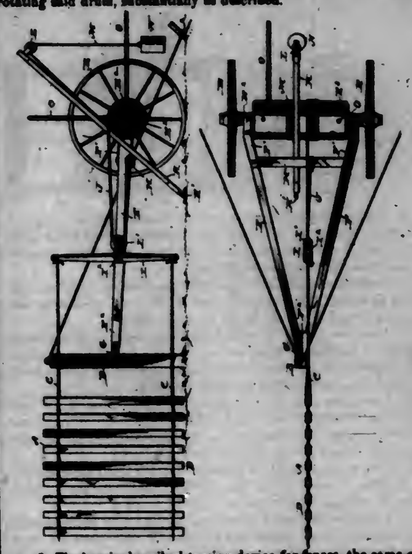
Claim.—1. In combination with the handle A and metal rod C, secured thereto, the hollow casing B, open at one end and adapted to be passed over said rod C, having slot B^2 in one side thereof, together with spring E, secured at one end to said casing B, extending forward within the same, having comb $E' E^2$ secured to its free extremity, said comb fitted to operate transversely in said slot B^2, said comb normally retracted within said casing by the backward tension of said spring E, and adapted to be thrust outwardly through said slot against said tension by the insertion of the said rod C into said casing B from said open end thereof, substantially as and for the purposes described.

2. In a hair curler or crimper, in combination with the hollow casing B, having contracted free end B', forming a bearing within, the internal detachable heating-rod C C', said rod supported in said bearing at the free end of said casing, and having its intermediate portion C extended along within said casing, separated from the inner walls thereof by the interposed air-space F, extending around said rod, the heat of said rod conveyed to said casing by radiation through said air-space F, substantially as described.

3. In a hair curler or crimper, the longitudinal casing B, open at one end, and having a concentric contraction B' at the opposite end, in combination with a central heating-rod C, having non-conducting handle A, and a concentrically enlarged part C^3 upon said rod near said handle, so that when said rod is inserted in said casing the free end thereof will be supported in said contraction B' and the enlarged portion thereof C^3 will fill the open end of said casing, together with the annular radiation-space F, formed thereby between the sides of said rod C and said casing B, substantially as described.

4. In combination with the handle A and heating-rod C, secured thereto, the external casing B, provided with slot B^2 in one side thereof, and the comb $E' E^2$, permanently secured within the said casing and adapted to be projected outward through said slot B^2 by the advance of said rod C in said casing, together with the non-conducting hand-piece D, surrounding the open end of said casing, substantially as described.

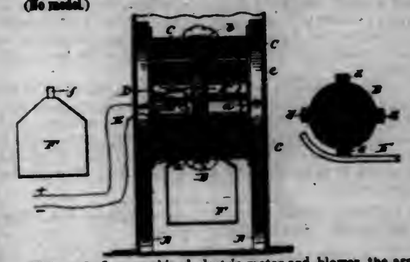
5. In a hair curler or crimper, in combination with the longitudinal casing B, open at one end and provided with slot B^2 in one side thereof, the elongated spring E, extended forward within said casing and provided with the hair-grasping part E', adapted to be forced out through said slot B^2, the rear end of said spring E extended along the outer side of said casing, and the perforated hand-piece D, fitted around the open end of said casing and adapted to clamp the free end E^3 of said spring E against the outer side of said casing and hold the same in place, together with the central rod C C' adapted to be inserted into the said casing B from its open end by its advance therein force the said part E' outward through said slot B^2, the said spring E retracting the same by its backward tension when the said rod C has been withdrawn, substantially as described.



6. In combination with the laterally-slotted hollow casing B, open at one end, the detachable rod C, adapted to be inserted therein, and the spring-mounted comb $E E^2 E' E^3$, said comb $E' E^2$ projected transversely through the slot B^2 by the advance of said rod C in said casing B, the downwardly-bent tip E^3 of said spring E E^2 adapted to rest upon said rod C and prevent contact of the body of said spring $E E^2$ or comb $E' E^2$ therewith, substantially as and for the purposes described.

7. In combination with a hollow casing, open at one end, and an internal heating-rod, of a like cross-section tapered and contracted at its free end and adapted to be inserted into and withdrawn from said casing, the comb E, contained within said casing, adapted to be thrust transversely outward or withdrawn through a slot in the side of said casing by the advance or withdrawal of said heating-rod longitudinally therein, substantially as described.

8. As an article of manufacture, a device for curling or crimping hair, consisting of a non-conducting handle A, metallic heating-rod C, attached thereto and extended longitudinally therefrom, a hollow casing B, open at one end and slotted at B^2 in one side thereof, a contained spring E, secured to said casing and provided with comb $E' E^2$ at its free end, stop B^3 within said casing, and C^3 upon said rod, said stops B^3 and C^3 by engaging with each other adapted to prevent the complete rotation of said rod within said casing when the same is inserted therein and operated by said handle A, substantially as described.

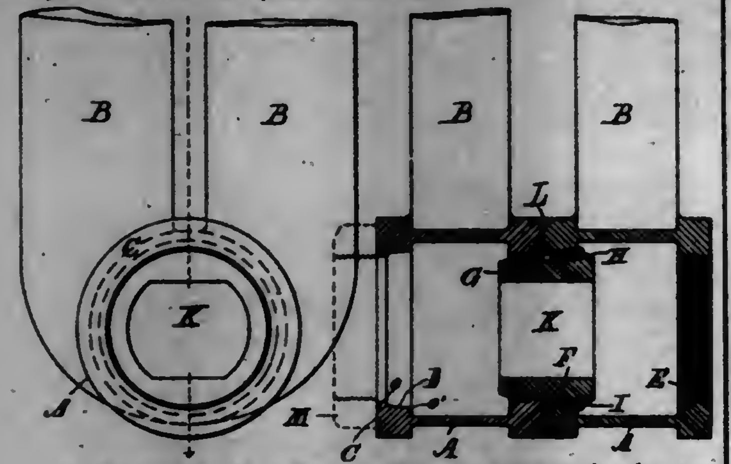


411,029. TENSION-MACHINE FOR USE IN CONSTRUCTING FENCES. WARREN W. HEISTAND, Hubbard, Ohio. Filed July 8, 1889. Serial No. 316,709. (No model.)

Claim.—1. In a fence-making machine, the combination, with a vertical tension-rod having a pulley secured thereto, of a rotatable cylinder or drum to the rear of the tension-rod, a transverse timber in advance of and adjacent to said drum, a rope secured to said transverse timber, passed through the pulley upon the tension-rod, and wound around said drum, an independent rope or chain secured to and wound around the drum in an opposite direction and passed over a pulley to the rear of and upon a higher plane than the drum and carrying upon its free end a weight, and means, as the levers O, for rotating said drum, substantially as described.

2. The herein-described tension device for fences, the same comprising, in combination, the wheels, the axle provided with a drum, as described, the timbers F, loosely sleeved at their rear ends upon the axle and united at their forward ends and provided with a metal pike, as described, a cross-timber connecting the timbers F at a point slightly in advance of the drum, the timber I, the pulley attached thereto, the rope J, secured to the cross-timber, passed through the pulley, and wound around the drum, the brace-timber K, between the cross-timber and drum, carrying at its upper end a pulley, and a rope or chain M, wound around the drum in a direction opposite to that of the chain J, passed over the pulley at the upper end of the brace-rod, and its free end provided with a weight, substantially as described, and for the purpose specified.

411,030. COMBINED ELECTRIC MOTOR AND BLOWER. CHARLES J. HEILMANN, Port Lee, N. J. Filed May 6, 1889. Serial No. 309,896. (No model.)



Claim.—1. In a combined electric motor and blower, the armature of the motor formed of a non-magnetic wheel having iron strips or armatures placed on each side thereof, in combination with the fan-blades attached direct to the periphery of the wheel.

2. The combination, with an electric motor and blower combined, of two standards, as A A, in which said motor and blower are mounted, air-passages through said standards, and a blower-casing inclosing the whole structure and provided with air-passages corresponding with the air-passages in the standards, substantially as described.

411,031. COUPLING FOR RADIATOR-SECTIONS. JOHN J. HOGAN, New York, N. Y. Filed Apr. 10, 1889. Serial No. 306,899. (No model.)

Claim.—1. A coupling for radiator-sections, screwed to enter

within the same, and provided with a conical packing in one side of the joint, as and for the purpose set forth.

2. The coupling for radiator-sections, consisting in the plug provided with the neck F, the screw G, and packing I, and fitted to the conical seat D, and the screw-thread E, formed upon the adjacent sections, as and for the purpose set forth.

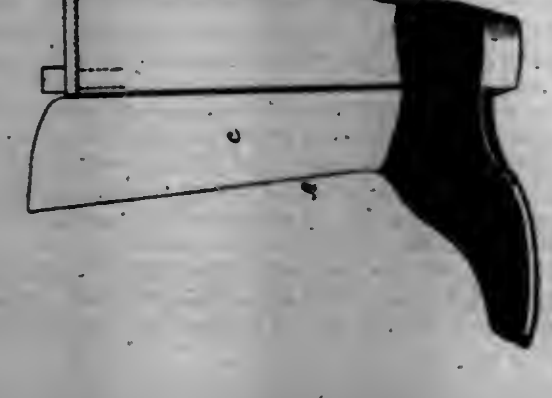
3. A radiator-section provided with the chamber A, having apertures at opposite sides furnished, respectively, with the conical seat D and the thread E, as and for the purpose set forth.

4. As a new article of manufacture, a coupling or connection consisting in the sleeve having at one end the threaded portion and at the opposite end a divided conical collar fitted in a groove or neck upon the sleeve, substantially as herein set forth.

5. A coupling-plug for radiator-sections, consisting in the neck F, provided with the screw G upon its smaller end, and the larger end of the neck being made smaller than the bottom of the thread upon the screw G, as and for the purpose set forth.

6. A coupling-plug for radiator-sections, consisting in the conical neck F, screw G, and packing I, and with means for turning by a key or wrench, substantially as herein set forth.

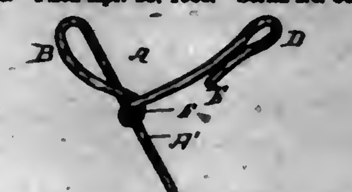
7. A radiator composed of sections having upon their opposite sides the conical seats D and screw-threads E, and united by plugs provided with screw-threads and conical packings, substantially as herein set forth.



8. The combination, with two radiator-sections having apertures formed, respectively, with a screw-thread and with a conical seat, of a sleeve having a screw-thread at one end, and a divided conical collar fitted to the other end, as and for the purpose set forth.

9. The combination, with a radiator-section provided with the chamber A, having apertures at opposite sides, furnished, respectively, with the conical seat D, having shoulder *o*, and with the thread E, of the annular packing fitted to such seat, and the coupling-plug provided with the cone F, the screw G, and with the collar H, adapted to bear upon the outer edge of the packing, substantially as herein set forth.

10. The combination, with a radiator-section provided with the chamber A, having apertures at opposite sides furnished, respectively, with the conical seat D, having shoulder *o* and corner *d'*, and with the thread E, of the annular packing fitted to such seat, and the coupling-plug provided with the cone F, the screw G, and with the collar H, rounded in contact with the edge of the packing and operated to expand the same outwardly over the corner *d'*, as and for the purpose set forth.

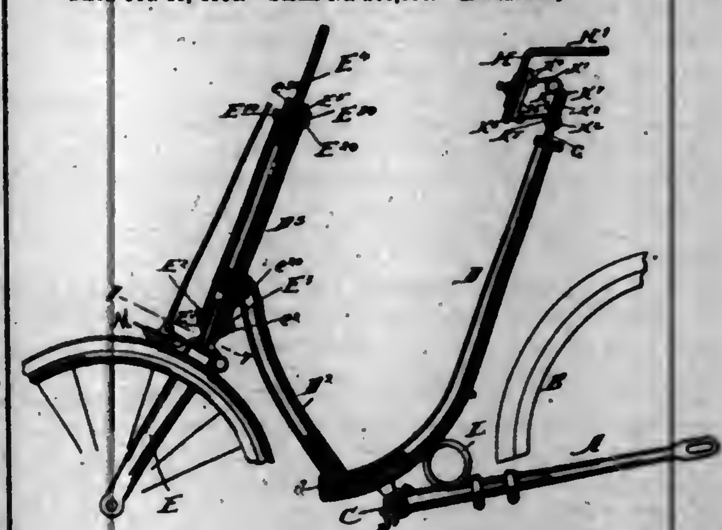


11. The combination, with a radiator-section provided with the chamber A, having apertures at opposite sides furnished, respectively, with the conical seat D, having shoulder *o*, and with the thread E, of the annular packing beveled internally, as set forth, and the coupling-plug provided with the cone F, the screw G, and collar H, tapered externally to fit within the flared edge of the packing, as and for the purpose set forth.

411,082. BOOT. CHARLES C. HOUGHTON, Worcester, Mass. Filed Apr. 10, 1889. Serial No. 306,661. (No model.)

Claim.—A boot having an upper the parts of which are severally formed with their foot and leg portions integral, the leg or top part of said boot being of dry or unoiled stock and the foot part of oiled stock or leather in its original oiled condition, substantially as set forth.

411,083. SHOCK OR BUNDLE TYER. WILLIAM W. HUFFMAN, Houston, Ohio. Filed Apr. 26, 1889. Serial No. 308,580. (No model.)



Claim.—A bundle-tyer formed from the single piece of wire A, bent back upon itself at B, twisted around itself at C, forming a bight for the twine, and the open loop D, extending at right angles to the main wire, as and for the purpose set forth.

411,084. PROCESS OF BATING. ALBERT HULL, West Winsted, Conn. Filed Dec. 24, 1888. Serial No. 294,535. (No specimens.)

Claim.—In preparing hides and skins to be tanned, the method of neutralizing the lime in hides and skins by subjecting them to the action of a solution of gallic acid and water and subsequently removing the gallic acid and neutralized lime therefrom by washing and working, substantially as set forth.

411,085. VELOCIPEDE. THOMAS B. JEFFERY, Ravenswood, Ill. Filed Oct. 15, 1888. Serial No. 288,096. (No model.)

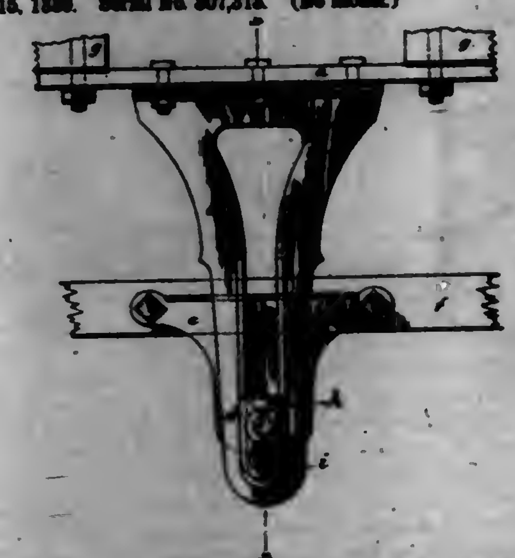
Claim.—1. In a velocipede, a rigid frame intermediate the driving-wheel fork and the steering-wheel fork, and made of tubular parts successively joined together, each joint being made by diverging lugs on the end of one of the joined parts clasping the other part, said end abutting against the side of the clasped part, substantially as set forth.

2. In a velocipede, in combination with the rear driving-wheel fork or frame, a frame pivoted thereto and comprising the steering-head and a seat-supporting arm, said steering-head and said arm being connected together by a cross-arm joined to the lower end of each, each of said junctions being made by diverging lugs on the end of one of the joined parts clasping the other part, said end abutting against the side of the clasped part, substantially as set forth.

3. In a velocipede, in combination with the fork, the upwardly-concave fitting E', terminating the fork at the upper end, the steering-head terminating at the lower end in a fitting E^2, having the flange e^2, adapted to fit outside the upper edge of the fitting E', and having a central boss adapted to enter the concavity of E', said boss having a ball-bearing groove on its under face, and the balls located in the concavity of the fitting E' and in said groove, and the steering-rod rigid with the fork and extending through the head, and a suitable stop-bearing for the upper end of the head, secured to the rod above the latter, substantially as and for the purpose set forth.

4. In combination with an axle and the part which revolves thereon, a sleeve on the axle constituting the bearing at one end for the revolving part and longitudinally extended beyond the portion which constitutes such bearing, and a clamp embracing such longitudinal extension, whereby the latter may be contracted about the axle to bind the sleeve thereon, substantially as set forth.

5. In combination with an axle and the part which revolves thereon, a sleeve located on the axle and serving as the bearing of the revolving part and longitudinally extended beyond the part which constitutes such bearing, and having the end or edge of such longitudinally-extended part oblique, and a stud projecting from the axle in contact with such oblique end, whereby the rotation of the sleeve



on the axle tends to adjust it longitudinally thereon, substantially as set forth.

6. In combination with an axle, a sleeve thereon which has the bearing for the part which revolves upon the axle, said axle having a stop which abuts against the end of the sleeve, one of said abutting parts having an oblique edge, whereby the rotation of the sleeve causes it to be adjusted longitudinally thereon, substantially as set forth.

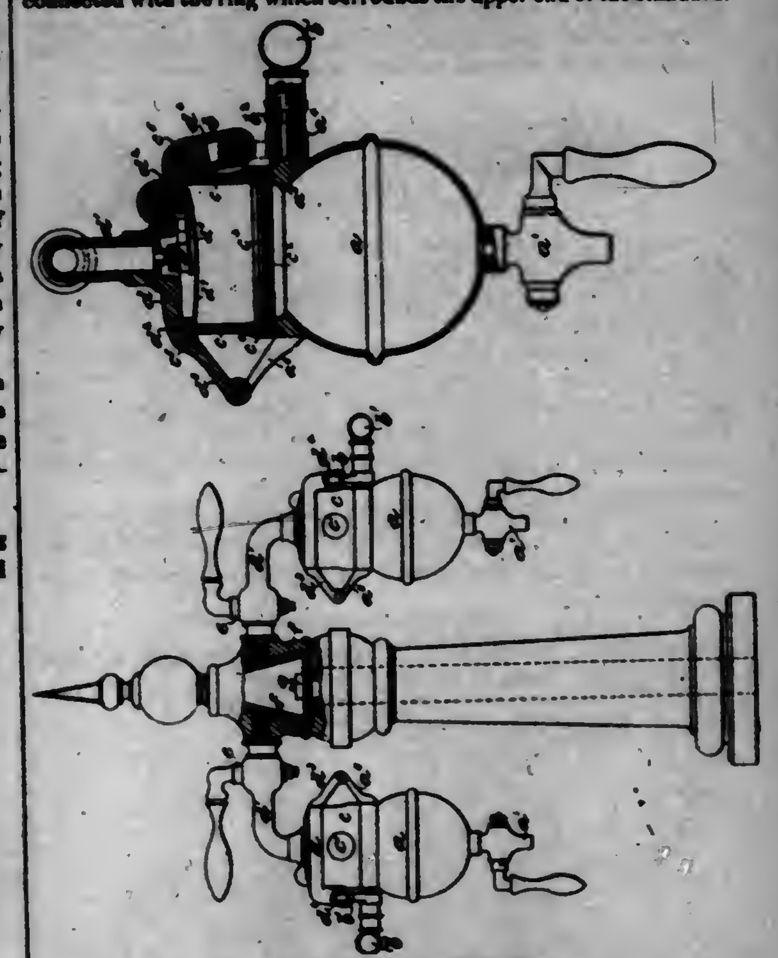
7. In combination with an axle, a sleeve located thereon, constituting an adjustable bearing and extended longitudinally on the axle beyond the part which serves as a bearing, a clamp encircling such extended part, whereby it may be contracted to bind the sleeve onto the axle, a stop fixed on the axle and abutting against the end of the sleeve, one of said abutting parts having an oblique edge, whereby the rotation of the sleeve causes it to be adjusted longitudinally, a clamp being secured at one point to the box, whereby it serves both to adjust and to secure the sleeve in adjusted position, substantially as set forth.

8. In a velocipede, in combination with the wheel, a spring-arm rigidly secured to the fork on both sides of the vertical plane of the wheel, and the brake-shoe attached to the spring-arm intermediate the points at which it is thus secured and overhanging the wheel, substantially as set forth.

411,086. STEADYING DEVICE FOR VEHICLE-BODIES. GEORGE JOHNSON, St. John's Hill, Battersea, County of Surrey, England. Filed Apr. 15, 1889. Serial No. 307,313. (No model.)

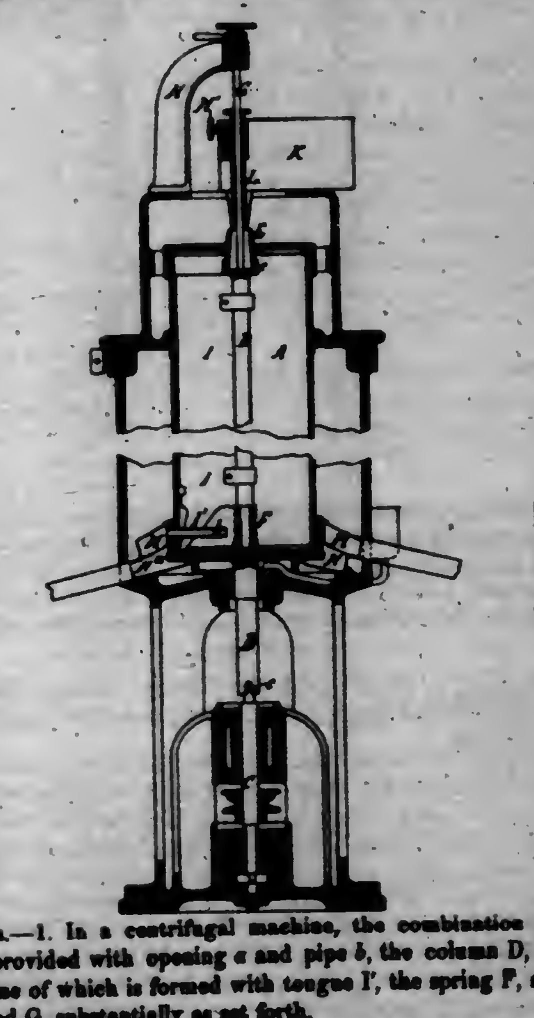
Claim.—In combination, the wagon-body, the axle, the pendant secured rigidly to the body and extending to a point below the axle and having its lower portion slotted, the bracket secured rigidly to the axle and also extending to a point below the same, the pin projecting from said bracket through the slotted lower end of the pendant, and the block on the pin and within the slot.

411,087. APPARATUS FOR MAKING INFUSIONS OR SOLUTIONS. CHARLES JONES, Woodford, assignor to James Childs, London, England. Filed Apr. 22, 1889. Serial No. 308,088. (No model.) Patented in England Oct. 10, 1887, No. 13,736.



Claim.—1. The combination, substantially as hereinbefore set forth, of the cover, the pipe fixed to the cover through which boiling water is supplied, the receiver hinged to the cover, the holder interposed between the cover and the receiver and removable therefrom, a perforated bottom held between the holder and the receiver, and a catch for locking the receiver to the cover.

2. The combination, substantially as hereinbefore set forth, of the cover, the pipe to which it is attached and through which boiling water may be admitted, the receiver, the removable holder interposed between the cover and the receiver, and the float-valve in the receiver to allow escape of air while the receiver is filling and which closes when the receiver is sufficiently full.

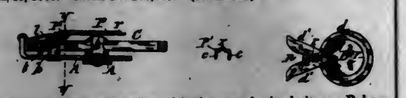


3. The combination, substantially as hereinbefore set forth, of the cover, the pipe to which it is secured, the receiver, the holder interposed between the cover and the receiver and removable therefrom, the handle for the holder, the perforated bottom piece held between the cover and the receiver, the float-valve a^2, and the draw-off tap a' at the bottom of the receiver.

4. The combination, substantially as hereinbefore set forth, of the cover, the supply-pipe to which it is secured, the receiver, the holder interposed between the cover and the receiver, the perforated bottom piece between the holder and the receiver, and the automatic valve d^2, interposed between the holder and the supply-pipe to shut off the supply of water when the holder is removed.

5. The combination, substantially as hereinbefore set forth, of the hollow standard through which boiling water is supplied and which is provided with an orifice at its upper end, a ring surrounding the upper end of the standard and adapted to turn thereon to open and close the orifice, the receiver, the cover, the holder interposed between the receiver and the cover, and a pipe leading from the cover and connected with the ring which surrounds the upper end of the standard.

411,088. CENTRIFUGAL CREAM-SEPARATOR. SVEN JOHNSON, Copenhagen, Denmark. Filed July 17, 1888. Serial No. 280,234. (No model.)

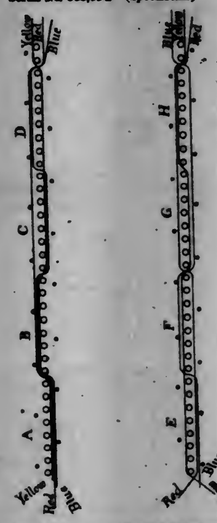


Claim.—1. In a centrifugal machine, the combination of the drum A, provided with opening *a* and pipe *b*, the column D, having vanes I, one of which is formed with tongue I', the spring F, and adjustable rod G, substantially as set forth.

2. In a centrifugal machine, the combination of the drum A, provided with the opening *a*, the vane I, having tongue I', and means for supporting and adjusting said vane I, substantially as set forth.

3. In a centrifugal machine, the combination of the drum A, screw-threaded rod G, the column D, carrying vanes I, one of which is formed with the tongue I', and the spring F, substantially as set forth.

411,089. ANIMAL-TRAP. HARRY R. KELLEY, Niagara Falls, assignor to the Oneida Community, (Limited,) Community, N. Y. Filed Jan. 11, 1889. Serial No. 296,065. (No model.)

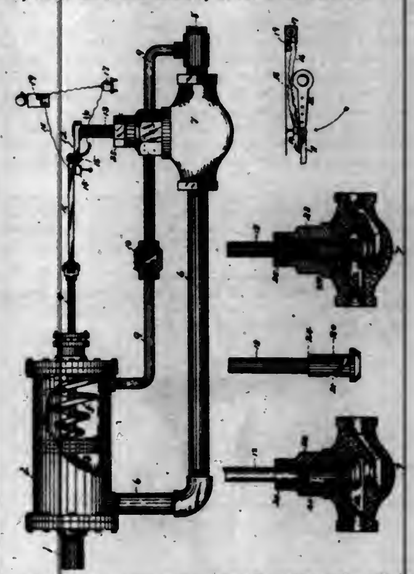


Claim.—1. In combination with the post *b*, the bait-pan P, having the shank P', formed with downward flanges *c c* and ears *e e* in one piece and hinged by said ears to the aforesaid post, substantially as described and shown.

2. In combination with the spring-actuated jaw, the bait-pan P, having the shank P', formed with flanges *c c*, terminating with perforated ears *e e*, projecting beyond the top of the aforesaid shank, and the retaining catch or latch *l*, having its free end lying between the ears *e e* and adapted to engage the under side of the shank P', substantially as described and shown.

3. In combination with the frame A, spring-actuated jaw C, and its retaining latch or catch, the bait-pan P, formed with the toe *t*, for limiting the upward movement of the bait-pan, substantially as described and shown.

411,040. WOVEN FABRIC. DAVID B. KERR, Frankford, Pa. Filed Apr. 4, 1889. Serial No. 305,924. (Specimens.)



Claim.—A woven fabric composed of a figuring-warp and a binder-warp and three weft-threads, each different in color, each color single in a shed in parts of the face and back of the fabric and parallel and contiguous in one shed, with each of the other colors in other portions of the figures or grounds, as herein specified and set forth.

411,041. REGULATOR AND CUT-OFF. ORLANDO S. KING and HOMER H. SWANEY, McKeesport, Pa. Filed Mar. 15, 1889. Serial No. 303,457. (No model.)

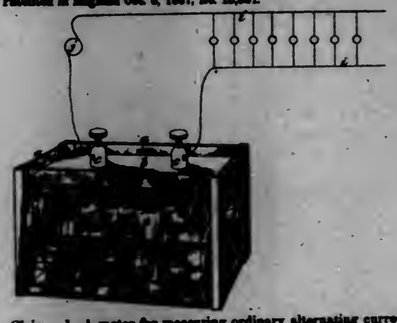
Claim.—1. A combined regulator and cut-off consisting of a cylinder to receive the high pressure, a piston with a coiled spring at its back moving in said cylinder, a piston-rod, a connecting-rod pivoted to said piston-rod and to a crank turning a valve-stem, a valve-stem having a spiral and a straight groove cut therein to track a pin set in the valve-shell, a spring in said valve tending to seat it, a high-pressure pipe leading from the front of the cylinder to the valve, a leakage-pipe having a check-valve leading from the rear of the cylinder to the low-pressure main, and an alarm brought into circuit by the straightening of the connecting-rod and crank when the pressure ceases, all substantially as shown and described.

2. A combined regulator and cut-off consisting of a cylinder to receive the high pressure, a piston with a coiled spring at its back moving in said cylinder, a piston-rod, a connecting-rod pivoted to said piston-rod and to a crank turning a valve-stem, a valve-stem having a spiral groove cut therein to track a pin set in the valve-shell, a spring in said valve tending to seat it, a high-pressure pipe leading from the front of the cylinder to the valve, and a leakage-pipe having a check-valve leading from the rear of the cylinder to the low-pressure main, all substantially as shown and described.

3. A combined regulator and cut-off consisting of a cylinder to receive the high pressure, a piston with a coiled spring at its back moving in said cylinder, a piston-rod, a connecting-rod pivoted to said piston-rod and to a crank turning a valve-stem, a valve-stem having a spiral and a straight groove cut therein to track a pin set in the valve-shell, a spring in said valve tending to seat it, a high-pressure pipe leading from the front of the cylinder to the valve, a leakage-pipe having a check-valve leading from the rear of the cylinder to the low-pressure main, and an alarm brought into circuit by the straightening of the connecting-rod and crank when the pressure ceases, all substantially as shown and described.

4. A combined regulator and cut-off consisting of a cylinder to receive the high pressure, a piston with a coiled spring at its back moving in said cylinder, a piston-rod, a connecting-rod pivoted to said piston-rod and to a crank turning a valve-stem, a valve-stem having a spiral groove cut therein to track a pin set in the valve-shell, a spring in said valve tending to seat it, a high-pressure pipe leading from the front of the cylinder to the valve, and a leakage-pipe having a check-valve leading from the rear of the cylinder to the low-pressure main, all substantially as shown and described.

5. A combined regulator and cut-off consisting of a cylinder to receive the high pressure, a piston with a coiled spring at its back moving in said cylinder, a piston-rod, a connecting-rod pivoted to said piston-rod and to a crank turning a valve-stem, a valve-stem having a spiral and a straight groove cut therein to track a pin set in the valve-shell, a spring in said valve tending to seat it, a high-pressure pipe leading from the front of the cylinder to the valve, and an alarm brought into circuit by the straightening of the connecting-rod and crank when the pressure ceases, all substantially as shown and described.

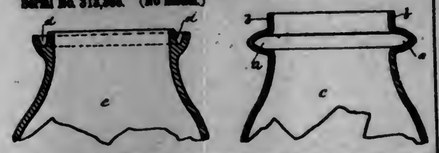


6. A combined regulator and cut-off consisting of a cylinder to receive the high pressure, a piston with a coiled spring at its back moving in said cylinder, a piston-rod, a connecting-rod pivoted to said piston-rod and to a crank turning a valve-stem, a valve-stem having a spiral and a straight groove cut therein to track a pin set in the valve-shell, a spring in said valve tending to seat it, and a high-pressure pipe leading from the front of the cylinder to the valve, all substantially as shown and described.

7. A combined regulator and cut-off consisting of a cylinder to receive the high pressure, a piston with a coiled spring at its back moving in said cylinder, a piston-rod, a connecting-rod pivoted to said piston-rod and to a crank turning a valve-stem, a valve-stem having

a spiral groove cut therein to track a pin set in the valve-shell, a spring in said valve tending to seat it, a high-pressure pipe leading from the front of the cylinder to the valve, and an alarm brought into circuit by the straightening of the connecting-rod and crank when the pressure ceases, all substantially as shown and described.

8. A combined regulator and cut-off consisting of a cylinder to receive the high pressure, a piston with a coiled spring at its back moving in said cylinder, a piston-rod, a connecting-rod pivoted to said piston-rod and to a crank turning a valve-stem, a valve-stem having a spiral groove cut therein to track a pin set in the valve-shell, a spring in said valve tending to seat it, and a high-pressure pipe leading from the front of the cylinder to the valve, all substantially as shown and described.

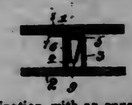


411,042. ELECTRIC METER. HAROLD W. ARLLS, London, County of Surrey, England. Filed July 30, 1888. Serial No. 281,445. (No model.) Patented in England Oct. 6, 1887, No. 13,561.

Claim.—1. A meter for measuring ordinary alternating currents of electricity, consisting of an electrolytic cell, metallic electrodes suspended therein, a means for indicating the precipitation of metal from the said electrodes, and electric-current connections from the said electrodes to a supply source of ordinary alternating currents of electricity, substantially as and for the purpose herein described.

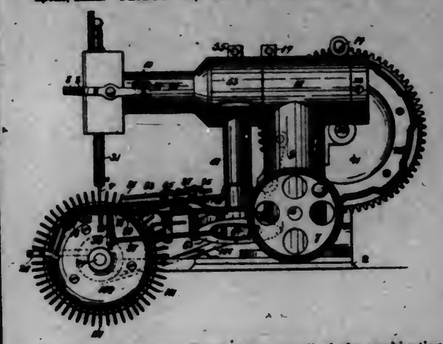
2. In a meter for ordinary alternating currents of electricity, the combination of two copper plates in a dilute solution of sulphuric acid, an air-sealing layer on the surface of the said solution, electrical connections to the said plates, and a weight-indicating mechanism, substantially as and for the purpose herein described.

411,043. METHOD OF FORMING THE NECKS OF FRUIT-JARS. CHRISTIAN F. LUDE and CHARLES LUDE, Pittsburg, Pa. Filed June 6, 1888. Serial No. 313,268. (No model.)



Claim.—The herein-described method of forming the necks of jars, consisting of providing an unfinished jar with an annular outwardly-projecting hollow bead *a* and an upwardly-projecting flange *b*, reheating the said bead *a* and flange *b*, and by means of a suitable tool form an annular groove *d* in the top surface of the neck, whereby the lid of the jar may be properly attached, substantially as described.

411,044. THILL-COUPLING. FRANCIS J. MILLER, Carrollton, Ky. Filed Jan. 9, 1889. Serial No. 296,231. (No model.)



Claim.—The thill-coupling E, consisting of the embracing-plates *b*, connected by the plate *b'* and bound in position by the nuts b^2, and of the forwardly-projecting opposite ears b^3, recessed as at b^4 and having the transverse recesses b^5, in combination with the thill C, having the thill-iron D, terminating in the T-head *d*, mounted in the recesses b^5, and with the spring c^3, bent as at c^4 and projected as at c^5, provided with the block c^6 at one end and with the supporting-plate *c* at the opposite end, which plate is formed with the thumb-lug c' and rearwardly-projecting shoulders c^2, adapted to take into the recesses b^5, substantially as specified.

411,045. FASTENER FOR ENVELOPES, BOXES, &c. FRANK J. MILLER, Upper Lehigh, Pa. Filed Apr. 27, 1889. Serial No. 308,814. (No model.)

Claim.—The combination, with an envelope, of the disk 2, connected to the inside of its rear wall and provided with the lug 3, bored as at 4, projected through and disposed at a right angle to said wall, and having the annular internal recess 5, and of the disk 1, mounted on the outside of the flap of the envelope and having the spring-tongue 6, bent as at 7 and 9, and secured to the disk, as at 8, and passing through the flap, said tongue being adapted for insertion in the bore 4 and to take under the shoulder therein, substantially as specified.

411,046. CROCHETING-MACHINE. GUSTAVE D. HEMMER, Minneapolis, Minn. Filed Feb. 16, 1889. Serial No. 300,294. (No model.)

Claim.—1. In a machine of the class described, the combination, with a longitudinally-reciprocating and laterally-movable needle, of a longitudinally-reciprocating and laterally-movable looper arranged to reciprocate transversely to the line of reciprocation of said needle, and means for moving said needle and looper laterally in the same direction in unison with each other, substantially as described.

2. The combination, with a feed-wheel having a step-by-step movement, of a longitudinally-reciprocating and laterally-movable needle, and a longitudinally-reciprocating and laterally-movable looper arranged to reciprocate transversely to the line of reciprocation of said needle, substantially as described.

3. The combination, with a notched and spurred feed-wheel, of a longitudinally-reciprocating and laterally-movable needle, and a longitudinally-reciprocating and laterally-movable looper arranged to reciprocate transversely to the line of reciprocation of said needle, substantially as described.

4. The combination, with a reciprocating and laterally-movable needle, of a reciprocating and laterally-movable looper arranged to reciprocate transversely to the line of reciprocation of said needle, and provided with a sliding latch, substantially as described.

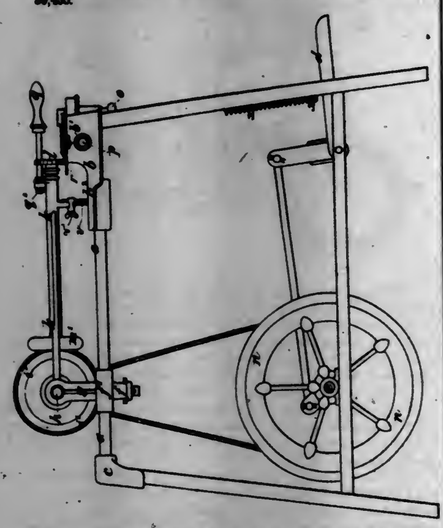
5. The combination, with a reciprocating needle, of a reciprocating looper arranged to reciprocate transversely to the line of reciprocation of said needle, and provided with a sliding latch and a reciprocating stitch-caster engaging said looper, substantially as described.

6. The combination, with a reciprocating needle, of a reciprocating looper arranged to reciprocate transversely to the line of reciprocation of said needle, and provided with a sliding latch, a reciprocating stitch-caster, and a swinging loop-holder, substantially as described.

7. The combination, with an oscillating arm 21 and a reciprocating needle supported upon said arm, of a depending arm secured upon said oscillating arm and moving therewith, and a longitudinally-reciprocating looper supported upon said depending arm and arranged to reciprocate transversely to the line of reciprocation of said needle, substantially as described.

8. The combination, with the oscillating arm 21 and the reciprocating needle supported upon said arm, of the adjustable wheel 41,

provided with the cam-groove 45, and the adjustable stud 47, engaging said groove and connected to the arm 21, substantially as described, and for the purpose set forth.



9. The combination, with the hollow oscillating arm 21 and the hollow depending arm 51, supported thereon, of the shaft 25, arranged in said arm 21, the shaft 57, arranged in said depending arm, the needle-bar connected with said shaft 25, the cam-disk 63, secured to said shaft 57, and the reciprocating looper supported upon said arm 51 and arranged to be operated by said cam-disk, substantially as described.

411,047. PROCESS OF EXTRACTING PRECIOUS METALS FROM THEIR ORES. JOHN S. MAC ARTHUR, Pollokshields, County of Renfrew, Scotland. Filed Dec. 13, 1887. Serial No. 257,801. (No model.)

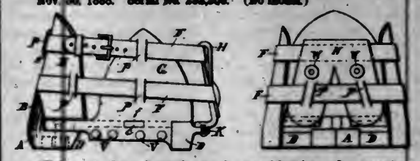
Claim.—1. The mode herein described of extracting gold from its ores, which consists in dissolving the gold out of the ore by treating the latter to the action of perbromide of iron, substantially as set forth.

2. The mode herein set forth of extracting gold from its ores by first removing the silver, copper, lead, and zinc by means of ferric salts, and then subjecting the ore thus freed from these metals to the action of perbromide of iron, all substantially as described.

411,048. APPARATUS FOR SHARPENING THE CUTTERS AND FINGERS OF REAPING AND MOWING MACHINES. ROBT. MCGREGOR, Leigh, County of Lancaster, England. Filed July 3, 1886. Serial No. 207,620. (No model.) Patented in England July 1, 1886, No. 8,607; in France July 31, 1886, No. 177,711, and in Germany Aug. 15, 1886, No. 39,495.

Claim.—1. The combination of a fixed frame with a frame universally jointed to the fixed frame and carrying a revolving spindle and grinding-wheel, substantially as specified.

2. The combination of a fixed frame and a piece movable thereon, with a fork swiveled on the said movable piece, a movable frame upon the swiveled fork, and a revolving grinding-spindle carried by the movable frame, all substantially as set forth.



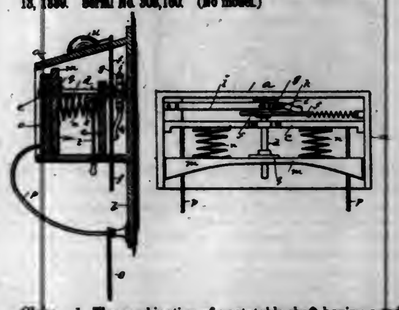
3. The combination of a fixed frame and a cross-piece adapted to slide thereon, with a swiveled fork mounted upon the sliding piece, a movable frame on the fork, and a revolving grinding-spindle carried by the movable frame, all substantially as set forth.

4. The combination of a fixed frame and driving devices thereon, with the horizontally-movable frame, a fork swiveled vertically on the latter, the frame *k*, pivoted horizontally to the fork, and a rotary grinding-wheel mounted in the frame *k* and driven from the fixed frame, all substantially as specified.

5. The combination of the frame with a spring-bolt and clip *o*, having an extra claw *o'*, as and for the purpose specified.

6. The combination of the fixed frame having parallel tubes or bars *a* and the sliding cross-piece *f f'*, adapted thereto, with a fork swiveled in the cross-piece and a movable grinding-frame pivoted to the fork and carrying a revolving grinding-spindle, all substantially as specified.

411,049. HORSE-BOOT. ANDREW MCKAY, Philadelphia, Pa. Filed Nov. 30, 1888. Serial No. 292,202. (No model.)



Claim.—1. In a horse-boot, the combination of a toe-piece A, constructed with slots *a* and recesses *b*, side pieces D, and connecting-bolts J, as shown and described.

2. In a horse-boot, the leather side pieces G, in combination with iron side pieces D, having ribs, so that the leather sides may be fastened on the edges of the irons D by rivets, as shown, described, and for the purpose specified.

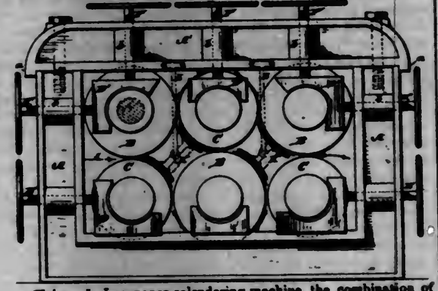
3. In a horse-boot, the combination of a back piece H with side pieces G and D, toe-piece E and A, and straps F F, all substantially as shown and described.

411,050. ADVERTISING AND STREET-ANNOUNCING APPARATUS. GEORGE W. MCKENZIE, Van Fort, and WILLIAM I. MILLER, Denver, assignors of one-third to R. H. Marks, Denver, Pa. Filed Mar. 13, 1889. Serial No. 303,160. (No model.)

Claim.—1. The combination of a rotatable shaft having a radial detent, a series of plates each having a radial slot, through which the detent on the shaft is successively passed as the plates are discharged one after another, a spring-controlled follower which normally presses the series of plates against one another and the detent on the shaft, and mechanism connected to the shaft for rotating the latter axially a predetermined distance at suitable intervals, whereby the radial detent on the shaft aligns successively with the slots in the plates to permit them to be forced off the shaft by the spring-follower, substantially as and for the purpose described.

2. The combination of a rotatable shaft having a detent, a series of slotted plates, a case within which the plates are housed, the guides *p*, passing through the plates and extending below the case, and mechanism for forcing the series of plates in one direction so as to expel the front exposed plate from the case when the detent on the shaft enters the slot therein, whereby the ejected plate is caused to slide on the guides and assume a position below the case with its rear side exposed, all arranged and combined substantially as described.

3. The combination of a rotatable shaft having a radial detent, a series of slotted plates through which said shaft passes, a lever secured to the shaft for turning it axially a predetermined distance, and a spring-controlled follower bearing against the plates, arranged and combined for service, substantially as and for the purpose set forth.



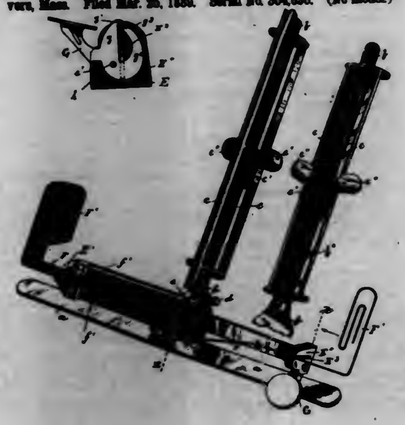
4. The combination of a suitable inclosing-case, a spring-controlled follower housed therein, a series of slotted name-plates arranged one in rear of the other and in front of the follower, an axially-turning shaft passing through the series of name-plates and having a radial detent at its outer extremity, and a lever for turning said shaft a predetermined distance to adjust its detent in line with the slot of the front plate of the series, arranged and combined for service, substantially as described, for the purpose set forth.

5. The combination, with a series of name-plates and a detaining device adapted to engage said plates to prevent the expulsion thereof from the inclosing-case, of a spring-controlled follower normally bearing against the plates, and a locking device arranged at a point some distance in rear of the normal position of the follower, whereby the follower can be held out of engagement with the plates to enable the latter to be adjusted, substantially as and for the purpose described.

6. The combination, with a series of name-plates and a detaining device therefor, of a spring-controlled follower having a slotted plate on its rear side, and a pivoted hook having a lifting-rod, which is arranged at a point some distance in rear of the normal position of the follower and in such a position that it enters the slot of the plate thereon when the follower is forced rearwardly, substantially as described.

7. The combination of an inclosing-case, a spring-controlled follower, a series of slotted name-plates arranged one in rear of the other and in advance of the follower, a shaft having a radial detent and passing through the slots of the name-plates, the fixed guides passing through the name-plates near the lower edges and extending below the case, a lever connected to the shaft, and a toothed wheel carried by the shaft and held in restraint by one or more pawls, all arranged and combined substantially as and for the purpose described.

411,051. PAPER-CALENDERING MACHINE. JOHN MCLAUGHLIN, Lee, Mass. Filed July 13, 1888. Serial No. 279,574. (No model.)

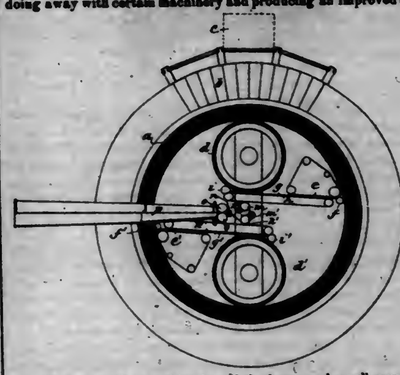


Claim.—1. In a paper-calendering machine, the combination of a series of calender-rolls arranged in sets, with each four rolls of the series in proximity and opposite to one another, substantially as described, to form double rows with four points of contact between each four rolls of the series, substantially as and for the purposes described.

2. In a calendering-machine, the combination of a series of calender-rolls arranged in horizontal sets, with two rolls in each set and one roll of each set over its mate, the rolls of the sets being contiguous to each other and to the rolls of the next set, to form four points of contact between each four rolls of the series, substantially as and for the purposes described.

3. In a calendering-machine, the combination of a series of calender-rolls arranged in horizontal sets and movable toward each other, movable journal-boxes for the journals of the rolls, and set-screws for adjusting said boxes and rolls horizontally, whereby the pressure between the rolls can be regulated, substantially as and for the purposes described.

4. In a calendering-machine, the combination of a series of calender-rolls arranged in horizontal sets, movable journal-boxes for the journals of the rolls, and set-screws bearing vertically and horizontally against said boxes for adjusting the boxes both horizontally and vertically to regulate the pressure between the rolls, substantially as and for the purposes described.

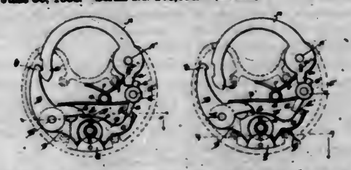


411,052. MUSIC-LEAF TURNER. JONAH R. NIGHTINGALE, Danvers, Mass. Filed Mar. 25, 1889. Serial No. 304,630. (No model.)

Claim.—The leaf-turner as described, consisting of a plate *a* and bar *b*, hinged to it, and the bar E, detachably secured to said bar *b*, said bar E having pivoted to it a series of spring-pressed leaf-turners F F, and the said bar *b* having hinged to it the spring-pressed clamping-jaws *c c*, as described, and a locking and releasing device for the leaf-turners, substantially as and for the purpose set forth.

411,053. WOOL-COMBING MACHINE. DAVID P. HOMER, Lawrence, Mass. Filed May 21, 1888. Serial No. 274,515. (No model.)

Brief.—The sliver is taken directly from the aprons to the mouth of a delivery tube or trumpet at the same level as the combs, thereby doing away with certain machinery and producing an improved sliver.

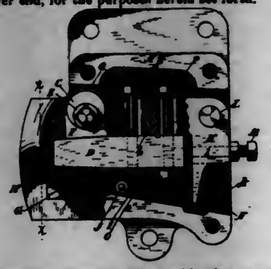


Claim.—1. The combination of the large and small combs and drawing-off rolls and aprons of a wool-combing machine with a single delivery-tube having its receiving end substantially at the level of the aprons and guides by which the fiber from the aprons taken from all the combs is directed without twist into the said tube, substantially as described.

2. The combination of the large and small combs and drawing-off rolls and aprons of a wool-combing machine with a single stationary guide-tube into which the united fiber from both aprons is carried and calender-rolls and a delivery-tube having its mouth opposite the said guide-tube, into which delivery-tube the sliver is carried from the guide-tube by the calender-rolls, substantially as described.

3. The combination of the large and small combs and drawing-off rolls and aprons of a wool-combing machine with a stationary delivery-tube having its receiving end substantially at the level of the aprons, and adjustable binders by which the fiber from the aprons is directed into the said tube, and means for fastening said binders in adjusted position, substantially as described.

411,054. PADLOCK. JONAS R. OPAL, Lake Linden, Mich. Filed June 30, 1888. Serial No. 278,631. (Model.)



Claim.—1. The combination, with a bow and a pivoted catch for retaining the bow in locked position, of a tumbler for actuating said catch, a rock-arm for locking the tumbler when the bow is locked, and an arm projecting from the bow for engaging and actuating said rock-arm, whereby the tumbler will be released when the bow is depressed, substantially as set forth.

2. In a padlock, the combination, with a bow, of a catch and a tumbler, each pivoted at one end upon the same arbor, an arm projecting from the catch adapted to engage the tumbler, a rock-arm for locking the tumbler when the bow is locked, and an arm projecting from the bow for actuating said rock-arm, substantially as set forth.

411,055. SAW-TOOTH SWAGE. C. OSCAR FOSTER and ALVIN D. FOSTER, Grand Rapids, Mich. Filed Jan. 28, 1889. Serial No. 297,812. (No model.)

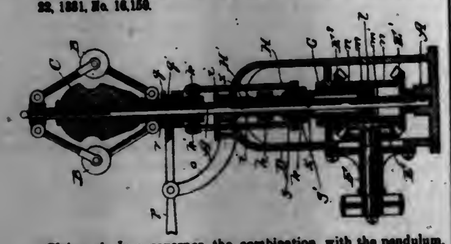
Claim.—1. In a saw-tooth swage, and in combination, a case, a bell-crank lever pivoted therein, a lifting-cap secured to the upper side, and a die secured to the under side of the horizontal arm thereof,

and having the vertical arm thereof prolonged and diminished toward the lower end, for the purposes herein set forth.

2. In a saw-tooth swage, and in combination, a case constructed as described, having a bed-plate A and ledges A′ and A″ and a cap B, a bell-crank lever journaled in said case, provided with a die secured to the under side of the horizontal arm, and a set-screw adapted for adjusting the die arranged in the vertical arm, a tooth-stop arranged upon the ledge A″ and having a notch engaging with the vertical arm of said lever, and a pin J, arranged as described, and for the purpose specified.

3. In a saw-tooth swage, and in combination with a case having a bed-plate having ledges A′ and A″ and a cap B, and an anvil arranged in ledge A″, substantially as described, the clamping or grip jaws H and H′, the jaw H provided with an adjusting-screw, whereby it may be adjusted more or less toward the anvil, and the jaw H′ provided with its spring and hand-lever, substantially as described.

4. In a saw-tooth swage, and in combination with the bed-plate A and ledge A″ and the clamping-jaws H H′, as described, the anvil G, consisting of a cylindrical steel plug having one flat top and one rearwardly-inclined face arranged in said ledge A″, substantially as described.



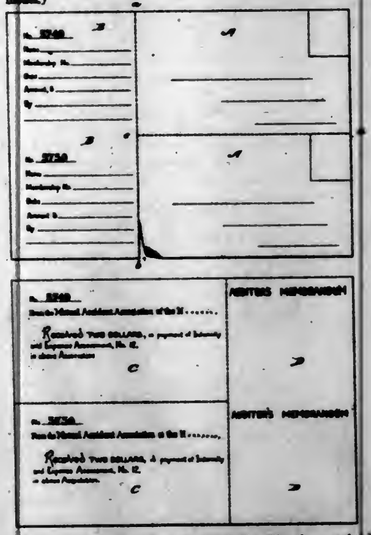
5. In a saw-tooth swage, substantially as described, and in combination, the lever K, pivoted in said case, having the lifting-cap Q and the die D secured upon the upper and lower sides of the horizontal arm thereof, respectively, and provided with the cam O and block F, for the purpose specified, the anvil G, and the clamping-jaws H H′, arranged as described, and for the purpose herein specified.

6. In a saw-tooth swage, and in combination with a case having a ledge A″ and an anvil G, arranged as described, and a bell-crank lever supporting a die and a lifting-cap upon its horizontal arm, and having a cam and block for lifting the same, substantially as described, and a vertical arm provided with an adjusting-screw for the die and a prolonged and diminished extension, pivoted in said case, a tooth-stop arranged upon said ledge, connected to said vertical arm, whereby the same is moved toward and away from the anvil, and clamping-jaws H and H′, arranged substantially as described.

7. In a saw-tooth swage, substantially as described, and in combination with the anvil G and the bell-crank lever K, having the die D, lift Q, cam O, and block F, and the vertical arm N, arranged as described, tooth-stop I, arranged as described, provided with the pin J and engaging with the arm N, for promoting its longitudinal movement, substantially as described and set forth.

8. In a saw-tooth swage, and in combination, the lever K, pivoted in the case, having the lift Q and the die D secured to its horizontal arm, and provided with the cam O and block F, and having the arm N for engaging the tooth-stop I, in combination with the anvil G, jaws H and H′, with their set-screw and hand-levers, respectively, and the tooth-stop I, arranged substantially as described.

411,056. GOVERNOR. STEPHEN GRANT, Chicago, Ill. Filed Mar. 12, 1889. Serial No. 302,940. (No model.) Patented in Germany Mar. 22, 1881, No. 16,159.

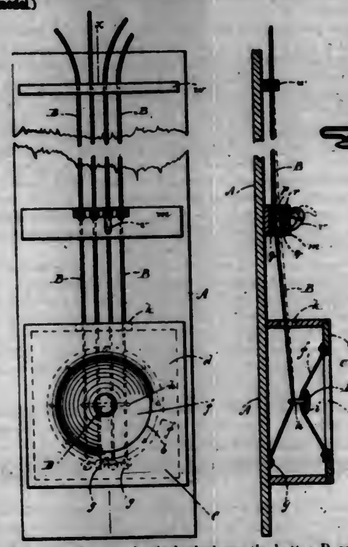


Claim.—1. In a governor, the combination, with the pendulum, driving-shaft, and connecting medium between the governor and the valve to be controlled, of a vertically-movable screw H and a vertically-immovable screw H′, both surrounding the governor-spindle and connected to rotate together, and interlocking mechanism actuated by the rise and fall of the pendulum to rotate the screw respectively in opposite directions, and thereby actuate the said connecting medium between the governor and valve to regulate the valve, substantially as described.

2. In a governor, the combination, with the pendulum, driving-shaft, and connecting medium between the governor and valve to be controlled, of a vertically-movable screw H and a vertically-immovable screw H′, both surrounding the governor-spindle and connected to rotate together, a miter-gear E on the driving-shaft, miter-gears F and F′ on the spindle and in mesh with the wheel E, and clutch mechanism actuated by the rise and fall of the pendulum, alternately to interlock the screw with the respective miter-gears on the spindle, and thereby turn the screw and produce action upon the said connecting medium to regulate the valve, substantially as described.

3. In a governor, the combination, with the pendulum, driving-shaft, and connecting medium between the governor and the valve to be controlled, of a vertically-movable screw H and vertically-immovable screw H′, both surrounding the governor-spindle and connected to rotate together, a miter-gear E on the driving-shaft, miter-gears F and F′ on the spindle and in mesh with the wheels E, flanges n on the respective wheels E and F′ and provided with clutch-teeth o, and clutch-teeth m′, connected with the screw and extending between the toothed flanges n, whereby the rise and fall of the pendulum alternately interlocks the screw with the miter-gears on the spindle, and by the resultant turning of the screw actuates the said connecting medium to regulate the valve, substantially as described.

4. A governor comprising, in combination, a rotary spindle A, supported by a suitable frame D and carrying a pendulum B, a weight C, having a sleeve-extension r loosely surrounding the spindle, a sliding collar g on the said sleeve-extension to engage with the lever b, leading to the valve to be controlled, a vertically-movable screw H, having a key g, and a vertically-immovable screw H′, having a key-sleeve g′, and both loosely surrounding the spindle, a toothed flange l on the lower end of the screw H, nuts k and k, respectively surrounding the screws H and H′, and connected, respectively, with a collar k′ on the sleeve-extension r and with the collar g, miter-gears F and F′, surrounding the spindle on opposite sides of the toothed flange l, and a miter-gear E, in mesh with the wheels F and F′ and actuated by the driving-shaft, substantially as and for the purpose set forth.



411,057. STUB-IDENTIFICATION RECEIPT-BLANK. THOMAS S. GREGORY, Chicago, Ill. Filed June 14, 1888. Serial No. 277,125. (No model.)

Claim.—1. The herein-described stub-identification receipt-blanks, comprising, in combination, permanent stubs and detachably-connected coupons, each bearing matter complemental of the other, whereby one may be identified by the other, and composed of stiff paper, whereby the coupons are adapted for transmission through the mail, said coupons having space upon one side to receive an address and the necessary postage and a space on the reverse side for the reception of the communication, substantially as described, and for the purpose set forth.

2. The herein-described stub-identification receipt-blanks, comprising a series of sheets bound together to form a book, and each sheet composed of a permanent stub and a coupon detachably connected thereto, the stub and coupon each bearing matter complemental of the other, whereby one may be identified by the other, and made of stiff paper, whereby the coupon is adapted for transmission through the mail, and having a space upon one side to receive an address and the necessary postage and a space on its reverse side for the reception of the communication, substantially as described, and for the purpose set forth.

411,058. MECHANICAL TELEPHONE. CARL M. RADFORD, Concord, N. H., assignor to himself, Frank L. Hood, Groton, and Freeman Emerson, Wakefield, Mass. Filed June 14, 1889. Serial No. 314,211. (No model.)

Claim.—1. In a mechanical telephone, the button D, comprising the head i and laterally-elongated loop h, substantially as described.

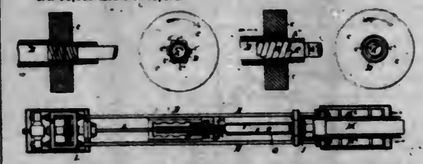
2. In a mechanical telephone, a transmitter, a button disposed in the diaphragm thereof and provided with an elongated shank, and a series of conducting-wires secured within the transmitter and passing through said button-shank, substantially as described.

3. In a mechanical telephone, a transmitter provided with a cone-shaped metallic diaphragm, a button secured in the apex thereof and provided with an elongated shank or loop, a series of conducting-wires passing through said loop, and mechanism for independently deadening or preventing said wires from vibrating, substantially as described.

4. In a mechanical telephone, a body-plate, a transmitter secured thereto and provided with a cone-shaped diaphragm, a button for said diaphragm having a laterally-elongated loop-shank, conducting-wires secured within said transmitter and passing through said loop, a bar on the body-plate provided with a wire-slot having a non-resonant lining, and cam-levers on the bar for forcing the wires against said lining, substantially as and for the purpose set forth.

5. In a mechanical telephone, a body-plate, a transmitter having a cone-shaped metallic diaphragm, a button disposed in the apex thereof and provided with a laterally-elongated loop, conducting-wires passing through said loop and in contact therewith, a bar secured to the body-plate and provided with a wire-slot having a non-resonant lining, pins projecting into said slot, and cam-levers pivoted to said pins, substantially as and for the purpose set forth.

6. In a mechanical telephone provided with a series of conducting-wires, a slotted bar through which the wires pass, said slot being lined with a non-resonant substance, and mechanism for forcing said wires into engagement with the slot-lining, substantially as and for the purpose set forth.



7. In a mechanical telephone, the bar m, provided with the wire-slot p, having the non-resonant lining q, in combination with the cam-levers v and pins r, substantially as set forth.

8. The plate A and transmitter C, having the diaphragm f, in combination with the button D, wires B, bar m, levers v, and pins r, substantially as described.

411,059. ART OF RENDERING PAPER INIMITABLE. ADOLPH EHRAPORT, Cincinnati, Ohio, assignor to the Strobridge Lithographing Company, same place. Filed Apr. 13, 1889. Serial No. 307,166. (No specimens.)

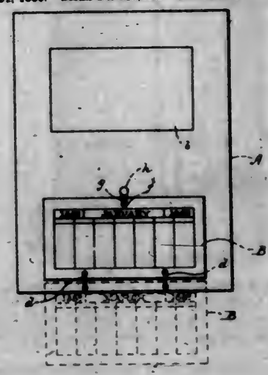
Claim.—The herein-described process of rendering paper inimitable, consisting in rubbing ink upon the face of a lithographic plate by means of another plate and transferring to paper by lithographic process the design so produced.

411,060. APPARATUS FOR THE MANUFACTURE OF METAL TUBES. JAMES ROBERTSON, Glasgow, County of Lanark, Scotland. Filed Dec. 14, 1888. Serial No. 293,564. (No model.) Patented in England Nov. 20, 1884, No. 15,782; in Germany Sept. 17, 1885, No. 36,614; in France Sept. 22, 1886, No. 171,280; in Belgium Sept. 22, 1886, No. 70,382; in Italy Aug. 13, 1886, No. 20,382, and in Austria-Hungary Feb. 6, 1888, No. 36,813 and No. 65,481.

Claim.—1. The herein-described rotary die for drawing down metal tubes or rods, said die having internal rounded acting edges to displace or draw down the metal as the die is rotated and forced over the tube or rod, all substantially as described.

2. The herein-described rotary die for drawing down metal tubes or rods, said die having internal rounded acting edges with intermediate grooves for lubricating the acting edges, displacing or drawing down the metal as the die is rotated and forced over the tube or rod, all substantially as described.

3. The herein-described rotary die for drawing down metal tubes or rods, said die having internal rounded acting edges in the form of a screw thread or threads to displace or draw down the metal as the die is rotated and forced over the tube or rod, all substantially as described.

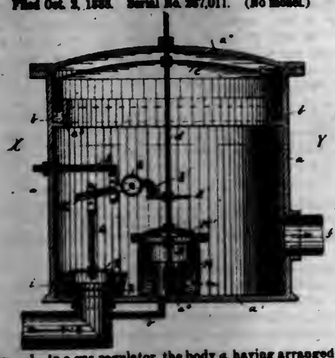


4. The combination of an internal mandrel for tubes with a rotary die having rounded acting edges to displace or draw down the metal of the exterior of the tube as the die is rotated and forced over the metal, all substantially as set forth.

5. The combination of an internal rotary mandrel, with rounded acting edges to form the interior of a tube, with a rotary die having rounded acting edges to displace or draw down the metal of the exterior of the tube, all substantially as described.

6. The combination of a rotary die, having rounded acting edges to draw down or displace the metal of the exterior of a rod or tube, with a hydraulic ram to force the die over the metal and means to rotate the die, all substantially as described.

7. The combination of a rotary die, having rounded acting edges to draw down or displace the metal of the exterior of a tube, with a mandrel for the interior of the tube, a hydraulic cylinder and ram carrying the die, and means for rotating the said ram, all substantially as described.

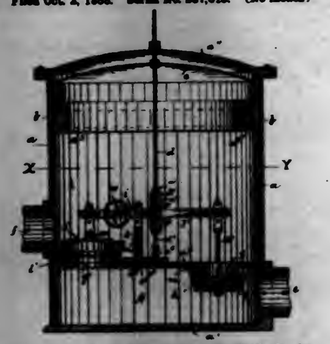


411,061. CALENDAR. RACHEL A. ROBINSON, Boston, Mass. Filed June 21, 1889. Serial No. 315,194. (No model.)

Claim.—1. A calendar comprising a body and a series of grouped cards hinged by their lower edges thereto, said cards being respectively imprinted with the days of one month and of the second succeeding month on opposite faces, substantially as described.

2. In a calendar, indicating-cards hinged to the body thereof, each card being imprinted on its face with the days of a month and on its reverse with the days of the second succeeding month in an inverted position, and held in position on said body by a catch or loop, substantially as set forth.

411,062. GAS-REGULATOR. WILLIAM C. ROBERT, Hyde Park, assignor of two-thirds to William Threlkeld and Charles L. Hunt, Boston, Mass. Filed Oct. 2, 1888. Serial No. 287,011. (No model.)



Claim.—1. In a gas-regulator, the body *a*, having arranged within it the liquid-seated gas-holder *c* and liquid-seated cup D, connected rigidly to said gas-holder, combined with the balanced valve *g*, the inlet and outlet pipes *e f*, a pipe or channel *o*, leading from the pipe *e* to below the cup D, and a weighted pivoted lever K, connected in one end to the valve *g* and having its free end resting on a disk *d'*, secured to the stem of the gas-holder, substantially as and for the purpose set forth.

2. In a gas-regulator, the body *a*, having arranged within it the liquid-sealed gas-holder *c* and liquid-sealed cup D, connected together by means of the stem or rod *d*, combined with the balanced valve *g*, the pivoted and weighted lever K, connected to said valve and having roller *k'* in its free end adapted to rest on a washer *d'*, secured to the gas-holder stem *d*, substantially as and for the purpose set forth.

3. In a gas-regulator, the body *a*, having inlet-passage *e*, covered by a balanced valve *g*, a liquid-sealed cup D, and pipe or passage *o*, leading from the inlet *e* to said cup, a liquid-seated gas-holder arranged within the body *a* and connected to the cup D, and a pivoted weighted lever K, connected in one end to the valve *g* and having its free end resting on a disk or projection on the gas-holder stem, substantially as and for the purpose set forth.

411,063. GAS-REGULATOR. WILLIAM C. ROBERT, Hyde Park, assignor of two-thirds to William Threlkeld and Charles L. Hunt, Boston, Mass. Filed Oct. 2, 1888. Serial No. 287,012. (No model.)

Claim.—1. In a gas-regulator, a case or body having a liquid-seated gas-holder arranged within it and having its stem connected to a pivoted lever, combined with a pair of balanced valves arranged on opposite sides of the said gas-holder stem, substantially as and for the purpose set forth.

2. In a gas-regulator, the case or body *a*, having arranged within it a liquid-seated gas-holder and a pair of balanced valves, combined with a lever pivoted to the fulcrum or post *k* and to the said valves and connecting mechanism between said lever and the gas-holder, said valves and their connecting mechanism being all contained within and inclosed by the gas-holder or bell, substantially as and for the purpose set forth.

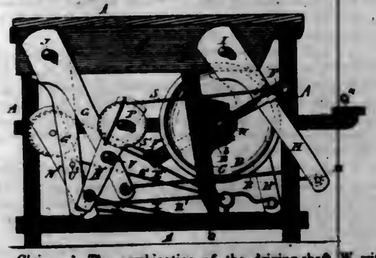
3. In a gas-regulator, the body *a*, having arranged within it the liquid-seated gas-holder *c*, and a pivoted lever connected to a pair of balanced valves, as described, said lever being loosely connected to the stem of the gas-holder by the medium of the yoke N, in which the said valve-actuating lever is free to adjust itself during the vertical movement of the gas-holder, so as to automatically change the leverage of said lever, as described, for the purpose of compensating for variations in the displacement of the liquid seal for the gas-holder, said valves and their connecting mechanism being all contained within and inclosed by the gas-holder or bell, substantially as and for the purpose set forth.

4. In a gas-regulator, the body *a*, having arranged within it the liquid-seated gas-holder *c*, a pair of balanced valves pivoted to the lever I, said lever being pivoted to the stationary fulcrum or post *k*, as described, in combination with the yoke N, swiveled to the gas-holder stem and provided with the anti-friction rollers *o p* and the lower guide a^2, substantially as and for the purpose set forth.

5. In a gas-regulator, the body *a*, having arranged within its upper end the liquid-seated gas-holder *c*, and having a valve-box A in its lower end, with a perforated plate or diaphragm a^4 between said parts, combined with a pair of balanced valves connected together and to the gas-holder by means of the weighted lever I, pivoted to the stationary post or fulcrum *k*, said valves and their connecting mechanism being all contained within and inclosed by the gas-holder or bell, substantially as and for the purpose set forth.

6. In a gas-regulator, the case or body *a*, having valve-box A and supply and delivery pipes *e f*, as described, combined with a pair of balanced valves connected together by means of a pivoted lever and a liquid-seated gas-holder arranged within said case or body, said gas-holder having its stem loosely connected to the valve-lever, said valves and their connecting mechanism being all contained within and inclosed by the gas-holder or bell, substantially as and for the purpose set forth.

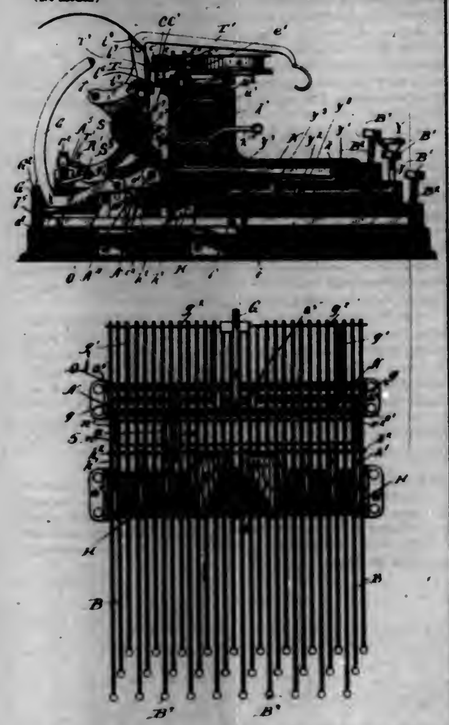
411,064. RAIL-JOINT. HENRY W. SCHEELE and AUGUST H. SCHEELE, Cross Plains, Wis. Filed Mar. 16, 1889. Serial No. 303,594. (No model.)



Claim.—1. A rail having its end beveled and interiorly grooved and provided with an inclined swell, combined with a second rail having beveled end and an inclined swell, and the transverse bolts and nuts for securing said rails, substantially as described.

2. A rail having its end beveled and interiorly grooved and provided upon its outer face with a beveled swell, combined with a second rail having its end beveled and provided with a ridge fitting the groove of the other rail and having formed upon its outer face a swell, and the transverse bolts passed through said rails and through the ridge and groove, substantially as described.

3. The combination, with the two beveled ends of two adjacent rails, one formed with a ridge and the other with a groove to receive said ridge, both of said rails being provided with elongated holes and inclined swells, of the bolts passed through said holes and provided with nuts adapted to bear flat against said inclined swells, substantially as and for the purpose specified.



411,065. MOTIVE POWER. JOHN P. SCHROCKER, Franklin Grove, Ill. Filed Aug. 30, 1888. Serial No. 283,295. (Model.)

Claim.—1. The combination of the driving-shaft W with the swinging lever G, double-fulcrumed lever N, pulley P, band S, and crank E, arranged, substantially as described, in connection with a duplicate set of parts, and for the purposes set forth.

2. The combination, with the frame A A A, beams A' A^1, posts C C', and blocks B *b* B' *b'*, of the swinging lever H, foot-rest K, swinging lever G, connecting-rod R, double-acting lever N, pulley P, band S, and crank E, arranged, substantially as described, in connection with a duplicate set of parts, and for the purposes set forth.

411,066. TYPE-WRITING MACHINE. SAMUEL J. SHEPARD, Chicago, Ill., assignor of two-thirds to Fred W. Munson, Logansport, Ind., and Louis L. Munson, Chicago, Ill. Filed Aug. 28, 1888. Serial No. 283,457. (No model.)

Claim.—1. The combination, with a rotatable sliding type-sleeve, of a series of stop devices for limiting the longitudinal movement of said type-sleeve and a multiple number or set of two or more key-levers for actuating each of said stop devices, substantially as specified.

2. The combination, with a series of key-levers arranged in sets of two or more in each set, of a series of levers H—one for each set of type-levers—a series of stop devices D, a longitudinally-sliding type-sleeve C, and mechanism for connecting said stop devices D with said type-sleeve, substantially as specified.

3. The combination of rotatable longitudinally-sliding type-sleeve C, rotatable shaft C', upon which said type-sleeve reciprocates, type-sleeve frame or shuttle C^3, stop-pins D, bent levers F F', a series of bent levers H—one for each stop-pin—and a series of key-levers B, arranged in sets with two or more in each set, adapted to operate a single bent lever H, substantially as specified.

4. The combination of rotatable longitudinally-sliding type-sleeve C, its shaft C', and carriage or shuttle C^3, having pins c^4 c^4, and forked levers F F', for reciprocating said sleeve in either direction, substantially as specified.

5. The combination, with rotatable horizontally-sliding type-sleeve C, its shaft C', and carriage C^3, of bent levers F F' and a series of vertically-sliding stop-pins D, adapted to engage said carriage C^3 and limit its movement, and provided with shoulders or projections *d* to engage and operate said bent levers F F', substantially as specified.

6. The combination, with a rotatable sliding type-sleeve having type arranged in longitudinal rows or lines thereon, of a series of sliding stop-pins D, for limiting the longitudinal movement of said type-sleeve, a series of key-levers, and connecting mechanism for sliding said type-sleeve to bring the separate type longitudinally into position for printing and actuating said stop-pins by the movement of said key-levers, substantially as specified.

7. The combination, with a reciprocating type-sleeve, of a series of stop-pins D to limit the longitudinal movement of said sleeve and connecting mechanism for operating said type-sleeve from said stop-pins, substantially as specified.

8. The combination, with a series of stop-pins D, having pins or projections *d*, of the bent levers F F', having arms f^2 extending over said projections *d*, and a sliding type-carriage connected with and operated by said bent levers F F', substantially as specified.

9. The combination, with a series of stop-pins D, having pins or projections *d*, of the bent levers F F', having arms f^2 extending over said projections *d*, and a sliding type-carriage connected with and operated by said bent levers F F', said type-carriage being provided with shoulders adapted to engage said stop-pins, and thereby limit the movement of the type-carriage, substantially as specified.

10. The combination, with type-carriage or shuttle C^3, having pins or projections c^4, of forked bent levers F F', pivoted on opposite sides of the normal position of said type-carriage, whereby the type-carriage can be moved in either direction, substantially as specified.

11. The combination, with a reciprocating type-carriage C^3, having pins c^4, of bent levers F F', having forked upper ends *f'* and horizontal arms f^2, the inner prongs f^{12} of said forks *f* being shorter than the outer ones, and vertically-sliding pins D, having shoulders *d*, for operating said bent levers, substantially as specified.

12. The combination, with a rotatable shaft C', mounted in fixed bearings, of a type-sleeve C, reciprocating thereon and having two or more faces or lines of types, a series of key-levers arranged in transverse rows or ranks and in sets of two or more keys in a set, a single connecting mechanism for each set of key-levers to reciprocate the type-sleeve, and an impression-hammer G, operated by said key-levers and adapted to strike said type-sleeve, substantially as specified.

13. The combination, with a rotatable sliding type-sleeve having two or more faces or lines of types, of a series of key-levers arranged in transverse rows or ranks in sets of two or more keys in a set, a single connecting mechanism for each set of key-levers to reciprocate said type-sleeve, and an impression-hammer G, operated by said key-levers, substantially as specified.

14. The combination, with a rotatable shaft C', journaled in fixed bearings on the frame of the machine, of a type-sleeve C, reciprocating thereon and having two or more faces or lines of types, a series of key-levers arranged in transverse rows or ranks and in sets of two or more keys in a set, a single connecting mechanism for each set of key-levers to reciprocate the type-sleeve, a single type-sleeve-rotating mechanism for each rank or row of keys, and an impression-hammer G, operated by said key-levers and adapted to strike said type-sleeve, substantially as specified.

15. The combination, with a rotatable sliding type-sleeve having two or more faces or lines of type, of a series of key-levers arranged in transverse rows or ranks and in sets of two or more keys in a set, a single connecting mechanism for each set of key-levers to reciprocate the type-sleeve, and a single type-sleeve-rotating mechanism for each rank or row of keys, substantially as specified.

16. The combination, with a rotatable sliding type-sleeve, of a series of keys arranged in transverse rows or ranks and in sets, a series of corresponding key-levers, a common mechanism for communicating longitudinal reciprocating movement to said type-sleeve from each set of key-levers, and a common mechanism for communicating a rotary movement to said type-sleeve from each row or rank of keys excepting one, substantially as specified.

17. The combination, with a rotatable type sleeve C, its shaft C', and carriage or shuttle C^3, of a three-toothed gear c^6, secured to said shaft C', the shaft-turning device M, and a bent lever N, having an arm extending over an alternating series of key-levers B, substantially as specified.

18. The combination, with a rotatable type-sleeve C, its shaft C', and carriage or shuttle C^3, of a three-toothed gear c^6, secured to said shaft C', shaft turning device M, and a bent lever N, having an arm extending over alternating series of key-levers B, said series of key-levers B having projections b^2, adapted to engage the cross-bar of said lever N, substantially as specified.

19. The combination of rotatable sliding type-sleeve C, its shaft C', and carriage or shuttle C^3, with bent levers F F', vertically-sliding stop-pins D, bent levers H, key-levers B, arranged in sets, each set of key-levers operating one of said bent levers H, bent lever N, an alternating series of said key-levers B, having projections b^2, engaging said lever N, type-sleeve-turning device M, and gear c^6 on said shaft C', substantially as specified.

20. The combination of rotatable sliding type-sleeve C, its shaft C', and carriage or shuttle C^3, with bent levers F F', vertically-sliding stop-pins D, bent levers H, key-levers B, arranged in sets, each set of key-levers operating one of said bent levers H, bent lever N, an alternating series of said key-levers B, having projections b^2, engaging said

lever N, type-sleeve-turning device M, and gear c^4 on said shaft C, bent lever O, an alternating series of said key-levers B being provided with projections b^3 to engage said lever O, and a type-sleeve-turning device M', operated by said lever O, substantially as specified.

21. The combination, with the rotatable sliding type-sleeve and its shaft C, furnished with three-toothed gear or cam c^3, of the key-levers and connecting mechanism engaging said three-toothed gear for turning the type-sleeve shaft, and a set-key lever and connecting mechanism for rotating the type-sleeve shaft to bring another series of the type-sleeve faces into operation, substantially as specified.

22. The combination, with rotatable sliding type-sleeve C and its shaft C, furnished with gear c^2, of the key-levers and connecting mechanism engaging said gear c^2 for turning the type-sleeve shaft, and a loose gear c^7 on said shaft C, for setting or adjusting the radial position of the shaft and allowing the shaft to rotate freely when operated by the key-levers, substantially as specified

23. The combination, with rotatable sliding type-sleeve C and its shaft C, furnished with gear c^2, of the key-levers and connecting mechanism engaging said gear c^2 for turning the type-sleeve shaft, and a loose gear c^7 on said shaft C, for setting or adjusting the radial position of the shaft and allowing the shaft to rotate freely when operated by the key-levers, and a sliding rack for revolving said gear c^7, substantially as specified.

24. The combination, with rotatable sliding type-sleeve C and its shaft C, furnished with gear c^2, of the key-levers and connecting mechanism engaging said gear c^2 for turning the type-sleeve shaft, and a loose gear c^7 on said shaft C, for setting or adjusting the radial position of the shaft and allowing the shaft to rotate freely when operated by the key-levers, and a sliding rack for revolving said gear c^7, and two set-key levers P' P^3, for giving different movements to said rack, substantially as specified.

25. The combination, with a sliding rotatable type-sleeve, its shaft, the key levers, and mechanism for operating said sleeve from the key-levers, of a loose gear c^7, for adjusting the radial position of the type-sleeve shaft, a sliding rack P, set-key lever P', its shank p^3 furnished with notch p^3 to engage the key-board and hold the set-key lever in position, substantially as specified.

26. The combination, with a sliding rotatable type-sleeve, its shaft, the key-levers, and mechanism for operating said sleeve from the key-levers, of a loose gear c^7 on said shaft C, sliding rack P, having projection p, and set-key levers P' and P^3, engaging said projection p, substantially as specified.

27. The combination, with a sliding rotatable type-sleeve, its shaft, the key-levers, and mechanism for operating said sleeve from the key-levers, of a loose gear c^7 on said shaft C, said gear c^7 having a projection c^8, and said type-sleeve shaft having a pin or projection c^9, substantially as specified.

28. The combination, with sliding rotatable type-sleeve C, shaft C, and shuttle C^2, of vertically-sliding stop-pins D, having pins or projections d, pivoted bent levers F F', operated by said stop-pins and connected to said shuttle, and spring-lever K, having a forked or T-shaped end adapted to bear against both said bent levers, substantially as specified.

29. The combination, with sliding rotatable type-sleeve C, shaft C, and shuttle C^2, of vertically-sliding stop-pins D, having pins or projections d, pivoted bent levers F F', operated by said stop-pins and connected to said shuttle, and spring-lever K, having a forked or T-shaped end adapted to bear against both said bent levers, and operating-levers H, having horizontal arms A, said lever K being provided with a foot K^2, adapted to be operated by horizontal arms A of said levers H, substantially as specified.

30. The combination, with the paper-holder carriage R, having rack R^3, of the vertically-vibrating lever K, having gears L^2 L^4, one adapted to oscillate upon the other the distance of one tooth, and a pawl L^3, substantially as specified.

31. The combination, with the paper-holder carriage R, having rack R^3, of the vertically-vibrating lever K, having gears L^2 L^4, one adapted to oscillate upon the other the distance of one tooth, a pawl L^3, and a spring L^5, connecting said gear L^2 L^4, substantially as specified.

32. The combination, with the paper-holder carriage R, having rack R^3, of the vertically-vibrating lever K, having gears L^2 L^4, one adapted to oscillate upon the other the distance of one tooth, a pawl L^3, and a spacing key-lever connected with and adapted to operate said lever K, substantially as specified.

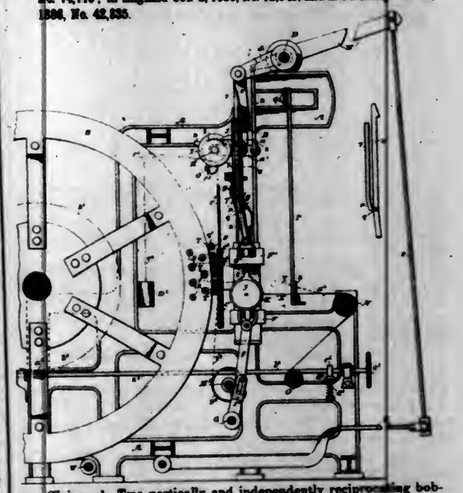
33. The combination, with a sliding rotatable type-sleeve, of a series of stops for limiting its longitudinal movement, a series of key-levers, and connecting mechanism for both rotating and sliding said type-sleeve by the movement of one and the same key-lever, substantially as specified.

34. The combination of a sliding rotatable type-sleeve C, a horizontal shaft upon which said type-sleeve reciprocates in a line parallel to the paper-roller, the paper-carriage and paper-roller, and an impression-hammer, the key-levers, and mechanism for reciprocating and rotating said type-sleeve from and by the key-levers, one and the same key-lever operating to both rotate and slide the type-sleeve, substantially as specified.

35. The combination of a sliding rotatable type-sleeve C, a horizontal shaft upon which said type-sleeve reciprocates in a line parallel to the paper-roller, the paper-carriage and paper-roller, and an impression-hammer, the key-levers, and mechanism for reciprocating and rotating said type-sleeve from and by the key-levers, said key-levers having rear ends which strike against and operate said impression-hammer, one and the same key-lever both rotating and sliding said type-sleeve, substantially as specified.

36. The combination of a sliding rotatable type-sleeve with key-levers B, impression-hammer U, its pivot or rock-shaft g, and foot or cross-bar g^2, and connecting mechanism through which said type-sleeve is both rotated and slid by one and the same key-lever, substantially as specified.

37. The combination, with a sliding rotatable type-sleeve, of a paper-carriage, a storage paper-roller mounted thereon, having a hinged clamp for clamping the edge of the paper, a hinged paper-feed frame having a limited opening movement to feed the paper the space of one line, and a paper-clamp lever pivoted to said paper-feed frame, substantially as specified.



38. The combination, in a type-writer, of a paper-carriage R with paper-roller S, hinged paper-clamp S', thumb-wheel S^2, crank s^1, and slotted link s^3, connected to said hinged clamp S, whereby said clamp is opened and held open when the paper-roller is turned in the reverse direction, substantially as specified.

39. The combination, in a type-writer, of a paper-carriage R with paper-roller S, hinged paper-clamp S', thumb-wheel S^2, crank s^1, and slotted link s^3, connected to said hinged clamp S', whereby said clamp is opened and held open when the paper-roller is turned in the reverse direction, and a spring s^5, for holding said clamp S' closed, substantially as specified.

40. The combination of spools V V', ribbon v, ratchet-wheels v^2, having hubs v^3, pawls U, lever u, vibrating lever K, said hubs v^3 having grooves v^4, and plug v^5, substantially as specified.

411,067. LOOM FOR WEAVING TUFTED FABRICS. (Métier à tisser.)

ARTHUR SERET, Roubaix, France, assignor of one-half to Jules Leon Ferdinand Saulnier, same place. Filed May 8, 1888. Serial No. 273,172. (No model.) Patented in France Sept. 18, 1886, No. 178,612; in Belgium Oct. 2, 1886, No. 74,713; in England Oct. 2, 1886, No. 12,543, and in Germany Oct. 15, 1886, No. 42,835.

Claim.—1. Two vertically and independently reciprocating bobbin-beams and bobbin-carriers mounted in and between said bobbin-beams, said carriers resting upon but detachable from the lower of said bobbin-beams, and said carriers having notches at their upper ends, the notches on alternate carriers being located on opposite sides, in combination with two independently-sliding bars adapted to said notched carriers, said bars being mounted on the upper of said bobbin-beams on opposite sides of said carriers, whereby either half or all of said bobbin-carriers may be connected with said upper bobbin-beam.

2. A vertically-reciprocating bobbin-beam and the vertically-reciprocating main operating-beam, in combination with a rock-shaft

located beneath said bobbin-beam, lever-arms secured to said rock-shaft, links connecting said lever-arms with said bobbin-beam, crank-arms connected with said rock-shaft, and hooked rods pivoted to said crank-arms and co-operating with the main operating-beam, substantially as set forth.

3. Two vertically and independently movable bobbin-beams and the vertically-reciprocating main operating-beam, in combination with hooked rods pivotally connected with the upper only of said bobbin-beams, and co-operating with said main operating-beam when said upper bobbin-beam is to be raised, and means for moving said lower bobbin-beam independently of said upper bobbin-beam, substantially as set forth.

4. The vertically-reciprocating main operating-beam and the upper vertically-movable bobbin-beam, in combination with hooked and notched rods pivotally connected with said bobbin-beam and co-operating with said operating-beam to raise said bobbin-beam, and spring-catch levers which engage the notches in said hooked rods when the same are raised, whereby said bobbin-beam may be held in an elevated position, substantially as set forth.

5. The main operating-beam, the upper bobbin-beam, the notched bobbin-carriers, and the sliding bars mounted on the bobbin-beam, which engage said notched carriers, in combination with rock-shafts mounted on said bobbin-beam, lever-connections between said shafts and said sliding bars, lever-arms secured to said shafts, and hooked rods pivotally connected with said lever-arms and co-operating with said main operating-beam, substantially as set forth.

6. A swinging and laterally-movable batten having batten-teeth and the main operating-beam of the loom, in combination with a rock-shaft from which said batten is suspended, a cam on said shaft for moving said batten laterally, a hooked rod co-operating with said main beam, and lever-connections between said hooked rod and said rock-shaft, substantially as set forth.

7. A rotary drum and a series of rollers journaled in said drum near its periphery, upon which the pile warp-threads are wound, in combination with a gear-wheel on said drum, a rotary shaft having a hand-wheel, and a worm on said shaft engaging said gear-wheel, substantially as set forth.

8. A rotary drum and rollers journaled therein, upon which the pile warp-threads are wound, in combination with a sliding rotary clutch member adapted to said rollers, a weight connected with said rotary clutch member by an intervening cord for giving tension thereto, and means for sliding said clutch member, substantially as set forth.

9. A rotary drum and a series of rollers journaled therein, upon which the pile warp-threads are wound, in combination with pile-carrying bars removably mounted on said drum, to which the ends of the pile warp-threads are secured.

10. A rotary drum and a series of rollers journaled therein, upon which the pile warp-threads are wound, in combination with a pile-carrying bar removably mounted on said drum, to which the ends of the pile warp-threads carried by one of said rollers are secured, and a nipping bar or rod for securing the ends of said threads to said pile-bar, substantially as set forth.

11. A rotary drum, a series of rollers journaled therein, upon which the pile warp-threads are wound, and a pile-carrying bar removably mounted on said drum, to which the ends of the pile warp-threads are secured, in combination with sliding bars which engage said pile-bar and move it from said drum, and mechanism for actuating said sliding bars, substantially as set forth.

12. A rotary drum, a series of rollers journaled therein, upon which the pile warp-threads are wound, and a pile-carrying bar removably mounted on said drum, to which the ends of the pile warp-threads are secured, in combination with curved or cam-shaped sliding bars which engage said pile-bar and move it from said drum, guide-rollers upon which said sliding bars rest and travel, and mechanism for actuating said sliding bars, substantially as set forth.

13. A rotary drum, a series of rollers journaled therein, upon which the pile warp-threads are wound, a pile-carrying bar removably mounted on said drum and to which the ends of the pile warp-threads are secured, and sliding bars which engage said pile-bar and move it from said drum, in combination with a rock-shaft, levers connecting said rock-shaft to said sliding bars, a pivoted sway-beam, a lever-arm connecting said sway-beam to said rock-shaft, the main operating-bar B, and a hooked rod pivoted to said sway-beam and co-operating with said main operating-bar, substantially as set forth.

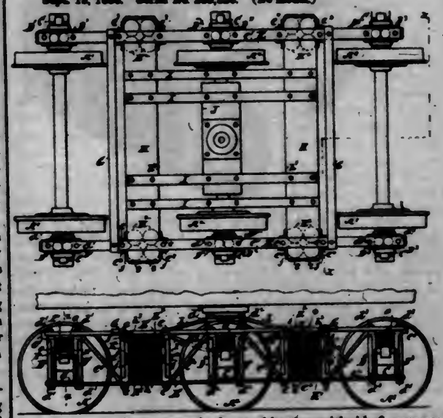
14. The pile-warp drum, the ground-warp bobbins, and mechanism for actuating said bobbins, in combination with a reciprocating pile-thread-shifting frame located between said pile-warp drum and said ground-warp bobbins, the pile warp-threads passing through said shifting-frame.

15. A vertically-reciprocating pile-thread-shifting frame, and weights connected therewith by intermediate cords and pulleys, whereby said frame is normally held in an elevated position, in combination with a rotary shaft beneath said frame, drums on said shaft, straps connecting said drums and said frame, the main operating-bar B, a hooked rod co-operating with said main bar, and a cord or strap connected at opposite ends to said hooked rod and to said shaft, substantially as set forth.

16. A vertically-reciprocating pile-thread-shifting frame, weights connected therewith by intervening cords and pulleys, a rotary shaft, drums on said shaft, straps connecting said drums with said shifting-frame, the main operating-bar B, a hooked rod co-operating with said bar, and a cord or strap connected at opposite ends to said rod and to said shaft, in combination with a second gravitating hooked rod, and a cord connecting the same with said rotary shaft, said gravitating hooked rod being brought into co-operation with the main operating-beam when the shaft has been rotated by the instrumentality of the first-named hooked rod, substantially as set forth.

17. The vertically-reciprocating bobbin-beams, bobbin-carriers, the bobbins thereon, and the pile-warp rollers, in combination with a laterally-movable comb mounted on each of said beams, between the teeth of which the pile warp-threads pass, and means for moving said comb laterally, substantially as set forth.

18. The vertically-reciprocating bobbin-beams, bobbin-carriers, the bobbins thereon, and the pile-warp rollers, in combination with a laterally-movable comb mounted on each of said bobbin-beams, between the teeth of which the pile warp-threads pass, the lateral movement of the comb on one beam being double that of the comb on the other beam, and mechanism for moving said combs laterally, substantially as set forth.



19. A vertically-reciprocating bobbin-beam and a laterally-movable comb mounted on said beam, in combination with a rock-lever pivoted to said bobbin-beam, one arm of which is connected with the comb, and stationary tappets fixed to the frame-work of the loom, which are encountered by the other arm of said rock-lever, substantially as set forth.

20. Two reciprocating bobbin-beams and the bobbins for carrying the ground warp-threads mounted in and between the same and supported alternately by each of said beams, in combination with rollers upon which the pile warp-threads are wound, a movable bar, to which the ends of the pile warp-threads are secured, which bar carries the pile-threads between the bobbins and one of said bobbin-beams when the latter has been separated from the bobbins, and mechanism for carrying said movable bar between said bobbin-beams, substantially as set forth.

21. Two reciprocating bobbin-beams and the bobbins for carrying the ground warp-threads, mounted in and between the same and supported alternately by each of said beams, in combination with rollers, upon which the pile warp-threads are wound, a vertically-movable pile-thread-shifting frame between said pile-rollers and said ground-warp bobbins, and a movable pile-carrying bar which carries the pile-threads through said shifting-frame and between said bobbins and one of said bobbin-beams, substantially as set forth.

411,068. CAR-TRUCK. (Truck de wagon.)

WILLIAM H. H. SMITH, Brooklyn, N.Y. Filed Sept. 12, 1888. Serial No. 285,226. (No model.)

Claim.—1. In a car-truck, the combination, with side frames provided with bearings, of a bolster made in three parts, comprising upper, middle, and lower parts, and springs arranged between the lower and middle parts, and other springs arranged in pairs between the middle and upper parts, substantially as specified.

2. In a car-truck, the combination, with side frames provided

with bearings for three pairs of wheels, of two bolsters connected together and severally composed of three parts, comprising an upper, a central, and a lower part, springs arranged between the lower and middle parts of each of said bolsters, and springs arranged between the middle and upper parts of each bolster, substantially as specified.

3. In a car-truck, the combination, with frames provided with bearings, of a bolster comprising an upper, a middle, and a lower beam, spiral springs arranged near the ends between the lower and middle beams, and other spiral springs between the middle and upper beams, substantially as specified.

4. In a car-truck, the bolster, comprising the upper, the middle, and the lower portions, extending across the truck, and spiral springs arranged between the upper and middle portions, and other spiral springs arranged between the middle and lower portions, substantially as specified.

5. In a car-truck, the combination of a side frame having two longitudinal bars, one above the other, and pedestal-jaws consisting of pieces fitted and secured between the two longitudinal bars by means of bolts extending transversely through the said bars and lengthwise through the pedestal-jaws, substantially as specified.

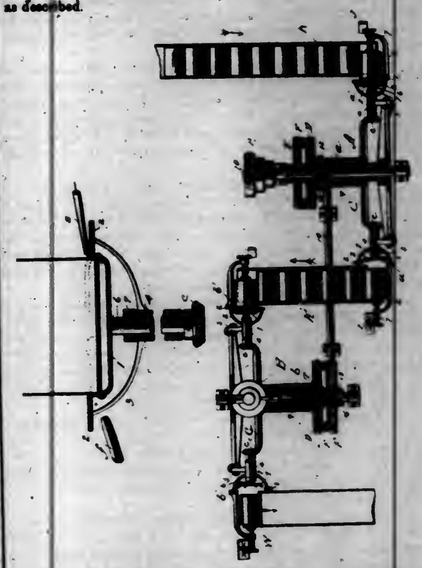
6. In a car-truck, the combination, with a side frame and an oil-box working within pedestal-jaws comprised in said side frame, of a rocker supported upon the oil-box, and a stirrup supported upon the rocker and engaged with said pedestal-jaws, substantially as specified.

7. In a car-truck, the combination, with a side frame and an oil-box working within pedestal-jaws comprised in said side frame, of a rocker supported upon the oil-box, and a stirrup consisting of two upright bars and a cross-bar, the cross-bar resting upon the rocker and the upright bars being engaged with the pedestal-jaws, substantially as specified.

8. In a car-truck, the combination, with a side frame and an oil-box working within pedestal-jaws comprised in said side frame, of a rocker supported upon the oil-box, and a stirrup consisting of a cross-bar resting upon the rocker, two upright bars engaging with the pedestal-jaws and provided with vertical slots receiving lugs with which the rocker is provided, substantially as specified.

411,069. METHOD OF BURNING CLAY FOR BALLAST.

CHARLES M. SNYDER, Mount Pleasant, Iowa. Filed Mar. 5, 1889. Serial No. 301,962. (No model.)



Claim.—The method herein shown of burning clay and other earths into suitable material for railroad-ballast and other like purposes, consisting in forming a series of deep trenches A in the earth parallel with each other, with standing walls of earth left in its natural state to be burned between said trenches, with said trenches filled with coal or other suitable fuel and fired, and the loose clay or earth excavated in forming said trenches placed in suitable layers interspersed with coal over said filled and fired trenches and intermediate standing walls, so as to ignite and burn it to proper consistency in harmony with said standing walls B by the fire in said furnaces or trenches A, substantially as shown, for the purposes specified.

411,070. CAN-SOLDERING MACHINE.

JOHN SOLTER, Baltimore, Md., assignor of one-half to George L. Kreba, same place. Filed May 27, 1889. Serial No. 312,262. (No model.)

Claim.—1. In combination, the two vertical can-carriers with separate can holding and releasing devices for each can, and a conveyer between them for transferring the cans from one carrier to the other and inverting them in relation to their can-seats, substantially as described.

2. In combination, a series of can-seats on a movable support with can-holders and means for releasing the cans when they are approximately in a horizontal position, a second series of can-seats with automatic can-gripping devices, and a conveyer for transferring the cans in approximately a horizontal position from one series of seats to the other and inverting them in relation to the can-seats, substantially as described.

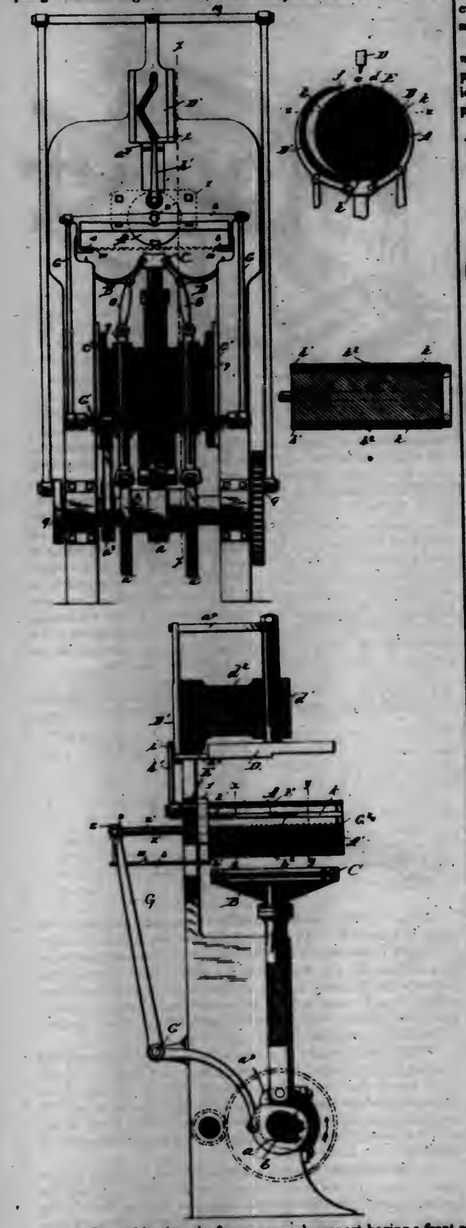
3. In combination, the two vertical wheels, the conveyer between them arranged to receive the can in a horizontal position from one wheel and convey and hold it in line with the can-seats of the other wheel, and cause it to be inverted in relation thereto, and separate automatic gripping and releasing devices for each of the cans, substantially as described.

4. In combination, a vertical table in which a feed-station and a discharge-station are arranged approximately opposite, a second vertical table having a feed-station positioned in relation thereto similar to that of the first feed-station to the first wheel, and a conveyer between the discharge-station of the first wheel and the feed-station in the second wheel for transferring the can in an inverted position to the second table, substantially as described.

5. In a can-seat, the ring having a depressed portion to allow feeding of solder to the seam, substantially as described.

6. In combination, the can-seat, the ring, the flame-tube below said ring, and the solder-tube arranged opposite and above the ring, said ring having a depressed portion to allow the feeding of solder, substantially as described.

411,071. METAL-SEAMING MACHINE.



JOHN SOLTER, Baltimore, Md., assignor of one-half to George L. Kreba, same place. Filed May 28, 1889. Serial No. 312,263. (No model.)

Claim.—1. In combination, the former for supporting the work, having a recess to receive a crimper and having a blade *f*, a revoluble crimper within said recess of the former, said crimper being formed with a recess, and a plunger co-operating with said recessed crimper to unite the edges of the metal, said crimper acting in connection with the blade *f* to crimp the united edges, substantially as described.

2. In combination, the former or work-support, the plunger, the revoluble crimper, and an operating-connection from said crimper to the plunger for moving the crimper, substantially as described.

3. In combination, the work-support, the plunger, the crimper, the crank-arm connected thereto, and the cam moving with the plunger for operating said crank-arm, substantially as described.

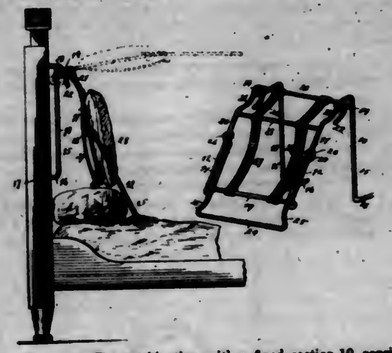
4. In combination, the former or work-support having a front recessed portion, a revoluble crimper therein extending approximately half way to the rear, and a plunger to act in conjunction with said crimper in the front portion for uniting the edges of the blanks, the said former having a rear part constituting a second former or work-support, the said plunger also having a rear part constituting a second plunger for finishing the seams, substantially as described.

5. In combination, the former or work-support having a front recessed portion, a revoluble crimper therein extending approximately half-way to the rear, and a plunger to act in conjunction with said crimper in the front portion for uniting the edges of the blanks, the said former having a rear part constituting a second former or work-support, said rear part being grooved to finish the seam, the said plunger also having a rear part constituting a second plunger to act in conjunction with the grooved rear part for finishing the seams, substantially as described.

6. In combination, the former, the revoluble crimper for uniting the metal, and the discharge comprising the automatic lever G, discharge-bars for engaging the metal, and the connection between the same and the lever, substantially as described.

7. In combination, the former supported at one end, means for uniting the material, including a plunger, a grip C, and means for positively reciprocating said grip to and from the former and for rigidly holding the same to support the former during the impact of the plunger, substantially as described.

411,072. RIDING-SADDLE.



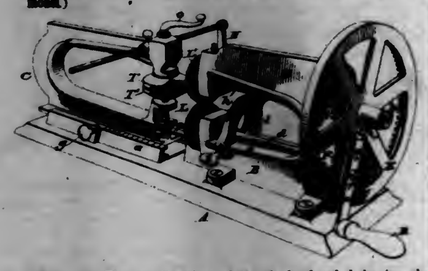
JOHN B. SULLIVAN, Jefferson City, Mo. Filed Mar. 23, 1889. Serial No. 304,735. (No model.)

Claim.—The combination of the fork and the pommel, said fork being in two parts, and said pommel having the two long projections extending from the lower end of the neck forward and sidewise upon the fork parts, respectively, and secured in position by screws passing into the fork at right angles to its vertical length, and the single short projection extending directly downward from the rear side of the pommel opposite the center and against the rear face of the fork, and held in place by screws passing into the fork in line with its width, whereby said pommel is secured to said fork by means of said projections and screws.

411,073. MOSQUITO-NET FRAME AND SHAM-PILLOW HOLDER.

WILLIAM TRUMBO, Mount Vernon, Ind. Filed May 20, 1889. Serial No. 275,445. (No model.)

Claim.—1. The combination, with a fixed section 10, consisting of cross-bar 13, standards 15, and eyes 14, produced at the intersection of the cross-bar and standards, of the frame-section 11 and the side-frame section 12, the former having an inclined portion 21 and hooks 22, adapted to enter the eyes 14 of the said section 10, the frame-section 11 having a cross-bar 19 at its outer end, and the section 12 having its side arms looped at their inner ends around the side arms of section 11 and bearing in advance of said looped ends on the cross-bar 19, all combined to operate substantially as and for the purpose specified.



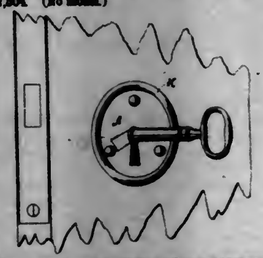
2. The improved mosquito-net frame and sham-pillow holder, comprising a fixed section 10, consisting of a cross-bar 13, standards 15, and eyes 14, produced at the intersection of said cross-bar and standards, a body-frame 11, having an inclined portion 21 formed in the side bars near the extremity, hooks 22, produced at the extremity of said side bars, strips 27, extending longitudinal of the said section 11, and a second body-section 12, connecting with and sliding upon the first body-section, as described, whereby the device may be adjusted to and held in horizontal position and extended to form a net-holder, substantially as and for the purpose specified.

3. The combination, with a fixed section 10, consisting of a cross-bar 13, standards 15, and the eyes 14, formed at the intersection of the standards and cross-bar, of the body-frame 11, having an inclined portion 21 produced upon side bars near their extremities, hooks 22, formed in said side bars at the extremities, brace-bar 23, strips 27, extending longitudinally of the said section 11, a sham pillow secured

upon said strips, and a second body-section 12, connected with and adapted to slide upon the first body-section, substantially as and for the purpose specified.

4. In a combined sham-holder and set-frame, the combination, with the eyes 14 and the frame 11, having hooks 22 engaging said eyes and movable in a longitudinal direction in said eyes, whereby the section 11, when adjusted to horizontal position, may be held therein, of the frame 12, connected with and sliding along the frame 11, whereby the device, when adjusted to horizontal position, may be extended, substantially as and for the purposes specified.

411,074. ROTARY SHEARS. CHARLES THOMAS and JOHN W. HAVILAND, Elmira, N. Y. Filed May 27, 1889. Serial No. 312,204. (No model.)



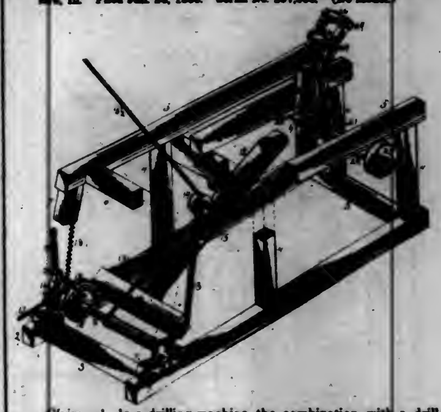
Claim.—1. The combination of the shafts *d* and *h*, having the rotary blades L L', secured to one end, and the intermeshing pinions F and G, rigidly secured at their opposite ends, with the internal gear-wheel E, arranged to engage with one of said pinions and thereby impart an increased velocity to the cutters, substantially as and for the purpose set forth.

2. In combination with the gear-wheel E and the intermeshing pinions F G, arranged to impart motion to the rotary cutters L L', the crank R, adjustably secured to said wheel E, whereby the power applied may be increased or decreased to adapt the machine to cut metal of varying thicknesses, as herein set forth.

411,075. COMPOUND FOR SETTLING COFFEE. MARY P. R. TILTON, New York, N. Y. Filed Jan. 30, 1889. Serial No. 297,980. (No specimens.)

Claim.—The herein-described composition of matter to form a clarifier for coffee and similar decoctions, which consists of a crystalline compound of albumen, gelatine, starch, and sugar intimately mixed together in about the proportions specified.

411,076. KEY-FASTENER. ELI C. TOWNSEND, New York, N. Y., assignor of one-half to Stephen J. Cox, same place. Filed Oct. 8, 1888. Serial No. 287,204. (No model.)



Claim.—A key-escutcheon consisting of two concentric circular plates with corresponding key-holes, the openings for the axial line of the key being placed in the center of the plates, the superimposed plate being permanently fixed, while the subjacent plate is capable of a limited rotation around the axial line of the key-shank by means of its projecting raised rim, and by the rotation of the subjacent plate the key-hole is occluded and the key securely held in place, substantially as set forth and described.

411,077. OINTMENT. HUGH G. TUBLEY, Dorchester, Ontario, Canada. Filed Jan. 28, 1889. Serial No. 297,300. (No specimens.) Patented in Canada Oct. 3, 1887, No. 27,712.

Claim.—The herein-described ointment, to be used for the treatment of diseases of horses—such as greasy legs, curbs, splints, or any other callous deposits—consisting of iodine, iodide of potassium, corrosive sublimate, cantharides, sulphate of copper, Prussian blue, arsenic, and hog's lard, in the proportions specified.

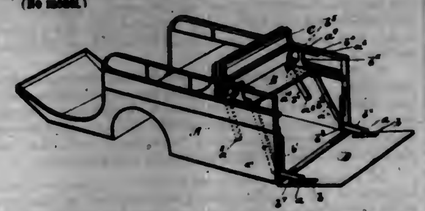
411,078. ROCK-DRILLING MACHINE. ROMAIN B. DYER, Rockford, Ill. Filed Jan. 28, 1889. Serial No. 297,802. (No model.)

Claim.—1. In a drilling-machine, the combination, with a drilling attachment, of a lowering device to said attachment, consisting of a ratchet-wheel, a pallet, an operating-handle attached to the pallet, and a spring connected with the pallet, the tension of the spring tending to hold the operating-handle raised and the advanced tooth of the pallet in engagement with the ratchet-wheel, substantially as set forth.

2. In a drilling-machine, the combination, with the main frame, of a rope-shaft journaled therein, two ratchet-wheels keyed to the rope-shaft, a ratchet-lever for engaging one of said ratchet-wheels to wind the rope about the shaft, a pallet engaging the other ratchet-wheel for letting out rope, and provided with an operating-handle, an operating-lever pivoted about said shaft, a sheave engaged with said lever, a rope wound about the rope-shaft, passed around the sheave, and provided with a drilling-tool, a main drive-shaft journaled in the opposite end of said main frame, and a cam upon said shaft for depressing the said operating-lever, substantially as set forth.

411,079. COMBINATION-TOOL. WARREN R. VAN VLIET, East Stroudsburg, Pa. Filed Sept. 26, 1888. Serial No. 286,419. (No model.)

Claim.—1. The combination, with a suitable steel blade, of the handle B, composed of the section C and the claw E, and the section F, having a similar claw E' and provided with a recess designed to receive a corkscrew, and attached to the section C by the pin *f*, that projects from the latter into an opening in the former, a corkscrew pivoted in said recess, and the sleeve holding the section F closely against the section C, with its inner or upper end against the shoulder D, substantially as specified.

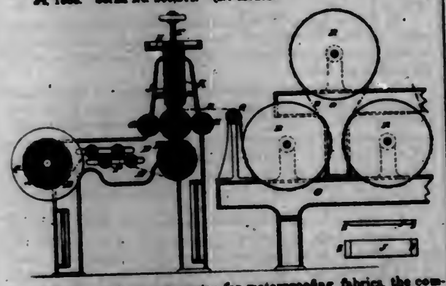


2. The combination, with a suitable blade, of the handle composed of the section C, provided with the shoulder D, claw E, pin *f*, and half of the hammer-head G, the section F, provided with the claw E, the opposite half of the hammer-head G, and having a recess in one of its sides and an opening for the pin *f*, a corkscrew pivoted in said recess, and the sleeve holding the sections closely together, substantially as described.

3. The combination, with a suitable blade and the larger handle-section C, secured to the blade and having the shoulder D, of the smaller handle-section F, provided with the recess *h'* on its inner face and the stop-pin h^2 in said recess, the corkscrew H, with its outwardly-bent end pivoted in the side or wall of said recess, and the sleeve I, holding said sections firmly together, substantially as specified.

4. The herein-described combination-tool, comprising the steel blade A, having the sharp edge *a*, the opposite serrated or toothed edge *a'*, the larger handle-section C, provided with the shoulder D, the pin *f*, the claw E, and one-half the hammer-head G, the smaller handle-section provided with the claw E', the opposite half of the hammer-head, the recess *h'*, the stop-pin h^2 in said recess, and an opening for

the pin *f*, the corkscrew H, pivoted in the recess *h'*, and the sleeve I, holding the two sections together, substantially as specified.



411,080. VEHICLE-SEAT. HARLAN P. WELLS and JAMES STOCKFORD, Jr., Amesbury, Mass. Filed Mar. 5, 1889. Serial No. 302,094. (No model.)

Claim.—1. The within-described automatically-reversible seat, which consists of the seat B, having the braces b^3, levers b^2, and brackets b^4, and the lazy-back C, having the arm-shanks a^3, with the slots b^4 and holes for the reception of the pivot-bolts a^5, in combination with the pivot-bolts a^5 a^6 a^6, connecting-bars b^7, having the shoulders b^8, metallic braces b', brackets b, and hinged rear end D, constructed and arranged substantially as described, for the purposes set forth.

2. In a seat for vehicles of the class herein named, the automatically-reversible lazy-back C, with the arm-shanks a^3, having the slots b^4 and the hole for the reception of the pivot-bolts a^5, in combination with said pivot-bolt a^5, secured in the body A, and the brackets b^4 of the seat B, substantially as described and set forth.

411,081. APPARATUS FOR WATERPROOFING TEXTILE FABRICS. THOMAS F. WILEY, Rawden, near Leeds, England. Filed Sept. 24, 1888. Serial No. 286,311. (No model.)

Claim.—1. In an apparatus for waterproofing fabrics, the combination of a mass of solid waterproofing material, a hollow cylinder of flexible material adapted to contain water arranged adjacent to the mass of waterproofing material, and guides for the fabric to direct it between the said flexible cylinder and the mass of waterproofing material, substantially as set forth.

2. In an apparatus for waterproofing fabrics, the combination of a slab of solid waterproofing material, a holder therefor in which it slides, a cylinder of flexible material adapted to contain water held opposite the edge of the said slab of material, and guides for the fabric which direct it to partially encircle the said cylinder to cause it to revolve, substantially as set forth.
